Louis XIV. having succeeded in placing his grandson, Philip, Duke of Anjou, on the throne of Spain in 1700 as Philip V., this prince became the founder of the Spanish B. dynasty, as well as of the B. dynasties of Naples, Parma, and Piacenza. These dynasties endured only a temporary overthrow from the policy and arms of Napoleon Bonaparte. Philip V. was succeeded on the Spanish throne by his son, Ferdinand VI., who died without issue in 1759, and the crown fell to his brother, Charles III., whose son and successor, Charles IV., was compelled to resign it in 1808, in favour of

a successor nominated by Napoleon, and died at Rome in 1811. The two eldest sons of Charles IV. by his marriage with Maria Louisa of Parma were—1. Don Fernando, Prince of Asturias, who, after the overthrow of Napoleon, ascended the Spanish throne as Ferdinand VII. (q. v.), and whose eldest daughter reigned till 1868; 2. Don Carlos (q. v.), who, on the death of his elder brother in 1833, became pretender to the Spanish throne until 1845, when he resigned his pretensions in favour of his son, Count de Montemolin. He died at Trieste, 1855. The Count de Montemolin died in 1861, and his claims to the Spanish throne are now represented by his nephew, Don Carlos, son of his brother Juan.

Philip V. did not succeed in keeping possession of the crown of the Two Sicilies (q. v.) as of that of Spain; the House of Hapsburg effecting its own restoration there in the person of a son of Leopold I., who in 1720 ascended the throne as Charles III. But in consequence of the peace of Vienna, the son of Philip V. became king of the Two Sicilies, likewise by the name of Charles III. Upon his accession to the throne of Spain in 1769, he gave up that of Sicily to his third son, Don Fernando, called Ferdinand IV., with the express stipulation that it should never again be occupied by a king of Spain. Ferdinand IV. was compelled to yield to the French arms in 1808; but after the overthrow of Napoleon, he became king of the Two Sicilies as Ferdinand I. (q. v.). His son, Francis I., left the throne in 1830 to his son Ferdinand II. (q. v.), whose son, Francis II., was expelled in 1860, when Naples was incorporated with the new kingdom of Italy.

By the peace of Aix-la-Chapelle in 1748, Austria made over the duchies of Parma and Piacenza to Don Philip, the youngest son of Philip V. of Spain, but with stipulation of their reversion to Austria on the failure of his male descendants, or on his succeeding to the throne of Spain. He was succeeded in 1765 by his son, Ferdinand I., whose son, the hereditary Prince Charles Louis Ferdinand, was made king of Etruria in 1801, under the guardianship of his mother, Maria Louisa of Spain; but Etruria being soon incorporated with France, they were completely dispossessed. The Congress of Vienna assigned Parma and Piacenza for life to Maria Louisa of Austria, the spouse of Napoleon, but meanwhile indemnified Maria Louisa of Spain with the duchy of Lucca. In 1847, Parma and Piacenza reverted to the B. family, in the person of the former king of Etruria, Charles Louis de B., who had succeeded his mother in Lucca in 1824. He abdicated on March 14, 1849, and was succeeded as Duke of Parma and Piacenza by his son, Charles III., and he in 1854 by his son Robert—born 1848—whose mother, Maria Louisa Theresa de B., daughter of the Duke of Berri, then became regent of the duchies. The B. family lost these duchies in 1859. See ITALY and PARMA; and see Coiffier-Demoret, *Histoire du Bourbonnais et des Bourbons* (2 vols., Par. 1828); Achaintre, *Histoire Chronologique et Généalogique de la Maison Royale de Bourbon* (2 vols., Par. 1825).

BOURBON, CHARLES, DUKE DU BOURBONNAIS, styled CONSTABLE DE BOURBON, born 1489, was the son of the Count of Montpensier; and in consequence of the death of his elder brother, and his marriage with the only daughter of the Duke of Bourbon, he united in his own possession the vast estates of both these branches of the Bourbon family. Holding a very high position in virtue of his birth and wealth, he soon shewed himself to be no ordinary character, by the brilliancy of his exploits in arms, and by his rigid morals and severe taciturn disposition. At the age of 26, he received from Francis I. the Constable's sword, and was sent

## BOURBONNAIS—BOURDON DE L'OISE.

to Italy at the head of an army, which he disciplined on the march; and crossing the Alps by passes previously deemed impracticable, he surprised the hostile generals, won the battle of Marignan (1515), and within a few days placed the keys of the citadel of Milan in the king's hand, acquiring for himself by these exploits the reputation of the greatest general of his time. But Maria Louisa, the king's mother, became enamoured of the brave Constable; and he, although a widower, declined her hand, openly declaring that he deemed her a woman devoid of modesty, and not to be thought of for a wife. Her revenge led to the seizure, on behalf of the crown, of the estates which he had acquired through his wife, and the withholding of his pay as Constable. Thus deeply injured, he renounced the interest of France, and concluded a private alliance with the Emperor Charles V., and with Henry VIII. of England. The former agreed to give him in marriage his sister, Eleonora, who had Portugal as her jointure, and to make an independent kingdom for him of Provence and Dauphiné, with his own possessions of the Bourbonnais and Auvergne. The rest of France was to be apportioned between the two confederates. The king, who was engaged in an expedition to Italy, received intelligence of this conspiracy. Forthwith he proceeded in person to the Constable, and offered him restoration to favour and also of his estates. The Constable, however, did not trust him, but fled in disguise, and reached Franche Comté in 1523. In order not to appear as a fugitive to the Spanish army, which awaited him in Lombardy, he drew around him 6000 German lancers, and soon contrived to gain their entire attachment. He attacked, in 1524, the French army on its march over the Alps, and thought to have advanced to the heart of France with the Spaniards, whose general he had been appointed by the emperor. But Charles V. did not entirely trust him, and appointed the Marquis of Pescara to assist and watch him. He was compelled to relinquish the siege of Marseille, on the approach of François I. with a great army. He repassed the Alps, and took his revenge in the battle of Pavia, 24th February 1525, where the king was made a prisoner. He now went to Madrid, but soon found himself entirely disappointed in his hopes, and was sent back to Lombardy by Charles V. Without money or support, surrounded by daring and mutinous bands, he conceived a plan to found for himself an independent dominion of his own, and to unite himself with France against Spain. Hastily gathering together the wild bands around Milan, he led them against Rome; and on 6th May 1527, unprovided with things necessary for a siege, appeared before the walls of that city. Resolved to conquer or die, he led up his troops in the most impetuous manner, and eagerly seized with his own hands a scaling-ladder, in order to make his way over a weak place of the walls, when he was mortally wounded by a bullet, which Benvenuto Cellini afterwards asserted that he had shot. His death was kept secret for a time from the storming army under his command. When it departed from Rome two months after, his corpse, which the soldiers would not part with, was taken with them, and buried at Gaeta, under a magnificent monument, which, however, was afterwards destroyed.

BOURBONNAIS, a gently undulating, terrace-formed district in the centre of France, northward of the high lands of Auvergne, abounding in grain, fruits, wine, iron, marble, and mineral springs. From 1327 to 1523, it formed the duchy of Bourbon, and afterwards, becoming a domain of the crown,

it formed a separate province of France. It now constitutes the department of Allier, and part of the department of Cher. The capital was Moulins.

BOURBONNE-LES-BAINS, a town of France, in the department of Haute-Marne, about 20 miles east-north-east of Langres. It is pleasantly situated at the confluence of the Borne and the Aspance, and has some fine promenades and manufactures of cotton hosiery and cutlery. Its chief feature, however, is its saline springs, which range in temperature from 121°—136° F., and are much resorted to by people suffering from chronic complaints or old wounds. Pop. (1872) 3942.

BOURDALOUE, LOUIS, one of the greatest pulpit orators of France, was born at Bourges, 20th August 1632, and having, at the age of 16, entered into the order of the Jesuits, obtained in succession the chairs of Humanity, Rhetoric, Philosophy, and Theological Ethics in the academy of his native place. He shewed a great capacity for science, but his remarkable powers of eloquence led his superiors finally to determine upon employing him as a preacher. Distraining the inflated style prevalent among the tasteless pulpit orators of his time, he assailed with manly vigour and truly religious earnestness the passions, weaknesses, and errors of men. The dignity of his manner and the fire of his eloquence made him famous even when the public mind was occupied with the festivities of Versailles, the victories of Turenne, and the literary master-pieces of Corneille and Racine. At the court of Louis XIV. he was remarkably well received. After the revocation of the Edict of Nantes, he was sent to Montpellier in 1686, to labour among the Protestants on behalf of the Roman Catholic Church. B. particularly understood how to accommodate his eloquence to the minds of those whom he addressed. Simple among the simple, a dialectician among ecclesiastics, he was equally a favourite with the common people and with the learned and the great. He was also much esteemed and beloved as a man; and in all circumstances, maintained unimpeached a high reputation for candour and honesty. In the later years of his life, he relinquished the pulpit, and devoted his time to hospitals, prisons, and pious institutions. He died at Paris 13th May 1704. How thoroughly his religious sentiments were governed by the theological tenets of his church, may be perceived from these remarkable words which he uttered on his death-bed: 'It is highly reasonable that God be fully satisfied; and at least in purgatory I will suffer with patience and with love.' Several editions have appeared of the collected works of B. (as 16 vols., Versailles, 1812, and most recently in the *Panthéon Littéraire*, 3 vols., Par. 1838). The best edition of his sermons is that published under the care of Bretonneau (16 vols. and 18 vols., Par. 1707—1734). His life was written by Madame de Pringy.

BOURDON DE L'OISE, FRANÇOIS LOUIS, a notorious character of the French Revolution, was born in the middle of last century at Saint Rémy, near Compiegne, and became a procurator in the parliament of Paris. He helped to storm the Tuilleries on 10th August 1792. He shortly afterwards obtained a seat in the Convention by a trick, presenting himself as the regularly elected deputy for the department of Oise, in which he had actually been defeated by a namesake who was elected also for that of Loiret. The trick was subsequently discovered, but he was not ejected. B. contributed much to bring about the execution of Louis XVI., the insurrection of 31st May, and the destruction of the Girondists. He was sent to La Vendée, where, however, he loudly condemned the revolutionary

## BOURGELAT—BOURIGNON.

cruelties, and appeared in the character of a moderate. Obnoxious on this account to Robespierre and Hébert, and fearing for his head, he urged on with the greatest eagerness the overthrow of the Terrorists on the 9th Thermidor (27th July 1794). From this time forth, B. shewed himself an enemy of the clubs, and a protector of the nobles and the priests. In consequence of the insurrection of 13th Vendémiaire (5th October 1795), he was sent as commissioner to Chartres, where he behaved harshly and brutally. He passed from the Convention into the Council of Five Hundred, became a persecutor of the republicans, and joined a royalist club. The Directory placed him upon the proscription list after the 18th Fructidor (4th September 1797). He was transported to Cayenne, where, in a short time, he died in great misery, tortured with remorse.

**BOURGELAT**, CLAUDE, founder of the first veterinary school, and consequently the first to institute a distinct profession of veterinary surgeons. Born in Lyon in 1712, he died there in 1799. He was a learned lawyer, an able writer, and the bosom-friend of the great D'Alembert, enjoying also the esteem of Pembroke, Voltaire, Buffon, and Haller. He was instigated to further the cause of veterinary science from a natural liking for horses, and conceived the idea of educating men to alleviate their infirmities and those of other domestic animals. In the execution of this project he found a friend and collaborator in a minister of Lyon, Bertin; and in 1761, the first veterinary school was opened in the suburbs of the city. It was patronised by royalty, and students flocked to it from all parts of France, Italy, Switzerland, Germany, Sweden, and Denmark. Probably the only dark spot in B.'s veterinary career is his treatment of Vial de St Bel, who, persecuted by his colleagues in France, came to England, and founded the St Pancras College, Camden Town, London, in 1792. B. had, however, endowed the Lyon school with so much vital energy that it has maintained itself in the foremost ranks. From it all other colleges in Europe sprang, and with them it has kept pace, being superior to the majority, and rivaling the very best, even those of Paris and Berlin.

B. wrote much—his works on Farriery, *Materia Medica*, External Form, Contagious Diseases, and on the various apparatus and bandages used for quadrupeds, being still highly esteemed.

**BOURG-EN-BRESSE**, a town of France, capital of the department of Ain, pleasantly situated on the left bank of the Reyssouze, about 20 miles east-south-east of Macon. It is well built, has several public fountains, a statue to Bichat, the celebrated anatomist, who was a student at the hospital here, a museum, a fine corn-market, and a public library of 19,000 volumes. The distinguished astronomer, Lalande, was a native of B. It has manufactures of linen, cotton, hosiery, and leather, and a trade in agricultural produce. The town was captured by the allies in 1814. Pop. (1872) 10,647.

**BOURGEOISIE**, a French term, but now not unfrequently employed in English, German, and other languages. It denotes the citizens of towns as a rank or class of society, including persons from the condition of heads of manufacturing or mercantile establishments, down to master-tradesmen. The French B. have long been extremely hostile to the aristocracy, but have themselves latterly become the object of attack on the part of the operatives and of the extreme radical or red republican party. The term *bourgeois*, from which B. is formed, is quite distinct in meaning from *citoyen*, the latter term designating a citizen of the state.

**BOURGES**, the capital of the department of Cher, in France, situated in a fertile plain at the confluence of the Airon and the Eure, 123 miles south of Paris. B. is divided into an old and new town, the latter being built round the former. Its houses are of antique architecture, and its streets crooked and dirty. It was formerly surrounded by ramparts flanked with high towers, some of which still remain; but the ramparts have been converted into promenades. B. has one of the noblest Gothic cathedrals in Europe, lighted by 59 splendid painted windows. Its university was suppressed at the Revolution. B. has greatly prospered since the railway has reached it. In 1861 it was chosen to be one of the military arsenals of France, and its strategical importance has become greater since the fall of Metz. Pop. (1872) 22,654. B. is of great antiquity, being the *Avaricum* of the Gauls, in the country of the *Bituriges Cubi*. Taken by Caesar in 52 B.C., it was afterwards named *Biturica*, and became the capital of the Roman province of *Aquitania Prima*. In the middle ages, it was the capital of the province of Berri. Charles VII. had his residence at B., when almost all France had been taken from him by the English; and its Hôtel de Ville was originally the abode of his unfortunate minister, Jacques Cœur. Louis XI. was born at B. Of the seven ecclesiastical synods held at B., that of 1438—in which the Pragmatic Sanction of the Gallican Church was established with approbation of Charles VII., and the resolutions of the Council of Basel, relative to the papal power and the king's prerogatives, were confirmed—was the most important.

**BOURIGNON**, ANTOINETTE, a celebrated religious visionary, born at Lille 13th January 1616. Her father was a merchant, and she inherited from him a considerable patrimony. She was so ugly an infant, that there was some thought of killing her as a monstrous birth. Her intellect, however, was very acute, and its powers were early developed, along with a tendency to religious mysticism, which was much encouraged by the reading of mystic books, till her imagination became inflamed, and she began to fancy that she saw visions, conversed with God, received special revelations, and was called to restore the pure spirit of the gospel. By the good offices of the Archbishop of Cambrai, she obtained admission into a convent, where she won over some of the nuns to her opinions, and soon found herself at the head of a considerable party. She afterwards had charge of a hospital at Lille, but from this position she was driven in consequence of her extravagant fancies. She now travelled through various countries, her enthusiasm gaining proselytes, whose conversion, she said, caused the pains of childbirth in her person. At last she was appointed head of a hospital in East Friesland. She died at Franeker 30th October 1680. According to Madame B., religion consists in internal emotion, and not in either knowledge or practice. Her own character exhibited a strange combination of pride and avarice, with a sort of mystic piety. She never gave anything to the poor, alleging as a reason that she had consecrated all to God. Some of her pretended revelations were of the most indecent nature; many of them were extremely ridiculous; yet many persons of intelligence and learning believed in them, and adopted the peculiar form of mysticism which soon began to receive the name of Bourignianism. Among the chief expounders of it was Peter Poiret, a Calvinistic minister. It spread to a remarkable extent both among Roman Catholics and Protestants; and about the end of the 17th c., and beginning of the 18th, prevailed so much in Scotland, that a solemn renunciation of it was demanded from every entrant on

## BOURMONT—BOURRIENNE.

the ministry at his ordination. A minister of Aberdeen was deposed for it in 1701. The formal renunciation of Bourignianism is still continued in the Established Church of Scotland, but has been given up as needless by other Presbyterian churches. The works of Madame B. were edited by Poiret (25 vols., Amst. 1676—1684; 2d edit. 1717). They exhibit not a little fiery eloquence.

**BOURMONT, LOUIS AUGUSTE VICTOR DE GAISNE, COUNT DE**, a French marshal, and the conqueror of Algiers, was born in 1773 at his paternal castle of Bourmont, in Anjou, went into exile at the Revolution, served as an officer in the army of the Prince of Condé, and from 1793 to 1796 was actively engaged in the anti-revolutionary struggle in La Vendée. Subsequently, he obtained the favour of the First Consul. Under the Empire, he was appointed to a colonelcy in the army of Naples, and was soon raised to the rank of brigadier-general. In the campaigns of 1813 and 1814, he distinguished himself upon a number of occasions, particularly in the battle of Dresden, and by the defence of Nogent, upon account of which Napoleon promoted him to the rank of a general of division. On 31st March 1814, he declared for the Bourbons, and received the command of a military division during the first Restoration; yet, on Napoleon's return, he went over to him, and was intrusted with the command of a division of the army of the Moselle. On the evening before the battle of Ligny, he deserted, and betook himself to Louis XVIII., at Ghent. There can be no doubt that B. was singularly ungenerous in choosing such a moment to resign, nor is there anything in his career to make us suppose he was actuated by any high principle in what he did. His evidence went a considerable way in bringing about the condemnation and execution of Marshal Ney. He received high military employment under Louis XVIII. Distinguishing himself in the Chamber of Peers as a zealous supporter of the king, he was appointed minister of war in 1823, and in this office displayed great activity. When the expedition against Algiers was undertaken in April 1830, he received the chief command of the troops, and the rapid success of the expedition was ascribed to his prudence and energy. For this he received the marshal's baton on 22d July, but on the revolution taking place in that month, he was superseded in his command, and went to England to share the exile of Charles X. Refusing to take the legal oath, he was struck off the lists of the French army and peerage in 1832. In 1833, Dom Miguel of Portugal placed him at the head of his troops, but the campaign was brief and unsuccessful. B. finally settled on his estate in Anjou, and died there in October 1846.

**BOURNE, HUGH**, the founder of the sect of Primitive Methodists, was born 3d April 1772 at Fordhays, in Staffordshire. Originally a preacher among the Wealeyans Methodists, he distinguished himself by the fervour of his religious sentiments, and by the zeal which he displayed for the conversion of the ungodly. His enthusiasm for 'revivals' and open-air meetings, however, received no countenance from the leading clergymen of the denomination to which he belonged. In 1808, B. was cut off from the Wealeyans connection, strange to say, for following much the same course of earnest evangelisation as Wealey himself had done. He was not, however, alarmed. His preaching was wonderfully acceptable, and he quickly gathered round him many devoted adherents. In March 1810, a committee of ten members was formed. This may be regarded as the first official organisation of the body. In 1818,

B. published in the *Primitive Methodist Magazine*, a narrative of his labours and of those of his coadjutors. In the course of his life he visited Scotland, Ireland, Canada, and the United States, where his ministrations were attended with great success. He died at Bemersley, in Staffordshire, 11th October 1852.

**BOURNE, VINCENT**, one of the most elegant Latin versifiers that England ever produced, was born about the close of the 17th century. In 1714, he entered Trinity College, Cambridge; in 1721, he took his degree of A.M., and subsequently he was appointed usher in Westminster School. He died December 2, 1747. It would be difficult to praise too highly B.'s exquisite contributions to Latin poetry. They will stand comparison, not only in point of Latinity, but also in point of originality, with the choicest productions of the ancient Roman poets. A gracefulness which pervades thought, sentiment, and expression, is their essential characteristic. The subject is indeed often insignificant, but the treatment is always perfect. His translations of English ballads and other lyrics into Latin are wonderfully felicitous, every beauty being retained with the most delicate skill, and every defect being most carefully remedied. Cowper, Beattie, Charles Lamb, and others have expressed their admiration of B.'s singularly fine *genius*, for assuredly a gift so rare as that which enables a man to find a complete utterance for his ideas in a dead tongue, deserves the name. The first edition of B.'s poems appeared in 1734. Their number was enlarged in a subsequent edition.

**BOURNOUSE** is the Arabic name of a garment worn in Algeria, Morocco, and other parts of North Africa. It is a large woollen mantle, worn above the other attire of the natives, and having a hood, which is thrown over the head in rainy weather. The B. is generally white, though distinguished individuals wear it of various colours—blue, green, red, &c. It has been long in use among the Spaniards under the name of *albornoz*. Through the conquest of Algeria by the French, the B. was imported into France and England, although its original form has been considerably altered.

**BOURRIENNE, LOUIS ANTOINE FAUVELLET DE**, the secretary and early friend of Napoleon I., was born at Sens, 9th July 1769, and received his education in the military school at Brienne, where he formed the closest intimacy with the future emperor. He became, in 1792, secretary to the embassy at Stuttgart. Deprived of this office by the breaking out of war, he lived for some time a rather retired life, until, in 1797, his former school-fellow appointed him his secretary. He accompanied him to Egypt and to Italy, and in 1801 was nominated a councillor of state. In 1802 he was dismissed from his office, for being implicated in the dishonourable bankruptcy of the house of Coulon, army-contractors; but in 1805 he was appointed ambassador to the States of the Circle of Lower Saxony, and in this capacity resided long at Hamburg. His tendency to peculation, however, necessitated his return to France, where he had to refund 1,000,000 francs into the public treasury. He now decidedly joined the party which sought the overthrow of the emperor and the restoration of the Bourbons. He was treated with little consideration by them during the first Restoration, yet he followed Louis XVIII. in his flight to the Netherlands upon Napoleon's return, and upon the second Restoration was honoured with the title of a minister of state. As deputy from the department of Yonne in 1815 and 1821, he shewed his weakness of character by opposing all

liberal measures, and even institutions for the promotion of science and popular education. The revolution of 1830, and the loss of his fortune (occurred by extravagance), caused his reason to give way, and he died in a lunatic asylum at Caen, 7th February 1834. His Memoirs concerning Napoleon, the Directory, the Consulate, the Empire, and the Restoration (*Mémoires sur Napoléon*, &c., 10 vols., Par. 1829), gave many new explanations of the events of his time, but were declared by contemporaries to be in many respects untrustworthy. See the article BOULAY DE LA MEURTHE. The work, however, is one which must always constitute an important part of the materials of history. A work entitled *Histoire de Bonaparte par un Homme qui ne l'a pas quitté depuis 15 Ans*, has been erroneously ascribed to him.

BOUSSA, a town of Sudan, Central Africa, capital of a district of the same name, is situated on an island in the Niger, in lat. 10° 14' N., and long. 5° 20' E. It is hemmed in by rocks, and being also surrounded by walls, is a place of very considerable strength. Population estimated at from 10,000 to 18,000. A melancholy interest attaches to B. as being the death-scene of Mungo Park (q. v.).

BOUSSINGAULT, JEAN BAPTISTE JOSEPH DIEUDONNÉ, a French chemist, particularly distinguished for investigations relative to agriculture, was born at Paris, 2d February 1802, attended the mining school at St Etienne, and went in the employment of an English mining company to South America; where, besides his professional and scientific labours, he served as a colonel under Bolivar in the South American war of liberty. Returning to France, he was appointed professor of chemistry at Lyon, and in 1839 was admitted into the Institute, and appointed to the chair of agriculture in the Conservatory of Arts and Measures, Paris. In 1848, he was elected a member of the Constituent Assembly, and voted with the moderate Republicans. After the coup d'état, he retired from political life. In 1857, he was made commander of the Legion of Honour. His *Economie Rurale* (2 vols., Par. 1844; 2d ed., Par. 1849) embodies the result of experiments and investigations which have won for him a European reputation. It contributed much to the promotion of the infant science of agricultural chemistry, and has been translated into English (Lond. 1845) and German. B. is the author of numerous valuable papers in scientific periodicals, which were collected and published in 1854, and is one of the authors of a report on the means of discovering the presence of arsenic in cases of poisoning (Par. 1841).

BOUSSOLE STRAIT passes through the Kurile Islands, uniting the Sea of Okhotak and the Pacific Ocean. Lat. 46° 30' N. It takes its name from one of the vessels of La Perouse, who, soon after Cook's death, nobly emulated, on the north-east coasts of Asia, that navigator's explorations on the north-west shores of America.

BOUSTROP'E'DON (Gr. *bous*, an ox, and *stropho*, I turn), a word used to describe a mode of writing practised by the Greeks in the earlier period of their history—viz., in which the lines did not proceed uninterruptedly from left to right, but alternately, the first line being written from right to left, the second from left to right, &c. Examples are frequently found in coins and inscriptions. The method received its name from its resemblance to the path made by oxen in ploughing a field.

BOUTERWEK, FRIEDRICH, a German philosophical and aesthetical author of merit, was born

on 15th April 1766 at Oker, near Goalar, in the Harz district. He at first devoted himself to the study of law; but in the second year of his academic course at Göttingen he relinquished it, imagining that his proper vocation was to be a poet. Besides poems, he wrote the romance of *Count Donamar* (*Graf Donamar*, 3 vols., Göttingen 1791—1793; 2d ed., 1798—1800). Not finding, however, that success which he expected in this career, he renounced it, and devoted his whole energies thenceforth to the study of philosophy and of the history of literature. In philosophy, he was at first a zealous follower of Kant, but afterwards adopted the system of Jacobi. He began to give lectures in Göttingen in 1791, and became extraordinary professor of philosophy in 1797, and ordinary professor in 1802. He produced several works on philosophy; but his great work, on which his reputation really depends, is his *History of Modern Poetry and Eloquence* (*Geschichte der neuern Poesie und Beredsamkeit*, 12 vols., Göttingen 1801—1819), one of the best works of its kind which Germany has produced. The part relating to Spanish literature is especially valuable, and has been translated into Spanish and much enlarged by Josa Gomez de la Cortina and Nic. Hugelde de Molinedo (3 vols., Madrid, 1828). B. died at Göttingen in 1828.

BOUTS-RIMÉS (Fr. 'rhymed endings') are a kind of verse the making of which forms a social amusement. Some one of the party gives out the rhymes or endings of a stanza, and the others have to fill up the lines as they best may. Suppose the rhymes prescribed are *wave, lie; brave, die*; the following are two of the ways in which the lines might be completed:

Dark are the secrets of the gulping  
Where, wrapped in death, so many heroes  
Yet glorious death's the guerdon of the  
And those who bravely live can bravely

wave,  
lie;  
brave,  
die.

Whenever I sail on the  
O'ercome with sea-sickness I  
I can sing of 'the sea,' and look  
When I feel it, I feel like to

wave,  
lie;  
brave;  
die.

BQUVET, JOACH., a learned French Jesuit, who was sent by Louis XIV. to China, to acquire information concerning that country, which he reached, along with five other missionaries, in July 1662. Being invited to Pekin, the missionaries received permission to disperse themselves over the whole Chinese empire, except B. and Gerbillon, who were required to remain in attendance upon the emperor, the famous Kanghi, whose respect and confidence they soon acquired in a high degree. He committed to them the erection of great buildings, and was so pleased with their performances, that he not only caused a church and a residence for them to be built within the bounds of his palace, but commissioned B. to return to his native country, and to engage as many missionaries as he could find. B. arrived in France in 1697, and brought with him, for the king, about fifty Chinese works. He returned again to China in 1699 with ten new missionaries, amongst whom was the learned Parrenin. He died at Pekin, June 28, 1732, after having laboured indefatigably in the cause of science, in that distant scene, for 50 years. He has left four different accounts of his various travels, and a work entitled *Etat Présent de la Chine, en Figures Gravées, par Grifart* (Par. 1697).

BOVEY COAL is a form of wood-coal or lignite, which derives its name from being found at Bovey, in Devonshire.

BOVIDÆ (Lat. *bos*, an ox), a family of ruminating

mammalia (see RUMINANTIA), to which different limits have been assigned by different naturalists, but which is generally regarded as equal in extent to the Linnean genus *Bos*, or to what is popularly called the ox tribe. The B. are all large animals, with stout limbs and broad muzzles. The facial outline is nearly straight. Their dentition agrees with that of some of the other ruminants, as sheep, goats, and antelopes: they have eight cutting-teeth in the lower jaw, and none in the upper, but instead of them, a fibrous and elastic pad, which covers the convex extremity of the anterior maxillary-bone; they have no canine teeth, but a large interval between the cutting-teeth and the grinders, which are six on each side in each jaw. In eating, they collect and roll the grass together 'by means of the long and movable tongue; it is firmly held between the lower cutting-teeth and the pad, the cartilaginous upper lip assisting in this; and then, by a sudden nodding motion of the head, the little roll of herbage is either torn or cut off, or partly both torn and cut.' Both sexes are furnished with unbranched tapering horns, which are directed more or less laterally, and generally upwards and forwards, and are usually curved throughout their whole length. There are, however, breeds of the common ox, in which both sexes are destitute of horns. The tail is rather long, and terminated by a tuft of long hair. The females have four teats. All the B. are gregarious. Native species are found in Europe, Asia, Africa, and North America. Fossil remains of species which no longer exist have been found in pliocene and pleistocene deposits. The number of existing species is by no means certain; as, besides the difficulty of deciding in some cases what are to be deemed species and what merely varieties, there is still a great deficiency of accurate information concerning the B. of different parts of the world. The very magnitude of the animals has probably prevented so frequent a comparison of specimens as would otherwise have taken place. It has recently been ascertained that the number of species is more considerable than had been supposed. Attempts have been made to divide the genus *Bos* into several genera, but they are not very clearly nor strongly distinguished. All the B. are valuable to man, for their flesh, tallow, skin, &c.; but some of them, having long been reduced to domestication, are among the most valuable of all domestic animals, particularly the common ox, different kinds of buffalo, and the yak of Tatary.—See ARNER, BANTENG, BISON, BUFFALO, GAUR, GAYAL, GALLA OX, MUSK OX, OX, PEGASSE, URUS, YAK, ZAMOUZE, ZEBU, &c.

BOVINO, a fortified town in the province of Foggia, South Italy, about 20 miles south-south-west of Foggia. It is the see of a bishop, has a cathedral, churches, and convents. The valley of B. was formerly notorious as the haunt of the brigands of Capitanata, and the town still enjoys the unavoidable reputation of being the nursery of all the highway robbers of this portion of the Apennines. Pop. 5700. B. occupies the site of the ancient *Vetinum*. The Imperialists defeated the Spaniards here in 1734.

BOW, of a ship, is a general name for the fore-part, or that which breasts the waves. Very often the word is used in the plural, the ship being considered to have starboard and larboard, or right and left bows, meeting at the prow or figure-head. A narrow or *lawn* bow, and a broad or *bluff* bow, are seamen's phrases for different shapes of bow, each of which has its own peculiar advantages at sea: a narrow bow will cut more smoothly through the

water, but a broad bow bears up more firmly in a high sea.

'On the bow,' in sea-language, is the position of a distant object when seen over the bow; it implies a sweep of one quarter of the horizon, embracing about 45° on each side of the prow or head.

BOW AND ARROW. In ARCHERS AND ARCHERY will be found a brief account of the military arrangements under which Bowman formed a component element in the armies of the middle ages; and under ARBALEST is a description of the cross-bow, which was once so favourite a weapon. We here describe the more effective, though simpler implement. The long-bow first gained ascendancy in England in the 14th century. It was found that a dozen arrows could be discharged from this weapon while the arbalester was winding-up his cumbersome cross-bow, and discharging one arrow or quarrel from it. Moreover, the long-bow being held vertically, the bowmen were able to stand in closer array than the arbalesters; they were enabled also to take a greater supply of the munitions of war into the field, seeing that the bow and arrows were much lighter in weight. In the time of Edward III., a bow was priced 1s. to 1s. 6d., and a sheaf of arrows, 1s. to 1s. 2d.; in the time of Henry VIII., the price (fixed by law) of the bow varied from 6d. to 3s. 4d. The last-named monarch adopted extraordinary means for encouraging the use of the long-bow. Many ordinances were issued for insuring a good supply of bow-staves. The bowyers, string-makers, fletchers, and arrow-head makers were all placed under stringent regulations. Merchants were compelled to import good bow-staves with cargo, in certain proportions. Very long bow-staves were admitted duty-free. Yew was considered the best wood; but in order that the supply should not be too speedily used up, bowyers were ordered to use elm, ash, and wych-hazel in certain proportions to yew. The heads of families were bidden to provide bows for their sons and servants; and town-councils or officers were required to provide shooting-butts just outside each town. Some of the bows had two arches, connected by a middle straight piece. The best length was regarded as about 5 feet 8 inches from nook to nook; but in earlier times, some of the bows were much longer. The first arrows were made of reeds; these materials were afterwards superseded by cornel-wood; but the wood finally adopted as the best was ash. The arrows had heads pointed with steel, sometimes barbed to render their action more terrible. They were feathered with portions of goose-wing. The best length for a bow of the above-named size was set down at 2 feet 3 inches. Sometimes the arrows were tipped with combustibles. The best makers of arrow-heads, as well as bows, were compelled by law to go from town to town, to exercise their craft wherever it was most needed. The Bowman usually carried 24 arrows, called a sheaf, or a quiver, at his right side or at his back; besides others in his girdle. He kept his bow in a case; hence Falstaff's comparison of Prince Hal to a bow-case, in allusion to his slenderness. Bowmen, in their hours of sport, used arrow-heads called *rugged*, *creased*, *shouldered*, and *spoon-headed*, according to the shape.

The circumstances attending the decline of the use of the long-bow are narrated in the articles above cited.

BOW ISLAND, an island of coral formation in the South Pacific, the largest in the Low Archipelago, being about 30 miles long and 5 miles broad. It can only be approached by a small opening in the reef at the north end. Within the lagoon, the

anchorage is safe. The east side is well wooded, but the west is low and barren. Pearl-oysters and other shell-fish abound in the lagoon. The inhabitants are few, ill-looking, and indolent, with a partiality for raw food. The island was first discovered in 1768 by Bougainville, who gave it the name of La Harpe, which Cook, who visited it in the following year, changed to the name it now bears.

**BOWDICH, THOMAS EDWARD**, an enterprising African traveller, born at Bristol in June 1790, was first engaged in trade in his native city, but afterwards appointed a writer in the service of the African Company. Selected, in 1816, to conduct a mission to the king of Ashantee, he published an account of it in 1819, 4to. On his return to Europe he resided for some years in Paris. To obtain funds for a new expedition into the interior of Africa, he published a translation of Mollien's *Travels to the Sources of the Senegal and Gambia*, and other works, and in August 1822 sailed from Havre. He died of fever on the river Gambia, January 10, 1824. A profound scholar and accomplished linguist, B. was a member of several literary societies both in England and on the continent.

**BOWDITCH, NATHANIEL**, an American astronomer of some note, born 26th November 1773, at Salem, in Massachusetts. He shewed at a very early age a great inclination for mathematics, in which he afterwards made great proficiency, without ever attending a university. He was at first bred to his father's trade of a cooper, and afterwards apprenticed to a ship-chandler. He acquired Latin that he might study Newton's *Principia*. He particularly devoted himself to the study of the practical applications of science. He went as supercargo of a merchant-ship in several long voyages, and added a thorough practical acquaintance with navigation to a theoretical knowledge of it. His work, *The American Practical Navigator*, was received with great favour. He published also an admirable translation of Le Place's *Mécanique Céleste* (2 vols. Boston, 1829), to which he added valuable annotations. These works obtained for him marks of honour from scientific societies in Britain, and led to his being called to the professorship of mathematics and astronomy in Harvard College, in his native state, which situation, however, he declined, in order to enter the executive council of the state. He afterwards became manager of the Massachusetts Life Insurance Association, president of the Mechanics' Institute, and president of the Academy of Arts and Sciences in Boston. He died 16th March 1838.

**OWER** (Ang. Sax. *bur*, a chamber). The 'ladies' bower,' a private apartment in ancient castles and mansions, used by ladies both as a parlour and sleeping-chamber.

Up, then, rose fair Annet's father,  
Twa hours or it were day,  
And he gan into the bower  
Wherein fair Annet lay.  
*Ballad of Lord Thomas.—Percy's Reliques.*

**BOWERBA'NKIA**, a genus of Zoophytes (q. v.), of the class Polyzoa or Bryozoa, order Infundibulata, the structure of which has been very carefully studied in the common British species, *B. imbricata*, one of the most abundant zoophytes on the coasts both of England and Scotland. It grows on sea-weeds, corallines, stones, &c., between high and low water mark, or in no great depth of water, and forms branching tufts sometimes 1½ inch in height. The branches are smooth and transparent,

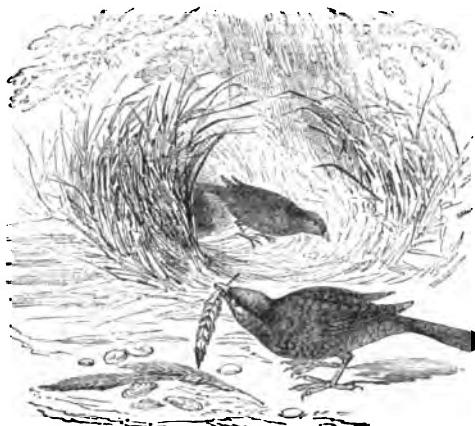

tubular, filled apparently with a granular fluid, and crowded with irregularly scattered clusters of delicate horny ovate or ovato-cylindrical cells, which are so transparent as to permit the most easy observation of their whole internal structure. The polypes which inhabit these cells are all connected with the tube of the branch, and so with the common life of the polyridom. Each, when fully expanded, is about one-twelfth of an inch in length, and has 10 finely ciliated tentacula. When alarmed, it contracts very rapidly, the tentacula being first drawn in, and then the body of the polype retracted into its cell. The organisation is much higher than in many zoophytes. The mouth does not lead at once into the *Bowerbankia imbricata*, stomach, but into a funnel-shaped tube, which contracts into a gullet or oesophagus, *a* in fig., and ends in a globular gizzard, *b*, apparently provided with radiating muscular fibres, and intended for trituration of the food. The gizzard opens below into a bag, which is regarded as the true stomach, *c*, and is supplied with a fluid, regarded as bile, from minute follicles or sacs in its sides, which follicles are therefore regarded as representing the liver. From the upper part of the stomach, near the entrance from the gizzard, arises the intestine *d*, a straight tube which passes up by the side of the gullet, and terminates in an orifice outside the circle of tentacula; the structure thus exhibiting a strong resemblance to that of the Ascidian Mollusca. When the polype is retracted, the gullet is bent upon itself, and the tentacula are enclosed in a tube or sheath formed by the inverted integument. When the polype is vigorous and lively, the cilia of the tentacula are kept in active motion, apparently quite under control of the will of the animal, forming a kind of whirlpool to bring animalcules or organic particles into the mouth.

**OWER-BIRD**, a name given to certain Australian birds of the Starling (q. v.) family, or Sturnide, remarkable for their habit of making bower-like erections, called *rusts* by the colonists of New South Wales, and for adorning them with gay feathers, rags, bones, shells, and such other white or brightly coloured objects as they can pick up. These bowers are not used as nests, but they appear to be places of much resort at the breeding-season in particular. The use made of them by the birds is very imperfectly understood; but their structure has been carefully examined, and fine specimens of them, transported with no little difficulty, have been deposited in the British Museum by Mr Gould, in whose work on the *Birds of Australia* an account of them was first given to the world. The bowers of the Satin B. (*Ptilonorhynchus holosericeus*) are built among the branches of some tree, and appear to be repaired and frequented from year to year. The base consists of an extensive and rather convex platform of sticks, firmly interwoven, on the centre of which the bower itself is built of more flexible twigs. It is chiefly at and near the entrance that the shells, feathers, &c., employed for decoration are placed. The bowers of the Spotted B. (*Chlamydera maculata*) are longer

## BOWIE KNIFE—BOWLS.

and more avenue-like than those of the Satin B.; they are placed upon the ground, and are outwardly built of twigs, and beautifully lined with

Spotted Bower-bird.

tall grasses so disposed that their heads nearly meet. The decorative propensity appears in the highest degree in this species. ‘In some of the larger bowers, which had evidently been resorted to for many years,’ Mr Gould says, ‘I have seen nearly half a bushel of bones, shells, &c., at each of the entrances.’ These are arranged in much the same way at both entrances. Small pebbles are often transported by the birds from considerable distances.

The Satin B. is particularly abundant in the mountainous districts of the west of New South Wales, and is found in all the ‘brushes’ from the mountains to the coast. The adult male has the whole plumage of a deep, shining black. The colours of the female are grayish green and brown, curiously mingled.—The Spotted B., which is rather smaller than the Satin B., or about the size of a starling, has a general colour of rich brown, beautifully marked with black and buff; a band of elongated feathers of light rose-pink crossing the back of the neck, and forming a broad, fan-like, occipital crest. It is exclusively an inhabitant of the interior of Australia.—Another species, the Great B. (*Chlamydera nuchalis*), considerably larger than either of the others, and very similar in form and plumage to the Spotted B., has been found on the north-west coast of Australia. Its bowers are always adorned with sea-shells, even when at a distance from the sea.

**BOWIE KNIFE**, an American knife, so called from its inventor, Colonel Jim Bowie, a famous fighter with the rifle and other weapons, and altogether one of the most daring characters in the southern states of the Union. The B. K. is a sharp-pointed weapon, and is usually carried concealed in a sheath in the breast, or some other part of the person, ready for any encounter.

**BOWING TOWARDS THE ALTAR** is an ancient practice in the church, derived from a belief in the superior sanctity of the east. There are scriptural allusions to the east, from which notions of this kind may have been drawn. ‘And, behold, the glory of the God of Israel came from the east.’—*Ezek. xliii. 2.* ‘For we have seen his star in the east.’—*Mat. ii. 2.* There was also an early legendary belief that Christ would come to judgment in the east. For these,

not to mention other reasons, it became customary to place the altar, with the crucifix and other symbols, at the eastern extremity of the church, to which all bowed. In the Romish Church, the practice is still kept up of bowing towards the altar, or more correctly towards the Host, on entering and departing from the church. Brand’s *Popular Antiquities*, edited by Sir Henry Ellis, contains much curious antiquarian lore on this subject. It was further a custom in the early Christian Church to bow at the name of Jesus. This is still done in the Church of Rome, at whatever part of the service the name occurs. In the Church of England, it is customary to bow at the name of Jesus only in repeating the *creeds*. This ancient usage is traced to *Phil. ii. 10*, ‘That at the name of Jesus every knee should bow.’ Punctilious bowings and turning towards the east in repeating the *creeds*, constitute at present one of the unhappy sources of disturbance in the Church of England.

**BOWLES**, WILLIAM LISLE, D.D., an English poet, was born 24th September 1762 at King’s Sutton, in Northamptonshire, where his father was then vicar. He received his education at Winchester School, and at Trinity College, Oxford, and became at last a prebendary of Salisbury Cathedral in 1803, and Rector of Bremhill, in Wiltshire, in 1805. Here he spent, in comparatively affluent circumstances, the remainder of his long life. His poetical career began with the publication, in 1789, of *Fourteen Sonnets, written chiefly on Picturesque Spots during a Journey*. This unpretending little volume was received with extraordinary favour; the sonnets were fresh and natural, and to many minds, all the more charming because of the contrast which they presented to the style of poetry which had long been prevalent. Coleridge, Wordsworth, and Southey were among their enthusiastic admirers; and through the influence which he exercised over them, B. may be regarded as the founder of a school of English poetry, in which their names soon became greater than his own. The subsequent poetical works of B. are very numerous, of which *The Spirit of Discovery* and *The Missionary* are generally regarded as the best of his longer blank verse poems. As a poet, B. shews a fine appreciation of the beauties of nature, and pleases by the expression of pure and generous sentiment, as well as by playfulness of fancy and perfect scholarly correctness, but he is greatly deficient in vigour and depth. He published an edition of Pope’s works in 1807; and an opinion which he expressed on the poetical merits of Pope, led at a subsequent period to a rather memorable controversy, in which Campbell and Byron were his antagonists, and which turned chiefly upon the comparative value in poetry of images derived from nature and those derived from art. B. was generally admitted to have discomfited his opponents. B. frequently employed his pen in defence of the Church of England, and endeavoured to vindicate all the peculiarities of the older English educational institutions. Of his prose writings may be mentioned a volume of sermons (Lond. 1826), and a rather dry *Life of Thomas Ken, deprived Bishop of Bath and Wells* (2 vols., Lond. 1830—1831). B. died at Salisbury on 7th April 1850, in the 88th year of his age.

**BOW-LINE**, in a ship, is a rope fastened near the middle of the perpendicular edge of the square sails by three or four subordinate ropes called *bridles*. It is employed to tighten the edge of the sail in a particular direction during an unfavourable wind.

**BOWLS, GAME OF.** This is a favourite pastime throughout the British Isles. It is played upon a

smooth, flat piece of turf, from 40 to 60 feet square, surrounded by a trench or ditch about half a foot deep. The players arrange themselves in sides, usually of four each, and each man is usually provided with two bowls. The bowls are made of lignum-vite wood, of 6 or 8 inches in diameter, nearly round, and with a bias to one side. A smaller ball, perfectly spherical, and white, is placed at one end of the bowling-green; this is termed the *jack*, and the aim of the players, who stand at the other end of the green, is to send their B. that they may lie as near as possible to the jack. The side whose B. are nearest the jack reckon one point for each bowl so placed. 7, 14, 21, or 31, make game, according to mutual arrangement beforehand. B. are biassed or weighted on one side, that the player may reach the jack by a curved instead of a straight course, an expedient which the nature of the game renders particularly desirable. Indeed, were it not for this, the game would lack half its charms. A bowl is played *forehand*, when it is so placed in the hand and delivered as to cause it to approach the jack with a curve from the right; and in order to attain this curve, the bowl must be held so that its bias is on the left or in-side. Backhand is the reverse. If a bowl goes into the ditch without touching the jack, it cannot count in the scoring of that end; but if it strikes the jack, and then rolls into the ditch, it reckons as if on the green. When the jack is carried by a bowl into the ditch, it is usually lifted, and placed on the green as near as possible to its position in the ditch. When the B. have so accumulated round the jack, that it is impossible to approach it from either side, without running the risk of touching an adversary's bowl, the last player frequently endeavours to run the jack, by playing straight at it with such force as to neutralise the bias, and, if fortunate, carry away the jack from the neighbourhood of his opponent's bowls. A *skip* is appointed on each side, whose duty it is to direct each of his men.—For BOWLING at cricket, see CRICKET.

The game of B. was anciently unlawful, and was the subject of prohibitive legislation in England in the reign of Henry VIII.; but the law then enacted was repealed in 1845 by the 8 and 9 Vict. c. 109, s. 1, so that B. or other similar games of mere skill may be legally indulged in by the people.

BOWRING, SIR JOHN, an English politician, linguist, and author, was born at Exeter, 17th October 1792. He early devoted himself to the study of languages, in the acquisition of which he displayed an unusual degree of talent. The national poetry of different peoples had particular attractions for him, and he rendered great service to literature by collecting and translating both the more ancient and the more modern popular poems of almost all the countries of Europe. His translations preserve remarkably well both the meaning and the spirit of the original, and exhibit no mean powers of versification. B. was very intimately associated with Jeremy Bentham, who appointed him one of his executors, and intrusted him with the editing of his collected works. A descendant of the old Puritans, he early came forward in writing and speaking against the political disadvantages experienced by dissenters. He took part from the first in the *Westminster Review*, which was established in 1824, and edited it for about five years from 1825. In 1828, he visited Holland; and his letters—which appeared in the *Morning Herald*, and were shortly afterwards translated into Dutch—procured for him the degree of Doctor of Laws from the university of Groningen. Subsequent travels were undertaken by him, on a commission from the British government,

to inquire into the commercial relations of certain states. He visited Switzerland, Italy, Egypt, Syria, and finally the countries of the German Zollverein, and everywhere found materials for valuable reports. He was a member of the House of Commons from 1835 to 1837, and again from 1841 to 1849, and actively promoted the adoption of free trade. In 1849, B. was appointed British consul at Hong-kong, and superintendent of trade in China. He returned in 1853, and in the following year was made knight, and governor of Hong-kong. In 1856, an insult having been offered to a Chinese vessel, said to have been under the protection of the British flag, B., without consulting the home government, ordered an attack on certain Chinese forts, a proceeding which excited considerable dissatisfaction in the country, and produced a ministerial crisis. B. afterwards returned to England. In 1855, he concluded a commercial treaty with Siam, and has given an interesting account of his visit in a work entitled *The Kingdom and People of Siam*. He retired on a pension in 1859, and afterwards published an account of the Philippine Islands. In 1861, B. was sent to Italy to report on Britain's commercial relations with that country. This was among the last of his public acts. He died in 1872.

BOW'SPRIT is a large boom, spar, or mast, which projects over the stem or head of a ship. Its use is to carry sail forward, as a means of counteracting the effect of the after-sails, and keeping the ship well balanced. It is also the chief support of the fore-mast, which is fastened to it by large stays or ropes. In ordinary ships of war, the B. rises at an angle of about 45° from the horizon, and is generally about two-thirds as long as the mainmast; but in many kinds of vessels the position is more nearly horizontal.

BOWSTRING HEMP, an English name, proposed by Dr Roxburgh, and partially adopted, for the fibre produced by *Sansevieria Zeylanica*, a plant of the natural order *Liliaceæ* (q. v.), tribe *Hemerocallæ*, a native of the East Indies. The employment of the fibre for making bowstrings led to this name. Dr Royle prefers to use the Sanscrit name MOORVA, on account of the confusion apt to be caused by applying the term hemp to a variety of fibres.—The genus *Sansevieria* is distinguished by a coloured funnel-shaped perianth, with a long tube, into the throat of which the stamens are inserted, and a 3-celled and 3-seeded, or abortively 1-celled and 1-seeded, berry. The plants have a general appearance much like that of many species of *Iris*, but their leaves are more fleshy; they have a thick creeping rhizome or root-stock; the radical leaves are long and narrow, and the flowering-stems have only scale-like leaves.—Very similar to *S. Zeylanica* are *S. Roxburghiana* and *S. lanuginosa*, also natives of India.—These plants grow under bushes in jungles near the sea, where the soil is salt, but may easily be propagated on almost any soil by the shoots which issue in great abundance from the root-stock. They are perennial. The leaves are about 2 feet, or in cultivation 3 or 4 feet long; the fibres extend their whole length; and to separate the fibres from the pulpy part of the leaves, ‘the natives place them on a smooth board, then press one end of the leaf down with one of their great toes, and with thin bit of hard stick held between the two hands, they scrape the leaf from them, and very quickly remove every part of the pulp.’ Steeping in water is also practised, but it discolors the fibre, which is beautifully white. One pound of clean fibre is obtained from about 40 lbs. of fresh leaves. Dr Roxburgh calculated that 1 acre would yield 1613 lbs. of clean fibre at a gathering, of which two might be reckoned

upon annually in good soil and favourable seasons, after the plants have reached a proper age. Moorva, or B. H., may well be supposed likely to acquire commercial importance. The fibre is hair-like and silky, elastic, and in strength apparently about equal to hemp. It does not rot in water so soon as hemp.—A species of *Sansevieria* very similar to the Indian ones, *S. Guineensis*, is found in abundance along a great extent of the west coast of Africa, specimens of the fibre of which, also fine and strong, have been brought to England under the name of AFRICAN BOWSTRING HEMP.

BOWYER, WILLIAM, an eminent English printer and classical scholar, born in London in 1639, was educated at Cambridge, and in 1722, joined his father in trade. Appointed, in 1729, printer of the votes of the House of Commons, he subsequently became printer to the Society of Antiquaries, and to the Royal Society. In 1767, he was nominated printer of the Rolls of the House of Lords, and the Journals of the House of Commons. He died in 1777. B. published several philological tracts, but his chief production was an edition of the New Testament in Greek, with critical and emendatory notes. He left a considerable sum in trust to the Stationers' Company, for relief of decayed printers. A small volume of anecdotes of B. and his learned contemporaries, published soon after his death by Mr John Nichols, his apprentice and partner, was afterwards enlarged, under the title of *Literary Anecdotes of the Eighteenth Century* (9 vols., 8vo).

BOX (*Buxus*), a genus of plants of the natural order *Euphorbiaceæ*; evergreen shrubs or small trees, with opposite leaves, entire at the margins, and easily split into two plates. The greenish inconspicuous flowers grow in little axillary clusters, the male and female flowers distinct, but on the same plant. The male flowers consist of a perianth of four leaves, and of four stamens; the female flowers have a perianth of three or four leaves, and in addition, three small bracts at the base, an ovary surmounted by three styles, and two honey-secreting glands. The capsule has three beaks and three cells, and two or three black seeds in each cell.—The most important species is the COMMON Box (*B. sempervirens*), which grows wild in the south of Europe, and in some parts of Asia. It is generally

attains a height of more than 12 or 14 feet, but in warmer countries, it is often twice that height. Its leaves are oval, generally from half an inch to three-quarters of an inch in length, smooth and shining, of a deep green colour. The box is remarkable for its compact habit of growth and densely crowded branches and leaves, presenting a very solid mass of foliage. There are several cultivated varieties, distinguished by differently variegated leaves—gold-edged, silver-edged, &c. The most interesting variety, however, is a very humble one, called DWARF BOX, which grows only to a height of two or three feet, and is very commonly used to form edgings for garden-plots, being kept down by clipping to the height of a few inches. These edgings—than which none are neater, or better serve the purpose of keeping gravel-walks free from earth—are generally formed by planting cuttings, which readily strike root. The box bears clipping remarkably well; and in a style of gardening once fashionable, but condemned by the taste of the present day, it occupied an important place, being cut into architectural and fantastic figures. The leaves of the box have a smell which is disagreeable to many people, and a very disagreeable bitter taste. When taken inwardly, they cause purging; an external application of them promotes the growth of the hair. In France, they are sometimes used instead of hops in making beer, but are extremely improper for the purpose. The wood of the box is heavier than that of any other European tree, and is the only European wood that sinks in water. It is of a beautiful pale-yellow colour, remarkably hard and strong, of a fine regular and compact texture, capable of a beautiful polish, and not liable to be worm-eaten. It is much valued for the purposes of the turner and the wood-carver; is preferred to every other kind of wood for the manufacture of flutes, flageolets, and other wind-instruments, as well as of mathematical-instruments; and is unrivalled for wood-engraving, admitting of a finish as sharp and fine as metal, whilst it takes the ink much better. See ENGRAVING. When scraped down and boiled, it can be used as a sudorific in many complaints, and as a substitute for guiacum. An empyreumatic oil, obtained from box-wood chips, is used for relief of toothache, and for other medicinal purposes.—Spain and Portugal send into the market large quantities of box-wood; also Circassia and Georgia, from which countries it finds its way to Odessa, and is again exported thence. In 1815, as many box-trees were cut down at Box Hill, in Surrey, as brought upwards of £10,000; but the tree is of so very slow growth, that it is seldom planted in Britain except for ornament.—The MINORCA Box, or BALEARIC Box (*B. Balearica*), a native of Minorca, Sardinia, Corsica, Turkey, &c., is a larger tree than the common box, and has leaves three times as large. It is much less patient of frost, but is occasionally seen in shrubberies in the south of England. The wood is of a bright yellow, and inferior to the true box-wood, but is brought in large quantities from Constantinople under that name, for wood-engraving.

BOX-DAYS. These are two days appointed by the judges of the Court of Session in Scotland, in the spring and autumn vacations, and one day in the Christmas recess, on which pleadings or other law-papers appointed by the court, or by one of the judges, towards the close of the preceding session, may be lodged or filed; the object being to expedite the procedure, notwithstanding the vacation or recess. These days are called B., in consequence of an act of sederunt or order of the Court of Session, dated the 29th November 1690, in which the evil custom of private solicitation of the judges is

Common Box:  
a, b, female flower.

regarded as a true native of the south of England, where it grows on dry chalky hills; and is remarkable as the only arborescent species of *Euphorbiaceæ* found in such cold latitudes. In Britain, it seldom

## BOX-HAULING—BOXING.

complained of: 'For preventing whereof,' says the order, 'and for easing the leidges, themselves, and the lawyers, they, according to the example of the most famous judicatories abroad, have appointed boxes for every one of the lords, to stand on a bank in the Session-house from three o'clock till seven o'clock at night, each box having a slit, in which the informations or bills may be lett in, and cannot be drawn out, untill the box be opened; the key whereof is to be kept by every judge himself, and to be committed to no other; and each lord is to send for his box at seven o'clock at night, that he may have competent time to peruse all the informations therein, and to consider the same, and the citations alleged in the same, whereby none of the leidges can be put to trouble to attend any of the lords for giving their informations, bills, or answers.' Further facilities for legal business in vacation-time are afforded in Scotland by the regulations of the *Bill-Chamber* (q. v.); and in England the equity and common law judges attend at chambers during vacation; but to English lawyers the use of B., or of any similar expedient, is unknown. See COURT OF SESSION and other COURTS.

**BOX-HAULING** is a particular mode of turning a ship, when the swell of the sea renders tacking impossible, or when the ship is too near the shore to allow room for veering. The operation is effected by a peculiar management of the helm and the sails. *Boxing-off* is an operation very similar to box-hauling. See further under TACK, VEER.

**BOXING**, or PUGILISM (*Lat. pugilatus*), fighting with the fists. It was practised as a manly exercise by the ancients, among whom it was an art so highly esteemed, that Pollux, Hercules, and some of the other gods were represented as having excelled in it. The pugilists of the ancient games had leather thongs on their hands, sometimes loaded with lead or iron; this armature of the hand was called the *cæstus*. Of course, their combats were not unfrequently attended with fatal consequences, which have resulted also in many instances of modern pugilistic encounters, although no armature of the fists is allowed. Among the Greeks, the practice of B. was at first permitted only to freemen, no slave, or person attainted with crime, being considered worthy to possess the high privilege of being beaten to the consistency of a jelly. Gradually, however, B. was taken up as a profession, and its character deteriorated. B. has been a favourite amusement of Englishmen for centuries; it is even said to have had such distinguished patrons as King Alfred and Richard III. But the golden age of pugilism as a profession in England commenced with the accession of the House of Hanover; then men calling themselves professors publicly announced their intention of giving lessons in 'the noble art of self-defence.' One professor challenged another to combat in the most bombastic language. In 1726, one Ned Sutton, who announces himself as 'pipemaker from Gravesend, and professor of the noble science of defence,' sneers at another professor, whom he calls 'the extolled Mr Figg,' for having by 'sleeveless pretence' shirked a combat with him, 'which I take,' says the pipemaker and professor, 'to be occasioned through fear of his having that glory eclipsed by me, wherewith the eyes of all spectators have been so much dazzled.' He further assures the said Figg, that if he can muster courage enough to fight with him, he (Figg) 'will have the advantage of being overcome by a hero indeed!' Figg had an 'amphitheatre' in Oxford Road, wherein fights were held; and a larger one was erected in the same locality in 1742 for one Broughton, the funds being subscribed by

some eighty noblemen and gentlemen. The pugilistic encounters that took place here were patronised by many of the nobility. Some faint protests against the brutality of the pastime now began to be made by the press, but these had little effect. Towards the end of the last century, fights were patronised by princes of the blood-royal; and the Prince of Wales, afterwards George IV., was present at one at Brighton, in which one of the combatants was killed. When the allied sovereigns and their generals came over to England in 1814, Lord Lowther treated them to a series of B.-matches in his drawing-room, which were so highly relished that they were repeated a few days afterwards. One of the pugilists, called Jackson, became quite a hero, and made enormous sums by giving lessons to young noblemen, among whom was Lord Byron. In 1817, the Czar Nicholas of Russia witnessed a prize-fight at Coombe Warren. At the close, the victor was presented to him, with whom he shook hands. This was the last time that royalty was present at one of these disgusting spectacles.

The character of the prize-ring, or, as it is called in the slang of its supporters, 'the P. R.', had been for many years declining. People of influence and respectability seemed to have withdrawn their countenance from it. The lowest and least reputable class of the population furnished the fighters, and money was the only object of their backers. 'Fair-play' was no longer 'a jewel' in the P. R.; fights were sold, and the meanest and most disgraceful tricks resorted to, in order to win or to avoid the payment of bets. Prize-fights were under the ban of the law; in many counties of England, the police actively interfered to prevent them; and some railway companies refused to convey those taking part in them along their lines. The year 1860, however, witnessed a strange revival of the pugilistic spirit, on occasion of a fight between Tom Sayers, the 'champion prize-fighter of England,' and John Heenan, the 'Benedict Boy,' an American, for £200 a side, and the belt, a badge of honour worn by the champion. The battle, which was elevated to the dignity of 'a great international contest' by sporting papers, took place at Farnborough, April 17, 1860. It lasted for more than two hours, in which time the American was beaten almost blind, and the Englishman dreadfully bruised. The continuance of the battle was prevented by the breaking in of the ring, caused by the interference of the police. After the fight, the English champion was ranked by many newspapers—not sporting ones—with the heroes of the Crimea and of Lucknow; hundreds, if indeed not thousands, of pounds were subscribed for him, in admiration of his bravery, by persons of all conditions of life, and residing in all parts of the country; and he was feted by merchants on the London and Liverpool 'Changes. His opponent received equally flattering and substantial testimonials from Americans. The fight formed the subject of discussion in the House of Commons, in which the home secretary announced that not only the principals, but all present at the spectacle, were amenable to the law. Though no steps were taken to bring the offenders to justice, it was intimated to those chiefly concerned, that if a renewal of the fight were attempted, the law should be put in force against those aiding or abetting it.

The training which prize-fighters undergo for some months before a battle is of the most healthful kind; it rids them of every superfluous grain of flesh, braces their nerves, and makes their muscles like iron; yet, owing to the rude way in which the result of all this training is demolished in an hour's fight, professional boxers are usually very short-lived. With the exception of one, Gulley,

who became M.P. for Pontefract, and the Jackson already alluded to, who made a fortune, few of them have ever risen to anything above the ownership of a low public-house, where they lay down the law on pugilism to their admirers, and take the chair at so-called ‘harmonic meetings,’ where B. is the entertainment. Several papers devote themselves to chronicle the doings of the P. R., which they do in a peculiar style. The following specimens of the slang will afford a sufficient idea of the character of this kind of literature. The month is called the ‘potato-trap,’ the ‘kisser,’ the ‘whistler,’ the ‘grubber,’ and the ‘oration-trap;’ the nose is variously described as the ‘claret-jug,’ the ‘smeller,’ the ‘sneazer,’ the ‘snorer,’ the ‘sniffer,’ the ‘proboscis,’ the ‘nozzle,’ the ‘snout,’ the ‘scent-bottle,’ and the ‘snuff-box;’ the ear as the ‘conk;’ and the eyes as the ‘daylights,’ the ‘peepers,’ the ‘squinters,’ the ‘goggles,’ &c. Instead of saying that the eyes did not swell up, the *littérateurs* of the P. R. would say that the boxer ‘did not seem inclined to adopt the early-closing movement with either shutter! ’

**BOXING-DAY**, the day after Christmas, and so called in England from being the day on which *Christmas boxes*, or presents, are given to servants and others. See CHRISTMAS BOX.

**BOXING THE COMPASS** is one among many sea-phrases not easily traceable to their origin. It means simply a rehearsal or enumeration of the several points, half-points, and quarter-points of the mariner’s compass, in their proper order; and is among the lessons which a young sailor has to learn.

**BO’XTEL**, a busy town of Holland, in the province of North Brabant, situated on the Dommel, six miles south of Bois-le-Duc. The river intersects the streets, affording passage for boats, and also supplies water to turn the machinery of several manufactures. B. is famed for the beautiful diapers it produces. Pop. 4000. The Anglo-Dutch army, under the command of the Duke of York, was here defeated with great loss by the French in 1794.

**BOX-THORN** (*Lycium*), a genus of plants of the natural order Solanaceæ, having funnel-shaped or tubular flowers, and 2-celled berries. The species are pretty numerous, and found in different quarters of the world. Several are natives of the south of Europe, thorny shrubs, with long slender shoots and simple lanceolate leaves. *L. Europæum* may be trained to a height of 30 or 40 feet, and is often planted—as are also other species—for ornament, to cover walls, &c. It has pale violet-coloured flowers, reticulated with red veins. Some of the species are almost trees. *L. fuchsioides*, although destitute of spines, is used as a hedge-plant in its native country, the Andes of Quito. Its flowers are orange scarlet, and grow in umbels.

**BOYA’CA**, a town of the U. S. of Colombia, near which, in 1819, Bolívar, by a victory over the Spaniards, secured the independence of Colombia. It gives name to the department, which stretches from the plateau of Bogota to the borders of Venezuela, being watered by the Magdalena, Sogamoso, Zulia, Cazanare, and Meta. The capital, however, is not B. itself, but the neighbouring city of Tunja, which is about 70 miles to the north-north-east of Bogota.

**BOYAR.** See BOJAR.

**BOYAU**, in military engineering, is a winding or serpentine trench, dug to form a path or communication between the different armed trenches of a siege-work, and to prevent them from being enfiladed, or fired upon in flank.

**BOY-BISHOP.** The custom of electing a B. on St Nicholas’s Day dates from a very early period.

Warton thought he could find some allusion to it in one of the anathemas of the Constantinopolitan Synod, 867 A.D. It quickly spread over most Catholic countries, and in England seems to have prevailed in almost every parish. Although the election took place on St Nicholas’s Day (6th December), the authority lasted to Holy Innocents’ Day (28th December). The B. was chosen from the children of the church or cathedral choir, or from the pupils at the grammar-school. He was arrayed in episcopal vestments, and, attended by a crowd of subordinates in priestly dress, went about with songs and dances from house to house, blessing the people, who, as Bishop Hall says, ‘stood grinning in the way to expect that ridiculous benediction.’ The B. exacted implicit obedience from his fellows, who, along with their superior, took possession of the church, and performed all the ceremonies and offices except mass. The custom found countenance not among the populace only. In 1299, Edward I., on his way to Scotland, permitted a B. to say vespers before him at Heton, near Newcastle-on-Tyne, and gave him and his companions a present. At Salisbury—and perhaps in other places also—the B., it is said, had the power of disposing of such prebends as happened to fall vacant during the days of his episcopacy; and if he died during his office, the funeral honours of a bishop, with a monument, were granted him. What secular shows and entertainments accompanied this practice, history does not inform us. Probably dramatic exhibitions of a rude nature were the principal. In England, the custom of electing a B. was abolished by a proclamation of Henry VIII., dated July 22, 1542; restored by Queen Mary in 1554; and again abolished during the reign of Elizabeth, though it seems to have lingered here and there in villages till about the close of her reign.

**BOYD, ZACHARY**, an eminent Scottish divine, born before 1590, was educated at Kilmarnock, and studied at the universities of Glasgow, and Saumur in France, of which latter he was, in 1611, appointed a regent or professor, and is said to have declined the principalship. The persecutions of the Protestants in France caused him to return to Scotland in 1621. In 1623, he became minister of the Barony parish, Glasgow, and was thrice elected rector of the university of that place. His principal prose work, *The Last Battell of the Soule in Death*, published at Edinburgh in 1629 in two vols., was reprinted, with a life of the author, by Gabriel Neil, Glasgow, 1831. He was author of eighteen other works, chiefly of a religious cast. The third edition of his *Psalms of David in Meter* appeared at Glasgow, 1646. He died in 1653 or 1654, leaving numerous MSS. and his library, with a considerable legacy, to the College of Glasgow, over the court gateway of which is his stone bust, whilst his portrait is in the Divinity Hall of the same university. Among his MSS. is a collection of quaint poems on Scriptural subjects, entitled *Zion’s Flowers*, usually called Zachary Boyd’s Bible. As a specimen of his homely style, the following extract from Jonah’s soliloquy within the whale’s belly may be quoted here :

What house is this, where’s neither coal nor candle,  
Where I nothing but guts of fishes handle?  
I and my table are both here within,  
Where day neere dawned, where sunne did never  
shine;  
The like of this on earth man never saw,  
A living man within a monster’s maw,  
Buried under mountains which are high and steep,  
Plunged under waters hundred fathoms deep.  
Not so was Noah in his house of tree,  
For through a window he the light did see;

He sailed above the highest waves—a wonder;  
I and my boat are all the waters under;  
Hee in his arke might goe and also come,  
But I sit still in such a straitened roomme  
As is most uncouth, head and feet together,  
Among such grease as would a thousand smother.  
I find no way now for my shrinking hence,  
But heere to lie, and die for mine offence.  
Eight prisoners were in Noah's hulk together;  
Comfortable they were, each one to other.  
In all the earth like unto me is none,  
Far from all living, I heere lye alone.

**BOYDELL, JOHN**, a liberal patron of art in England, born in 1719. At the age of 21, he apprenticed himself for seven years to an engraver in London, and on the expiration of his apprenticeship, published, by subscription, a series of views in England and Wales, with the profits of which he set up a print-selling business in the metropolis. English engraving was at a low ebb when B. threw his money and intelligent energy into the work of its improvement. Under B.'s liberal patronage of native artists, the importation of foreign prints, for the most part, not only ceased, but English prints were exported to the continent. B. now determined to do for English painting what he had done for engraving. He accordingly selected Shakespeare's works for illustration; and in the carrying out of his object, secured the most eminent painters in the kingdom, including Opie, Reynolds, Northcote, and West. The result was the magnificent 'Shakspeare Gallery,' from which was engraved a superb volume of plates (Lond. Boydell, 1803). B. also published, at Bulmer's press, a splendid edition of Shakespeare's works in 9 vols. fol. (1792—1801). The immense sums of money he spent on the Shakespeare illustrations, and the commercial depression consequent on the French Revolution, brought him into difficulties, from which he was not wholly extricated before his death, in December 1804. An alphabetical catalogue of plates containing engravings by the best artists, from the finest works of the Italian, Flemish, German, French, and English schools; sketches from Claude Lorraine, &c., were among the collections published by Boydell.

**BOYER, ALEXIS BARON DE**, a French surgeon of the greatest eminence, was born at Uzerche, in Limousin, on 30th March 1757, or, according to others, in 1760. He was for some years in the service of a notary, before he began his medical studies. In 1787, he was appointed second surgeon to the Hôpital de la Charité at Paris, and afterwards professor, first of operative surgery, and then of clinical surgery, at the École de Santé. In 1804, he was appointed first surgeon to the emperor, who also raised him to the rank of baron. He accompanied the emperor on his campaigns and journeys. After the Restoration, B. became professor of practical surgery in the university of Paris, and first surgeon at the Hôpital de la Charité. In 1823, he was appointed consulting-surgeon to the king; and in 1825, was admitted a member of the Institute. He died on 25th November 1833. His greatest works are his *Traité Complet d'Anatomie*, 4 vols. (Par. 1797—1799, and other editions), and his *Traité des Maladies Chirurgicales et des Opérations qui leur conviennent*, 8 vols. (Par. 1814—1822). From 1798 to 1817, he was engaged with Roux and Corvisart in conducting the *Journal de Médecine, Chirurgie et Pharmacie*.

**BOYER, JEAN PIERRE**, a mulatto, president of the republic of Hayti, was born 2d February 1776, at Port-au-Prince, capital of that part of the island then belonging to France. At a very early age he was sent to France, where he received a European education; and in 1792, entered the

military service. He very soon became a *chef de bataillon*, and fought against the British on their invasion of his native isle. After further fighting against the British under General Rigaud, leader of the mulattoes, and afterwards under General Leclerc, he entered into a combination which had for its object the union of the negroes and mulattoes, and a complete emancipation of the colony. After the negro Dessalines had seated himself upon the throne, B., along with Péthion, took the lead of the coloured people. They assisted Christophe to overthrow the bloody tyrant in 1806, but deserted Christophe when they saw that he wished to make himself sovereign. Péthion now established an independent republic in the western part of the island; and B. made himself indispensable to him by his military and administrative knowledge, so that he was invested by the new president with the command of the capital, Port-au-Prince, and the rank of a major-general. In this capacity he endeavoured to discipline his troops after the European manner; drove back, more than once, the black hordes of Christophe, thereby preserving Port-au-Prince from destruction; was recommended to the people by Péthion, when dying, as most worthy to be his successor; and was unanimously elected president of the republic. He arranged the financial affairs, collected funds into the treasury, improved the administration, and encouraged arts and sciences. After the death of Christophe, he united the monarchical part of the island with the republic in 1820; and in 1821, the eastern district also, which had hitherto remained under the dominion of Spain; and he urgently sought the recognition of the independence of the youthful state by France, which was obtained, in 1825, upon payment of an indemnity of 150 millions of francs. B. carried on the government of the republic of Hayti for fifteen years, from this time, with the most perfect peace; but his policy, which was rather arbitrary, and directed to the object of depressing the negroes in favour of his own race, the coloured people, resulted in a victorious insurrection in 1843. B. fled to Jamaica, whence he announced his resignation to the Haytian revolutionary committee, and condemned himself to a voluntary ostracism. From the proclamation of the provisional government, it appeared that he was the victim of his aristocratic policy; but the provisional government, after it had obtained the upper hand, conducted itself very moderately towards the defeated party. See HAYTI. After a protracted stay in Jamaica, B. went to Paris, where he died in the beginning of July 1850. He was a man of great perseverance, and of captivating manners, but artful, and often harsh and cruel to those under him.

**BOYLE**, a town in Roscommon county, in a picturesque valley on both sides of the Boyle, one mile above its expansion into Lough Key, and 8 miles north-west of Carrick-on-Shannon. Pop. (1871) 3161. It has a large trade in corn and butter. Latin and English annals of B. date from 420 to 1245, and have been published. An abbey was built here in the 12th c., and was reduced to its present ruined state in 1595 by the Earl of Tyrone.

**BOYLE, RICHARD**, the founder of the House of Cork and Orrery, and fitly styled the Great Earl of Cork, was born in 1566, at Canterbury, of a good but not wealthy family. At the age of 22, after having studied at Cambridge and the Middle Temple, he went over to Ireland with a few pounds in his pocket, to hew his way to fortune. His energy, prudence, and signal capacity for government, received their reward. He bought estates and improved them, promoting the immigration of

English Protestants, and triumphed over the envy of his enemies, making good his cause before Queen Elizabeth, and winning her favour. Due honours flowed in upon him, and at length he was knighted. In 1620, he became Viscount Dungarvan and Earl of Cork. In 1631, he was made lord high treasurer, an office which remained hereditary in his family. In his old age, the Munster rebels compelled him to gird on armour, and turn his castle into a fortress. He soon raised a little army of his servants and tenants, and with an auxiliary force commanded by his four sons (and paid, when his money was spent, out of his plate-chest), the noble old earl took castles, smote the rebels, and quenched rebellion in his borders. He died in 1644, at the age of 78.

**BOYLE, THE HON. ROBERT**, seventh son, and fourteenth child of the first Earl of Cork, was born at Liamore, Waterford, January 25, 1628. As a child, he was distinguished by precocity of intellect and a rare love of truth. After studying at Eton, and at home, he went to the continent, where he stayed for six years. On his return in 1644, he found himself in possession, by his father's death, of the manor of Stalbridge, Dorsetshire, where he took up his abode, and resided till 1650. He took no part in political strife, but devoted himself to the cultivation of science, and particularly of chemistry and natural philosophy. He was one of the first members of that association of scientific men which about that time (1645) held private meetings at Oxford and London, and some years after, became better known as the Royal Society. In 1654 he settled at Oxford. Here he experimented extensively in pneumatics, and improved the air-pump. At the same time, he devoted considerable study to theology. After the Restoration, he was urgently advised by Lord Clarendon to enter the church, but he thought that he could do better service to religion as a layman. Among the proofs which he gave of this, besides his own theological writings and eminent example, were his exertions as a director of the East India Company for the propagation of Christianity in the East, as well as in procuring and circulating at his own expense translations of the Scriptures, and his bequest for the foundation of the 'Boyle Lectures' (q. v.), in defence of Christianity. In 1668, he took up his residence permanently in London, and was thenceforth able to devote much of his time to the business of the Royal Society. In 1680 he was chosen president, but declined the honour. A peerage had repeatedly been offered to him, and declined. In 1688, finding his health decline, he shut himself up against all interruption, in order to husband his remaining time for the labour of repairing the loss caused by the accidental destruction of his MSS. In 1691, his health finally gave way, and on the 30th of December 1692 he died, seven days after his beloved sister, Lady Ranelagh. B. was tall and emaciated in person, and extremely temperate in his habits, often subject to low spirits, but naturally lively and of rare conversational powers. His piety, benevolence, and charity would have made him remarkable, apart from his scientific attainments and reputation. His complete works (including his very interesting correspondence), with a life by Dr Birch, and an index, were published in 5 vols. fol. (Lond. 1744).

**BOYLE, CHARLES**, third Earl of Orrery, was born at Chelsea, August 1676, and entered Christ Church, Oxford, in his 15th year, where he had for his tutors Drs Atterbury and Friend. His attainments as an undergraduate were respectable for a nobleman; and probably this circumstance

induced the master of the college, Dr Aldrich, to select the youth for the annual task of editing a classic. In B.'s case, it unfortunately happened that the *Epistles of Phalaris* were chosen, Sir William Temple having about that time passed the most extravagant encomiums upon them. In 1695 the work appeared. Two years later, Bentley published his famous *Dissertation*, in which he proved that the Epistles, instead of being composed in the 6th c. B.C., were the production of the 2d c. after Christ. B., in reality, had little to do with the unlucky performance to which his name had been attached. It was the work chiefly of Atterbury and Friend. Nevertheless, in the following year, and while B. himself was absent from the country, the wits and scholars of Christ Church again exposed him and themselves to the merciless criticism of Bentley, by publishing *An Examination of the Dissertation, &c., by the Hon. Charles Boyle*. In 1699 Bentley once more replied, and sealed the lips of his adversaries for ever. But for this *Battle of the Books*, in which he only seemed to be engaged, B.'s name would have been forgotten. In honour of him, the name of 'Orrery' was given to the scientific apparatus of that name by its constructor, to whom B. had been kind. He fought, as a major-general, at Malplaquet, was promoted to diplomatic and court appointments, wrote some literary pieces, and died in 1731. Of his poems, even Sir Richard Blackmore said :

After his foolish rhymes, both friends and foes  
Conclude they know who did not write his prose.

**BOYLE LECTURES**, so called from the founder, the Honourable Robert Boyle (q. v.), who settled an annual salary, charged upon his dwelling-house in St Michael's, Crooked Lane, London, for 'some preaching minister,' who shall preach eight sermons in the year for proving the Christian religion against Atheists, Deists, Pagans, Jews, and Mohammedans, not descending to any controversies among Christians themselves. Archbishop Tennison procured a yearly salary of £50, to be charged upon a farm at Brill, Bucks, instead of the original charge for the endowment. The office is tenable for three years.

The first series of lectures, *A Confutation of Atheism*, was preached in 1692 by Richard Bentley (q. v.). In 1704, Dr Samuel Clarke preached the lectures, entitled *A Demonstration of the Being and Attributes of God*, in answer to the arguments of Hobbes, Spinoza, and their followers. In 1709, Dr Lilly Butler lectured on *Religion no Matter of Shame*. All the lectures preached up to 1732 were collected into a fine folio edition, in 3 vols. (Lond. 1739); since that period, till recently, few of the lectures have been published. In 1846, the course of lectures was preached by the Rev. F. D. Maurice, and published under the title, *The Religions of the World*. The more eminent lecturers of recent years whose courses have been published are : Merivale, the historian (1864–1865), who lectured on *The Conversion of the Roman Empire and Northern Nations*; Professor Plumptre (1866); Professor Stanley Leathes (1868–1870); and Dr Heasey (1871–1873).

**BOYLE'S FUMING LIQUOR** is the term applied to a concentrated solution of ammonia, saturated by a stream of hydro-sulphuric acid, which combining with it, forms the sulphide of ammonium ( $\text{NH}_4\text{S}$ ). Exposed to the air, it fumes, and evolves a very disagreeable odour, resembling, but in an intensified degree, ordinary bilge or sewerage water.

**BOYNE**, a river in the east of Ireland, rises in the Bog of Allen, and flows through Kildare, King's County, Meath, and Louth. It passes Trim, Navan, Slane, and Drogheda, and enters the Irish Sea

## BOYS—BRABANT.

4 miles below the last town, after a course of 65 miles in a carboniferous limestone basin, its total descent being 336 feet. Its chief tributaries are the Deal, Mattoch, and Blackwater. It is navigable for vessels of 250 tons to Drogheda, and for barges of 70 tons to Navan, 19 miles up. Its banks are studded with many ruins of monasteries and castles. In 838, Turgesius the Dane sailed up the B., and plundered Meath. But this river is chiefly famous for the battle of the Boyne, which took place on its banks, near Oldbridge, on the 1st of July 1690, and in which William III. defeated James II. An obelisk, 160 feet high, marks the scene of the battle.

**BOYS, SHIPS'.** In nautical language, all the young or green hands on board are called *boys*, without much reference to their age; but in recent times, arrangements have been made to give a more precise meaning to the term, by engaging boys or lads as part of the crew.

In the royal navy, boys were first voted for in the estimates in 1834. There were 1000 in that year; and this number increased to 7000 in 1874. The Admiralty has, in recent years, made many regulations for attracting boys into the navy. Most of the seamen at present in the service entered it as boys. They enter mostly at about 14 years of age, but some as late as 18, and they are bound for 7 years. There are schools established for them at Portsmouth, Plymouth, Cork, and one or two other places. The boys are ranked in two classes, according to age and experience. When out of their time, they have a tendency to enter the merchant service for two or three years; but they usually return to the navy, and enter as ordinary seamen. See further under MANNING THE NAVY.

In the merchant service, boys are apprenticed to the shipowners; they learn their duties by degrees; and constitute the source out of which mates, masters, and captains are ultimately supplied. By the Merchant Seamen's Act of 1844, every merchant-ship was bound to take a certain number of boys as apprentices, according to tonnage; the better hands were apprenticed by their friends; the worst were picked up by the Marine Society from the poor and wretched of the streets, and apprenticed as a means of setting them up in life. The indenture was from 12 to 18 months. The regulations have been modified in form, but not in substance, by the Mercantile Marine Act of later date.

**BOZZARIS, MARCOS,** a Greek patriot who distinguished himself in the early part of the modern War of Independence, was born at Suli, in the mountains of Epirus, towards the close of the 18th century. His youth was spent amid the din of arms. In 1803, he was forced to retreat to the Ionian Isles, by Ali Pasha (q. v.), who, in a series of bloody combats, had nearly exterminated the Suliotes. In 1820 two events occurred which called forth his patriotic energies: Hysilanti summoned the Greeks to insurrection, and war broke out between Ali Pasha and the sultan. On learning the news, B. put himself at the head of some 800 expatriated Suliotes, and passed over into Epirus. Ali, who dexterously endeavoured to identify his cause with that of the Greeks, soon found means to secure B.'s services against their common enemy, the sultan. B. obtained several victories, and on the death of Ali at the taking of Janina in 1822, he continued the war successfully against Khurshid Pasha, the Turkish general. Shortly after, Prince Mavrocordato landed at Mesolonghi, with a body of disciplined troops, and being joined by B., he engaged the Turks at Petta, on the 16th July 1822. Through treachery the Greeks were overpowered,

their best soldiers perished, and B., along with Mavrocordato, was compelled to retire to Mesolonghi. This place he skilfully defended against the Turks, until a Hydriote fleet forced them to retire. In the summer of 1823, a Turco-Albanian army of 20,000 men, under the command of the Pasha of Scodra, descended from the north of Epirus. B., who knew that the fortifications of Mesolonghi were too weak to withstand an assault, determined to surprise his enemies by a sudden blow. He advanced swiftly at the head of 1200 men, and on the 20th of August reached Kerpenisi, where the van of the Turco-Albanian army, 4000 strong, was encamped. At night, the Suliotes burst in upon their startled foes, who were routed with great slaughter. The victors captured their camp, standards, and a vast quantity of baggage. This triumph was saddened by the loss of the heroic B., who fell while leading on his men to the final attack. His body was solemnly interred at Mesolonghi, and he was honoured with the title of the 'Leonidas of Modern Greece.'

**BOZZOLO,** a town of Lombardy, North Italy, situated on the right bank of the Oglio, about 16 miles west-south-west of Mantua. B., which was at one time a small independent republic, has remains of old fortifications, some silk-weaving, and an annual fair. Pop. about 4500.

**BRA,** a town in the province of Cuneo, North Italy, 25 miles south-east of Coni. It has metal foundries and silk manufactures, and a good trade in cattle, grain, and wine. Pop. 12,500.

**BRABANCONNE,** the patriotic song of the Belgians, originally sung by the insurgents during the revolution of September 1830. A young French player, by name Jenneval, at that time connected with the theatre at Brussels, was the author of the song; it was set to music by a singer named Campenhoult. Jenneval fell in a combat with the Dutch at Berchem. The Belgians allowed his mother a pension of 2400 francs. Campenhoult received from King Leopold a golden snuff-box, and was appointed director of the royal chapel. Each verse of the B. ends with the refrain—

La mitraille a brisé l'orange  
Sur l'arbre de la liberté.

**BRA'BANT** was the name formerly given to an important province of the Low Countries, extending from the left bank of the Waal to the sources of the Dyle, and from the Maas and the plain of Limburg to the Lower Scheldt. In the time of Caesar, B. was inhabited by a mixed race of Germans and Celts; it afterwards came into possession of the Franks; and in the middle ages it formed a duchy by itself, dependent upon Lower Lorraine, with which, in 1107, the county of Antwerp was incorporated, and in 1347, for a time, the lordship of Mechlin or Malines, formerly connected with Liege. After many changes, B. (divided into the provinces of North and South B.) was made a part of the kingdom of Holland, at the Congress of Vienna; but at the revolution of 1830, South B. separated from Holland, and became part of Belgium (q. v.). Old B. is now divided into three provinces: 1. North or Dutch B., containing about 2000 square miles, and (1869) 428,672 inhabitants; 2. The Belgian province of Antwerp, which contains 1094 square miles, and (1870) 492,482 inhabitants; and 3. South B., also Belgian, containing 1260 square miles, and an extremely dense pop. of (1870) 879,814. The country consists of a plain gently sloping to the north-west, and rising in the south into gentle hills, which are offsets of those of Ardennes. In the level northern part are many heathy and fenny tracts;

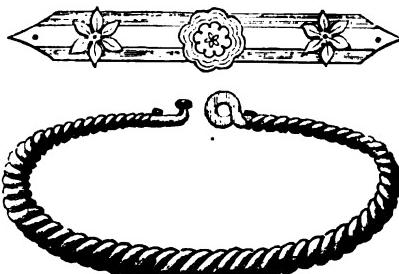

one of them, called the Peel, 20 miles in length, and from 2 to 6 broad. In the hilly district of the south, is the Forest of Soignies. The Maas and the Scheldt are the principal rivers; but some of their tributaries, as the Eupel, the Dyle, the Demer, the Aa, &c., are also very useful for internal commerce, which is further promoted by canals and railways. The climate in the northern parts is humid, but generally mild, and careful drainage has made it more healthy than in any other part of the Netherlands; the soil is fertile, and agriculture and cattle-husbandry are the principal occupations of the inhabitants, and are prosecuted with great success. Many kinds of goods made of flax, cotton, wool, and leather, are among the products of industry. B. lace has long been celebrated. The inhabitants in the north are Dutch; in the middle district, Flemish; and in the south, of Walloon race. The boundary between the languages is a few leagues to the south of Brussels, the Walloon French being spoken to the south, and Flemish and Dutch to the north of this line.

**BRACCIO, FORTEBRACCI, COUNT OF MONTONE,** a celebrated condottiere (see CONDOTTIERI), born at Perugia in 1368, of an old patrician family, was, in early youth, the leader of a troop of mercenaries in the service of the Count of Montefeltro, against the Malatesti, lords of Rimini. He became the champion of the Perugian nobles who were driven into exile in 1393; and after serving in Lombardy under Alberico da Barbiano, he carried on a partisan warfare in the Marches of Ancona against the Marquis Ludovico Migliorati, nephew of Pope Innocent VII. In 1408, he entered the service of Ladislao, king of Naples, who had designs on Central Italy, and, with his condotta, crossed the Apennines, scoured the valley of the Tiber, and took several towns. In June of the same year, the people of Perugia offered the dominion of their city to the Neapolitan king on condition that he would prevent the nobles from returning. He accepted it, and ungenerously sent a large force against B., who retired to the Marches. In 1416, however, B. obtained the sovereignty of his native city, when the banished nobles, after an exile of twenty-four years, were restored. In 1417, B. got possession of Rome by capitulation, but was soon obliged to evacuate it. He afterwards made terms with the pope (Martin V.), with whom he had a conference at Florence in February 1420, and subsequently accepted from Joanna, queen of Naples, the command of her land-forces, with the rank of high constable of that kingdom. Entering the Abruzzo, he surprised Capua, and having relieved Naples, then besieged by the queen's enemies, was created by her Count of Foggia and Prince of Capua. In 1423, B. was, by her order, crowned at Perugia, as Prince of Aquila and Capua. Aspiring to the throne of Naples, he overran Campania and Apulia with a considerable army, took Bari, and advanced into Calabria. In a battle which ensued for the relief of the strong town of Aquila, besieged by him, B. was wounded and taken prisoner. After lingering for three days, refusing food, he died June 5, 1424, in his 56th year. His deeds, in chronological order, and those of his contemporary, Piccinino, are commemorated by Lorenzo Spirito, in a poem of 101 chapters, in terza rima, entitled *L'Altro Marte* (Vicenza, 1489).

**BRACE**, in Carpentry, an oblique piece of wood used to bind together the principal timbers of a roof or other wooden structure. See ROOF.

**BRA'CELET** (Fr. *braceiale*, from Lat. *brachium*, the under part of the arm), an ornament worn on the arm, generally at the wrist. Bracelets and armlets (Lat. *armilla*) have been used by every nation,

both savage and civilised, from the earliest periods to our own. They are frequently mentioned in Genesis, as worn both by men (xxxviii. 18) and by women (xxiv. 30); both by the Hebrews and the surrounding nations (Numb. xxxi. 50). Similar ornaments were worn round the ankles, but they were stigmatised by Isaiah as marks of luxury (iii. 16). The Medes and Persians were remarkable, even amongst Asiatics, for their love for ornaments of this class. They wore not only bracelets and armlets, but earrings, collars, and necklaces, which often consisted of strings of valuable pearls, or were enriched with other jewels. These ornaments were used to indicate the rank of the wearer, and this use has continued to be made of them in the East down to the present day. In Europe, bracelets and armlets were worn both by the classical nations and barbarians from the earliest times. The Gauls wore them; and the Sabines, as early as the foundation of Rome, had ponderous golden armlets on the left arm. The same was the case with the Samians about the same period. It does not appear that armlets were worn by men during the historical period of Greece, but ladies wore both armlets and bracelets of the most various materials and forms. Both generally passed round the arm several times, and the form of B. now most in fashion has been accurately copied from those twisted spirals described by Homer in the eighteenth book of the *Iliad*, line 401. Many examples of this kind of B., as represented on painted vases, will be found in Sir William Hamilton's work. We are indebted to the Greeks even for the idea of giving to these spiral bracelets the form of a snake, the best models of our present goldsmiths being exact copies of antique bracelets. The goddesses of the Greeks, like the blessed Virgin in Roman Catholic countries, were represented as attired in the style of ladies of the highest rank; and the celebrated marble statue of Aphrodite, preserved at Florence, exhibits traces of a metallic armlet. Amongst the Romans, armlets were frequently conferred upon soldiers for deeds of valour, of which an instance is mentioned by Livy (x. 44). Roman ladies wore bracelets, not only for ornament, but also for the purpose of containing amulets, which were supposed to effect miraculous cures. On this principle it is said that the Emperor Nero wore on his right arm the skin of a serpent, enclosed in a golden armilla. But at Rome also, it was chiefly as an indication of rank or wealth that these ornaments were worn. Many Roman bracelets have been preserved, and the accompanying wood-cuts, taken from Smith's *Dictionary of Greek and Roman Antiquities*, to

which we have been indebted for much of the information contained in this article, exhibit two antique bracelets of different forms.

**BRACES**, on shipboard, are ropes attached to the yard-arms, and employed to shift the sails in a horizontal direction round the masts, so as to receive advantageously the wind that may be

blowing at any particular moment. The phrases, 'to brace to,' 'to brace about,' 'to brace the yards sharp up,' &c., apply to this operation.

**BRACHE** (Fr. *braque*, diminutive *brachet*), a term frequently employed by the older English authors to designate some kind of dog. To what kind this name belonged, is, however, not very certain. The probability appears to be, that it was applied to hounds or hunting-dogs in general. The term is believed to be of Celtic derivation (from *brac*, a spot), and to have originally signified a spotted hound.

**BRA'CHIAL ARTERY** is that portion of the great arterial trunk supplying the upper extremity between the armpit and the elbow; in other words, it is the continuation downwards of the axillary artery. The B. A. runs along the inner side of the arm, just behind the inner margin of the biceps muscle, and behind the great median nerve. Here it may be pressed against the bone, in cases of bleeding from any point below. In its course, the B. A. gives off, 1st, the superior profunda branch, which winds round the back of the arm-bone, and reappears on the outer side, where it joins some twigs coming up from the radial artery; 2d, an artery which enters the bone to supply its medullary membrane; 3d, the inferior profunda, which, running

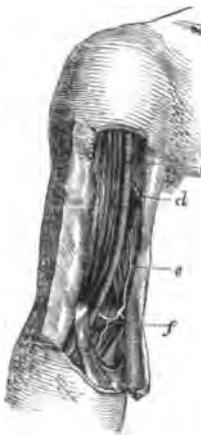

down behind the internal condyle (the funny bone) of the humerus, joins branches coming from the ulnar artery; 4th, a short branch, the anastomotica magna, which breaks up into numerous branches inosculating round the elbow.

**BRACHIO'PODA** (Gr. arm-footed), or **PA'LLIO-BRANCHIATA** (Gr. mantle-gilled), a class of molluscan animals, having bivalve shells, but differing in important points from the vast majority of recent mollusks with bivalve shells, the *Lamellibranchiata* (q. v.). The chief differences existing in the shelly covering itself have been already pointed out in the article **BIVALVE SHELLS** (q. v.), but those of internal structure are still more important. The mantle or *pallium* (see *MOLLUSCA*) in the B. consists of two broad expansions or lobes, covered by the two valves of the shell, and enclosing all the other soft parts of the animal; whilst respiration or the aeration of the blood is carried on by the surface of these lobes themselves, traversed by minutely ramifying blood-vessels, extended into processes, and furnished, especially along the edge, with vibratile cilia which create a continual current in the surrounding water, and thus keep up a fresh supply, from which the necessary air may be obtained. The organs by which food is procured are also remarkable—two long arms arising from the sides of the mouth, and disposed wholly or partly in spiral curves, when not extended to seek or seize prey. These arms are usually furnished with numerous vibratory filaments, which are supposed not only to aid in the capture of

prey, but in the maintenance of the current necessary for respiration. The B. are attached to solid bodies either by a footstalk or by one of the valves of the shell. Of existing species, the *Terebratulae* or Lamp-shells (q. v.) are by far the most numerous; but even these appear to have existed in far greater numbers in former geologic periods, and of some of the other families of B. only a single species is known to exist, or the existing species are very few, whilst the fossil species are very numerous. The existing species are very widely diffused over the globe. All of them are marine, and one (*Crania personata*) has been brought up from the depth of 255 fathoms. The B. are regarded as exhibiting structural affinities not only to the *Ascidia* (q. v.) and the *Lamellibranchiata*, between which they are commonly placed, but also to the class *Bryozoa* or *Polyzoa* among *Zoophytes* (q. v.).

**BRACHYPTERÆ**, or **BRACHYPTERES** (Gr. short-winged), in Ornithology, that section of the order of *Palmipedes* (q. v.), or web-footed birds, in which the wings are short, and the feet are placed far back, so as to compel the birds to assume a nearly erect posture when on land. They are all very aquatic in their habits, and excel in diving, so that the name *Divers* is sometimes used as equivalent to B.; but that name is also not unfrequently applied to other aquatic birds, and is sometimes restricted to the genus *Columbus*. Auks, puffins, penguins, grebes, guillemots, and divers (*Columbus*) are among the Brachyptera.

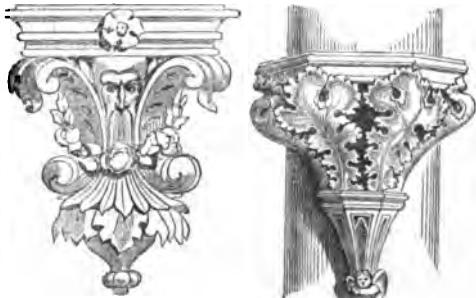

**BRACKET**, an ornamental projection from a wall, used for the purpose of supporting a statue, bust, or the like. See CORBEL. Brackets may be either of stone or wood, and they are sometimes

Brachial Artery:

a, brachial artery; d, superior profunda branch; e, inferior profunda; f, anastomotica magna.

down behind the internal condyle (the funny bone) of the humerus, joins branches coming from the ulnar artery; 4th, a short branch, the anastomotica magna, which breaks up into numerous branches inosculating round the elbow.

Ornamental Brackets.

elaborately designed and carved. The term B. is also employed in joinery, &c., to designate supports in the form of a bent knee, of shelves, galleries, &c. B. is also generally applied to such gaslights as project from the wall.

**BRACKLESHAM BEDS**, a group of highly fossiliferous strata in the middle Eocene formation, included in the Bagshot series (q. v.).

**BRACT**, or **BRA'CTEA**, in Botany, a leaf from the axil of which a flower or a floral axis is produced, instead of an ordinary leaf-bud or branch. Bracts are sometimes called floral leaves. The term B. is not, however, generally employed when, as is often the case, there is no marked difference from the ordinary leaves of the plant; but the flowers are said to be axillary, or in the axils of the leaves. On the other hand, the term B. is very frequently applied to all altered leaves interposed between the ordinary leaves and the flower or flowers. In this case, they are sometimes very small and scale-like. The ordinary leaves often pass, by imperceptible gradations, into bracts, diminishing in size, becoming

## BRADDOCK—BRADLEY.

more simple, and often also scarious. Bracts are generally entire, even when the ordinary leaves are divided. They are sometimes coloured so as apparently to form part of the flower, and sometimes crowded, so as to resemble an involucrum or an outer calyx. They appear to serve purposes analogous to those of leaves, or, when coloured, of petals. When the primary floral axis is branched, bracts (sometimes distinguished as *bracteoles* or *bractlets*) are often to be seen at its ramifications. Bracts sometimes fall off at an early stage, sometimes they are more permanent, and sometimes they even remain to cover and protect the fruit.

**BRADDOCK, EDWARD**, a British major-general, commander against the French in America in 1755, arrived in February of that year at Richmond, Virginia, and with a force of 2000, British and provincial troops, reached the Monongahela, a branch of the Ohio, on July 8. Leaving the baggage behind, on the 9th his force moved forward to invest Fort du Queane, now Pittsburg, Pennsylvania, when, from his slighting the warning of his American officers, of the probability of a surprise, the troops, in passing through a deep forest ravine, fell into an ambuscade of Indians, while they were attacked in front by the French, and half of them slain. The rest made a hasty retreat under Colonel, afterwards General Washington, B.'s aide-de-camp, the only one of his officers who escaped with life. B. himself, mortally wounded, was carried off on a tumbril 40 miles to the place in which the baggage had been left, where he died.

**BRADFORD**, an important manufacturing town in West Riding, Yorkshire, on a tributary of the Aire, at the meeting of three vales, 8 miles west of Leeds. Pop. in 1871, 145,827; of whom considerably more than one half are immigrants from other districts. The area of the parish is 34,146 acres, extending to the confines of Lancashire. It returns two members to parliament, having been created a parliamentary borough in 1832. It became a municipal borough in 1847. B. is the chief seat in England of the spinning and weaving of worsted yarn, and the great mart for the long wools used in worsted fabrics. Cottons are also manufactured. There are nearly 200 mills, employing 40,000 persons. Notwithstanding the large population, and the nature of their employment, the annual rate of mortality is now only 24 per thousand. Twelve years ago, the rate was 30. The Saltaire Alpaca and Mohair Mills, on the Aire, 3 miles from B., cover more than 6 acrea. This establishment, erected by Sir Titus Salt, Bart., is the most splendid manufacturing concern in England. Here is also the largest silk-mill in England, built by Mr S. C. Lister. Coal and iron mines occur near Bradford. There are twenty churches belonging to the establishment in the borough, and many Dissenting and Roman Catholic churches. The gross estimated rental of the borough is £600,000, and the rateable value £500,000. It has two public parks in use, and others in progress, and also many excellent charities. The Romans seem to have worked iron-mines here, Roman coins having been found in foundry refuse near the town. The early history of B. is connected with the castle of the Lacey's here. In the civil wars, the people of B. took the parliament side, and twice defeated the royalists, but were afterwards themselves defeated by the Earl of Newcastle. In a riot at B., against the introduction of worsted power-looms, in 1826, two of the rioters were shot dead by the defenders of the mill which contained the obnoxious machinery, and many more were wounded. In 1825, a strike for increased wages, in which 20,000 persons were concerned, lasted six

months. The Baptists, Independents, and Wealeans have colleges near Bradford. This town is the seat of the first English temperance society. At Fulneck, 3 miles east of B., is a Moravian settlement, founded in 1748, where Montgomery the poet was educated. B. has been latterly much improved in its buildings, and possesses a spacious and elegant public hall, in which the National Association for Promoting Social Science met in 1859, and the British Association in 1873. The merchants of B. are distinguished by their liberality and enterprise. Their warehouses form the great wholesale market in the worsted and alpaca trade.

**BRADFORD, GREAT** (Sax. *Bradanford*, broad ford), a town in the county of Wilts, on both sides of the Avon, and on the Kennet and Avon Canal, 6 miles E.S.E. of Bath. Pop. (1871) 4871. It has been noted for many centuries for its manufacture of fine broadcloths. Kerseymeres were first made here. An India-rubber manufactory has been also lately established. The remains of a monastery, founded in the 7th c. by St Aldhelm, are still visible.

**BRADFORD CLAY**, a member of the Lower Oolite, is a blue unctuous clay, occurring at Bradford near Bath, and extending for a few miles around: it is never more than 40 or 50 feet in thickness. It is remarkable for the occurrence in it of large numbers of a crinoid (q. v.), (*4piocrinus Parkinsoni*). The upper surface of the calcareous rock on which the clay rests is completely incrusted over with a continuous pavement formed of the stony bases of this crinoid. It had once formed the bottom of a sea, in which these animals lived, their stems bending with every motion of the water, and their star-like crown of arms outstretched in search of food. At length, however, the clear water was invaded by a current largely charged with mud, which threw them down, and broke most of their stems off near the base. The stem, body, and arms have been dismembered, and are confusedly scattered through the clay.

**BRADLEY, DR JAMES**, one of the most distinguished astronomers and discoverers of any time or country, was born at Sherborne, in Gloucestershire, in 1692. He received his early education at a boarding-school at North Leach, whence, being destined for the church, he proceeded to Oxford. Soon after graduating, he obtained successively the livings of Bridalow and of Welfrie, in Pembrokeshire; but there is reason to fear that his mathematical pursuits considerably distracted his attention from his clerical duties. Devoting himself to mathematics and astronomy, he soon exhibited such a genius for these pursuits as to win the friendship of all the leading mathematicians of his time, among others, of the great Isaac Newton, and to get elected a member of the Royal Society. About the time of his election, 1721, he became, in his 29th year, Savilian professor of astronomy at Oxford, resigned his livings, and devoted himself wholly to science. In 1727, he published his theory of the aberration of the fixed stars, containing the important discovery of the aberration of light, to which, it is related, he was led somewhat by accident, as Sir Isaac Newton was to the theory of gravitation. What suggested this discovery to B., it is said, was the observation that the vane of a yacht in which he was sailing never lay in the line of the wind, but was always inclined to it at an angle depending on the line and amount of the yacht's motion. This led him to a train of thought resulting in the proposition, that the direction in which we see a star is not that in which it actually lies, but inclined to it by an angle depending on the direction of the earth's

motion round the sun at the time of the observation, and the ratio of its velocity to that of light. See *ABERRATION*. Three years after this publication, B. became lecturer on astronomy and physics at the Oxford Museum. His next discovery was that the inclination of the earth's axis to the ecliptic is not constant, a fact including the explanation of the precession of the equinoxes and the nutation of the earth's axis. This discovery constitutes a great epoch in astronomy. Latterly, B. became Regius Professor of Astronomy at Greenwich, where, by his observations, he still further enriched the science. He declined the living of the parish of Greenwich, which was offered to him, and was favoured by the crown with a pension of £250 a year for his services to commerce and navigation. Towards the end of his life, B. was elected member successively of almost all the leading scientific societies in Europe. He died on the 2d of July 1762, in his 70th year. B. is described as having been gentle, modest, compassionate, and liberal; little given to speaking or writing, from diffidence and the fear of hurting his reputation. No man ever better merited the title of a great astronomer.

**BRADSHAW, JOHN**, an eminent Puritan, was born in 1586 of a good family in Cheshire, and studied law at Gray's Inn. Called to the bar, he gained a good practice by his ability and learning, especially as a chamber council. In October 1646 he was appointed a commissioner of the Great Seal, and in February 1647 chief-justice of Chester. In October 1648 he received the degree of serjeant, and in the following January, was elected president of the high court of justice for the trial of King Charles I. As the reward of his services on that solemn occasion, he was made President of the Council of State, and Chancellor of the Duchy of Lancaster, besides the grant of estates worth £4000 per annum, the deanery house of Westminster for a residence, and £5000 to furnish it. B., however, refused submission to the Protector. He was an able lawyer, but not an able politician. His mind was rigid rather than broad, and, in consequence, he was unable (like so many others of the stern fanatical republicans of his time) to see or comprehend the necessity for a great iron rule like Cromwell's. He even engaged in some Fifth Monarchy and other plots against Cromwell, but his respectable character and past services saved him from molestation. He was deprived, however, of his office as chief-justice of Chester. After Oliver's death, he was Lord President of the Council of State, and a commissioner of the Great Seal under Richard. His last public act was to protest against the violent seizure of Speaker Lenthall by the army. He died November 22, 1659. His body was buried with pomp in Westminster Abbey, but it was afterwards exhumed and hung on a gibbet, with those of Cromwell and Ireton.

**BRADSHAW'S RAILWAY GUIDE**, the pioneer, and still the type, of that now extensive class of publications whose object is to convey all necessary information in regard to travelling. It derives its name from George Bradshaw, originally an engraver and printer in Manchester, who in 1839 issued an occasional work, called the *Railway Companion*, which was corrected by means of another work, in the form of a broad sheet, styled the *Monthly Time Tables*. This sheet was frequently delayed to the 5th or 6th of the month, and was subject to changes made by the Companies, perhaps in the middle, or even the latter end of the month. By great efforts, the Railway Companies were induced to consent to adjust their tables, once for all, for the beginning of each month; and

Mr Bradshaw having established an agency in London, the first number of the monthly *Railway Guide* was brought out in December 1841. The second number now before us, published '1st month (January), 1842,' runs to 32 pages, and contains 42 or 43 lines of railway, in England only, without any advertisements. Through the suggestions and exertions of Mr W. J. Adams, the London agent and publisher, the plan was gradually enlarged and perfected, and resulted in the *Railway and Steam-navigation Guide* for Great Britain and Ireland, so well known to the public. The number for July 1874 extends to 398 pages, which comprise the needful knowledge regarding all lines and branches in the three kingdoms; besides, 62 pages of steam-boat information; full details regarding coaching in Scotland; and numerous advertisements—price 6d. The information is obtained from the Companies, at the last moment, in time to appear on the 1st of the month. The *Guide* has attained an immense circulation, and given birth to many publications of a similar character. Its plan has been imitated in France and Germany, in America, and even at the antipodes, where a *Bradshaw* is published at Sydney; and in spite of many rivals, the original work has always maintained its place in general estimation.

In 1847, the first number of *Bradshaw's Continental Railway Guide* was issued, which has prospered no less than the British *Guide*. In addition to the tables, as furnished by the companies abroad, it contains a large quantity of topographical information. A series of *handbooks* was also projected by Mr Bradshaw, which includes Great Britain, France, Switzerland, &c., but is still incomplete. The handbooks of the *Overland Journey*, and to the *Presidencies of India*, were published after Mr Bradshaw's death, which occurred in 1853.

**BRADYPIUS.** See *SLOTH*.

**BRAEAMAR' (including the united parishes of Braemar and Crathie)**, an extensive Highland district, occupying the south-west corner of Aberdeenshire, in the heart of the Grampian Mountains, and intersected by the upper part of the Dee and its tributaries. The chief mountains are Ben Macdhui (q. v.); Cairntoul, 4220 feet; Braeriach, 4225; Ben-a-Buird, 3851; and Ben Avon, 3826, on the north; and Lochnagar (q. v.), on the south. Patches of snow lie on these mountains all the year round. The rocks of B. are granite, gneiss, and quartz, with beds of primary limestone, and masses of serpentine, trap, and porphyry. Most of the district is uncultivated, and consists of heathy tracts, while about a twentieth of the surface is in wood. The natural woods are birch, alder, poplar, and rowan, and the planted chiefly larch and Scotch fir. The fir-timber of the ancient Caledonian forest of Mar, now nearly all cut down, is, for size and quality, the best in the kingdom. Red-deer, roes, grouse, ptarmigan, and alpine hares abound. Many rare alpine plants are found on the mountains and in the glens. Black-faced sheep and small black-horned cattle are reared. Here the Earl of Mar first raised his standard for the Pretender in September 1715. The district is intersected by the great military road from Blairgowrie to Fort George, made by General Wade. In the east part of the district is Balmoral (q. v.); and near its centre is the small village of Castleton of B., a favourite resort for travellers, sportsmen, and lovers of grand scenery. Pop. (1871) 1566, a few of whom still speak Gaelic.

**BRA'GA**, a city of Portugal, capital of the province of Minho, is situated on an eminence between the rivers Cavado and D'Este, about 35 miles north-east of Oporto. The neighbourhood is charming, especially along the banks of the river

Cavado. B. is surrounded by old walls, flanked with towers, and defended by a castle. It is the residence of the primate of Portugal, who has a palace here. It has also a fine Gothic cathedral, several spacious squares; and manufactures of linen, hats, cutlery, firearms, jewellery, &c. Pop. 19,514. It is a very ancient place, being supposed to owe its origin to the Carthaginians. In the time of the Romans, the city was named *Bracara Augusta*, and the ruins of a temple, an amphitheatre, and an aqueduct, belonging to that era, still remain. Not far from B. stands the celebrated *Sanctuario do bom Jesus do Monte*, which is still a place of pilgrimage. After the Suevi had taken Lusitania from the Romans, B. was made the metropolis; and here, at a council held in 563 A. D., the Suevi, with their king, renounced the errors of Arianism, and submitted to the teaching of the Roman Catholic Church. After the fall of the Suevian and West-Gothic kingdom, B. fell into the hands of the Arabs, from whom it was taken by the forces of Old Castile in 1040. After the establishment of the Portuguese dynasty, it was annexed to the crown of Portugal.

**BRAGA'NCA**, the name of two considerable towns in Brazil.—1. B., a seaport of about 6000 inhabitants, at the mouth of the Caite, which enters the Atlantic about 100 miles to the east-south-east of the Amazon.—2. B., an inland city of about 10,000 inhabitants, 50 miles to the north-east of San Paulo, and about 200 to the west of Rio de Janeiro.—The first is about a degree to the south of the equator, and the second about a degree to the north of the Tropic of Capricorn.

**BRAGA'NZA**, or **BRAGANÇA**, a city of Portugal, capital of the province *Tras-os-Montes*, is situated in a pleasant and fertile district, on the river Fervenza, an affluent of the Sabor. The city is surrounded with walls; has two castles, partly in ruins, of which one was the ancestral seat of the Dukes of Braganza; and has manufactures of silk and velvet. Pop. 5000. This city gives its name to the House of Braganza, the present ruling dynasty in Portugal. John, eighth Duke of Braganza, having ascended the throne as John IV., when the Portuguese liberated themselves from the Spanish yoke in 1640. See PORTUGAL.

**BRAGI**, son of Odin and Frigga, in the Norse or Scandinavian mythology, was the god of poetry and eloquence. Upon his tongue were engraved the runes of speech, so that it was impossible for him to utter a sentence that did not contain wisdom. According to the older or poetic Edda, he was the most perfect of all scalds or poets, and the inventor of poetry, which is designated by a kindred word, *bragr*. Unlike Apollo, who, in the Greek mythology, is represented as enjoying eternal youth, B. was supposed to be an old man with a long flowing beard; but his brow was always mild and unwrinkled. B.'s wife was Idunna. Together with Hermoth or Hermode, he received and welcomed all those heroes who had fallen in battle, on their arrival in Valhalla. On festive occasions, as well as on the burial of a king, a goblet, called Bragafull (B.'s goblet), was presented, before which each man rose up, made a solemn vow, and emptied it. Several German periodicals and works, intended to cherish a national spirit, have taken the name of Bragi.

**BRAHAM**, JOHN, a celebrated tenor-singer, of Jewish origin, was born in London in 1777, and died February 15, 1856. He had an unusually long professional career, having sung on the stage at the age of ten, and continued to make occasional appearances at concerts until within a few years of his death. About the close of the 18th c. he visited

France and Italy for improvement; returning to London, his triumph was transcendent, and from that time, for half a century, he held the reputation of one of the greatest tenor-singers in Europe. It was as a concert-singer that he excelled most, and his great declamatory power and florid execution made his singing of the national songs wonderfully effective.

**BRAHÉ**, TYCHO, one of the most distinguished names of which astronomical science can boast, was born at Knudstorp (a place near the Baltic), in Denmark, in 1546. He was descended from a noble family, originally Swedish, and sent, at the age of 13, to the university of Copenhagen, where he had not been more than a year, when an eclipse of the sun turned his attention to astronomy. His uncle, who destined him for the law, furnished him with a tutor, and sent him to Leipzig in 1562; but B., who cared nothing for that study, devoted just so much time to it as would save appearances, and while his tutor slept, busied himself nightly with the stars. By these surreptitious observations of the heavens, and with no other mechanical contrivances than a globe about the size of an orange, and a pair of rude compasses, he succeeded, as early as 1563, in detecting grave errors in the Alphonsine and Prutenic tables, and set about their correction. The death of an uncle, who left him an estate, recalled him to his native place in 1565; but he very soon became disgusted with the ignorance and arrogance of those moving in the same sphere with himself, and went back to Germany. At Wittenberg, where he resided for a short time, he lost part of his nose in a duel with a Danish gentleman; but for the lost organ he ingeniously contrived one of gold, that fitted so admirably, and was so naturally coloured, that few could have detected that it was artificial. After a couple of years spent in Augsburg, he returned home, where, in 1572, he discovered a new and brilliant star in the constellation Cassiopeia. In 1573, he married a peasant girl, which his fellow-noblemen thought even more undignified than being addicted to astronomy; and that they considered very degrading in a gentleman, whose only becoming qualification was, in their estimation, expertness in the use of arms. After some time spent in travel, B. received from his sovereign, Frederic II., the offer of the island of Hven or Hōsne, in the Sound, as the site for an observatory, the king also offering to defray the cost of erection, and of the necessary astronomical instruments, as well as to provide him with a suitable salary. B. accepted the generous proposal, and in 1576 the foundation-stone of the castle of Uraniberg ('city of the heavens') was laid. Here, for a period of 20 years, B. prosecuted his observations with the most unrewarded industry—with a zeal, in fact, sufficient to create a new epoch—one of the three great epochs indeed—in astronomy as a science of observation. See ASTRONOMY. The scientific greatness of B. was no protection against the petty prejudices of the nobles, who could not bear to see honour heaped on one who, according to their notions, had disgraced their order, nor against the meaner jealousies of physicians, who were annoyed at his dispensing medicine gratis to the poor. So long as his munificent patron, Frederic II., lived, B.'s position was all that he could have desired, but on his death in 1588, it was greatly changed. For some years under Christian IV., B. was just tolerated; but in 1597, his persecution had grown so unbearable, that he left the country altogether, having been the year before deprived of his observatory and emoluments. After residing a short time at Rostock and at Wandsbeck near Hamburg, he accepted an invitation of the Emperor

Rudolf II—who conferred on him a pension of 3000 ducats—to Benatek, a few miles from Prague, where a new Uraniberg was to have been erected for him; but he died at Prague on the 13th October 1601. At Benatek he had Kepler as his assistant, and to the advice of B. that celebrated astronomer owed much. The scientific publications of B. are numerous.

**BRAHILOV, BRÄILOFF, or IBRAÄYL**, a fortified seaport town of Walachia, Danubian Principalities, on the left bank of the Danube, about 99 miles from its mouth, and 15 miles south from Galatz. From B., which is the chief shipping port in Walachia, large quantities of corn are exported, and also other products of the principality. In 1871, there were exported 849,607 imperial quarters of wheat; 857,123 of maize; 518,336 of barley; 97,129 of rye. Rape-seed was exported to the quantity of 119,109 imperial quarters; among the exports there were also linseed, millet, deal planks, timber, masts, and sleepers, spirits, and petroleum. The sturgeon fisheries on the Danube, in which many of the inhabitants of B. are engaged, are a source of considerable profit. A railway from Galatz to B., thence to Bucharest, was begun in 1870. Pop. (1866) 25,767. During the war of 1854—1856, B. was occupied by Russian troops.

**BRAHMA.** In the religion and philosophy of the Hindus, this word has two meanings. The crude or undeclined form is *brahman*, the etymological significance of which is doubtful; when declined as a neuter noun, it has the nominative *Brahmā* (with the final syllable short); as a masculine, it is *Brahmā* (with the a long). **BRAHMĀ** (neuter) designates the universal Spirit, the ground and cause of all existence; which is not, however, conceived as an individual personal deity to be worshipped, but only as an object of contemplation. It is spoken of as ‘that which is invisible, unseizable, without origin, without either colour, eye, or ear, eternal, manifold (in creation), all-pervading, undecaying—the wise behold it as the cause of created beings. The human soul is a portion of this universal Spirit, and a man can only be freed from transmigration, and be reunited to Brahmā, by getting a correct notion of it and of the soul.—**BRAHMĀ** (masculine) is one of the three chief gods of the Hindu pantheon, and is specially associated with the function of creation. See **TRIMURTI**. Yet he himself is a creation of or emanation from *Brahmā*, the First Cause. The origin of *Brahmā*, and the way in which he created heaven and earth, is thus narrated by Manu : \*

‘This universe was enveloped in darkness, unperceived, undistinguishable, undiscoverable, unknowable, as it were entirely sunk in sleep. Then the irresistible self-existent Lord, undiscerned, causing this universe with the five elements, and all other things, to become discernible, was manifested, dispelling the gloom. He who is beyond the cognizance of the senses, subtle, undiscernible, himself shone forth. He, desirous, seeking to produce various creatures from his own body, first created the waters, and deposited in them a seed. This [seed] became a golden egg, resplendent as the sun, in which he himself was born as *Brahmā*, the progenitor of all the worlds. Being formed by that First Cause, undiscernible, eternal, which is both existent and non-existent, that Male (parusha) is known in the world as *Brahmā*. That lord having continued a year in the egg, divided it into two parts by his mere thought. With these two shells he formed the heavens and the earth; and in the middle he placed the sky, the eight regions, and the eternal abode of the waters.’—See Dr J. Muir’s *Original Sanscrit Texts*, vol. iv, 31.

In later times, at least, B. has had few special worshippers; the only spot where he is periodically adored being at Puskhara in Rajputana. He sometimes receives a kind of secondary homage along with other deities. B. is represented with four heads. See **INDIA** (section on Religion), **TRIMURTI**, **VISHNU**, **SIVA**.

**BRAHMĀN**, or **BRAHMIN**, the name of the highest Caste (q. v.) in the system of Hinduism.

**BRAHMAPU'TRA**, a river which has its origin in Tibet, and, after partially mingling its waters with those of the Ganges, flows into the Bay of Bengal by three mouths. It is formed by the junction in Assam of two main branches—the Brahmaputra, with a course of fully 200 miles from the north-east; and the Sanpoo, with a course of about 1000 from the north-west; and, as the united current has still upwards of 700 miles to run, the entire length rather exceeds 900 miles from the one principal source, and 1700 from the other. The B. Proper rises towards the east end of the Himalayas, about lat. 28° 30' N., and long. 97° 20' E.; while the Sanpoo, about lat. 30° 25' N., and long. 82° 5' E., springs, on the north side of the mountains just mentioned, from the same swamp as the Sutlej and the Indus. Of these two branches, while still separate, the latter approaches Lassa, the capital of Tibet; while the former divides, for some distance, Tibet itself from British India. About 75 miles below the point of confluence, the river diverges into two channels for a distance of 65 miles. Being again united for a stretch of 220 miles, it at last leaves Assam, near Goulpara, after having watered Durrung and Gowhatta. After 60 miles more in a south-west direction, it takes a sweep of about 50 miles round the west extremity of the Garrow Mountains. Being now in lat. 25° 10' N., and long. 89° 43' E., it throws off the Konaie, which it partly recovers after a separation of 180 miles, having meanwhile, however, exchanged the name of B. for that of Meghna. About 25 miles further down, it receives tribute from the Ganges through the channel of Kirtynassa; and, being still 90 miles from the sea, it co-operates with its new partner in cutting up their common delta into a complex net-work of inland navigation.

**BRAHMIN OX.** See **ZEBU**.

**BRAILS**, on shipboard, are among the many varieties of ropes used in furling the sails. To ‘brail-up’ is to haul up a sail by means of brails.

**BRAIN** is the nervous centre in which reside consciousness and power over the voluntary movements of the body. It consists of one or more masses of *gray* and *white* nervous matter, or what are technically called vesicular and tubular neurine. When these substances are blended together, the mass is termed a *ganglion*, and from it proceed prolongations of the tubular matter, which are called nerves, and are conductors of impressions to or from the vesicular neurine. The number and size of these ganglia vary with the powers of the animal. In the lowest forms of mollusk, we find a single ganglion, from which proceed all the nerves of the animal; in the higher, there are two ganglia, joined by a nervous cord round the gullet, and distinct from, though connected with, the ganglion which supplies nerves to the foot, and the one for the respiratory apparatus. In the common slug, we have these cephalic ganglia united so as to form one bilobed mass or B. above the oesophagus.

In the **ARTICULATED ANIMALS** (q. v.), the B. consists of two cephalic ganglia over the oesophagus; there are also two nervous cords, one on each side of the body, connected with each other. In the *Cephalopoda*, as the pearly nautilus, the B., or

## BRAIN.

mass of nervous matter situated over the gullet, is a transverse cord-like ganglion; in the cuttle-fish (*Sepia officinalis*) we find a distinct rounded mass, supported by a rudimentary skeleton. In FISHES, we find, instead of one supra-oesophageal mass or ganglion, several separate masses, the nerves ending in their own special ganglia; i.e., where each nerve ends or begins in the B., there

is a collection of vesicular neurine. In addition to these ganglia in fishes, there are parts corresponding to the cerebral lobes or hemispheres of the human brain. There is also a cerebellum.

Suppose we examine a cod's brain (fig. 1). Removing the roof of the skull, we see three pair of neurine masses; two small and round in front, *a*, the hemispherical ganglia; two larger in the middle, the optic ganglia, *b*; and a little triangular appendage behind, the cerebellum, *c*. From just in front of the anterior of those three pairs of masses diverge nervous prolongations, which end in two bodies, *d*, *d*, called the olfactory ganglia. On lifting the appendage we have named cerebellum, we see on each side of the spinal cord a deposition of neurine, which represents the auditory ganglia of more fully developed brains. The olfactory ganglia vary in their distance from the general mass. In REPTILIA, they are placed very near the cerebral hemispheres, which

are small, as is also the cerebellum. But when we reach the BIRDS (fig. 2), the size of *a*, cerebral lobes, or hemispherical ganglia; *b*, *c*, cerebellum; *d*, *d*, olfactory ganglia; *e*, bulb, con-

necting to all the other parts is much increased, so that they overlay the different ganglia, connected to brain by long prolongations or roots. front of the other, as in fishes

and reptiles, but packed one above the other. We now begin to find some indications of convolutions. On the surface of the B. in the parrot, Leuret describes the furrowing as distinct, though many

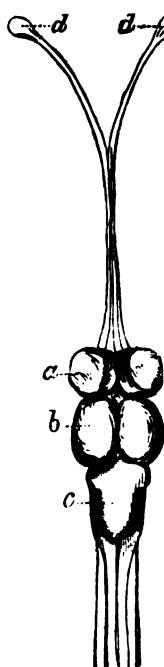

Fig. 1.—Brain of Cod : drawn to shew by bellum. But when we reach removing roof of skull. the BIRDS (fig. 2), the size of *a*, cerebral lobes, or hemispherical ganglia; *b*, *c*, cerebellum; *d*, *d*, olfactory ganglia; *e*, bulb, con-

Fig. 2.—Brain of Domestic Fowl: *a*, cerebral ganglia; *b*, olfactory ganglia; *c*, cerebellum; *d*, optic ganglion of the right side, seen under cerebral ganglion. The optic nerves and eyeballs have been left in the preparation.

birds have perfectly smooth hemispheres; these also are not hollow, as in fishes and reptiles; and it will be seen that the convoluting or folding of the B. substance backwards and forwards, must allow of more being packed into the space than could be

admitted by any other arrangement. The middle part of the cerebellum is very large, *c*, and divided into laminae or leaflets; its lateral portions are much smaller than in Mammalia; the olfactory ganglia are small, *b*, and close to the cerebral hemispheres. The optic ganglia and other nerves rising from them are very large, and the wedge-shaped portion, called *medulla-oblongata*, connecting the B. with the spinal cord, is also large. We now approach the MAMMALIA, and in the Monotremata, which in some important respects resemble birds—the *Ornithorhynchus paradoxus*, for instance—we find small smooth hemispheres in a B. which to the whole body bears only the proportion of 1 to 130. Even this is greater than in the Marsupials; the kangaroo's B. is as 1 to 800.

If we examine a rabbit's B., we find it to consist, apparently, of three parts—the olfactory bulb, the cerebral hemispheres, and the cerebellum. The cerebral hemispheres are connected by a transverse band of union, or what is technically termed a commissure. Continuing the dissection, we turn aside the hemispheres, and find they have concealed four ganglia, which represent the single pair of optic ganglia we found in birds. There are two other bodies in front of those just alluded to—viz., the optic thalamus, and in front of it another (inferior) longitudinal commissure. This forms a communication between the anterior and posterior portions of the hemisphere, on the same side. Two little white lines, running from the back of the thalamus, join a little body called the pineal gland, interesting in connection with some fantastic physiological theories. It will be observed that the hemispheres lie over these structures like a cap; the space between the two, on each side, is termed the lateral ventricle.

We have now the most complicated B. before us, the human encephalic mass of ganglia (figs. 3, 4, 5), and include with it the medulla oblongata, the link which unites the B. to the spinal cord. First viewing the B. from its upper surface (fig. 3), we

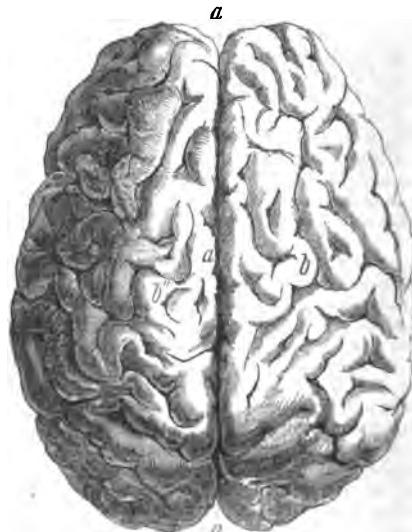

Fig. 3.—Human adult Brain: Seen from above—membranes removed. *a*, *a*, *a*, the longitudinal fissure, separating the two hemispheres; *b*, *b*.

see that it is divided by the longitudinal fissure into two equal halves or hemispheres, which are broader behind than in front. They are irregularly marked

by convolutions, *b*, and a smooth appearance is given to the whole surface by the glistening arachnoid membrane (q. v.). On slicing them transversely with a knife, the section appears white in the centre, and gray at the margins, of the *convolutions*, which are now seen penetrating to various depths below the surface. The white substance is dotted with the blood-vessels which supply the brain. On drawing the hemispheres asunder from each other with the fingers, the great commissure, or uniting band, is seen, the *corpus callosum*, which is streaked both longitudinally and transversely. The hemispheres should now be completely sliced off on a level with this commissure, and its transverse fibres will be seen to extend into their substance, constituting a large white surface, called by anatomists the *white oval centre*.

If we take the handle of the knife, and scratch with it through this white substance, the instrument soon opens a cavity, which is the *lateral ventricle* (fig. 4). Let this be done on both sides, and the ventricles exposed to view. They are shaped somewhat like the italic *S*. Their extremities are

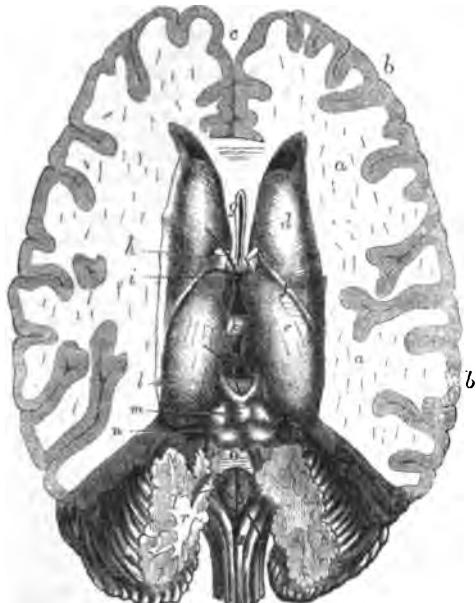

Fig. 4.—Human adult Brain :

In this dissection the cerebral lobes have been sliced off, and the lateral ventricles opened; to allow a view of the cerebellum, the posterior part of the cerebrum has been cut off opposite *a*.

*a*, *a*, remains of white oval centre; *b*, *b*, gray outer portion of hemispheres; *c*, longitudinal fissure; *d*, corpus striatum, or streaked body, lying in lateral ventricle; *e*, optic thalamus; *f*, tenia semicircularis, or worm-like body; *g*, the two layers of septum lucidum, open to shew fifth ventricle; *h*, anterior crura, or portions of the fornix, one of the great antero-posterior commissures; *i*, points to the foramen of Monro, a bristle is sticking down into the third ventricle; *k*, in the middle, or soft transverse commissure, joining the two optic thalami—sometimes absent, and easily destroyed; *l*, a bristle passed from the third to the fourth ventricle (*g*), the transverse lines beneath it indicate the posterior transverse commissure; *m*, the pineal gland, lying on *n*, the corpora quadrigemina; *n*, valve of Vieussens, a layer of gray matter from cerebellum; *p*, processes which connect the cerebellum to corpora quadrigemina; *q*, section of cerebellum line, points to gray matter in fourth ventricle; *r*, white matter projecting into the gray, giving a toothed or arborescent appearance, hence the name, *arbor vitae*; *s*, posterior pyramids, or back of medulla oblongata.

termed cornua, and the anterior look from each other, and are nearer than the posterior, which are

turned the opposite way. We have now removed the hemispherical ganglion, and uncovered the others. The pia mater, which supports the vessels bringing blood to the *B.* substance, is seen in a purple wreath lying in each ventricle, and passing down into a depression termed the *middle horn* of the ventricle. This is the *choroid plexus*, and, if lifted, it will be found continuous with that on the opposite side, through an aperture called the *Foramen of Monroe*, *e*, after the great Scotch anatomist of that name. If the remains of the *corpus callosum* are now scraped away, the *choroid plexus* will be found continuous with a web of pia mater called the *velum interpositum*, which lies over the central cavity of the *B.*, or third ventricle. In front and behind will be seen portions of the inferior longitudinal commissure or *fornix*, *h*, the body of which has been removed to shew the *velum*; but, placed vertically between its anterior part and the under surface of the *corpus callosum*, are two layers of gray matter, between which is a narrow space termed the *fifth ventricle*, *g*. Behind, there will be seen a small hole, through which a probe will pass into the *fourth ventricle*, *l*.

The accompanying cut (fig. 4) shews the parts now exposed. The mass most in front is the *corpus striatum*, *d*, behind it is the *optic thalamus*, *e*. Through the former, motor fibres pass from the anterior columns of the spinal cord into the hemisphere; through the latter, the sensory fibres from the posterior columns of the cord. These are by some considered to be the ganglia of motion and common sensation.

Behind these are the *corpora quadrigemina*, *n*, which are analogues of the optic ganglia of the lower animals. Upon them lies the *pineal gland*, *m*, and behind them, projecting into the *fourth ventricle*, *g*, some gray matter, said to be the auditory ganglia. We now come to the upper surface of the *cerebellum*, consisting of two hemispheres split transversely into leaflets, and connected by a central portion to each other, and by two bundles of white fibres to the *corpora quadrigemina*, *p*. Between these is the *fourth ventricle*; and stretched across between them is a thin layer of gray matter, called the *valve of Vieussens*, *o*.

We now turn what remains of the *B.* upside down, and examine the base or under surface. It is very irregular in outline. The cerebral hemispheres are now found to be divided on each side by a *fissure (Sylvian)*, *f*. The part in front is called the *anterior lobe*; that behind the *middle*, as far as the cerebellum, when it is called the *posterior lobe*.

The diagram (fig. 5) gives a better idea of the appearance than words could possibly do. The olfactory lobes, *h*, *h*, are now seen lying in a fissure in the anterior lobes. The optic tracts are seen meeting at their commissure, *i*, interchanging fibres, and passing on as the optic nerves to the orbit. The larger bundles behind, and directed outwards, are the *crura cerebri*, *p*, passing towards the hemispheres, emerging from the transverse mass called the *pons varolii*, *s*, which lies like a clamp between the two halves of the cerebellum, *d*. From the inner side of each crus arises the third nerve, *o*, destined to supply four of the muscles which move the eyeball. The fourth nerve, *q*, comes from the valve of Vieussens, and is seen on its way to supply the superior oblique muscle which turns the eye upwards and outwards, hence called *patheticus*. From each side of the pons the fifth pair, *r*, arises; the sixth, *t*, between the pons and the anterior pyramids of the medulla oblongata; *w* is the eighth, consisting of: 1. The Glosso-pharyngeal, or nerve of deglutition; 2. The Pneumo-gastric distributed to the respiratory apparatus and stomach; and with it, 3. The Spinal Accessory.

## BRAINE-LE-COMTE—BRAINSTONE CORAL.

The chemical composition of B. matter averages in 100 parts—

Water,	75 $\frac{1}{2}$ parts.
Albuminous matter,	7
Fat,	11 $\frac{1}{2}$
Salts (containing 1 $\frac{1}{2}$ of phosphoric acid),	6

The proportion of these constituents varies not only in different species of animals, but also in different members of the same animal group, and appears to be much influenced by the age, temper, and intellectual capabilities of each individual. Thus, the normal quantity of salts in the B. of a healthy man is 6 per cent., and in the B. of an insane patient, only 2 $\frac{1}{2}$  per cent. were found.

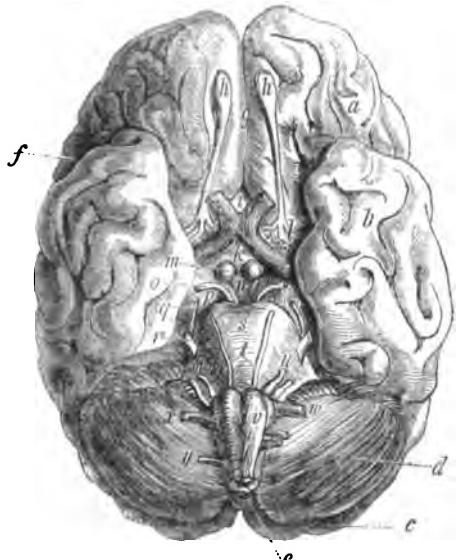

Fig. 5.—Human adult Brain:

a, anterior lobe of cerebrum; b, middle lobe; c, posterior lobe of cerebrum, appearing behind; d, cerebellar hemisphere; e, medulla-oblongata; f, fissure of Sylvius; g, longitudinal fissure; h, olfactory bulb; i, optic commissure—the optic nerves are seen interchanging fibres; l, three roots of olfactory process; m, white round bodies (*corpora albicantia*), the terminations of the anterior portions of fornix; n, where the vessels perforate the brain substance, hence called posterior perforated space; o, third pair of nerves coming to supply muscles of the eyeball, from p, the crus-cerebri; q, fourth nerve, turning round from the valve of Vieussens; r, fifth pair; s, pons varolii; t, sixth pair of nerves; u, seventh pair, portio dura for muscles of face, and portio molle for hearing; v, posterior pyramids of cerebellum, seen to interchange fibres; w, and two below, are eighth pair—viz., glosso-pharyngeal, vagus pneumo-gastric, and spinal accessory nerve; between w and v is the small prominence called olivary body; x, y, two roots of ninth pair of nerves, motor nerve of tongue.

*Softening of the Brain* (*ramollissement*) is a frequent result of chronic inflammation of the brain. The patient has been for some time in low health, troubled with headaches, loss of appetite, depression of spirits, and a gradual loss of memory, and acute perception of things in general. Then a spasm may occur, followed by paralysis, or the legs and arms may be bent up, and remain in that position. This condition of B. may be caused by want of proper nourishment to the cerebral substance, owing to plugging up, or from disease of its arteries. When the softening is caused by inflammation, we frequently find pus forming an abscess of the brain. Induration may also occur as the result of inflammation.—The other diseases, as hydrocephalus, will be treated under their own names.

*Diseases of the Brain.*—*Inflammation* (*acute*) of the B. (*phrenitis*, or popularly, *B.-fever*) rarely occurs separately, and can scarcely be distinguished from inflammation of its membranes (*meningitis*). According to Dr Watson of London, when the disease begins in the latter, the first remarkable symptom is a convulsion fit; when in the B. substance itself, nausea and vomiting generally usher in the attack.

In the first stage, there is rapid pulse, severe headache, the eyes suffused, and their pupils contracted to a small point, very intolerant of light. The patient is constantly watchful, and much annoyed by even ordinary sounds. Then furious delirium sets in, and lasts for a period, varying with the case, generally from twelve to forty-eight hours; when it is succeeded by collapse, in which the patient lies—his face devoid of colour, and covered with cold sweat—in a state of stupor. If roused, he now speaks with slow, indistinct utterance; his pupils are now dilated, and indifferent to the brightest light; and the loudest speaking ceases to annoy him. The stupor increases with the general prostration, and continues till death. After death, we find serous fluid upon and in the B., deposits of lymph, thickening of the membranes, and softening of the B. substance itself.

General and local bleeding, with antimony and digitalis, to subdue the pulse; mercury, to prevent the deposit of lymph; blisters, as counter-irritants, to the back of the head and neck, are the usual remedies for this rare, but terrible disease. The younger school of practitioners, however, as Dr Tanner expresses it, prefer waiting to see if nature unaided, or only *gently guided*, will not carry the patient through a disease where the efforts of art are notoriously futile, and are rather content to *watch the symptoms*, to calm excitement by sedatives, to lessen increased heat of body by diluents and tepid sponging, to prevent accumulations in the intestines by purgatives, and to diminish maniacal delirium by the application of cold to the head.

**BRAINE-LE-COMTE**, a busy town of the province of Hainault, Belgium, about 13 miles north-north-east of Mons. It is an ancient place, and formerly belonged to the monks of St Waudru at Mons, from whom it was bought by Count Baldwin in 1158. It has an old church of the 13th c.; and cotton and corn mills, dye-works, breweries, &c. Some of the finest flax that can be produced is grown in the district. Pop. (1870) about 6400.

**BRAINSTONE CORAL**, the popular name of certain kinds of Coral (q. v.) or Madrepore (q. v.), included in the Linnean genus *Madrepora*, but now forming the much more restricted genus *Meandrina*. They derive their name from the general resemblance to the brain of man or of a quadruped exhibited in their large rounded mass, and numerous winding depressions. Perhaps the true B. C. is *Meandrina cerebriformis*, a species always nearly hemispherical. When the hemispherical mass is broken, the ridges which bound its furrows may be traced inwards through its substance, even to the central nucleus from which they commenced. The mouths of the polypes, in all the species of this genus, are in the furrows or elongated hollows, in which they are ranged side by side, in sinuous series. The brainstone corals are very common in collections, and are much admired for their beauty. They are found chiefly in the seas of warm climates, particularly in the Indian and South Atlantic Oceans. They sometimes attain a large size. Ehrenberg noticed single masses (polypidoms) in the Red Sea, from six to nine feet in diameter. Their rate of growth, however, appears to be slow. The fossil

species are few, and chiefly belong to the oocitic formation.

BRAINTREE, a market-town of Essex, about 40 miles north-east from London. It is an old place, having been constituted a market-town by King John. Its streets are narrow, and many of its houses are of wood. It has manufactures of silk and crape, and also of straw-plait. It is the polling place for North Essex, and has obtained some notoriety in connection with political and ecclesiastical proceedings. Pop. (1871) 4790.

BRAKE, a genus of Ferns of the division *Poly-podæz*, distinguished by spore-cases in marginal lines covered by the reflexed margin of the frond. The COMMON B. or BRACKEN (*P. aquilina*) is very abundant in Britain and in most parts of the continent of Europe, growing in heaths, parks, &c., often covering considerable tracts. It is a widely distributed plant, and is found in many parts of Asia, and in some parts of Africa. It has a long, creeping, black rhizome, or root-stock, from which grow up naked stalks of 8—18 inches in height; each stalk divides at top into three branches;

Common Brake :

a, end of a branch, much reduced; b, end of a pinna, the lower side, shewing fructification.

the branches are bipinnate, the inferior pinnules pinnatifid. The root-stock, when cut across, exhibits an appearance which has been supposed to resemble a spread eagle, whence the specific name *aquilina* (Lat. *aquila*, an eagle). The root-stock is bitter, and has been used as a substitute for hops; it has also been ground, mixed with barley, and made into a wretched bread in times of distress. The plant is astringent and anthelmintic; and as such, it had at one time a high reputation, although it is now little used, at least by medical practitioners. It is employed in dressing kid and chamois leather. The ashes, containing a large quantity of alkali, were formerly used in the manufacture of soap and of glass, so that the collecting of them for sale was a considerable resource of the poor in some parts of the Hebrides. B. is also employed for thatching, for littering cattle, &c., and occasionally chopped up with straw or hay, for feeding cattle. It is a favourite covert of deer and of other game. The abundance of this plant is sometimes regarded as a sign of poor land, although, probably, its absence from the richer soils is very much a result of cultivation. To extirpate it, nothing more is necessary than a few successive mowings of the

young shoots as they appear. The annual growth of B. is killed by the first frosts of autumn, but remains rigid and brown, still affording shelter to game, and almost as characteristic a feature in the landscape of winter as in that of summer, perhaps adding to its general desolation.—*Pteris caudata*, a large species of B. very similar to that of Europe, is one of the worst pests which the farmer has to contend with in the south of Brazil.—*Pteris esculenta*, a native of New Zealand, Van Diemen's Land, &c., has a more nutritious rhizome than the common brake. See TARA FERN.—Rock B. (*Cryptogamma crispa* or *Allosorus crispus*, formerly *Pteris crispa*) is a pretty little fern, common on stony hills in the northern parts of Britain.

BRAMA, a genus of fishes of the family *Chelodontidae* (q. v.). B. *Raii* is common in the Mediterranean, and occasionally found on the British shores. It is one of the fishes to which the name Bream (q. v.) or Sea-bream has been given; and it has also been described as a Gilt-head (q. v.); but these names belong to fishes of other families, with some similarity of general appearance. The genus B. has the body very deep and compressed, the head rather obtusely terminated, a single elongated dorsal fin, and the anal fin with a very lengthened base. The tail is forked, its points extremely divergent. This fish is sometimes more than two feet in length. Its flesh is of exquisite flavour.

BRAMAH, JOSEPH, an eminent practical mechanist, the son of a farmer, was born at Stainborough, Yorkshire, April 13, 1749, and early exhibited an unusual talent for mechanics. Incapacitated in his 16th year from agricultural labours by an accidental lameness, he was apprenticed to a carpenter and joiner, and afterwards obtained employment with a cabinet-maker in London. Subsequently, he established himself in business in the metropolis, and became distinguished for the number, value, and ingenuity of his mechanical inventions, such as safety-locks, improvements in pumps and fire-engines, in the construction of boilers for steam-engines, in the processes of making paper, in the construction of main-pipes, wheel-carriages, the beer-machine used at the bar of public-houses, and many others. About 1800, he constructed the hydrostatic press known by his name. See HYDROSTATIC PRESS. In all, he took out about twenty patents. He died 9th December 1814.

BRAMANTÉ, DONATO LAZZARI, one of the most celebrated Italian architects, and also distinguished as a painter, was born at Monte-Asdroaldo, in the duchy of Urbino, 1444. From 1476 to 1499, he resided in Milan, where he studied geometry and perspective, neither of which sciences was well understood by artists in his day. He was noted as one of the best painters in Lombardy; but his success in architecture eclipsed his fame as a painter. In Milan, he built the choir of Santa-Maria delle Grazie, and the church of Santa-Maria presso San-Satiro. After the fall of Ludovico Sforza, B. went to Rome, where he was first employed by the pope Alexander VI., and afterwards by Julius II. The first great work which he undertook for the latter was to connect the Vatican palace with the two pavilions of the Belvedere by a series of immense galleries; the second was the rebuilding of St Peter's Church, of which he laid the new foundation in 1506. When only a small portion of his plans had been realised, B. died at Rome, 1514, and succeeding architects departed widely from the original design of a grand cupola over a Greek cross. Among other works of B. in Rome may be mentioned the palaces

Cancellaria and Giraud (now Torlonia), in which he adhered more strictly than in other works to antique forms, but not without a characteristic grace in his application of these.

**BRAMBANA'N**, a district of the province of Soorakarta, Java, rich in remains of Brahmanical temples, which are superior in magnificence to any in India. The edifices are composed entirely of hewn stone, and no mortar has been used in their construction. In all, there are 296 temples, disposed in five parallelograms one within the other. The outer one consists of 84 temples; the second, of 76; the third, of 64; the fourth, of 44; and the inner one, of 28. In the centre stands the largest and most imposing structure of all. It is 90 feet high, and profusely decorated with mythological figures, which are executed in a very fair style of art. On the south face of the outside parallelogram, there are two monstrous figures, with uplifted clubs, kneeling in a threatening attitude. The great temple is pretty entire, as are also about a third of the others, but the rest lie strewn upon the ground.

**BRA'MBLE** (*Rubus fruticosus*), a plant common in Britain and most parts of Europe, having prickly stems, which somewhat resemble those of the Raspberry (q. v.). The flowers do not appear till the summer is considerably advanced, and the fruit ripens towards the end of it, continuing to be produced till the frosts of winter set in. The fruit (brambleberry or blackberry) is too well known to need description. Besides affording much enjoyment to children, who collect it from hedges and thickets, it is sometimes offered for sale in towns, and jelly and jam are prepared from it of very delicate flavour, besides a wine, which, both in strength and flavour, is held by many to excel all products of similar native fruits of Britain. The B. is rarely cultivated, perhaps because it is in most districts so abundant in a wild state; but it seems to deserve attention at least as much as the raspberry, and might probably be as much improved by cultivation. A slight rail on each side of a row of brambles, to restrain the straggling stems, affords the necessary security for neatness and order, and the care bestowed is repaid by abundance of fruit,

Bramble.

very acceptable where wild-brambles are not plentiful, and at a season when there is no other small fruit in the garden.—There are many different species of B., according to some—varieties according to other botanists—to which the name is indiscrimi-

306

nately given, and which may almost all be regarded as belonging to the Linnean *Rubus fruticosus*. From this was separated *R. corylifolius* of Smith, a common British plant, and from these some German and British botanists have separated many other alleged species. *R. suberectus* has more the habit of the raspberry than most of the other kinds, but even its claims to be received as a species are not admitted without doubt by some of the most eminent botanists. A variety of B. with white fruit is occasionally met with.—Species of *Rubus* very similar to the common B., or varieties of it, abound in the northern parts of Asia, the Himalaya Mountains, and North America. See RUBUS.

**BRAMBLING, BRAMBLE FINCH, or MOUNTAIN FINCH** (*Fringilla Montifringilla*; see FINCH and FRINGILLIDÆ), a bird nearly allied to the Chaffinch (q. v.). It is a little larger than the chaffinch, which it much resembles in its general appearance, its bill, and even the disposal of its colours. The tail is more forked. In the males, the crown of the head, the cheeks, the back and sides of the neck, and the upper part of the back, are mottled in winter with brown and black; but in spring, the whole of these parts become of a rich velvety black; the throat and breast are of a rich fawn colour, which is also the prevailing colour of the wings, but they are crossed, when closed, by an oblique band of jet-black, and by another oblique band of white. The quill-feathers are also black, edged with yellow on their outer webs; the tail-feathers black, edged with reddish white; the rump and the belly are white; a small tuft of feathers under each wing and some of the lower wing-coverts are bright yellow. The B. is a mere winter visitant in Britain,

Brambling, or Mountain Finch.

and the period of its arrival appears to vary according to the severity or mildness of the weather in the more northerly regions. The B. has never been known to breed in any part of the British islands, and even in the south of Sweden it is a mere winter visitant. It breeds in the more northerly parts of Scandinavia. It has no song, its call-note is a single monotonous chirp. It is a very widely distributed species, being found as far east as Japan, and, in its winter migrations, visiting Italy, Sicily, Malta, Smyrna, &c.

**BRA'MPTON**, a very ancient town in the county of Cumberland, near the Arthing, 8 miles E.N.E. of Carlisle. It is surrounded by hills; and the Castle-hill commands a very extensive view. Pop. (1871) 2617. The chief manufacture is the weaving of checks and ginghams; and there are coal-mines in the vicinity. On a rock, two miles to the south, is a Roman inscription, supposed to have been cut by one of Agricola's legions in 207 A.D. Two miles to the east stands Lanercost Abbey, founded in 1116.

## BRAN—BRANDENBURG.

**BRAN** is the material obtained from the outer covering or husk of grain during the process of grinding, and which is separated from the finer flour before the latter is made into bread (q. v.). It is generally met with in commerce in thin scaly yellowish-brown particles, with sharp edges, and its composition in 100 parts is as follows :

Water,	.	18·1
Albumen (coagulated),	.	19·3
Oil,	.	4·7
Husk, with a little Starch,	.	55·6
Ash or Saline matter,	.	7·8
		100·0

Bread made of flour, containing B., is known as *Brown Bread*. See **BREAD**. The main uses to which B. is put are in the feeding of horses and cattle, and poultry, and in clearing and brightening goods during the processes of Dyeing (q. v.) and Calico-printing (q. v.). In the practice of medicine, B. is employed as a warm poultice in abdominal inflammation, spasms, &c., and an infusion is used as an emollient footbath. It is also used internally in catarrhal affections.

**BRANCH**, in Botany, is a part of a tree or other plant not taking its rise immediately from the root, but rather forming a sort of division of the stem, and which is often divided into secondary branches, again, perhaps, to be further much ramified into *branchlets* and twigs, the ultimate ramifications producing leaves, flowers, and fruit. Branches originate in leaf-buds, which are produced at the *nodes* of the stem, or of the already existing branches. See **BUD**, **PLANT**, and **STEM**. The buds being formed in the axils of leaves, the arrangement of the branches, as alternate, opposite, whorled, &c., varies like that of the leaves, but buds often remain dormant, according to a regular law of alternation. The angles of ramification are very different in different plants, producing great variety of appearance, and giving marked characteristics to different kinds of trees. The great difference between the ramification of the *Conifers* in general (Pines and Firs) and that of other trees must have attracted the attention of every one. In many herbaceous plants whose axis is scarcely developed into a stem, instead of branches there proceed from the lateral buds *runners*, which lie close to the ground, send down roots, and produce new plants, as in the strawberry.

**BRANCHIÆ**. See **GILLS**.

**BRANCHIOPODA** (Gr. gill-footed), an order of *Crustacea* (q. v.) of the division *Entomostraca* (q. v.) deriving this name from the distinctive peculiarity of having the *branchia*, or gills, which are numerous, attached to the feet. They are all small creatures, many of them almost microscopic, and chiefly abound in stagnant fresh waters. Some are popularly known by the name of Water-fleas (q. v.); the Brine-shrimp (q. v.) is another example; and the genera *Cyclops* and *Cypris* may be mentioned, the former on account of its great frequency in stagnant fresh waters, the latter because its hard shells resist decomposition, and are therefore abundant in a fossil state.

**BRA'NCO, RIO**, a river of that portion of Brazil which, originally comprised within the understood limits of Guiana, lies to the north of the Amazon. It rises in the Parime Mountains, on the very borders of Venezuela; and after a southerly course of about 400 miles, it joins, near lat. 1° 20' S., and long. 62° W., the Rio Negro, of which it is the principal tributary, on its way to the Amazon.

**BRA'NCURSINE**. See **ACANTHUS**.

**BRAND**, a name given in some parts of Britain to some of those diseases of plants, especially of

corn-plants, which are also called **BLIGHT**, **BUNT**, **MILDEW**, **RUST**, and **SMUT**.—See these heads.—It is the German name for the disease generally known in Britain as **BUNT**, and sometimes as **Pepperbrand**. Both as a German and an English word, it appears to be derived from the verb *brennen* to burn, and to refer to the burnt appearance which characterises the diseases to which it is applied.—Its most common application in Britain, however, is not to any of the diseases already mentioned, but to a peculiar spotted and burnt appearance often seen on the leaves, and sometimes also on the bark of plants, which does not seem to be in any way connected with the presence of parasitic fungi, but which sometimes becomes so extensive as to cause the death of the plant. The nature of this disease is still somewhat obscure. Occurring most frequently when warm sunshine succeeds to moist weather or to hoar-frost, and frequently affecting plants in hotbeds upon which drops of condensed moisture fall from the frame, it has been ascribed to the concentration of the sun's rays by the drops of water on the leaf or bark—a theory utterly untenable, as no concentration can take place in such circumstances. The probability appears to be, that the action of the moisture unequally distributed, and particularly when sudden changes of temperature take place, deranges the vegetable functions, and destroys the fine tissues. **BRAND**, a mark made on a cask for trade or Excise purposes. See **FISHERIES**, and **TRADE MARKS**.

**BRANDENBURG**, a province of Prussia, in the centre of the kingdom, in lat. 51° 30'—53° 45' N., and long. 11° 13'—16° 8' E. B. has an area of 15,416 sq. m., and a population (1871) of 2,863,461. It formed the nucleus of the Prussian monarchy, but the modern province does not quite correspond with the old *Mark* of B., which included also a part of the province of Saxony and of Pomerania, while it lacked certain small portions of territory now contained in the province of Brandenburg. Almost the whole province is a plain, so low that at Potsdam the surface of the river Havel is only 14·6 Prussian or about 15 English feet above the level of the sea. The ground becomes slightly hilly towards Silesia. In general, the soil is sandy and naturally unfruitful. Without its numerous rivers and canals, B. would be one of the most barren tracts on the continent. The inhabitants are mostly Germans, mixed with French and Dutch colonists, who, however, are almost completely Germanised; and in the south of the province, with people of Wend extraction. With the exception of 55,000 Roman Catholics, and 31,000 Jews, they belong to the Protestant Church. Agriculture and the rearing of cattle afford occupation for a considerable number of the inhabitants. The manufactures are silk, cotton, wool, linen, sugar, leather, paper, metals, &c. There are also numerous distilleries throughout the province. B. is divided into the governments of Potsdam and Frankfurt, which are subdivided into 34 circles. Berlin is the chief town. In the beginning of the Christian era, B. was inhabited by the Suevi, and afterwards by Slavonic tribes. It was subjugated by Charlemagne in 789, but it again acquired independence under his weak successors, and remained free until 928, when Henry I possessed himself of it. After passing through numerous changes in connection with the general history of the German empire—of which we need here mention only the facts that Albert the Bear (q. v.) became the first *Markgraf* of B. in 1142, and Frederick of Nürnberg the first elector in 1417—it became associated with the rise of the Prussian state into a monarchy under Frederick I., Elector of Brandenburg, in 1701. See **PRUSSIA**.

## BRANDENBURG—BRANDY.

BRA'NDENBURG (the ancient *Brennaborch* or *Brennabor*), the town from which the province Brandenburg is named, is situated on the line of the Berlin and Magdeburg Railway, about 37 miles west-south-west of Berlin. The river Havel divides it into two parts, Old and New B., which are both surrounded with walls. On an island in the river there is a third quarter, containing the castle, cathedral, equestrian college, &c. The cathedral has a fine old crypt, and several interesting antiquities. The inhabitants, amounting in 1871 to 25,828, inclusive of the garrison, are engaged in the manufacture of woollen, linen, hosiery, paper, leather, beer, &c. Boat-building is also carried on to a considerable extent.

BRA'NDENBURG, NEW, a walled town in the grand duchy of Mecklenburg-Strelitz, North Germany, is situated near the north end of Lake Tollens, about 50 miles west-north-west of Stettin. It is a beautiful town, with regular, broad, and well-built streets. The grand duke has a palace in the market-place. It has manufactures of woollen, cotton, damask, leather, paper, tobacco, &c., besides corn-mills, oil-works, and a trade in hides and horses, and is altogether a very thriving place. Pop. (1871) 7245.

BRANDING was a mode of punishment practised in England for various offences. It was effected by the application of a hot iron, the end of which had the form which it was desired should be left imprinted on the skin. But B. by such means has long ceased, and now it is practically confined to the case of desertion from the army—the B. or marking being not done by a hot iron, but with ink, or other similar preparation. By the Mutiny Act of 1858, 21 Vict. c. 9, it is enacted by section 35 as follows: ‘On the first, and on every subsequent conviction for desertion, the court-martial, in addition to any other punishment, may order the offender to be marked on the left side, two inches below the arm-pit, with the letter D, such letter not to be less than an inch long, and to be marked upon the skin with some ink or gunpowder, or other preparation, so as to be visible and conspicuous, and not liable to be obliterated.’ Formerly, B. was employed in the case of all *clerical* offences by burning on the hand (see BENEFIT OF CLERGY); and with a view still further to repress theft and petty larceny, the 10 and 11 Will. III. c. 23, s. 6, provided that such offenders as had the benefit of clergy allowed them should be ‘burnt in the most visible part of the left cheek, nearest the nose.’ This additional severity, however, not having the desired deterrent effect, but the reverse, was repealed by the 5 Anne c. 6, which nevertheless provided for offenders being burnt on the hand as formerly. The latter punishment, however, was entirely abolished by an act passed in 1822, the 3 Geo. IV. c. 38. Brawling in church (q. v.) was, by the 5 and 6 Edw. IV. c. 4, made an offence punishable by having one of the ears cut off, or, the offender having no ear, by B. with the letter F on the cheek. This punishment was repealed by the 9 Geo. IV. c. 31. B., therefore, in the case of felonies, has been entirely abolished.

BRANDIS, CHRISTIAN AUG., professor of philosophy in Bonn, was born at Hildeheim, 13th February 1790, his father being J. D. Brandis, one of the most distinguished physicians of his time. Having studied philology and philosophy at Kiel and Göttingen, he began lecturing in the university of Copenhagen, from which he removed to Berlin (1816). Here he was soon called upon to take part in the preparations for the great critical edition of the works of Aristotle, contemplated by the Berlin Academy of Science, 4 vols.

306

(Berlin, 1831–1836); and with this object, spent several years, along with Immanuel Bekker (q. v.), in exploring the chief libraries of Europe. In 1821, he resumed his academic career in the university of Bonn, where he edited Aristotle's *Metaphysica* (vol. i., Berl. 1823), *Scholia in Aristotelem* (Berl. 1836), and *Scholia Graeca in A. Metaphysicum* (Berl. 1837). He accepted, in 1837, a call from the young king of Greece, and spent several years in that country as cabinet counsellor. As a result, we have his *Mittheilungen über Griechenland, Communications on Greece* (3 vols., Leip. 1842). Other works of his are—*Handbuch der Geschichte der Griech.-Röm. Philosophie* (3 vols., Berlin, 1835–1836), and *Geschichte der Entwickelungen der Griech. Philosophie und ihre Nachwirkungen im röm. Reiche* (Berlin, 1862–1864). He died July 24, 1867.

BRANDLING. See PAR. and SALMON.

BRA'NDON, a town on both sides of the Little Ouse or Brandon River, where it separates Norfolk from Suffolk, 78 miles north-north-east from London by road. Pop. (1871) 2116. It has a considerable corn-trade. Great rabbit-warrens occur near Brandon. There was formerly an extensive manufactory of gun-flints here, the army being exclusively supplied with these articles from B. before the introduction of percussion-caps.

BRANDT, SEBASTIAN, the author of a very popular German book, the *Narrenschif*, or Ship of Fools, was born at Strasburg, 1458; studied law and the classics with zeal at Basel, where he received permission to teach; and soon became one of the most influential lecturers in that city. The Emperor Maximilian shewed his regard for B. by appointing him an imperial councillor. He died at Strasburg in 1521. His Ship of Fools, a satire on the follies and vices of his times, which was published at Basel, 1494, is not very poetical, but is full of sound sense and good moral teaching, and was so much esteemed that the German popular preacher Geiler occasionally took his texts from it. It was translated into Latin by Locher (1497); and into English by Henry Watson, *The Grete Shyppe of Fodes of the Worlde* (1517); partly translated and partly imitated by Alexander Barclay, *The Shyp of Fodes of the Worlde* (1508); and imitated by W. H. Ireland in the *Modern Ship of Fools* (1807). It has also appeared in French, and indeed in almost all European languages.

BRANDY (Ger. *Brannwein*, Fr. *eau de vie*) is a term sometimes applied generically to all kinds of ardent spirits, but usually restricted to the liquid obtained by distilling the fermented juice of the grape. See DISTILLATION. The fermented liquors or wines which are employed for that purpose are various, and contain a proportion of alcohol (q. v.), which runs from 10 to 25 per cent. of their weight. The red wines generally are preferred, as containing most alcohol; but though they yield a larger amount of B. than the white wines, yet the latter afford a spirit which possesses a finer flavour and more agreeable taste. 1000 gallons of wine give by distillation from 100 to 150 gallons of B., which varies in strength, but is commercially judged of according to the quantity of *eau de vie* or B. à *preuve de Holland* which it contains, and is generally diluted with water till it contains from 50 to 54 per cent. by weight of absolute alcohol. When originally distilled, B. is clear and colourless, and if wished to remain so, is received and kept in glass vessels; but when placed in wooden casks, the spirit dissolves out the colouring-matter of the wood, and acquires a light sherry tint, which is deepened by burnt sugar and other colouring-matter, intentionally added by the dealers. The pleasant aroma of

## BRANDYWINE CREEK—BRANK.

B. is due to the presence of more or less of fusel oil (q. v.) accompanied by camphoric ether (q. v.). The most famous B. is that distilled in Cognac, a district in the west of France, from the choicest wines, but comparatively little of that sold under the name of *Cognac* comes from this district. A second-class B. is obtained from the red wines of Portugal, Spain, &c., as also from the refuse (*marc*) of the grapes left in the winepress, the scrapings of wine-cacks and vats, the deposits in wine-bottles, &c.; and very much of the B. sold in Great Britain and Ireland is prepared at home from ordinary grain alcohol, by adding thereto argol (q. v.), bruised French plums, some French wine-vinegar, a little good Cognac, and redistilling, when the spirit which passes over may be coloured with burnt sugar, or by being kept in an empty sherry cask. Occasionally, grains of paradise and other acrid matters are added, to give the B. a fictitious strength; and catechu or oak-bark, to give it an astringent taste. B. is the form in which alcohol is administered medicinally either internally or externally. It is distinguished from other ardent spirits by its light, cordial, and stomachic properties, and especially when set fire to for a minute or two, forming what is known as *Burnt B.*, it is valuable as a household remedy for diarrhoea. B. is administered internally (1), in *mild cases of diarrhoea*, unaccompanied by inflammation, but attended with griping pain, and the addition of nutmeg is productive of good; (2), as a *powerful excitant* for restoring patients who are suffering from suspended animation, and to relieve those who are labouring under fainting symptoms during an operation in surgery; (3), as a *stimulant and restorative*, where patients are much depressed in the ultimate stages of fever; and (4), as a *general stomachic stimulant* in indigestion after taking food, in the relief of flatulency and spasms of the stomach, and to check vomiting, especially in sea-sickness. Externally, B. is employed (1), in healing sores, and in stopping hemorrhage or the oozing out of blood from bruised or injured parts, and is generally applied by soaking linen or cotton with it, and laying the cloth on the part; and (2), in hardening the skin or cuticle over tender parts, the soles of feet which have been blistered, and the nipples of females for several days before delivery. The action of B. externally appears to be strictly chemical, as it coagulates the albumen of blood, and otherwise tends to render more solid all flesh tissue.

The duty on B. imported into Great Britain, which from 1814 had been as high as 22s. 10d. a gallon, was reduced in 1846 to 15s., and in 1860 to 8s. 2d., but was soon afterwards raised to 10s. 5d. The consumption in the United Kingdom from 1822 to 1862 averaged about 1,400,000 gallons. From 1862 to 1872, it averaged 4,600,000 gallons.

**BRANDYWINE CREEK**, a stream of 36 miles in length, rising in Pennsylvania, and flowing through Delaware. In the latter state, it enters Christians Creek, about 2 miles above its confluence with the Delaware River, and immediately below Wilmington, a port of entry. It possesses a historical interest in connection with the War of Independence—a battle, in which the British had the advantage, having been fought on its banks in September 1777.

**BRANK**, or **BRANKS**, an instrument formerly used for the punishment of scolds in England and Scotland, and often in the former country called ‘the scold’s bridle.’ It seems to have come in place of the ducking-stool orucking-stool (q. v.). ‘I look upon it,’ says Dr Plot in his *Natural History*

of *Staffordshire*, published in 1686, ‘as much to be preferred to the ducking-stool, which not only endangers the health of the party, but also gives the tongue liberty betwixt every dip: to neither of which is this at all liable; it being such a bridle for the tongue as not only quite deprives them of speech, but brings shame to the transgression, and humility thereupon, before it is taken off.’ The B., in its simplest form, is a hoop of iron, opening by hinges at the sides, so as to enclose the head, and fastened by a staple with a padlock at the back; a plate within the front of the hoop projecting inwards, so as to fit into the mouth of the culprit, and by pressing upon the tongue, be an effectual gag. There must have been difficulty in keeping such a hoop in its place; and so it received the addition of a curved band of iron, having a triangular opening for the nose, passing over the forehead, and so clasping the crown of the head that escape from it was scarcely possible. This may be regarded as the second form of the brank. In the third form, the curved band was hinged in the middle, and passing over the whole head, was locked into the staple at the back of the hoop. The next addition seems to have been a second band crossing the first at right angles, so as to clasp the sides of the head, and keep the B. still more firmly in its place. In its last most complicated shape, the B., by the multiplication of its hoops and bands, took the form of a conical cage or lantern, with a door behind opening by a hinge and fastened by a staple, the front being fashioned into a rude mask, with holes for mouth, nose, and eyes. In one instance, the mask quite covers the face, the iron plate being hammered out to fit the nose, with apertures for the nostrils and the eyes, a long hollow conical peak, perforated with holes, being affixed before the mouth. The way in which the punishment of the B. was inflicted, may be described in the words of an eye-witness, reported by a country gentleman of Northumberland, Ralph Gardiner of Chriton, in a work,

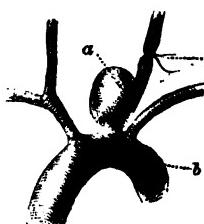

Branks.

called *England’s Grievance Discovered in Relation to the Coal Trade*, published in 1665, and dedicated to Cromwell: ‘John Willis of Ipswich, upon his oath, said that he was in Newcastle six months ago, and there he saw one Anne Bidlestone drove through the streets by an officer of the same corporation holding a rope in his hand, the other end fastened to an engine called the branks, which is like a crown, it being of iron, which was muzzled over the head and face, with a great gap or tongue of iron forced into her mouth, which forced the blood out; and that is the punishment which the magistrates do inflict upon chiding and scolding women, and that he hath often seen the like done to others.’ When the B. first came into use is unknown. It is found at Edinburgh in 1567, at Glasgow in 1574, at Stirling in 1600, and at Macclesfield, in Cheshire, in 1623. One B. in the church of Walton-on-Thames, in Surrey, has the date of 1633. In another, called ‘the witches’ bridle of Forfar,’ dated in 1661, the gag for the mouth is not a flat plate, but a long piece of iron with three sharp spikes. Of two examples in private custody in England, one has the date of 1688, the other the crowned cipher of King William III. The B. was used at Langholm, in Dumfrieshire, in 1772: it was used still more recently at Manchester and at

Macclesfield; and in the *Archaeological Journal* for 1856, it is stated that 'at Bolton-le-Moors, in Lancashire, the iron bridle was still in use, not many years since, for the correction of immorality: it was fixed in the female's mouth, and tied at the back of the head with ribands, and thus attired, the offender was paraded from the cross to the church steps, and back again.' Examples of the B. may be seen in the Ashmolean Museum at Oxford, in the National Museum of the Antiquaries of Scotland at Edinburgh, in the county hall at Forfar, in the Guildhall at Lichfield, in the town hall at Macclesfield, in the parish church of Walton in Surrey, and in St Mary's Church at St Andrews in Fife.—Brank was at one time a common name in Scotland for any sort of bridle. The word is supposed to be derived from the Teutonic *pranghe*, a bridle. In the Dutch Netherlands, the pillory was called *pranghe*, from the yoke or collar in which the neck of the culprit is held. An instrument resembling the B., in its simplest form, is said to have been in use among the Spaniards in the West Indies for the punishment of refractory slaves.

**BRANTOME, PIERRE DE BOURDEILLES, SKINNEUR DE**, was born at Perigord, in Gascony, about 1527. He travelled in several countries in the capacity of chamberlain to Charles IX. and Henry III.; fought against the Huguenots (1562), in Barbary (1564), and went in 1566 to Malta, to fight against the Turks. After his return to the court of France, he retired into private life, and wrote his *Mémoires*, full of self-praise but very interesting, as they afford a lively portraiture of the manners and morality of his times, the women, in particular, being very severely handled. The style is charmingly piquant, full of ingenious turns of expression, sudden sallies of wit, occasional flashes of eloquence, and withal so naïvely simple, that if the author cannot on account of the abundance of his gossip be reckoned a grave historian, he must needs be considered a most fascinating chronicler. B. died July 15, 1614. His complete works were published at the Hague (10 vols. 1740), and were republished by Buchon in the *Panthéon Littéraire* (2 vols., Paris, 1837).

**BRASDOR'S OPERATION.** It is stated in the article ANEURISM, that a cure is effected in that disease by successive layers of the fibrine of the blood being deposited in the aneurismal sac, and

Brasdor's Operation.  
a, aneurismal sac; b, arch  
of aorta; c, artery, tied.

sure, without any cutting operation, as was shewn by Mr Edwards of Edinburgh, who succeeded in obliterating aneurisms at the root of the neck by pressure applied to the arteries beyond the tumour.

**BRA'SENOSE**, one of the colleges of Oxford University, sometimes called King's Hall and College of Brasenose, was founded in the year 1509, by the joint benefaction of William Smith, Bishop

of Lincoln, at one time Chancellor of the University, and Sir Richard Sutton, Knight of Prestbury, in Cheshire. The original foundation was for a principal and twelve fellows. Eight fellowships were afterwards added by various benefactors, from 1522 to 1586. This college is also very rich in scholarships and exhibitions; more particularly the Hulme exhibitions, 15 in number, of value £135 per annum each, besides £20 to be spent in books, to be approved of by the principal. The statutes of this college, which were issued in 1520, three years after the publication of Luther's theses, seem to have been framed by a person warmly attached to the Roman Catholic faith. They enjoin devotional exercises of a peculiarly popish character, such as repeating five times each day the Lord's Prayer in honour of the five wounds of the crucifixion, of the angelic salutation in honour of the five joys of the blessed virgin, &c. These devotions were in some cases enforced by fines and whipping. The origin of the name of the college is obscure. Legends say that it was originally 'Brewing-house,' which became corrupted into the present appellation; but Anthony Wood tells us that the college was 'near finished out of the ruins of several hostels, the chief of which was Brasenose Hall, so called, without doubt, from such a sign, which was in ancient time over its door, as other halls also had, viz. Hawk or Hieron Hall, Elephant, Swan, or Bull Hall.' The former theory is supported by the fact, that B. has always been celebrated for the excellence of its beer; the latter is borne witness to by a nose in brass, curiously fashioned, which is now conspicuous over the great gateway. Till lately, all the fellowships were confined to natives of certain counties. The senior fellowships, owing to the appropriations of fines to the seniors, were very valuable, about £500 per annum; while the junior fellowships were about £80. By the commissioners appointed under 17 and 18 Vict. c. 81, many important alterations have been introduced. Five out of the twenty fellowships have been suppressed, one being elevated to the endowment of a professorship, the remaining four to the establishment of additional scholarships. All the remaining fellowships have been thrown open. The senior fellowships have been limited to £300 per annum; the junior raised to £150. Various oaths, previously taken by the fellows, committing them to statements which were untrue, and binding them to duties impossible to be performed, have been by the same authority abolished. B. presents to 33 benefices, besides 29 pieces of preferment vested in the trustees of the Hulme exhibitions, for behoof of the exhibitioners. Though considered what is commonly called a 'good college,' B. has never attained much distinction in the 'schools.' In all probability this has been owing to the restrictions subject to which its endowments were so long administered. The number of names on the books, in 1873, was about 500, the number of resident undergraduates probably about 100.

**BRASH.** See PYROSIS.

**BRASH, SHIVERS, BLAZE, and RUBBLE,** are names given in different districts to layers of broken and angular fragments of rock. They occasionally form the basement bed of alluvial deposits. At Canonmills, and other places near Edinburgh, the boulder-clay rests on a bed of shivers composed of fragments of the subjacent bituminous shale.

**BRASIDAS**, the bravest and most energetic Spartan general in the earlier years of the Peloponnesian war. Having distinguished himself (a. c. 431)

by the courage with which he relieved the town of Methone from a hostile attack, he was made one of the chief-magistrates of Sparta. In 424 he relieved Megara; and in his expedition to Macedonia, in the same year, to aid the states which had thrown off their allegiance to Athens, he was completely successful. In 422, B., who could obtain no reinforcements from Sparta, had to encounter with his helots and mercenaries the flower of the Athenian army under Cleon. A battle took place at Amphipolis, in which both Cleon and B. were killed, but the army of the former was completely beaten. He was buried at Amphipolis, within the walls, and for long after his death his memory was honoured as that of a hero, by the celebration of yearly sacrifices and games. The Greek writers speak highly of Brasidas. Thucydides notices his eloquence, unusual in a Spartan, his justice, liberality, and wisdom, while Plato compares him to Achilles; but circumstances are not wanting to shew that he was as much endowed with Spartan duplicity as with Spartan courage.

**BRASS** is an alloy of copper and zinc, largely used for household furnishings, certain parts of machinery, and other ornamental and useful articles. Technically, the term B. is extended so as to include compounds of copper and tin, as in *brass-ordnance*, the *brasses* or bearings of machinery, &c.; but such alloys of copper and tin, though styled *hard* B., are more strictly varieties of **Bronze** (q. v.), and the present notice will be confined to the alloys of copper and zinc, or *yellow brass*. In ancient history, biblical and profane, frequent allusions are made to the employment of B. in the construction of musical instruments, vessels, implements, ornaments, and even gates; but as no mention is made of its mode of manufacture, or even of its composition, it is doubtful if the B. of the ancients was composed of copper and zinc. In the manufacture of B. on the large scale, two parts by weight of copper to one part of zinc are used, the zinc being one-half the weight of the copper; but alloys are made for particular purposes with less or greater proportions of zinc. Thus, where a material of more than ordinary tenacity is required, the zinc is reduced to one-fourth the weight of the copper; and where an alloy of a hard and brittle nature, possessing little resisting power, is wished for, the zinc is increased to an amount equal with the copper, or greater. In the manufacture of B., either of two processes may be followed. The direct method is to fuse the zinc in a crucible, and gradually add the copper in pieces. But this process is attended with disadvantage, owing to the volatile and oxidisable nature of zinc. The indirect method of forming B. is that which is generally followed in England and elsewhere, and consists in heating in crucibles or pots a mixture of calamine (carbonate of zinc,  $ZnCO_3$ ), charcoal, and thin pieces of scrap or grain copper. The calamine (q. v.) is generally first calcined or roasted, so as to expel any traces of sulphur, then mixed with one-fourth of its weight of charcoal, and this mixture introduced into the crucible, after which the metallic copper is diffused through the mixture by being beaten in with hammers or mallets. The proportions employed are 3 parts of the mixture of calamine and charcoal to 2 parts of copper; and when introduced into a furnace, and subjected for 5 to 24 hours to the action of a white heat, the charcoal reduces the calamine and separates the zinc, which, combining with the copper, forms 3 parts of B., containing about 2 of copper to 1 of zinc.

For ordinary purposes, B. is first cast into plates of about 100 lbs. weight, and  $\frac{1}{2}$  to  $\frac{1}{4}$  inch thick, which can be readily broken up, remelted, and cast

in a mould of any desirable shape or size. The crude casting so obtained is generally screwed to a turning-lathe, and turned and bored into the required form with iron tools. B. is very largely employed in the construction of door-handles, window-shutter knobs, &c.; and since the introduction of gas, though the brazen candlesticks have almost ceased to exist in towns, yet the immense number of stop-cocks, and brass-pendants and brackets required, has given a considerable impetus to the brass manufacture. The proportion of copper and zinc in the alloys resembling B., and which are known as *gilding metal*, *Mannheim gold*, *pinchbeck*, *bath metal*, *Bristol brass*, *Muntz sheathing metal*, *spelter solder*, and *Mosaic gold*, have already been noticed under **ALLOY** (q. v.).

**BRA'SSARTS**, the name of the pieces which, in plate-armour, protected the upper part of the arms, and united the shoulder and elbow pieces. *Brachiale* was the ancient name for brassarts. When the front of the arm only was shielded, the pieces were called *demi-brassarts*.

**BRASSES** (*sepulchral*), large plates of brass, or of the mixed metal called *latten* or *laton*, inlaid on slabs of stone, and usually forming part of the pavement of a church. The figure of the person intended to be commemorated was generally represented either by the form of the brass itself, or by lines engraved on it. Such, however, was not always the case, an ornamented or foliated cross, with other sacred emblems, being frequently substituted for the figure. Nor was the practice of imbedding them in the pavement uniform, as we sometimes find them elevated on what were called *altar-tombs*. It has been ascertained that the incised lines on these B. were originally filled up with some black resinous substance, and that in the case of armorial decorations, and the like, the field or background was often cut out by the chisel, and filled up with some species of coarse enamel, by which means the appropriate tinctures were produced. In England, the brass was usually of the form of the figure, the polished slab forming the ground, and the ornaments, arms, inscription, &c., were also inserted each as a separate piece. On the continent, where the metal was more abundant, the B. were one long unbroken surface, formed of plates soldered together, on which were engraved all the objects represented, the portions of the plate not so occupied being ornamented by elaborate flower-work. B. are known to have been used for monumental purposes from a very early period, though there are no existing traces of them in England previous to the middle of the 13th century. There is reason to think, that if not imported from France, they were at first executed by French artists. Latterly, the art took root in England, and English B., like English architecture, acquired a distinctive national character. The oldest complete specimen in England is that on the monument of Sir John d'Anbernoun, at Stoke Daberton. The knight died in 1277, and it is probable that the brass was executed shortly after that date. Next in antiquity are those of Sir Roger de Trumpington, who died in 1289, and of Sir Richard de Busingthorpe, 1290; the former at Trumpington in Cambridgeshire, the latter at Busingthorpe in Lincolnshire. In addition to the interest which they possess from their age, these B. are remarkable as being still unsurpassed in the beauty of the workmanship and the spirit of the design. As regards the earliest English B., it is further worthy of note that they are so similar, both in design and execution, as to lead to the conjecture that they are the work of one artist; whilst from their differing in many respects from the B. which were executed

on the continent at the same period, it would seem that this artist, if not an Englishman, at all events worked exclusively in this country. In the following century (1325), on the brass of Sir John de Creke, at Westley Waterless, in Cambridgeshire, the artist's

Inlaid brass Monument of Eleanor Bohun, Duchess of Gloucester. About 1400.

mark is affixed by a stamp—a fact which has been regarded as a proof that his craft had attained to some importance, and that his services were pretty frequently called into requisition. But in this case, as in every other, with one exception, the name of the artist has perished. The exceptional case is that of the brass which once covered the tomb of Bishop Philip, in the church of the Jacobins at Evreux, in Normandy, where the inscription ended with the words, 'Guillaume de Plalli me fecit.' Many of the B. executed in England in the 14th c. are probably Flemish; and in the churches at Bruges some exist which appear to be by the same hand with others which are found in England. There can be little question, indeed, that for this, as for most of the other departments of the arts, which were afterwards successfully cultivated in England, we were indebted to continental artists. Nor will it surprise those who know the results of recent archaeological investigations in similar subjects, to learn that the artists of France and Flanders in their turn were debtors to those of the worn-out empire of the East. As in painting, sculpture, and architecture itself, so in the art of working in brass, the sparks of antique genius which smouldered in Byzantium were the means of kindling those

which afterwards burned so brightly in modern Europe. The taste for lingering

Among the knightly brasses of the graves, And by the cold *hic-jacets* of the dead, has grown to something like a passion of late, and there are few subjects which have been more carefully illustrated than that of sepulchral brasses. References to most of the leading works, too numerous to be mentioned here, will be found in Parker's *Glossary of Architecture*, in an article in which their results have been carefully condensed. Of modern B., the most remarkable is that in the Cathedral at Cologne, engraved in 1837, as a monument to the late archbishop.

**BRASSICA**, a genus of plants of the natural order *Cruciferae* (q. v.), distinguished by a round and tapering 2-valved pod (*silique*), of which the valves have each only one straight dorsal rib and no lateral veins, the seeds globose, in one row in each valve, and the cotyledons (q. v.) conduplicate (folded laterally). The species are chiefly natives of the temperate and colder regions of the old world; several are British plants. A number of species are very extensively cultivated, both in fields and gardens, and are of great importance in an economical point of view, particularly the **CABBAGE** (q. v.), of which Kale, Borecole, Colewort, and different kinds of Greens, Savoy, Cauliflower, Broccoli, Brussels Sprouts, and Kohl Rabi are varieties; **TURNIP** (q. v.); **RAPE** (q. v.) (*Colza*, Cole-seed) and **NAVVEW** (q. v.). Among the British species is one, called Isle of Man Cabbage, or Wallflower Cabbage (*B. monensis*), which differs from all these, and in some measure departs from the strict generic character, in having the valves of the pod 3-nerved, and one or two seeds in its beak. It has deeply pinnatifid leaves. It is found on the sandy shores of the west of Scotland, the Isle of Man, the north of Ireland, &c. Sheep and oxen are very fond of it, and it has been suggested that it might be profitably cultivated for feeding cattle. Its peculiar adaptation to sandy soils ought to recommend it to attention.

**BRAUN**, AUG. EMIL, an eminent archeologist, was born 19th of April 1809, at Gotha, in Germany. He studied at Göttingen and Munich, where he made the friendship of his teachers, Schelling and Gerhard; with the latter of these he went to Rome in 1833, and in a short time was made librarian, and subsequently secretary, to the Archaeological Institute. He died at Rome, on the 12th September 1856. B. wrote many valuable works on art in German, Italian, and even English. Among these may be mentioned, *Il Giudizio di Paride* (Paris, 1838), *Kunstvorstellungen des geflügelten Dionysos* (Munich, 1839), *Griechisch Mythologie* (Hamburg and Gotha, 1850), *Griechische Götterlehre* (Gotha, 1851–1855), *Vorrede der Kunstdiyalogie* (Gotha, 1854, with 100 copperplate engravings), translated into English by Mr Grant; and an admirable guide-book, *Die Ruinen und Museen Romae* (Brunswick, 1854), translated into English, 1855. B. also executed numerous electrotype copies of ancient works of art.

**BRAUNSBERG**, a walled town of East Prussia, in the government of Königsberg, about 35 miles south-west of the city of that name. It is situated on the Passarge, which divides the town into two parts; and has manufactures of woollen and linen, and a considerable trade in yarn, grain, ship-timber, &c. Pop. (1871) 10,471.

**BRAUWER**, or **BROUWER**, ADRIAN, a painter of the Flemish school, was born at Oudenarde (or as others say, at Haarlem) in 1608. He was apprenticed to the well-known artist Franz Hals, who made profitable use of his pupil's great talents;

keeping him in a garret like a prisoner, and making him work almost night and day, in painting small pictures, which Hals sold at very good prices. By the advice of a fellow-pupil, Adrian Van Ostade, young B. ran away from his hard taskmaster, and going to Amsterdam found, to his own astonishment, himself famous as a painter. He now worked for himself, and might soon have made a fortune; but his intemperance was so extreme, that, it is said, he would never apply himself to painting, while he could have credit or be supplied with liquor at a tavern. During the war in the Netherlands he went to Antwerp, where he was seized as a spy, and taken to the citadel. Here, to prove himself a painter, he executed a sketch of the guards who had him in their custody. This picture was shewn to Rubens, who immediately exclaimed: 'That is the work of Brauwer! no other artist could treat the subject in that style.' B. was liberated through the interposition of Rubens, who gave him a lodging, supplied him with clothing and food, and in every way acted as a generous friend. But the sole return for all this kindness was, that B. secretly fled from the house of his patron, in order to renew his career of low dissipation. After visiting Paris, and failing to find work, he returned to Antwerp, where he died in the hospital (1640), and was interred, at the cost of Rubens, in the Carmelites' Church. All B.'s paintings are marked by power and harmony of colouring, and clearness of chiaroscuro. They are pervaded by a jovial humour, and betray the favourite haunts and associations of the painter.

**BRAVI**, were those individuals in Italy, but especially in Venice, who undertook to perform any dangerous deeds for money. It is now employed chiefly to designate hired assassins. The Italians also gave the name of B. to those fanatics in the Turkish army, who, after maddening themselves by opium, rushed upon the ranks of the enemy, and so met death.

**BRAVO**, 'Excellent!' 'Well done!' an Italian exclamation of praise, the superlative form of which is *Bравissimo!* It is commonly used in England without distinction of number or gender; but the Italians say *bravo!* to a male singer or actor, *brava!* to a lady, and *bravi!* to a company of actors or singers.

**BRAVO DEL NORTE**, or **RIO GRANDE**, the largest river in the Gulf of Mexico next to the Mississippi. It is politically important, as being throughout its whole course the boundary between Texas and Mexico; while physically its mouth may perhaps be regarded as that point on the coast where Central America, in its geographical aspect, begins to taper itself off towards the south. It rises in the Rocky Mountains, near lat. 38° N., and long. 106° 30' W.; and after a course of 1800 miles in a generally south-east direction, it enters the sea near lat. 25° N., and long. 97° W. The commercial value of the river is not great, for, besides being for the most part very shallow, it is here and there beset by rapids and sand-bars. Small steamers, however, have got up as far as Kingsbury's Rapids, about one-fourth of the entire length of the stream.

**BRAVOURA**, an Italian word, in music applied to a composition as well as style of performance. As a composition, the B. is an air or song, with many difficult passages and divisions of notes, requiring great spirit and volubility of execution. The intention of merely astonishing by execution has brought this species of composition into undeserved discredit. The B. style first came from the Neapolitan school. Rossini, Bellini, &c., united the B. with the cantabile style; and instead of leaving

the embellishments to the taste of the singer, wrote the whole of the notes in the music. The compositions of Mozart, Beethoven, &c., give abundant proofs of how they united true artistic merit with the B. style.

**BRAWLING IN CHURCHES**, in the law of England, is an offence against the public peace. This offence may generally be described as quarrelling or creating a disturbance in a church; therefore, mere quarrelsome words, which are neither an affray nor an offence in any other place, are penal here. It was enacted by 5 and 6 Edw. VI. c. 4, s. 3, that if any person shall, by words only, quarrel, chide, or brawl in a church or churchyard, the ordinary shall suspend him, if a layman, *ab ingressu ecclesie* (from entering the church); and if a clerk in orders, from the ministration of his office during pleasure. And if any person in such church or churchyard proceed to smite or lay violent hands upon another, he shall be excommunicated *ipso facto*; or if he strike him with a weapon, or draw any weapon with intent to strike, he shall, besides excommunication, have one of his ears cut off, or having no ears, be branded with the letter 'F' in his cheek. But this portion of the act was repealed by the 9 Geo. IV. c. 31, s. 1. Other regulations respecting the disturbance of a congregation, or molestation of a clergyman during the celebration of divine service, will be found in the 1 Mary, c. 3, passed in the year 1553, which, although of Roman Catholic origin and application, is still held to be the law for the protection of the Protestant Established Church. It enacts (section 2) that if any person or persons shall willingly and of purpose, by overt word or deed, molest or disquiet any preacher . . . . in any sermon, preaching, or collation, that he shall make in any church, chapel, churchyard, or in any other place or places, used or appointed to be preached in; or (section 3) if any person or persons shall molest a priest preparing or celebrating mass, 'or other such divine service, sacraments, or sacramentals as was most commonly frequented and used in the last year of the reign of the late sovereign lord, King Henry VIII., or that at any time hereafter shall be allowed, set forth, or authorised by the queen's majesty; or shall abuse the blessed sacrament—such person or persons shall be liable to be committed to gaol, there to remain without bail or mainprize for the space of three months then next ensuing; and further, to the next quarter-sessions, at which the persons so offending shall only be delivered and discharged out of prison upon sufficient sureties for their good behaviour during one whole year. The act contains other regulations for the protection of the ministrations of the church, and it saves the jurisdiction of the ecclesiastical law.

By another act, 1 Will. and Mary, c. 18, s. 18, passed in 1688, it is provided that if any person or persons shall disquiet or disturb any cathedral or parish church, chapel, or other congregation, or misuse any preacher or teacher, such person or persons may be committed to prison, and on conviction, be fined £20.

It remains to be added, that reviling church ordinances subjects to fine and imprisonment—and profaning the Christian religion, and depraving the Book of Common Prayer, are also subjects of penal legislation. See on this subject 1 Eliz. c. 2, and the 9 and 10 Will. III. c. 32. See also articles on **BLASPHEMY** and **RELIGION, OFFENCES AGAINST**, in which latter the Scotch law on the subject of this article will be found stated.

**BAWN**, a preparation of meat made from the head and belly-piece of a young pig, with the addition

of ox-feet, to render it gelatinous. The whole is rolled up tight in sheet-tin, and boiled for four or five hours. The moisture is then well pressed out of it, and having been allowed to stand for some ten or twelve hours, the meat is put into cold salt and water, and is then fit for use. It seems to have been a well-known dish as early at least as the latter part of the 15th c., for in Tyndale's version of the Book of Common Prayer, revised by Cranmer, and still in use, in the 70th verse of the 119th psalm, we find the words: 'Their heart is as fat as *brawn*.' The B. of Wiltshire is celebrated, and it is also a famous dish in Canterbury.

**BRAXY, BRAKES, BRAXIT, BRACKS.** These words are given as synonymous in Jamieson's *Dictionary*, indicating a disease in sheep. In the dialect of Anglia, it is called braik and bracks. The derivation of the word is uncertain. The vague way in which the term braxy is used, renders it difficult to define the disease, for in different parts of the country, totally different disorders are included under this head. Of the two most generally recognised as braxy, the one is an intestinal affection attended with obstinate diarrhoea, the other is a blood disease, and the result of plethora or fulness of blood. The first will be considered under the head DIARRHOEA; but the second, which is spoken of by the better informed shepherds as the true braxy, may be described here.

**Cause.**—A very lean flock of sheep placed on rich food is very apt to be decimated by braxy. By rich food is meant more particularly those substances containing an abundance of nitrogenous principles, such as luxuriant heather, strong and succulent grass, the best turnips, &c. Hilly land is favourable to the production of braxy, from the firm nature and nutritive qualities of food growing on it. We find the disease in such situations in the winter season. About the month of November, many of the well-fed hoggs placed on turnips die suddenly from braxy; and, again, when farmers resort to the forcing-system towards spring, the mortality is great, particularly when, in addition to much artificial food, sheep are allowed rich pasture. The mortality is greatest at the period of full moon, from the sheep grazing during the light nights as well as by day. The shepherd very frequently at these times finds one or two dead in the morning. Some assert that, in the winter, exposure induces braxy; and it is very possible that it may be produced by any sudden check to the exhalations, which tend so much to maintain the balance of the functions and purify the blood.

**Symptoms.**—The animal, in full health, suddenly ceases to eat, has a staring look, is peculiarly excitable, and separates itself from the flock. The head is lifted high, the breathing becomes laboured, the countenance appears anxious, and the animal loses the power of its limbs. It totters, falls over, is seized with convulsions, and dies within five or six hours, and often within an hour from the first symptoms of the disease.

**Cadaveric appearance.**—If the sheep's throat is cut before it breathes its last, the absence of any peculiar appearances within the body is very remarkable: the flesh appears of a dark-red colour, and the veins are charged with dark blood, but, on the whole, the body of the sheep looks so well that the mountain-shepherd cuts it up to make 'braxy mutton.' If the sheep is allowed to die of itself, the body soon swells, putrefies, and is rendered useless.

**Treatment.**—The prevention of the disease alone affords hope, and it consists in regulating the animal's diet, to prevent sudden transitions from low to rich keep; to mix food so as to modify the

action of the more highly nitrogenised kinds; and to check the development of plethora or fulness of blood by saline purgatives and diuretics, such as Epsom and Glauber salts or nitre. The principles to be followed out in preventing this disease are precisely similar to those referred to under the head BLACK QUARTER in cattle. Shelter during severe winter weather is insisted on by shepherds as essential to prevent the malady.

**Braxy mutton**, above alluded to, is, as a general rule, not unwholesome; though in warm climates the same disease in sheep assumes a very malignant type, and indeed constitutes one of the carbuncular diseases. Though the flesh can be eaten with impunity in the mountains of Scotland, it is most dangerous and condemned in Southern Europe.

**BRAYERA.** See CUSCO.

**BRAZI'L**, the most extensive state of South America. Towards the interior, it borders on all the other states of that continent except Chili and Buenos Ayres—on Uruguay, the Argentine Confederation, Paraguay, Bolivia, Peru, Ecuador, New Granada, Venezuela, and Guiana, English, Dutch, and French; while its sea-board, beginning about 200 miles to the north of the Amazon, and reaching to within the same distance of the Plata, projects into the Atlantic fully 1000 miles to the east of the direct line—pretty nearly a meridian—between its two extremes. This immense country extends between lat. 4° 30' N. and 33° S., and between long. 35° and 70° W., being, in round numbers, 2600 miles long and 2500 broad. The area, according to official accounts, is 3,100,000 square miles. But B. was not always, in point of extent, what it now is. The Portuguese, who, in 1500, accidentally discovered the south-east coast of the country (but that only after one of the Pinzons had, on behalf of Spain, followed the shores of the continent from its eastern angle to the mouth of the Orinoco), claimed all between the Plata and the Amazon. Soon, however, the Spaniards of Buenos Ayres, feeling that the complete command of their mighty river was to them a necessary of life, colonised the left bank by founding Monte Video. But nearly twenty years earlier, B. had acquired more territory on the Amazon than it was to abandon on the Plata, having, in 1509, wrested from France, then at war with Portugal, what may now be designated Brazilian Guiana. It was only in 1531 that the Portuguese, busy as they were in India, here planted their first settlement. In 1578, B. fell, along with Portugal itself, under the power of Spain—a connection which, besides being essentially detrimental, speedily threw it as a prey into the hands of the Dutch Republic; and though Portugal regained its own independence in 1640, it was not until 1654 that B. was entirely recovered from the Hollanders. Thenceforward, the colony entered on a new era. Supplanted, in a great measure, throughout the east by the Dutch, the mother-country was now directing most of its attention to its possessions on either side of the Atlantic. About a century and a half later, a still more beneficial change—and that, too, arising from the mother-country's own disasters—was inaugurated in the colony. In 1808, under the pressure of French invasion, the monarchy, in the persons of the royal family, was virtually transferred from Portugal to B., an event which, doubtless through British counsels and influence, was immediately followed by the opening of the ports to foreigners. As a remoter benefit, too, of an incident which had no parallel either in English or in Spanish America, B., on shaking off, like its neighbours, the European yoke altogether, found a merely nominal revolution

sufficient for its purpose, establishing, or rather accepting, an hereditary empire instead of restless and precarious republicanism; and ever since the transition-period of 1821—1825, this consolidated government, with subordinate institutions for local objects, has secured to B.'s twenty vast provinces comparative unity and peace. A war was undertaken in 1865, in concert with the Argentine Republic and Uruguay (formerly a province of B.) against Paraguay, which terminated in the defeat of the Paraguayans in 1870. Although B. bore the brunt of the war, it demanded the cession of no territory; while the Argentine Republic, which had only a few troops in the field, appropriated a considerable portion.

The executive authority is vested in the emperor, who, besides being aided by a council of state, must act through responsible ministers. The legislature consists of two chambers, which sit four months every year. Both the deputies and the senators, who must have annual incomes respectively of 800 milreis and 1600 are indirectly elected by voters who must possess 200 milreis per annum—the former for four years, and the latter for life. The senate, however, appears to represent the crown as well as the people, inasmuch as each constituency merely nominates three individuals for his majesty's choice of one. Justices of peace, also, are appointed by the respective communities; and in the courts generally, whether civil or criminal, there prevails trial by jury. The revenue in 1869—1870 amounted to £18,048,871, the expenditure to £17,644,201, while the public debt in 1871 amounted to £88,398,886, contracted principally in connection with the war against Paraguay. By votes of Congress passed in 1869 the standing army was fixed at 20,000 men on the peace-footing, and at 60,000 on the war-footing; and the standing naval force was fixed at 4000 men, which might be raised to 8000 in time of war. The navy in 1870 consisted of 89 men-of-war, including 52 steamers and 20 ironclads.

The population in 1872 amounted to 10,095,978 (including 1,633,864 slaves), and consisted of aborigines, Africans, and Europeans, the first being proportionally fewer than in most parts of Spanish America. The Africans continued to be imported till 1854, and their amalgamation with the Europeans gradually produced perhaps the finest variety of the mulatto in the world. A law for the gradual emancipation of the slaves was passed in 1871. It enacts that henceforth the children born of slave women shall be 'considered of free condition,' but bound to serve the owners of their mothers for the term of 21 years, under the name of apprentices. Roman Catholicism is the prevailing religion. Notwithstanding the recent efforts of the legislature for the advancement of education, it is still very defective. In 1868, the attendance at the public schools was only 107,483.

But physically, as well as politically and socially, B. differs in many respects from most of the other divisions of the new continent. It knows nothing of the volcanoes and earthquakes of the Pacific coast; with winds blowing constantly from the Atlantic Ocean, it is exempted from those droughts which are always blighting one or other of the slopes of the Andes, the remoter slope in Peru and Chili, and the nearer in Buenos Ayres and Patagonia; its mines, again, are as famous for gold and diamonds as those of the Western Cordilleras for silver. In its hydrography, B. contrasts unfavourably with the other divisions. While the Amazon and the Plata, the Mississippi and the St Lawrence—not to mention countless rivers of inferior magnitude on both shores—are for the most part practicable almost to their sources, the streams of B.,

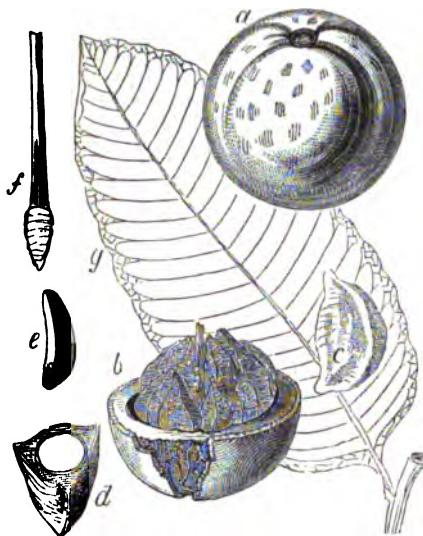

with the exception of the Amazon, are mostly impeded throughout by cataracts and shallows, thus counterbalancing, as it were, its matchless seaward facilities by the deficiencies of its inland communications. Further, the most navigable of these streams, instead of entering the open sea, mingle their waters with those of the Plata or of the Amazon—the Paraná and the Uruguay joining the former, and the Madera, the Tapajos, the Zingu, and the Tocantins, the latter; and even among those that do send their tribute at once to the ocean, a similar direction is sometimes impressed by the dividing ridges—the San Francisco, for instance, by far the largest of them, running to the northward parallel with the south-east coast through 11° of lat., and leaving only 4° of long. for its remaining course to the Atlantic. A humid surface and a luxuriant vegetation conspire to render ordinary roads all but impossible. B. possesses 6 lines of railway of a total length of 410 miles, and has also a system of telegraphs, the lines at the beginning of 1873 being 1800 miles in extent. Telegraphic communication has been established between B. and Europe; the first message was despatched by the cable to Lisbon, June 23, 1874.

Among the mineral treasures, besides gold and diamonds already mentioned, iron of superior quality is abundant; and salt, also, is extensively produced in saline marshes by the alternate processes, according to the season, of inundation and evaporation. The productions of the soil, which are, of course, equally various and rich, will be more satisfactorily considered under the heads of the respective localities. Suffice it to say, that the cotton is naturally excellent, and that the tea-plant of China has been introduced, though hitherto with indifferent success. The exports are necessarily different from the different sections of the country. From the north, they are coffee, cotton, cocoa, sugar, and tobacco; from the south, hides, tallow, horns, &c.; and from the middle, drugs, diamonds, gold-dust, dyes, rice, manioc, tapioca, spirits, and rosewood. Their total value in three years, 1870—1872, averaged £19,000,000; the corresponding imports averaging £22,500,000. The chief centre of foreign trade, and, along with São Paulo in the interior, the principal cities of the empire, are Para, Maranhão, Bahia, Pernambuco, and Rio de Janeiro. This last-named port, which is likewise the seat of government, is the favourite halting-place of the outward-bound vessels for India, China, and Australia.

**BRAZIL NUTS** are the seeds of the *Bertholletia excelsa*, a majestic and beautiful tree of the natural order *Lecythidaceæ* (q. v.). The tree grows to the height of 100 or 120 feet, and abounds on the banks of the Orinoco and in the northern parts of Brazil. It produces a round woody pericarp, or seed-vessel, almost as large as a man's head, within which are many of the seeds or nuts. The pericarp is very heavy and solid, requiring a blow of a sledge-hammer to break it; and at the time when this great fruit is ready to fall, it is dangerous to walk under the tree. The seeds, which are popularly called nuts, and much resemble fruits of that description, are wrinkled and triangular, having a hard shell and a pure white kernel, which, when fresh, is very agreeable. They are chiefly exported from Para and French Guiana, and are well known in our shops. They yield a large quantity of oil, which is good for burning. The nuts or seeds of the *Lecythis ollaris*, or Pot Tree, are produced in a pericarp which resembles a rusty iron pot with a lid, the lid dropping off and letting the seeds out, which are oblong, grooved, and esteemed of a very superior quality to the common

## BRAZIL WOOD—BRAZING.

B. N.; but they have not yet become an article of commerce, as the tree grows chiefly in the interior

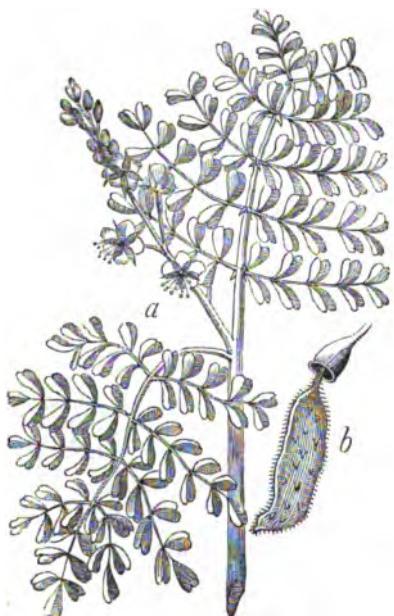

Brazil Nut:

a, the fruit; b, the same, with half of the pericarp removed to shew the nuts or seeds; c, a single seed or nut; d, a nut cut across; e, a kernel of a nut; f, the central placenta, to the lower end of which the nuts are attached in the pericarp; g, a leaf.

parts of the country, from which the nuts are only occasionally sent to the coast.

**BRAZIL WOOD**, a dark-red or yellowish-brown dye-wood, which forms a considerable article

Brazil Wood:

a, a branch with leaves and flowers; b, a pod.

of export from Brazil, where some of the trees which yield it are very abundant. It is the produce of

316

different species of *Cesalpinia* (q. v.). The best kinds are those called Pernambuco Wood, All Saints' Wood, and St Martha Wood. Much of the B. W. of commerce is obtained from *Cesalpinia Brasiliensis*, a tree which is a native of the West Indies, commonly growing in dry places and among rocks, and seldom exceeding 30 feet in height. It has bipinnate leaves, with many smooth, obtuse, oblong leaflets, and no terminal leaflets, the flowers in panicles, with downy stalks. The heart-wood alone is of any value.—**PERNAMBUCO WOOD** is the produce of *Cesalpinia echinata*, a prickly tree, with prickly pods, and of which the red and yellow flowers have a delicious smell, resembling that of the lily of the valley. The sap-wood is extremely thick, and the valuable heart-wood bears a small proportion to the whole diameter of the stem.—The Sappan Wood (q. v.) of the East Indies nearly approaches B. W. in quality. It is the produce of *Cesalpinia Sappan*, a small thorny tree.—**THE BRAZILETTO WOOD**, sometimes also called B. W., which is brought from the Antilles, is much inferior. *Cesalpinia crista* probably yields some of the inferior West Indian Brazil-Wood.—It is a curious circumstance, that B. W. is said not to take its name from Brazil, but to be mentioned under the name *Brazile* in documents much older than the discovery of America, the Sappan Wood of the East Indies being probably intended, and the name of Brazil has even been supposed to be derived from that of this product of its soil.

When freshly cut, the colour of B. W. is yellow; but when exposed to air, moisture, and light, it becomes red, and is generally sent into market ground down to the size of ordinary saw-dust. When treated with water, alcohol, or ether, the weathered B. W. readily yields up its red colouring matter, called *Brazilein*. The latter is supposed to be produced from the oxidation of a colourless substance called *Brazolin*, which exists in the original yellow wood of the tree. Strong decoctions of B. W. are used by the dyer and calico-printer in the fabrication of reds, browns, &c.; it is also used in the manufacture of red ink. See INK.

**BRAZILIAN GRASS**, an incorrect popular name applied to a substance used in the manufacture of a very cheap kind of hats, known as B. G. hats, and also as *chip hats*. It consists of stripes of the leaves of a palm, *Chamaerops argentea*, which are imported into Britain for this manufacture, and chiefly from Cuba. See CHAMEROPS.

**BRAZILIAN PLUM**. See HOG PLUM.

**BRAZING**, or **BRASS SOLDERING**, is the process of uniting together two pieces of brass, two pieces of copper, or one of each, by means of a hard solder, partaking more or less of the composition and properties of ordinary *brazz*. The edges or parts of metal to be joined are first filed bright, so as to be thoroughly clean, then there is strewed over the gap or crevice a mixture of the solder and borax. The solder employed varies in composition according to the kind of work, and may be rendered more fusible by the addition of a larger amount of zinc, but the general proportions are (1) 16 copper, 16 zinc, and 1 tin; (2) 12 brass, 4 zinc, and 3 tin; or (3) 18 brass, 3 zinc, and 2 tin. When the whole has been fused together, it is allowed to cool, and is then filed down to a coarse powder, in which state it is used. The borax is employed to form a glaze over the brightened surfaces, and thus prevent the oxidation of the metal, which would seriously interfere with B., and even stop the operation. An outward coating or layer of charcoal is likewise serviceable in the exclusion of the air during the B. of large pieces of metal. Where a very high heat is

required in the process, a little powdered glass is mixed with the borax. The mixture of solder and borax may be applied dry, but it is better to moisten it with water, and to lay it on the filed surfaces with a spoon. The whole is then gently heated, when the water evaporates and leaves a crust of borax and solder. The work may now be strongly heated before the blow-pipe, or over a clear fire, and at a bright red heat the solder fuses and the zinc begins to burn with a pale-blue flame. At this stage, the solder *fusches* or becomes liquid enough to permeate the joint or crevice; but should it be tardy in acting thus, several slight taps will insure the proper result. The whole is now cooled, and, towards the close, the articles may be introduced into cold water for more rapid reduction in temperature. Pieces of metal which have undergone the process of B. are so firmly united that they may be rolled and re-rolled without the parts yielding. See SOLDER.

**BR'AZOS DE DIOS**, a river of Texas, North America, the second, if not the first, in magnitude that flows within the state. It runs towards the south-east, rising in the table-land of Bexar County, and falling into the Gulf of Mexico about 40 miles to the south-west of Galveston. With a course of about 900 miles, it is navigable at all times to a distance of 40 miles from its mouth, and at certain seasons to a distance of 300 miles. The valley of the river, the lower half being merely an alluvial plain, presents extensive forests, interspersed with plantations of maize, sugar, and cotton.

**BRAZZA**, an island in the Adriatic, belonging to Dalmatia, Austria, in lat. 43°—44° N., and long. 16°—17° E. It has an area of about 170 square miles, and a population of 15,495; and is separated from the mainland by a channel of some 8 or 10 miles in breadth. Its surface is mountainous, and extensively wooded; vines, yielding excellent wine, are grown in the valleys, and figs, saffron, almonds, and oil are produced in considerable quantities, but not much grain is raised. Bees and silk-worms are reared in large numbers. B. is also celebrated for its cheese, and the delicacy of the flesh of its lambs and kids. Excellent building-stone, which is largely exported, is found in the east part of the island. St Pietro di Brazza is the chief town.

**BREACH**, in siege-works, is a gap in any of the defensive walls or gates of a city; and *breaching* is the operation by which the gap is produced by the guns of the besiegers. *Breaching batteries* are employed, consisting of several pieces of ordnance, so chosen as to kind and size, and so placed as to distance, as to burst a hole through the defences in the shortest practicable time. The greatest effect is produced by lodging the balls in two vertical lines, from the parapet of the wall downwards, and in a horizontal line, connecting the lower ends of those vertical lines; and then overturning the mass of material thus loosened by an irresistible salvo or volley. When a hole has once been made, by thus knocking away the masonry or earthwork, the breaching is continued until the crumbling mass has so accumulated as to form a practicable slope, up which the storming-party of the besiegers may run. See ASSAULT. During the Peninsular war there were some formidable examples of breaching. At Badajoz, 14,000 shot brought down 180 feet of wall in 104 hours, from a distance of 450 yards. At Ciudad Rodrigo, 6700 balls brought down 105 feet of wall in 32 hours, from a distance of 560 yards. At St Sebastian, 13,000 shot brought down 100 feet of wall in 62 days, from a distance of 620 yards. It was calculated, from these and other instances, that

10,000 24-lb. shot, or 240,000 lb. of iron, will breach 100 feet of wall from a distance of 500 yards—the wall being of fair average masonry, and the height and thickness a fair average of those used in fortified towns. It must be remembered, however, that this estimate was made before the days of rifled cannon and Armstrong guns; and, on the other hand, that the walls adverted to were not constructed of granite.

**BREACH**, in law, signifies a breaking or violation of a right or of an obligation or engagement legally binding; and in this sense it has numerous applications, of which the following are those more particularly treated in law-books :

**BREACH OF ARRESTMENT**, in the practice of the Scotch law, is the disregard or violation of the process of arrestment, or attachment, by the arrestee, or party in possession of the arrested or attached property, but who, notwithstanding, pays the sums or delivers the goods arrested; and such B. is viewed by the courts as a contempt. But at present the only consequence of the B. is, that the person guilty of it, where it is a question as to *money*, is liable in damages to the extent of the funds paid away, and the costs. Where goods are arrested, and the arrestment is removed on bail (or ‘loosed on caution,’ as the Scotch lawyers say), if the goods themselves cannot be recovered, or their value cannot be clearly ascertained, the surety or ‘cautioner’ is held to be liable for the original debt. See ARRESTMENT. In England, the disputing or disobeying a rule or order by a judge for attachment of a debt very nearly means the same thing. See ATTACHMENT, GARNISHEE.

**BREACH OR CLOSE** is a trespass by which an unwarrantable entry is made on another man's land, for satisfaction of which injury an action will lie to recover damages. It is called a trespass for breaking a man's *close*, because every man's land is, in the eye of the law, enclosed and set apart from his neighbour's; and that either by a visible and material fence, as one field is divided from another by a hedge; or by an invisible boundary, existing only in the contemplation of the law, as when one man's land adjoins to another's in the same field. The liability to this injury attaches not only to the party himself trespassing, but also to trespass by his cattle. And the law gives the party injured a double remedy in this case, by permitting him to distrain the cattle till the owner shall make satisfaction, or else by leaving him to the ordinary remedy by action for the damage done.

But in some cases this trespass is justifiable; as where it is done in exercise of a right of way, a right of common, or the like; or where a man comes to demand or pay money payable on the particular land; or to execute, in a legal manner, the process of the law; or by the licence of the plaintiff himself. Also, a man may justify entering into an inn or public-house without the leave of the owner first specially asked; because when a man professes the keeping of such an inn or public-house, he thereby gives a general licence to any person to enter his doors. So a landlord may justify entering to distrain for rent; and a reversioner to see if any waste be committed on the estate, for the apparent necessity of the thing; and it has been held that the common law warrants the hunting of ravenous beasts of prey, as badgers and foxes, in another man's land, if no greater damage be done than is necessary, because the destroying such creatures is said to be profitable to the public. But in cases where a man misdemeanors himself, or makes an ill use of the authority with which the law intrusts him, he is accounted a trespasser *ab initio*; as if one comes into a tavern, and will

not go out in a reasonable time, but remains there all night, contrary to the inclinations of the owner; such wrongful act is held to affect and have relation back even to his first entry, and make the whole a trespass. But a bare nonfeasance, as not paying for the wine he calls for, will not make him a trespasser, for this is only a B. of contract. See Blackstone and Stephen's *Com.* respecting 'civil injuries.'

In the Scotch law, the term *close* is not used, and not known—but there any violation of a right of property in land may be redressed by legal process, and in many cases form the ground of an action for the recovery of damages. See *CLOSE*. The term *Inclosure*, in Scotch law, has a different meaning, although the penalties for breaking such inclosure are somewhat analogous to those for breach of Close. See below, *BREAKING INCLOSURE*, and see *TRESPASS*.

**BREACH OF COVENANT** is one of those civil injuries by which is meant a violation of a covenant or agreement contained in a deed of conveyance, either to do or omit to do something, and which B. gives a right of action against the party who made the covenant and his representatives. See *COVENANT*.

**BREACH OF CONTRACT** is a general description of injury, by which is understood the violation of any contract or legal engagement, and for which, at law, damages may be recovered, according to the nature of the breach and character of the contract; and by the Common Law Procedure Act, 1854, jurisdiction is conferred upon the courts of common law, by which a plaintiff can compel a defendant to fulfil any precise or actual duty. But it is only in the courts of equity that complete relief is given by enforcing the specific performance of agreements or contracts. See *CONTRACT*; *DAMAGES*; *SPECIFIC PERFORMANCE*; *EQUITY*, COURTS OF; *CHANCERY*, COURT OF.

In Scotland, although there is no distinction between law and equity, the remedy for this injury is very much the same. The party wronged may either conclude for damages, or *ad factum prestandum*, or for both of these remedies.

**BREACH OF DUTY** may be legally defined as either the non-execution of an office, or the performance of it in such a way that the conditions on which it was undertaken are violated. Such misconduct may either violate the conditions of an express contract, or it may be equally opposed and do equal violence to any implied engagement or *assumpsit*, as it is technically called in the law of England, not from the express determination of any court or the positive directions of any statute, but from natural reason and the just construction of law, which assumes and intends that every man has engaged what his duty or justice requires at his hands. And he must do this with integrity, diligence, and skill; for if by his neglect, injury accrues to individuals, they have their remedy against him in damages. See *CONTRACT*, *DUTY*, *OBLIGATION*, *DAMAGES*, *EQUITY*, *PERFORMANCE OF CONTRACTS*.

**BREACH OF THE PEACE** is an offence against the public tranquillity and safety, and is either felonious or not felonious. But the law on this subject will be best considered under *PEACE, OFFENCES AGAINST THE PUBLIC*.

**BREACH OF POUND** is an indictable offence, and means the breaking any *Pound* (q. v.), or place where cattle or goods distrained are deposited, in order to rescue them. When once impounded, such goods or cattle are understood to be in the custody of the law, and an action for treble damages will lie for illegally taking them out of pound upon a distress for rent. Further, it is enacted by the

6 and 7 Vict. c. 30, that if any person shall release, or attempt to release, cattle lawfully seized by way of such distress, from the pound or place where they shall be impounded, or on the way to or from such pound or place, or shall destroy such pound—he shall be liable to a penalty not exceeding £5, and in default, may be committed to the house of correction. See Stephen's *Com.*, vol. iii., and see *DISTRAIN*, *DISTRESS*, *POUND*.

**BREACH OF PROMISE TO MARRY.** See *PROMISE* and *MARRIAGE*.

**BREACH OF TRUST.** See *TRUST*.

**BREAD.** The earliest and most primitive way of making B. was to soak the grain in water, subject it to pressure, and then dry it by natural or artificial heat. An improvement upon this, was to pound or *bray* the grain in a mortar, or between two flat stones, before moistening and heating, and from this *braying* operation some etymologists propose to derive the word *bread* (as if *brayed*). A rather more elaborate bruising or grinding of the grain leads to such simple forms of bread as the *oat-cakes* of Scotland, which are prepared by moistening oatmeal (coarsely bruised oats) with water containing some common salt, kneading with the hands upon a baking-board, rolling the mass into a thin sheet, and ultimately heating before a good fire, or on an iron plate, called a *girdle*, which is suspended above the fire. In a similar manner, the barley-meal and pease-meal *bannocks* of Scotland are prepared; and in the East Indies (especially the Punjab and Afghanistan), as well as in Scotland, flour is kneaded with water, and rolled into thin sheets, as *scones*. The *passover cakes* of the Israelites were also prepared in this way. A similar preparation of wheat-flour, but where the sheet of dough is made much thicker, forms the *dampers* of Australia. The Indian corn-meal, kneaded with water and fired, affords the *corn-bread* of America. The kinds of B. referred to above are designated *unleavened*, as no leaven has been added to the dough to excite fermentation. Even in the time of Moses, however, *leaven* was employed in making bread. It is held probable that the Egyptians were the first to use leaven; that the secret afterwards became known to the Greeks; and that the Greeks communicated the process to the Romans, who spread the invention far and wide in the northern countries during their campaigns.

The grain of wheat is generally employed in the manufacture of B. among the better classes, and more advanced nations, though rye, barley, Indian corn, and rice are also extensively used. The average composition of the grain of wheat when dried, so as to evaporate about 14 per cent. of moisture, is

Gluten and albumen, . . . . .	184
Starch, . . . . .	544
Gum, sugar, oil, and fibre, . . . . .	20
Saline matter, . . . . .	2

The proportion of these ingredients varies, however; and though the native country of wheat is unknown, yet it is found that, within the wheat zone (see *WHEAT*), the quality improves as we travel south. Thus, Scotch wheat is inferior to English, the latter to French, that to the Italian; and the finest wheat in the world is grown in Barbary and Egypt. The principal constituents of wheat may be separated from each other without much difficulty. Thus, if wheat-flour be placed in a cloth-bag with the mouth well closed, and the whole introduced into a basin of water, and pressed by the fingers for some time, the starch is squeezed through the cloth as a fine white powder, and the gluten is left in the cloth as a viscous or sticky substance.

Again, if wheat-flour be burned on a porcelain plate on a fire, or oven, or gas-lamp, till it can burn no longer, it leaves behind a small amount of ash or saline matter.

Previous to being employed in the fabrication of B., the grain of wheat undergoes the process of *grinding*, with the double object of reducing it to a fine state of division, and separating the more hard and indigestible parts. See MILL. During the grinding operations, the wheat as it passes from grain to flour nearly doubles its bulk. The products come from the dressing-machine divided into different qualities, a quarter of wheat yielding—

	Bushels.	Pecks.
Fine flour,	5	3
Second flour,	0	2
Fine middlings,	0	1
Coarse middlings,	0	04
Bran,	3	0
Twentypenny,	3	0
Pollard,	2	0
	14	24

In the making of bread in Great Britain, the finest flour is employed in making *firsts* or the *fine 4-lb. loaf*; a coarser flour is made into *seconds* or household B.; and a still coarser into *thirds* or coarse bread. There is no bran in *firsts*, but a greater or less proportion of the finer bran in *seconds* and *thirds*. In the making of good B. three things are absolutely requisite: flour or meal, yeast or leaven, and water containing salt. The yeast (q. v.), or leaven (q. v.), is added to give a start to the fermentation (q. v.) process, thereby supplying carbonic acid, which communicates a spongy or light texture to the bread. Leaven is the more primitive ferment, and is simply a portion of moistened flour or dough in which the putrefactive agencies have begun to work. It may be procured by allowing moistened flour to lie in a warm apartment (summer heat) for six or eight days, and when sufficiently formed, has an acid taste and reaction, and a somewhat fusty odour. When brought in contact with a new portion of flour and water, and incorporated therewith by kneading, it very quickly acts as a ferment, and develops partial fermentation in the whole. Hence it is that where leaven is used, it is customary to retain a portion of the leavened dough for the next baking. On the continent, leaven is still very extensively employed, especially in districts far from breweries. In Britain, yeast is generally used as the ferment.

The materials being at hand, and the proper benches, utensils, and oven being within reach, the baker takes a quantity of water and adds to it the yeast and salt; after which the flour is added, and the whole thoroughly and laboriously kneaded together till it assumes aropy consistence. It is then called the *sponge*, and is placed in a kneading-trough in a warm place, which is styled *setting the sponge*. In a short time, the yeast begins to act on the gluten, starch, and sugar of the flour, compelling the latter to pass into alcohol and carbonic acid gas in every part of the dough, which thereby becomes inflated with innumerable air cavities. When the fermentation has sufficiently advanced, the baker takes the sponge, adds more flour, water, and salt, and a second time subjects the whole to a thorough process of kneading, to prevent portions being so far fermented as to become *sad*, and again allows the mass to lie in a warm place for a few hours. The dough swells considerably from distension by gas, and is weighed out into lumps of the proper size, which are shaped into loaves, constituting the *batch*, or placed in tin pans, and are allowed to lie for a short time till they get further distended. The oven has

previously been heated by flames, by heated air, or by wood being burned within it, to a temperature of at least 320° F., which is the lowest temperature at which B. can be baked, and ranging up to 572° F.; and when it has been thoroughly cleaned out, the loaves are introduced and placed on the floor, and the oven shut up. The heat acts in dissipating much of the water from the dough, in distending the air cavities more fully, and in partially boiling the starch and gluten of the dough, and developing some gum from the starch. Indeed, though the temperature of the oven is much higher, yet the loaves beyond the mere crust are bathed in an atmosphere of steam, and are never heated above 212°, as has been proved by direct experiments with the thermometer. One effect of the heat is to arrest any further fermentation (q. v.; see also YEAST). After several hours' baking in the oven, the length of time being determined by the temperature, the loaves are withdrawn, and allowed to cool. The brown appearance of the crust of loaves, and the pleasant taste of the crusts, are due to the action of the heat on the starch and the formation of dextrine (q. v.), a sort of gum. The number of quatern (4 lb.) loaves which a sack of flour weighing 280 lbs. yields, is 90. It will be apparent, therefore, that as 280 lbs. of flour yield 360 lbs. of B., that a good deal more water must be present in the latter than in the former; and, indeed, ordinary good wheaten B. contains about 45 per cent of water. This water is retained even after the loaf is apparently dry, and even mealy, as the yeast and gluten have a great affinity for water.

Improvements in the process of making B. are occasionally effected. Thus a form of yeast, called German barn or yeast (q. v.), has been introduced, which is more cleanly than ordinary yeast or leaven, but appears to be too rapid in its power of causing fermentation to be manipulated easily in the making of ordinary loaves, though it does well for pan-loaves and fancy B. in general. Ovens heated by flames are being constructed, instead of the primitive method of heating them by wood, which smokes the whole oven. Instead of raising the dough by the action of yeast, which decomposes a part of the flour and causes the loss of about 2 per cent, bicarbonate of soda and hydrochloric acid are sometimes employed. The proportion by this process are 4 lbs. of flour intimately mixed with 320 grains of bicarbonate of soda; to this is added a mixture of 300 grains of common salt in 35 ounces of water and 6½ fluid drachms of hydrochloric acid, sp. gr. 1·16, and the whole is kneaded and placed in the oven. When the mixture is made, the acid acts on the bicarbonate of soda, forming common salt, which is left in the dough, and carbonic acid is liberated at every point, and communicates a spongy texture to the dough. The disadvantage attendant on this mode of raising the dough is, that it is apt to leave too much common salt in the B. This is obviated by using water charged with carbonic acid, as described under AERATED BREAD. Sesquicarbonate of ammonia is employed to some extent in the preparation of rusks, ginger B., and other light fancy B.; when heated, it entirely passes into gas, and thus yields a very spongy mass. Short-bread is prepared from flour which has been incorporated with butter. See UNFERMENTED BREAD.

The appearance which good wheaten B. ought to present, is that of a vesicular or spongy mass, from which layers can be readily detached; and this, known to bakers as *piled B.*, is the best index of good wholesome and easily digested bread. When the layers cannot be detached, and the loaf cannot be crumbled down by the fingers into a coarse powder, or the fragments be thoroughly soaked

## BREAD.

and be readily diffused through water, but become a permanent tough mass of dough, the B. is imperfectly made.

Rye B. is very extensively used in northern European countries, where the soil being sandy is admirably adapted for the growth of that grain. It yields a flour darker than wheat-flour. It is almost equal in nutritive value to wheaten-bread. Barley and oats, which when used as B. are generally made into cakes or bannocks, possess also a composition not unlike wheat. Indian corn, which thrives luxuriantly on the American soil, and is largely used there for B., as also to a considerable extent in the Old World, is little different from wheat in the proportion of its ingredients. Rice is occasionally employed in making B., but it is not nearly so nutritious as wheat.

But although, with the exception of rice, the various kinds of grain do not sensibly differ in the amount of nutritious matter contained in the meal, yet there is a great difference as to the quality of yielding a light, spongy bread. In this respect, the flour of wheat excels all others. This quality seems to depend upon the mechanical structure of the gluten of wheat, which gives a glutinous, sticky consistency to the dough, rendering it impervious to the carbonic acid gas formed in it during the fermentation, so that the gas thus imprisoned swells it up. The meal of other grains forms a more granular and less tenacious dough, which allows the gas to escape with more or less ease as it is formed. It is thus impossible to make a light, spongy loaf of oat-meal, however finely it might be ground. In the case of whole-meal B. or brown B., the rough, hard particles of the bran interfere with the ordinary tenacious quality of wheaten-flour, and make the dough slightly porous, so that much of the gas escapes, and thus this kind of B. is never so much raised as B. of fine flour.

Brown, COMPOSITION, or WHOLE FLOUR B. is made from the ground but undressed wheat, and therefore contains the bran as well as the flour. Some years ago it was suggested, that as the bran contained more nitrogenised matter than the flour, the whole meal must be more nutritious than the finer flour alone. But that opinion is now considerably modified; for while it is true that the whole meal (bran and fine flour) contains chemically more nutritive matter than the fine flour alone, yet the gritty particles that are present in the former, cause an unnatural irritation in the alimentary canal, and lead to a quicker evacuation of the but partially digested and absorbed food. This explains why brown B. possesses laxative properties, and why labourers fed on it consider that it makes them hungry soon again; they feel that it does not last in the stomach, and consequently think it has little nourishment in it.

The adulterations of B. are various. Very commonly boiled potatoes are added to the flour and water in the making of the dough, and some consider that this yields a lighter and more palatable bread. It must be remembered, however, that the addition of any substance of a nature foreign to the composition of any material is an adulteration (see next article); and that though potatoes may be supposed to improve the B., yet good B. can be made without them, and the addition of the potatoes lessens the nutritive value of the wheat-flour. Alum is occasionally added to the dough, to increase the whiteness and improve the general texture of the B.; and this it appears to do by arresting the passage of the starch into gum and sugar, which tends to take place during the process of baking. In Belgium, sulphate of copper

is often used for a similar purpose, but it is not employed in this country. All such admixtures are destructive of the nutritive value of a certain part of the B., and are injurious to the animal system. For the nutritive qualities of B. see NUTRITION and FOOD, and for biscuit-bread, see BISCUIT.

The law on the subject of bread, so far as relates to England and Scotland, is regulated by a local act for London, the 3 Geo. IV. c. 106, the provisions of which are imitated by a general act for the country, the 6 and 7 Will. IV. c. 37. These provisions are as follow: B. may be made of flour or meal of wheat, barley, rye, oats, buckwheat, Indian corn, pease, beans, rice, or potatoes, or any of them, or with any common salt, pure water, eggs, milk, barm, leaven, potato or other yeast, and mixed in such proportions as bakers may think fit, and with no other ingredient or matter whatsoever; and with the exception of French or fancy B. and rolls, the B. so made must be sold by weight, and in no other manner. It has been settled by many recent cases that bakers must weigh the bread before selling it, whether asked by the customer or not to do so. For this purpose, they must provide in their shops, on or near the counter, a beam and scales, with proper weights, or other sufficient balance, in order that the same may be weighed in the presence of purchasers—a regulation that also applies to delivery of B. by cart or other conveyance, it being directed that the scales and weights shall be constantly carried in the cart or other conveyance, under a penalty, in either case, not exceeding £5. From this regulation, however, fancy B., or French B., or rolls, are also excepted. The act further provides that B. made of mixed meal or flour—that is, B. made wholly or partially of pease, or beans, or potatoes, or of any sort of corn or grain other than wheat—shall be marked with the large Roman letter 'M' under a penalty, in case this rule be neglected, of a sum not exceeding 10s. for every pound-weight of such mixed B. sold, and so on in proportion for any less quantity. From this regulation, however, is excepted B. made of the meal or flour of wheat, in the making of which potato-yeast shall be used.

The following are the enactments against the adulteration of B.: 1. No baker shall, in the making of B. for sale, use any mixture or ingredient whatsoever other than those above mentioned, under a penalty for every offence not exceeding £10, nor less than £5, with the alternative of imprisonment, with or without hard labour, for any time not exceeding six calendar months; and the offender's name, place of abode, and offence may be published in the local newspapers. 2. Any person adulterating corn-meal or flour, by the introduction of any ingredient not being the real produce of the corn or grain; or any person selling meal or flour of one sort of corn or grain as the meal or flour of another sort, whether separate or mixed, shall forfeit and pay, according to the discretion of the magistrate or justice, a sum not exceeding £20, nor less than £5. 3. Magistrates or justices of the peace, and also peace-officers authorised by warrant, may, at seasonable times in the daytime, enter a baker's premises, and search for adulterated flour or B.; and if any be found, the same may be seized, and carried with all convenient speed to the nearest resident magistrate or justice of the peace, to be disposed of as he may think proper, the penalties varying from £2 to £10, with alternative imprisonment for six months; the offenders' names may also be published. Parties obstructing such search of bakers' premises, or upon the occasion of the search, carrying away the adulterated flour or B., are liable to a penalty not exceeding £10. Should it, however, appear that

any offence against the act shall have been occasioned by the wilful act or the neglect of the baker's journeyman or other servant, the magistrate may issue his warrant for bringing such servant before him, and, on conviction, may adjudge him to pay a reasonable sum to his master, by way of recompence. The Adulteration of Food Act gives a more efficient mode of prosecuting these offences, and exposing them, when detected.

The act further provides that bakers shall not bake bread, rolls, or cakes, on the Lord's Day; or, on any part of that day, after half-past one o'clock in the afternoon, sell such bread, rolls, or cakes; or bake meat, pies, or other victuals; or in any other manner exercise the trade of a baker, save and except so far as may be necessary by way of preparation for the following day's baking. For a first offence against this regulation, a penalty of 10s. shall be paid; for a second offence, 20s.; and for a third and every subsequent offence, respectively, the penalty of 40s., together with the costs of prosecution, a portion of the penalty to be paid to the prosecutor, and the residue to be applied towards the poor-rate of the place. This regulation as to Sundays does not extend to Scotland.

The law of Ireland on the subject of this article is contained in several acts of the Irish parliament, the leading provisions of which are similar to the above.

**BREAD, ARMY.** In camps and in barracks of any size, the bread for the army is baked on the spot by bakers of the supply sub-department of control organisation. Though perhaps a little rough in its manufacture, the article supplied is made from the best ingredients, and is genuine and wholesome. On a march, the control bakeries supply bread at the several halting-places. In smaller barracks, bread has to be obtained by contract, but the most vigorous supervision is exercised to secure proper quality. Formerly, army bread was notoriously bad. A contractor would sometimes send in a tender so low, in order to obtain the contract, that he could not possibly make good bread at a profit; and then he relied on small fees paid him by the soldiers as a means of obtaining better. This discreditable state of things was ascertained by a committee of inquiry some years ago; it was found that the average of army bread was not equal in quality to that of workhouse bread. Steps were forthwith taken to remedy the evil; experiments were made to determine whether troops could bake their own bread in the field, and the result was the adoption of the present system of army baking. With the improvement of the bread, a visible amelioration in the health of the soldiers has taken place.

**BREAD-FRUIT TREE** (*Artocarpus incisa*), a tree of the natural order *Artocarpaceæ* (q. v.), a native of the islands of the Pacific Ocean and of the Indian Archipelago—one of the most important gifts of nature to the inhabitants of these regions, its fruit supplying the principal part of their food, and its inner bark a considerable part of their clothing, whilst its timber and its milky juice are also employed for economical purposes. The genus to which it belongs (*Artocarpus*, Gr., Bread-fruit) is distinguished by having the male flowers in catkins, with a 2-leaved perianth and one stamen; the female flowers naked; the fruit roundish, fleshy, and tuberculated. The B. T. is a rather slender tree, of 40—50 feet high, often rising almost half its height without a branch. It has large, pinnatifid leaves, frequently 12—18 inches long, dark green, and glossy. The fruit is generally oval, or nearly spherical, and about the size of a child's head. It is a *sorosie*, a compound or aggregate

fruit formed from numerous flowers on a common axis, and is covered with a roughish rind, which is marked with small square or lozenge-shaped divisions, having each a small elevation in the centre; is at first green; when imperfectly ripened, brown; and when fully ripe, assumes a rich yellow hue. It is attached to the small branches of the tree by a short thick stalk, and hangs either singly or in clusters of two or three together. It contains a somewhat fibrous pulp, which, when ripe, becomes juicy and yellow, but has then a rotten taste. At an earlier stage, when the fruit is gathered for use, the pulp is white and mealy, and of a consistency resembling that of new bread. In a still less mature state, the fruit contains a tenacious white milk. The common practice in the South Sea Islands is to cut each fruit into three or four pieces, and take out the core; then to place heated stones in the bottom of a hole dug in the earth; to cover them with green leaves, and upon this to place a layer of the fruit, then stones, leaves, and fruit alternately, till the hole is nearly filled, when leaves and earth to the depth of several inches are spread over all. In rather more than half an hour, the bread-fruit is ready; ‘the outside are, in general, nicely browned, and the inner part presents a white or yellowish cellular pulpy substance, in appearance slightly resembling the crumb of a wheaten loaf.’ It has little taste, but is frequently sweetish, and more resembles the plantain than bread made of wheat-flour. It is slightly astringent, and highly nutritious. Sometimes the inhabitants of a district join to make a prodigious oven—a pit 20 or 30 feet in circumference, the stones in which are heated by wood burned in it, and many hundred bread-fruits are thrown in, and cooked at once. Baked in this manner, bread-fruit will keep good for several weeks. Another mode of preserving it is by subjecting it in heaps to a slight degree of fermentation, and beating it into a kind of paste, which, although rather sour, is much used when fresh bread-fruit cannot be obtained. There are numerous varieties of the B. T. in the South Sea Islands, and they ripen at different seasons. The tree produces two, and sometimes three, crops a year. In the West Indies and South America, into which it has also been introduced, the bread-fruit has not come much into use as an ordinary article of food; but various preparations of it are reckoned delicacies.—The fibrous inner bark of young bread-fruit trees, beaten and prepared, is used for making a kind of cloth, which is much worn by the common people in the South Sea Islands, though inferior in softness and whiteness to that made from the paper mulberry (see MULBERRY, PAPER).—There exudes from the bark of the B. T., when punctured, a thick mucilaginous fluid, which hardens by exposure to the air, and is used, when boiled with cocoa-nut oil, for making the seams of canoes, pails, &c., water-tight, and as bird-lime.—The timber is soft and light, of a rich yellow colour, and assumes, when exposed to air, the appearance of mahogany. It is used for canoes, house-building, furniture, and many other purposes. It is durable when not exposed to the weather.—The JACI (q. v.) or Jaca (*A. integrifolia*), and the DEPHAL (*A. Lakoocha*), both large East Indian trees, belong to the same genus with the bread-fruit tree.

**BREAD-NUT**, the fruit of *Brosimum alicastrum*, a tree of the natural order *Artocarpaceæ*, and therefore allied to the bread-fruit, a native of Jamaica. The genus *Brosimum* is distinguished by male and female flowers on separate trees, in globose catkins, with peltate (shield-like) scales for perianth, and the fruit a one-seeded drupe. The B. tree has ovate-lanceolate evergreen leaves; it abounds

## BREAD-ROOM—BREAKWATER.

in a tenacious gummy milk. Its leaves and young shoots are much eaten by cattle, but deleterious qualities are developed in them as they become old. The nuts, boiled or roasted, form an agreeable article of food, and are eaten instead of bread. Their taste resembles that of hazel-nuts.—To this genus the *Palo de Vaca*, or Cow TREE (q. v.), of Demerara is supposed also to belong.

**BREAD-ROOM.** In the navy, the biscuits are called *bread*, and the place where they are stored is the bread-room; it is carefully constructed, warmed before being filled, and kept as much as possible free from damp.

**BREAD-ROOT.** See PEORALEA.

**BREAD-TREE.** See CAFIER BREAD.

**BREADTH**, in art, is a term which, though often used in a very indefinite manner, is not without a definite meaning. It signifies that peculiar disposal of the background of a picture which, without sacrificing or even concealing details, gives to the whole unity and harmony of effect. With the older landscape-painters, it was a common fault to produce the effect of distance either by a certain trick of light and shadow, or by one uniform hazy colour in which the individual objects were entirely lost to view, and *breadth became vacancy*. In this respect, their pictures contrast unfavourably with those of such modern painters as Turner, of whom Mr Ruskin has very truly said that 'the conception of every individual inch of distance is absolutely clear and complete in the master's mind—a separate picture fully worked out: but yet, clearly and fully as the idea is formed, just so much of it is given, and no more, as nature would have allowed us to feel or see; just so much as would enable a spectator of experience and knowledge to understand almost every minute fragment of separate detail, but appears to the unpractised and careless eye just what a distance of nature's own would appear—an unintelligible mass. Not one line out of the millions there is without meaning, yet there is not one which is not affected and disguised by the dazzle and indecision of distance. No form is made out, and yet no form is unknown.' On the subject of breadth Mr Ruskin has, moreover, the following very judicious remarks: 'It were to be wished that our writers on art would not dwell so frequently on the necessity of breadth, without explaining what it means, and that we had more constant reference made to the principle, which I can only remember having seen once clearly explained and insisted on—that breadth is not vacancy. Generalisation is unity, not destruction of parts; and composition is not annihilation, but arrangement of materials. The breadth which unites the truths of nature with her harmonies is meritorious and beautiful, but the breadth which annihilates those truths by the million is not painting nature, but painting over her; and so the masses which result from right concords and relations of details are sublime and impressive, but the masses which result from the eclipse of details are contemptible and painful.'

**BREAKERS**, in maritime language, are the waves that break violently over rocks lying a short distance under the surface of the sea. They cover that particular part of the sea with a foam, and produce a hoarse and often terrible roaring. 'Breakers a-head' is one of the most alarming announcements made by the look-out men of a ship, seeing that the B. denote the existence of sunken rocks which may, perchance, pierce the hull of the vessel.

**BREAKING BULK**, in the Scotch law, signifies making use of an article supplied in bulk, or in quantity; by which act one is said to break bulk, and is, in consequence, prevented from afterwards

objecting to it, and returning it to the seller. See SALE OF GOODS.

**BREAKING INCLO'SURES** is an expression to be found in Scotch law-books, and means the destruction or invasion of planting and inclosures by persons or their cattle. The punishment for this offence is provided for by several old Scotch statutes, the principal of which are two passed in 1661 and 1685 respectively. The penalties are pecuniary, with right to detain the cattle found trespassing, until such penalties, along with the damage and costs, are paid. See PLANTATION.

**BREAKWATER** is a barrier intended for the protection of shipping in harbours or anchorages. It sometimes happens that, in front of a semicircular bay, a small island is so situated as to form a natural breakwater. This is to some extent the case with the Isle of Wight, which occupies such a position as to protect Portsmouth and Southampton from the south. In many other places, however, bays and harbours are without such screens. A pier may be so placed and constructed as to serve also the purpose of a B., but the term B. is generally confined to a structure used solely for protection, and not for berthing or traffic, and breakwaters are frequently insulated, so as to be cut off from any communication with the shore unless by water.

Plymouth B. is the best known of these engineering works. The sound or harbour, being open to the south, was so much exposed to storms that, early in the present century, it was determined to construct a B. across its mouth, with openings between it and the shore, on either side, for the ingress and egress of shipping. The works were commenced in 1812. The operations consisted in transporting along a tram-road large blocks of limestone got from a neighbouring quarry, shipping them in vessels fitted with trap-doors, and by means of these depositing them in the shape of a huge mound in the required situation. As soon as the stones began to appear above water, a perceptible benefit resulted in the relative calmness of the sound during the prevalence of storms; but the structure was frequently very roughly handled by the waves, which altered and flattened its shape. A severe storm in November 1824 threw a great portion of the stones over into the sound. It was not until 1841 that the works were finally completed, by the deposition of more than 3,000,000 tons of stone, and the expenditure of nearly £1,500,000. The B. is nearly a mile long, the central portion is 1000 yards; and two wings, of 350 yards each, extend from the ends of this at a slight angle. The open channels at each end, between the B. and the shore, are each about half a mile wide, and their depth is respectively 40 and 22 feet, at low-water. The B. is 133 yards wide at the base, and 15 at the top—the two sides being made very sloping for the security of the stones. The slopes and top are faced with masonry. The water-space protected by this B. comprises 1120 acres, and it is generally admitted that the money has been well spent on the work.

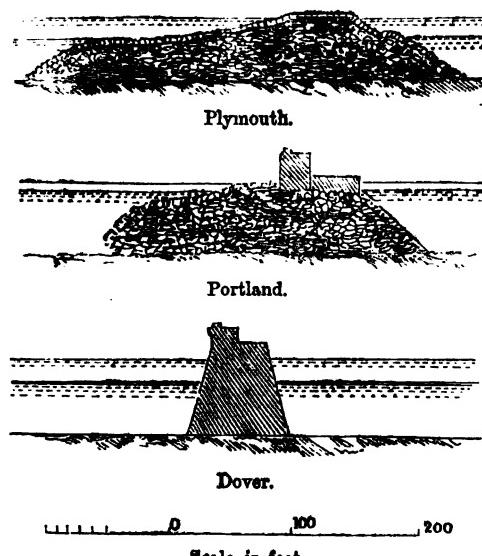

Holyhead B. is formed of stone quarried in Holyhead mountain, drawn along a tram-way on a timber structure, and cast into the sea. It more resembles a pier than the B. at Plymouth, for it is attached at one end to the shore, and is intended to convert Holyhead Bay or roadstead into a harbour of refuge. The works consist of a mound of loose stones up to low-water, and ashlar upright walls with a parapet above that line, with a railway on the top for trains.

Portland B. is of very great value, in converting into a harbour of refuge the expanse of water between

## BREAKWATER—BREAM.

the Dorsetshire coast and the isle, or rather peninsula of Portland. An act of parliament was obtained in 1847, authorising the works. The B., starting from the north-east point to the isle, stretches nearly due north for more than two miles, with one or two intervening openings for the ingress and egress of shipping. The works were conducted more easily than those of any other great B.; for the isle contains an abundance of stone easily quarried, and the steep shores afforded facility for transporting the stones by their own gravity to their destination. The work—which is an upright ashlar superstructure, with a parapet founded on a mound of rubble stones—was done chiefly by convict labour; the depth is about 50 feet at low-water. From the nature of the operation, any part of the B. became useful as soon as constructed, increasing the safety of Portland Bay as a harbour of refuge.

### BREAKWATERS.—SECTIONS.

Dover B. progresses slowly, and has involved an enormous outlay. There is no stone near to form a mound, as in the other breakwaters spoken of, and, in consequence, the work requires to be brought up in solid ashlar from the bottom by the diving-bell, with the interior formed of blocks of concrete. It has never been clearly stated whether the government regards this B. as a protection to a great naval station and fortified harbour, or as a chief feature as a harbour of refuge for commercial fleets. In 1844, a commission of inquiry recommended that £2,500,000 should be laid out in forming a harbour of refuge at this place. In 30 years the work has not been finished, the great depth and frequent storms constituting terrible obstacles. The water is very deep—viz., 42 feet at low-water; the accumulations of shingle very troublesome; and several years must elapse before it can be made evident whether the Dover B. is worth the national money expended upon it.

Alderney B. is a great work, consisting of ashlar walls and parapet, built on a stone mound up to low-water from a depth of 72 feet. Small breakwaters have been constructed at Cotte near Mar-scuille, at the mouth of the Delaware in the United

States, and at Buffalo in Lake Erie; but they do not call for description.

Cherbourg B. is the greatest and the most costly ever constructed. Nearly 100 years ago, M. de Cessart proposed to the French government the formation of a B. at Cherbourg, to be commenced by the construction of a number of hollow cones formed of timber-framing, sunk in a line as close as they could be placed to each other, and then filled with stones. These cones, of which there were to be 64, each about 70 feet high, 150 feet in diameter at the base, and 60 feet at the top, were intended to form a nucleus to the stone breakwater, to prevent the stones, during its formation, being knocked about and too much spread out by the action of the waves. In 1784 to 1788, 16 cones were constructed, and 13 of them sunk; but so great was the destruction which they underwent during stormy weather, that the government at length abandoned the plan, and carried on the stone breakwater without the aid of the cones. It was completed under Napoleon III. at a cost exceeding £2,500,000. The B. itself was finished in 1853, but since that year large fortifications have been built upon the upper works. The length is nearly 2½ miles; the B. is 300 feet wide at the bottom, and 31 at the top. The chief mass consists of rubble or unshaped stones, thrown down from ships; but there is a larger ratio of wrought and finished masonry than in the Plymouth B., consisting of granite blocks imbedded in cement. The depth of water is about 60 feet at low-water spring-tides; and the B. rises to 12 feet above high-water level. The water-space included within and protected by the B., is about 2000 acres, but two-thirds of this has scarcely depth enough for the largest sized ships. The relation which this B. bears to the vast military and naval arrangements of the place will be noticed under CHERBOURG.

Many substitutes have been proposed for solid breakwaters, such as floating breakwaters constructed of timber framework, open iron screens, &c., but none of them have been shewn to be suitable for actual practice. Close timber-work, filled in with stones, is found to be quite efficacious; but on most of our coasts the timber is liable to be eaten by the marine worm, which is an almost insuperable objection to its being used under water.

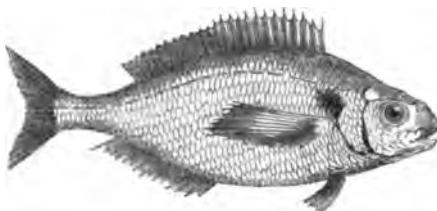

**BREAM**, a name which is apt to occasion some confusion to beginners in ichthyology, being applied equally to certain fresh-water fishes of the family *Cyprinidae* (q. v.), and to certain sea fishes of the families *Sparidae* (q. v.) and *Chætodontidae* (q. v.) or *Squamipennes*, among which the resemblance is a mere general one of outward form, the first of these families belonging to the order of *Malacopterous*, or soft-finned, the other two to that of *Acanthopterous*, or spiny-finned fishes.

The breams of the family *Cyprinidae* were included in the genus *Cyprinus* (see CARP) by the older naturalists, but are readily distinguished from that genus as now defined, and from other allied genera, by their deep and compressed form, by the great convexity of both the dorsal and the abdominal outline, by the want of spiny rays in the dorsal and anal fins, by the great length of the base of the anal fin, and by the want of cirri or barbules at the mouth. They form the genus *Abramis* of Cuvier.—The COMMON B., or CARP B. (*A. Abramis*), is an inhabitant of many rivers and lakes of Europe, even as far north as Norway and Sweden, and of some of those of Britain and Ireland. It thrives best in still waters, and in some of the Irish lakes attains a large size; it has been known to reach 12 or even 14 pounds. The tail is very broad and much forked, the head small and acuminate,

## BREAM—BREAST.

eyes very large, the scales small, the general colour yellowish-brown, the cheeks and gill-covers silvery white.—The WHITE B., or BREAMFLAT (*A. Blicca*), differs from the Common B. in its silvery colour, the smaller number of rays in the pectoral and anal fins, and other particulars. It has never been taken of so large a size. It is found in many parts of the continent of Europe, and in some of the British lakes and rivers.—The POMERANIAN B. (*A. Buggenhagii*) differs much more widely from the Common B.; the body is much thicker in proportion to its depth, the scales larger, the base of the anal fin shorter, the tail less forked. This fish is known to occur in a few places of England and Ireland, and is said to abound in Pomerania.

The acanthopterous Breams, or SEA BREAMS, are mostly of the family *Sparidae*, and nearly allied to the Gilthead (q. v.), in connection with which they

Common Sea Bream (*Sparus centrodontus*).

may most properly be noticed. The Common Sea B., indeed, often receives the name of gilthead. Only one of the British sea fishes called B., the *Brama Raisi* already noticed (see BRAMA), belongs to the family *Chelodontida*.

*Angling for Bream.*—Of the two kinds of B. known to anglers, the carp B. is much the best for sport. The flesh of the B. is not held in much estimation, though the carp B. is infinitely to be preferred of the two. B. are found in both ponds and rivers. They prefer deep, still holes, or quiet, well-sheltered eddies in the bends of rivers. Here the angler will find them in large numbers. They are rather capricious in feeding; at times they will not bite for weeks together. Being a sly, shy-biting fish, the tackle required for them must be fine. They may be taken by means of the ledger (q. v.) in rivers, where they should be fished for in the same way as directed for barbel, save that it will be found advisable to use another hook, which should be fastened on to the line about eight inches or a foot above the ledger lead, as B. often take their bait some inches off the bottom. The hooks should be No. 7. In float-fishing for B. in holes or eddies, a stout swan-quill float and half-a-dozen No. 1 shot below it, will be found sufficient for the purpose; and having ground-baited as directed for barbel, put on two small red worms for the angling bait, or about an inch of the tail of a bright, well-scoured lob-worm. The former is preferable. Two hooks, one to rest on the bottom, and one 6 or 8 inches off it, will be found useful, for sometimes one will be taken, and sometimes the other. The fish being tender-mouthed, should be played gently. After the first rush, a B. soon tires, for his form is not fitted or shaped for a prolonged resistance. The B. has an unpleasant practice of boring downwards and rubbing the line with his tail, and the line often comes up covered with a thick slime from his body, for a foot or more above the hook. It is needless to remark that this must be cleared off before the tackle is again used. The rod should be a light cane-rod, moderately stiff, and some twelve or thirteen feet long for float-fishing for B. from a boat or punt.

Of all baits, worm is decidedly the best. Some recommend bullock's blood and grains to ground bait with, but worms are found to answer all purposes. B. spawn about the end of May, choosing the most weedy spots for that purpose; and after scouring and cleansing in some gentle gravelly stream for a week or two, they return to the deep still holes again. A clay or sandy bottom is preferred to any other. The presence of B. may always be detected by their fondness for coming at times to the top of the water, or, as anglers term it, 'primeing.' Early in the morning, or late in the evening, the whereabouts of B. may always be discovered by their rising then. In Lough Erne the shoals are prodigious, and cause a ripple on the water like a stiff breeze of wind.

**BREAMING**, in nautical affairs, is a cleansing process which a ship undergoes after a voyage, or after lying for a long time in harbour. The ship's bottom, under such circumstances, often becomes covered with grass, ooze, shells, or sea-weed; and B. consists in the removal of these impurities. The ship is laid aground after the tide has ebbed, or is docked, or is careened (see CAREENING); furze and fagots are placed under it; fire is applied; the heat melts the pitch, &c., of the hull; and the pitch and filth can then be scraped and brushed off.

**BREAST**, THE FEMALE, or mammary gland, consists of a series of tubes, radiating from a common centre, the nipple, which is situated in an areola or dark-coloured patch. On the surface of the latter are several (from 4 to 10) sebaceous glands, which secrete an unctuous fluid to protect the skin of the nipple, which is very thin, from the saliva of the sucking infant. The milk-tubes (15 to 18

A, lactiferous ducts dissected out and injected; B, nipple, with briaties inserted into the orifices of the lactiferous ducts.

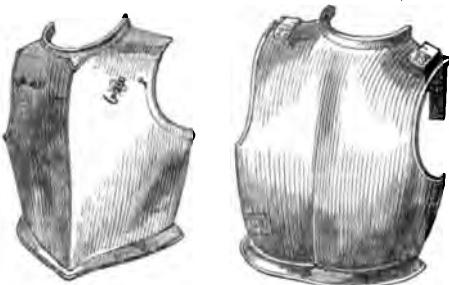

in number) enlarge into sinuses, and pass each to a separate lobe or subdivision of the breast, where they divide into twigs and branches (the *lactiferous ducts*), which end in minute vesicles. The lobes are held together by fibrous tissue, and are well packed in fat, which increases sometimes to an enormous extent the apparent size of the organ.

The accompanying cut shews the structure of the

## BREASTPLATE—BRECKNOCKSHIRE.

gland; and with a little consideration, it will be readily understood how over-distension of these delicate tubes, from whatever cause, must be productive of great suffering. When an abscess forms in the B., it is very dangerous to allow the matter to remain; but when an opening is made into an abscess of the B., the cut must be made in some line radiating from the nipple, so as to avoid division of the milk-tubes.

**BREA'STPLATE**, in ancient armour, was a plate of iron, steel, or other metal, so fastened as to protect the chest or front of the wearer. The back-plate, in like manner, was worn to protect him from

Breastplate.

Backplate.

attack from behind. In modern European armies, almost the only representative of the B. is the front half of the *cuirass*, worn by the *cuirassiers* in certain foreign states, and by the household cavalry (Life-guards and Horse-guards) in England.

**BREA'ST-SUMMER**, BRESSUMER (Fr. *somier*, a lintel), a beam supporting the whole front of a building, in the same way in which a lintel supports the portion over an opening. They are seen in England and on the continent in old houses that are built partly of wood and partly of stone, brick, or mud.

**BREA'ST-WORK**, in Fortification, is a hastily constructed earthwork; not so high as to need a *banquette* (q. v.) for the defenders to stand upon, but sufficient to afford shelter when they are standing on the level of the ground, and firing over the crest. The dry ditch or trench from which the earth has been taken to form the B., affords an additional defence. A B. is midway between a *parapet* and an *épaulement*, in size and importance.

**BREATH AND BREATHING**. See RESPIRATION.

**BREATH, OFFENSIVE**, may depend upon some cause limited to the mouth or nose, or it may arise from diseased conditions of the respiratory or digestive apparatus. If, from want of proper attention, the teeth have collected a quantity of putrescent particles around them, they must be well scrubbed with a brush and tepid water, with some powdered carbonate of magnesia mixed with it. A wash composed of a teaspoonful of tincture of myrrh in a pint of water is also very useful. Occasionally, the secretion from the tonsils (q. v.) is very offensive; and then a solution of nitrate of silver, 4 grains to 1 ounce of water, should be applied to them every morning, with a camel-hair brush, and small alterative doses of medicine administered. Solutions of soda in water are also very useful. Should the fetid smell arise from a portion of dead bone, the latter must be removed whenever it becomes loose. Inhalations of steam from hot-water into which some creasote has been dropped, is much recommended for cases in which the cause

resides in the nose and respiratory passages. When, however, it is caused by digestive derangements, the treatment should consist in purging, to empty the intestinal canal, followed by soda, to correct acidity, and tonics, of which the bitter infusions and tinctures, and the dilute mineral acids, are among the best.

All medical treatment is unavailing to correct the foul odour which rises from the stomach of the habitual drunkard, or from the victim of gangrene or abscess in the lungs.

**BRE'CCIA**, a term adopted from the Italian to designate a mass composed of angular fragments of rocks of the same or different kinds, cemented together by an enveloping paste, or by infiltrated iron or carbonate of lime.

**BRECHE-D-E-ROLAND**, a defile of the Pyrenees, between France and Spain, about 11 miles south of St Jean de Luz, with an elevation of about 9500 feet above the sea. It is a difficult passage of from 200 to 300 feet in width, between precipitous rocks rising to a height of from 300 to 600 feet.

**BRECHIN**, a town of Forfarshire, on the left bank of the South Esk, 8 miles west of its junction with the sea at Montrose. Pop. (1871) 7959. It unites with Montrose, Arbroath, Forfar, and Bervie in returning one member to parliament. Spinning, bleaching, distilling, and brewing are carried on here, as also the manufacture of linens and sailcloth. B. was once a walled town, and contained an abbey of Culdees, instituted, it would seem, about the end of the 10th century. David I founded a cathedral and bishopric here in the 12th century. Part of the cathedral, built chiefly in the 13th, 14th, and 15th centuries, is now the parish church. Close to the church is a round tower, similar to the Irish ones and to the one at Abernethy, the only other example in Scotland. The tower is 85 feet high, 25 feet in diameter at the base, and 12½ feet at the top, and it is surmounted by a 15th c. spire of 25 feet. B. Castle, the ancient seat of the Maules, and now of their representative Lord Panmure, was taken by Edward I in 1303, after a siege of 20 days. B. was burned by Montrose in 1645; and near it, Huntly, on the part of James II., defeated the Crawfords in 1452. Gillies, the historian of Greece, and Dr Guthrie, the famous Scotch preacher, were natives of Brechin.

**BRECKNOCKSHIRE**, or BRE'CON, an inland county of South Wales, to the south of Radnor, from which it is separated by the Wye. Length, about 35 miles; average breadth, 20. Area, 719 square miles, of which two-thirds are cultivated. B. is one of the most mountainous counties in South Wales, and has deep, beautiful, and fertile valleys. Two principal mountain-chains, the highest in South Wales, rising with Brecknock Peaks to a height of 2862 feet, intersect the county in the north and south, and occupy, with their offshoots, a great part of the surface. Old red sandstone occupies the south and middle of the county, and Silurian rocks the north. The chief rivers are the Wye, Usk, Yrfon, Elan, Claerwen, and Tawe. The climate is severe and rainy but healthy among the mountains, and in the valleys comparatively mild. The agriculture, though still defective, especially in the higher districts, was greatly improved by the Brecknockshire Agricultural Society, instituted in 1755. The chief crops are oats and barley, but much wheat is also grown in Talgarth and Crickhowell, the most fertile districts of the county. In the valleys in the east some hops are raised, and some orchards are seen. The native small black-cattle are reared in the hills, while in the lowlands the Hereford breed

## BRECON—BREECH-LOADING.

predominates. The mineral produce is small, consisting of iron, especially along the south border; coal and limestone are also found in the south and west. The Brecon canal connects the county with the Bristol Channel, and many railways have been constructed, or are in progress. There are several small factories of woollens and worsted hosiery; also several important iron-works, but the ore is chiefly obtained from adjoining counties. B. returns one member to parliament. Pop. in 1871, 59,901. The chief towns are Brecon, the county and only corporate one, Builth, Crickhowell, Hay, and Llanelli. There are many remains of British and Roman camps, Roman roads, cairns, cromlechs, mounds, and castles throughout the county. B. formed part of the territory of the Silures, who bravely withstood the Romans. The Normans, under Barnard Newmarch, wrested the county from the Welsh princes in 1092. Llewelyn, the last British prince of Wales, was killed in this county in 1282, and by his fall the native mountain-chiefs were entirely subdued. Half the people in B. still speak Welsh.

**BRECON, BRECKNOCK, or ABERHONDDU,** the capital of Brecknockshire, South Wales, is situated in an open valley in the middle of the county, at the confluence of the Usk, Honddu, and Tarell, 171 miles west-north-west of London. It lies in the midst of fine mountain scenery, and has beautiful public walks. South of B. lie the three mountain-peaks, the Brecon Beacons. Pop. (1871) 5345. It returns one member to parliament. Flannels, coarse woollens, and hats are manufactured. Barnard Newmarch, a relative of William the Conqueror, founded the town, and built a castle here in 1094. He also founded two priories here in the reign of Henry I. Henry VIII. turned one of the priories into a college, still existing; the other is now the parish church. B. was formerly surrounded by a wall having ten towers and five gates. Hugh Price, founder of Jesus College, Oxford, and Mrs Siddons, the celebrated actress, were natives of Brecon.

**BREDA'**, a strongly fortified town of North Brabant, Holland, situated at the confluence of the navigable rivers Merk and Aa, and containing (1870) 14,756 inhabitants. It possesses the means of laying the surrounding country under water in the event of an attack, but the importance of the town, as a military position, is not so great as formerly. It has a Gothic cathedral, with a lofty tower and several interesting monuments; also an old castle built in 1350, which was for some time the residence of Charles II. of England, and now serves as a military academy. There are manufactures of carpets, linen, hats, soap, leather, &c., and dye-works, breweries, and rope-walks. It is celebrated as the place where, in 1588, the protest of the Dutch nobles, known as the 'Compromise of Breda,' against the measures of Philip II. of Spain in the Netherlands, was presented and scornfully rejected. During the subsequent centuries, it was the scene of much conflict and diplomatising until 1813, when the French were finally driven out. B. is now a station of the railway net.

**BRÉE, MATTHIAS IGNATIUS VAN**, an excellent Flemish painter, born at Antwerp 22d February 1773, and educated partly there, and partly under Vincent in Paris. As early as 1798, he attracted attention by his 'Death of Cato,' and several other excellent pictures soon followed. A peculiar talent for rapid and vivid sketching enabled B. to execute for Napoleon, in a few hours, 'The Manoeuvring of the Fleet before Antwerp on the Scheldt' and, with equal celerity, Napoleon's 'Entrance into Amsterdam, at the Moment when the Magistrate presents him with the Keys of the City.'

230

In 1816, he painted the famous Leyden burgomaster, Van der Werff, in the act of addressing the famished and murmuring populace during the siege of 1576: 'Take my body, and share it among you.' This great work—now in the town-house of Leyden—is marked by a felicitous arrangement of the figures, and by a bold and lively colouring, after the style of Rubens. Other celebrated pictures of B.'s are: 'Count Egmont receiving Spiritual Consolation before his Execution,' 'Rubens dictating his Dying Testament,' 'The Tomb of Nero at Rome, with a Group of Lazaroni-and Musicians.' B. died 15th December 1839. In the latter part of his life, he was Director of the Academy of Fine Arts at Antwerp.

**BRÉE, PHILIP JACOB VAN**, brother of the preceding, born 1786, also acquired some reputation as a historical painter.

**BREECH**, of a gun, is the end furthest removed from the muzzle. It always contains a great mass of metal, to enable it to withstand the shock occasioned by the explosion of the gunpowder. For details, see CANNON, HOWITZER, &c.

**BREECHES BIBLE.** See BIBLE.

**BREECHING**, of a naval gun or carronade, is a strong rope by which the recoil of the gun is checked at such a point that the muzzle is brought wholly within the port-hole, where the seamen can sponge and reload it.

**BREECH-LOADING**, in Artillery, relates to a mode of constructing large pieces of ordnance, and small-arms or hand-firearms, the peculiar manner of charging which the term describes. This subject is now occupying much attention, and the patented inventions relating to it are very numerous. The Armstrong gun (see ARMSTRONG), among others, is a breech-loader; and so is the Whitworth gun. A considerable amount of additional mechanism is necessary for this purpose; seeing that the breech must be so far opened as to admit of the introduction of a ball or shell, and a cartridge, and then so firmly closed as to resist the immense pressure occasioned by the explosion. The objects sought to be attained by this change from the old system are many—quickness in loading, ease in cleaning after firing, accurate adjustment of the diameter of the ball to the calibre of the gun, facility in making the ball accommodate itself to the spiral rifle-grooves of the piece, &c.; but it is still a contested question, especially between the rival inventors of breech-loaders and muzzle-loaders, to what extent these objects are attained. In relation to muskets and fowling-pieces, Mr Greener, of Birmingham, who has written much on the subject, disputes the usefulness of B.; he denies that it is more safe, more accurate, or more forcible than muzzle-loading; while certain advantages which it may possess are, he thinks, counterbalanced by the greater cost of the weapon.

The annexed cut—for which, together with the

Breech-loading Rifle.

description, we are indebted to Stonehenge's excellent work, *The Shot Gun and Sporting Rifle*—represents part of the mechanism in one of the many

kinds of breech-loaders—viz., the Le Faucheur or French crutch gun, invented about 20 years ago, and now largely made in England as well as in France: *a* is a lever which opens the mechanism, but which lies flat against the gun at other times; *d* is a notch which, when a hook is liberated from it, allows the barrels to be so adjusted as to be easily loaded at their breech end; *c* is a central pivot around which the movement is made; *b* is a slide that assists in the opening and closing. At 14 is a pin which, when struck by the hammer, transfers the blow to a cap inserted in the cartridge. The relative merits of breech and muzzle loading fowling-pieces were tested in 1859—60 by various trials, under the management of the editor of *The Field*, and resulted in favour of the breech-loaders. The demand for the latter has, in consequence, enormously increased.—This subject receives further notice in various parts of the Encyclopedia, in relation to certain kinds of ordnance and small-arms expressly constructed on the B. principle. See BREECH-LOADING in SUPP., Vol. X.

BREED, in domestic animals, a variety, or often merely a race distinguished by the possession of particular qualities, but not differing from the ordinary type of the species so as to constitute what naturalists usually designate a variety. The peculiarities of breeds in animals find an exact counterpart in cultivated plants, the value of particular kinds often depending, in a great measure, upon characters scarcely capable of being defined in the language of scientific description, but to the production and perpetuation of which the attention of the cultivator cannot be too earnestly directed. These, also, in plants, as in animals, have of themselves little permanence, and the preservation or perpetuation of them depends upon the same assiduous attention and high cultivation from which, more frequently than from any mere accidental circumstances, they have originated. Thus it happens that the most improved varieties of garden-plants usually degenerate even under ordinary horticultural treatment, and the choice pincers of the florist lose their characteristic excellences if a place is simply assigned to them in a common flower-border. The improvements which cultivation has effected in the productions of the fruit, flower, and kitchen garden do not, however, possess an economic importance to be compared with that of the similar improvements in the cereals and other plants cultivated on the most extensive scale, or in the breeds of some of the most valuable domestic animals. To the breeding of these, great attention has of late been paid—probably more since the beginning of the 19th c. than in all the previous history of the world—and with results the magnitude of which may in some measure be estimated from the statement made on very competent authority, that within the last thirty years the weight of mutton produced has been about doubled in proportion to the number of sheep kept. To the improvement of the B. of horses, attention has been paid for a much longer time than to that of oxen and sheep; and to this must, in a great measure, be ascribed the different excellences of some of the well-known breeds employed for very different purposes. The use of the horse in war, and for purposes of pomp and luxury, appears to have been the reason of the higher degree of attention thus paid to it, even from ancient times. The Arabs have long been particularly careful of the B. of their horses, and diligently preserve a record of their pedigree. What is called blood in horses, however, only fits them in a higher degree for certain purposes; and with regard to this as to other animals, the judgment of the breeder must be

exercised, as the perpetuation, increase, or combination of particular qualities may be the object which he has in view. Fleetness and strength are important qualities in horses, the extremes of which never co-exist in the same animal, but of which a certain combination is for some purposes very desirable; and either of these may be displayed in a great degree without much bottom, or power of enduring continued severe exertion—a quality of very high value. The properties most desired in sheep and oxen are very different from those most highly esteemed in the horse—the fleece and the flesh being chiefly regarded in sheep, the flesh and the milk in oxen. Sometimes a perpetuation of good qualities is the great object of the breeder, and a combination of them in the highest possible degree is aimed at; sometimes, the production of the largest possible quantity of beef or mutton in the shortest time being almost exclusively designed, the breeder neglects considerations which would be of importance if his stock could not be improved by animals obtained from other quarters. Extraordinary differences are certainly found to exist among animals of the same species in the readiness with which they convert food into flesh and fat, and in the age at which they are fit for the hands of the butcher. One effect of the attention bestowed of late upon the breeding of stock, has been to supply the market, to a great extent, with the flesh of younger animals than could previously be sent to it—a change evidently tending not only to the benefit of the farmer, but to the increase of the national wealth; because that land, even without increased produce of grass, sends a greater amount of beef and mutton to market within the same term of years. Those sheep and oxen which exhibit in the highest degree the qualities just referred to, are also characterised by shortness of legs, smallness of bones, smallness of head, and fineness of skin; qualities the very opposite of those which would fit the animal for a wild state and an independent existence.

Some of the most important breeds of domestic animals will be mentioned under their proper heads. It remains for us only to allude here to the rules and physiological principles of breeding; but the latter, in so far as application of them has yet been found practicable, are only the best known principles of physiology (q. v.). In a great measure, however, the rules which guide the breeding of stock have been learned by experience, and are rather to be regarded as contributions to science than as deductions from it. The probable relative influence of the male and female parent upon their progeny, is a point unquestionably of the greatest importance, but concerning which widely different opinions have been maintained; and another much controverted and important point is, the propriety of breeding in and in. Practically, the rule is always observed by those who seek the improvement of a breed, of selecting the very finest animals possible, both male and female; although a great improvement of the existing stock on a farm is often effected in the most advantageous manner by the mere introduction of males of better quality. The dangers of breeding in and in are very generally acknowledged, even whilst it is contended that they may very much be obviated by careful rejection of every faulty animal, and that in this way the utmost advantage may be taken of the very highest improvements; but it is likewise very generally admitted that, if equally improved individuals can be obtained not so nearly related, it is better to seek the perpetuation of the B. by their means. It is a rule also of much practical importance, that an improvement of B. is to be attained not by a cross between animals of very different breeds, as between

a dray-horse and a race-horse, but only between those which are comparatively similar. The result of the intermixture of very dissimilar breeds is never in any respect satisfactory.

**BREEDÉ**, a river in Cape Colony, flowing chiefly through the district of Zwellendam, which contains Cape Agulhas, the most southerly point of Africa. It rises in the Warm-Bokkeveld, a mountain-basin about lat. 33° 10' S., and long. 19° 30' E., running first to the west, and afterwards to the south-east; and it enters St Sebastian's Bay or Port Beaufort, from which, upwards, it is navigable to a distance of 40 miles. Its exports are wool, aloes, skins, feathers, grain, butter, cattle, mules, &c.

**BREEZE.** See WIND.

**BREGENZ**, a frontier town of Austria, capital of the district of Vorarlberg, is situated at the mouth of the small river Bregenz, which here flows into the Lake of Constance, between the Swiss and Bavarian territories, about 80 miles west-north-west of Innsprück. From the ruins of the castle of Hohenbregenz, on a hill near the town, a very beautiful prospect is obtained of the lake and its surrounding vineyards, &c. B. is one of the oldest towns, and was formerly one of the chief fortified places in the southern part of Germany. The inhabitants, about 3000 in number, are engaged in agriculture, horticulture, and cattle-keeping. Cotton-spinning and weaving are also carried on; and articles of wood, gold, and iron are manufactured. Its position secures B. a large transit-trade in the produce of the district. In the neighbourhood lies the mountain-pass, the *Bregenzer-Klause*, formerly a strong military position between Swabia and the Tyrol. During the Thirty Years' War, the Swedes, in 1646, stormed and captured the fortress of B., and destroyed the works in the pass.

**BREHON LAWS** (in Irish, *Dlighidh Breitheamhuis*—that is, ‘judges’ laws’), the name usually given to the system of jurisprudence which prevailed among the native Irish from an early period till towards the middle of the 17th century. The *breitheamhuis* (pronounced *bri-hoo-in*, or *brehon*), from whom the laws had their name, were hereditary judges, who administered justice among the members of their tribe, seated in the open air, upon a few sods, on a hill or rising ground. The poet Spenser, in his *View of the State of Ireland*, written in 1596, describes the B. L. as ‘a rule of right unwritten, but delivered by tradition from one to another, in which oftentimes there appeareth great share of equity, in determining the right between party and party, but in many things repugning quite both to God’s law and man’s: as, for example, in the case of murder, the brehon—that is, their judge—will compound between the murderer and the friends of the party murdered, which prosecute the action, that the malefactor shall give unto them, or to the child or wife of him that is slain, a recompence, which they call an *eric*; by which vile law of theirs many murders amongst them are made up and smothered: and this judge being, as he is called the lord’s brehon, adjudgeth for the most part a better share unto his lord, that is, the lord of the soil, or head of the sept, and also, unto himself for his judgment, a greater portion than unto the plaintiffs or parties grieved.’ Spenser was ignorant that pecuniary compensation for manslaughter had obtained in the ancient laws, as well of England as of most European nations. He was mistaken, too, in believing that the B. L. was an unwritten code. Many manuscript collections of the B. L. still exist in public and private libraries in Ireland, England, and Belgium. These manuscripts are regarded as

varying in date from the early part of the 14th to the close of the 16th century. For the laws themselves, a much higher antiquity is claimed. On this point, we must be content to quote what has been said on the part of the very few persons who have had an opportunity of making themselves acquainted with the existing collections of the brehon laws. ‘So far as we have external evidence to guide us,’ say Dr J. H. Todd and Dr C. Graves, two eminent Irish antiquaries, ‘there is no reason to suspect that the brehon laws have undergone any material change since the time of Cormac Mac Cuileannain, king and bishop of Cashel, who died 908 A. D. He was a man of great learning and energy, who certainly promoted the execution of considerable literary works, and under whose influence it is not improbable that a systematic compilation of the laws may have been effected. Of this, however, we have no distinct record. On the other hand, we find scattered through all parts of the laws allusions to a general revision of them made in the 5th c. at the instance of St Patrick, who, in conjunction with certain kings and learned men, is said to have expunged from them all those institutions which savoured of paganism, and to have framed the code called the *Seanchus Mor*. These same documents assert the existence of still more ancient written laws, the greater part of which are ascribed to Cormac Mac Art, monarch of Ireland, in the middle of the 3d century. However slow we may be to acquiesce in statements of this kind, which contradict what we have learned concerning the progress of legislation in the remaining parts of Western Europe, we may readily admit that the subject-matter of many of the laws demonstrates their great antiquity, as it indicates the primitive nature of the society in which they prevailed. In spite of the attempts to efface it, traces of heathenism are still discernible in many parts of them. They enumerate various ordeals of a pagan character, which are expressly termed *magical*, and specify the occasions on which a resort to them was prescribed. There are also provisions in the laws of marriage which prove that Christianity could have exercised but a feeble influence at the time when they were enacted. The language in which the brehon laws are written is a convincing proof of their antiquity. They are not composed in a peculiar dialect, as many writers have maintained; but if their style differs from that of the vernacular Irish of the present day, as Anglo-Saxon does from modern English, this dissimilarity is to be ascribed mainly to the effects of time, by which the orthography and grammatical forms of the language have been modified, and legal terms and phrases of constant recurrence have become obsolete.’ The world of letters will be able, in no long time, to judge for itself on the opinions thus expressed. It is now upwards of twenty years since the publication of the B. L., at the charge of the Irish government, was strongly urged by such men as Guizot, Grimm, and Ranke abroad, and Hallam, Macaulay, and Earl Stanhope at home. A commission was accordingly appointed by the Earl of Eglington in 1852, ‘to direct, superintend, and carry into effect the transcription and translation of the ancient laws of Ireland, and the preparation of the same for publication.’ The commissioners intrusted the transcription and translation of the B. L. to the two most eminent of Irish scholars—the late Dr John O’Donovan, professor of Celtic in the Queen’s College at Belfast; and the late Eugene O’Curry, professor of Irish archaeology in the Roman Catholic university of Ireland. These gentlemen having finished their task, the editorship of the work was intrusted to Mr W. J. Hancock, late professor of political economy in Trinity College, Dublin, and the Rev.

Thaddeus O'Mahony, professor of Irish in the university of Dublin. The publication, it is reckoned, will extend to eight volumes, of about 550 pages each. Three of these have already appeared—the last in 1873—under the title of *Ancient Laws and Institutes of Ireland*. Along with the Irish text, an English translation is given, accompanied with preliminary dissertations, glossaries, and indexes, and they give a vivid and characteristic picture of the polity and social life of a Celtic people. A facsimile reprint of the B. L. has recently been published in 17 volumes by the B. L. Commission.

BREISA'CH, ALT., a very old town of the grand duchy of Baden, situated on an isolated basalt hill on the right side of the Rhine, about 12 miles west of Freiburg. As early as the time of Julius Caesar, *Mons Brisiacus* was known as a strong military position, and was taken by Ariovistus when he invaded Gaul. Being regarded as the key to the west of Germany, it was a prominent scene of action during the Thirty Years' War, at the conclusion of which it was ceded to the French. During the next century, it frequently changed masters, now belonging to France, and now to Austria. The French destroyed its fortifications in 1744, and during the war of the Revolution in 1793, part of the town was burned by them. In 1806, the French handed it over to the House of Baden. The minister of St Stephen is a venerable structure in good preservation, and contains several old monuments. Pop. 3200.

BREI'TENFELD, a village and manor of Saxony, about 5 miles north of Leipsic. It is historically remarkable for three battles, fought on a plain in its neighbourhood. The first of these, between the Swedes and the Imperialists, which was fought on the 7th September 1631, was of the highest importance to Europe, as it secured the permanency of Protestantism and the freedom of Germany. Tilly's pride had reached its highest point after the fall of Magdeburg, which took place on the 10th of May 1631; and in the early part of September of the same year, he advanced against the Saxons, with an army of about 40,000 men, for the purpose of forcing the elector, John George I. (who would not submit to the edict of restitution, and was treating with the Swedish king, Gustavus Adolphus), into an alliance with the emperor. No other way remained than for the elector to join the Swedish king, who had just entered Pomerania. Gustavus Adolphus, joined by the Saxons, advanced towards Leipsic, where Tilly lay, who advanced into the plain of Breitenfeld. The imperial forces were completely defeated, and their three most distinguished generals, Tilly, Pappenheim, and Fürstenberg, wounded. The second battle which B. witnessed again resulted in the triumph of Swedish valour: it took place on the 23d of October 1642, between the Swedes, headed by Torstenson, one of the pupils of Gustavus, who had invested Leipsic, and the Archduke Leopold, with General Piccolomini, who were advancing from Dresden to its relief. The Swedes gained a complete victory over the Imperialists, who fled into Bohemia, leaving behind them 46 cannon, 121 flags, 69 standards, and the whole of their baggage. The third battle of which B. was the scene, was fought on the 16th of October 1813, and was part of the great contest known as the battle of Leipsic.

BREMEN, one of the four free cities of Germany, is situated on the Weser, about 50 miles from its mouth. Pop. (1871) 82,807, nearly all Protestants. B. is divided into the old and the New Town—the former on the right, the latter on the left side of the river, which is spanned by

two bridges. The ramparts and bastions round the old town have been levelled, and formed into public promenades, which are laid out with excellent taste. Among the principal buildings, the Cathedral (built about 1160), the Gothio Town-hall (begun about 1405), with its famous wine-cellars, said to contain hock of the vintage of 1624, the Exchange, the Museum, and the Observatory of Dr Olbers, from which he discovered the planets Pallas and Vesta, are remarkable. The position of B. makes it the emporium of Brunswick, Hesse, and other countries through which the Weser flows. Besides its excellent water-communication, it is connected by railways with the whole of Western and Central Germany. B. is an exceedingly thriving place, its trade having more than doubled within the last ten years. Large vessels stop at Bremerhafen, where there is a spacious harbour constructed, about 38 miles below B., with which it is connected by electric telegraph. Vessels not drawing more than 7 feet of water can come up to the town itself. B. carries on an extensive commerce with the United States of America, the West Indies, Africa, the East Indies, China, and Australia. Its great foreign trade, however, is with the United States, from which alone, in 1869, it imported produce of the estimated value of 20,000,000 dollars, exporting in return goods to the value of 15,000,000 dollars. With the exception of Liverpool, no port in Europe ships so many emigrants to the United States as B., through its main port at Bremerhafen. The total number of vessels arriving at B. in 1869 was 3032, and the number departing, 3176. The number of ships belonging to the port in January 1870 was 300, with an aggregate burden of 212,874 tons. In 1869, the value of the imports amounted to £15,000,000, exports to about £14,000,000, a very great increase as compared with the year 1858, when the imports were valued at £8,237,000, and the exports at about £8,000,000. The chief imports are tobacco, coffee, sugar, cotton, rice, skins, dye-woods, wines, timber, hemp, &c. The exports consist of woollen goods, linens, glass, rags, wool, hemp, hides, oil-cake, wooden toys, &c. Large quantities of tobacco are re-exported. B. has manufactures of woollens and cottons, cigars, paper and starch, and extensive ship-building yards, breweries, distilleries, and sugar-refineries. The cigar and sugar manufacturers have of late declined, the former on account of the increase of duty. In 1851, it is said that 5000 hands were engaged in making cigars. It has steam-communication with New York, and Hull, Havana, the north coast of South America, &c.

B. first became of historical note in the 8th c., when it was erected into a bishopric by Charlemagne. It soon attained considerable commercial importance, and became one of the principal cities of the Hanseatic League (q. v.). Having frequently suffered at the hands of the French, it was, in 1810, incorporated with that empire; but it recovered its independence in 1813, and by the Congress of Vienna was admitted, in 1815, as one of the Hanse towns, into the Germanic confederation. In 1867, it became a member of the North German confederation, and now it forms part of the German empire. The area of the territory, of which it is the capital, is about 100 square miles; pop., including the town of B. (1871), 122,402. The government is intrusted to a senate composed of four burgomasters, two syndics, and twenty-four councillors, and to a convention of resident burgesses.

BREMER, FREDERIKA, the well-known Swedish novelist, was born at Abo, in Finland, in 1802; but when she was only three years old, her father removed to Sweden, where he became a landed proprietor. According to the accounts of it given by herself in

a letter to her friend and translator, Mrs Howitt, her early life appears to have been outwardly uneventful, though 'with humility she confesses that she always regarded herself as a heroine.' As a child of eight, she had already begun to write verses; and the works of German poets, Schiller more especially, exercised a most powerful influence over her youthful imagination. Her original novels first made their appearance under the general title *Tekningar ur Hvardaglivet*, at Stockholm, in 1835. It was not, however, till 1842 that the English public hailed with delight the appearance, in an English dress, of *The Neighbours*, perhaps the most universally popular of all Frederika B.'s charming pictures of domestic life in Sweden. Encouraged by its enthusiastic reception, Mrs Howitt subsequently published translations of *The Diary*, *The H. Family*, *The President's Daughters, Brothers and Sisters*, *Life in Dalecarlia*, and *The Midnight Sun*. In 1843, Miss B. visited the United States, and there spent two years, passing some time in England on her return. In her *Homes of the New World*, published simultaneously in England, America, and Sweden, in 1853, she not only presents us with exquisite descriptions of scenery, and vivid pictures of social life, but with sound and comprehensive views on political and moral subjects. Returning to her home in Sweden, to find a beloved sister removed from it by death, Miss B. devoted her talents and energies no longer to literature, but to the carrying out of certain philanthropic objects, in which she had throughout life felt deep interest, more especially the education of the poorest classes. As a writer of fiction, she is distinguished for feminine delicacy, shrewd sense, humour, deep knowledge of human nature, and a graphic and forcible style. Her works have been translated into almost all the languages of Europe. She died in 1865. Her Life and unpublished writings were issued by her sister in 1868.

BRENNUS, the name, or rather the title of several Gallic princes, is probably a Latinized form of the Kymric word *Brennus*, which signifies a king. The most famous B. was that leader of the Gauls who, in 390 B.C., crossed the Apennines, and hurrying through the country of the Sabines, at the head of 70,000 men, encountered and overthrew on the banks of the Allia (q. v.) the Roman army. Had the barbarians immediately followed up their advantage, Rome might have been obliterated from the earth; but instead of doing so, they abandoned themselves to drunken delights on the battle-field, and gave the Romans time to fortify the Capitol, whither were removed all the treasures and holy things of the city. When B. entered the gates, he found that all the inhabitants had fled, with the exception of the women, children, and old men, the last of whom, with pathetic heroism, had resolved not to survive the destruction of their homes, and so, the chief among them, clothed in their robes of sacerdotal or consular dignity, and sitting in the curule chairs, waited the approach of their enemies, and received their death in majestic silence. B., having plundered the city, now besieged the Capitol for six months. During the beleaguerment occurred the famous night-attack, which would have been successful had not the cackling of the geese, kept in Juno's temple, awakened the garrison. At length, however, the Romans were compelled to enter into negotiations with the besiegers. They offered 1000 lbs. of gold for their ransom, which was agreed to. According to Polybius, B. and his Gauls returned home in safety with their booty; but the rather mythical Roman traditions affirm that, just as the Gauls were leaving the city, Camillus, who had been recalled from banishment, and appointed dictator, appeared at the head of an army, attacked them,

and, in two bloody battles, slew the whole of the barbarians to a man.

Another B., who occupies a conspicuous place in history, was that Gallic chief who invaded Greece, 279 B.C., at the head of 150,000 foot and 61,000 horse. After desolating Macedonia, B. forced his way through Thessaly to Thermopyla. The Grecian army fled at his approach. B. now rushed on with a division of his great host to Delphi, which he had resolved to plunder; but the Delphians, having taken up a very advantageous position on some rocks, resisted his further progress. Assisted by the terrors of an earthquake and a terrible storm, besides, according to reverential tradition, by the supernatural help of Apollo, they utterly routed the Gauls, who fled in dismay. B. was taken prisoner, and drank himself to death in despair.

BRENT GOOSE, or BRENT BARNACLE. This bird has been already noticed under BARNACLE (q. v.). We add here a few sentences from Colonel Hawker's *Instructions to Young Sportsmen*, which we borrow from Yarrell's *British Birds*. They refer to wild-fowl shooting on the coasts of Dorsetshire and Hampshire. 'Towards November or December, we have the Brent Geese, which are always wild, unless in very hard weather. In calm weather, these geese have the cunning, in general, to leave the mud as soon as the tide flows high enough to bear an enemy; and then they go off to sea, and feed on the drifting weeds. To kill Brent Geese by day, get out of sight in a small punt, at low water, and keep as near as possible to the edge of the sea. You will then hear them coming like a pack of hounds in full cry, and they will repeatedly pass within fair shot, provided you are well concealed, and the

Brent Goose.

weather is windy to make them fly low. Before you fire at them, spring suddenly up, and these awkward birds will be in such a fright as to hover together and present a mark like a barn-door.—The extensive muddy and sandy flats between Holy Island and the coast of Northumberland are a great winter resort of this species. It is also particularly abundant on muddy and sandy flats in Cromarty Bay. The markets, both of London and Edinburgh, are well supplied with it during winter. The B. G. is known in some parts of England as the Black Goose; it is considered the most delicate for table of all its tribe, and is perhaps as much sought after as any. The B. G. differs in its habits from the common gray lag and several other species, inasmuch as it never feeds on fresh-water herbage, its tastes being exclusively saline. B. G. may be distinguished, when on the wing, by their black bodies and white tails. Folkard, in his excellent work *The Wild Fowler*, gives much interesting information regarding this bird.

BRENTA (*Medoacus Major*), a river of North Italy, rises from two small lakes in the Tyrol; flows first in a southern, then in an eastern course through the Venetian territory; passes the towns Ciamona and Bassano; receives an arm of the Bacchiglione below Padua, where it becomes navigable; and falls into the Gulf of Venioe, at the haven of Brondolo. The ancient bed of the B. was, some centuries ago, altered by the Venetians, who feared that their lagoons might be choked with sand by its floods. Afterwards, the old bed of the river was made use of as a canal—the *Naviglio di Brenta Magra*, which forms the chief communication by water between Venice and Padua; while the B. is but little used for navigation.

BRENTANO, CLEMENS, known as a novelist and dramatic poet, and as the brother of Goethe's 'Bettina,' was born at Frankfort-on-the-Main, 1777. He studied at Jena, and afterwards resided successively at Frankfort, Heidelberg, Vienna, and Berlin. In 1818, through a morbid discontent with himself and his fellow-men, he retired to the cloister at Dülmen, in Münster. Latterly, he resided at Regensburg, Munich, and Frankfort-on-the-Main, where he led the life of a recluse, and gained a considerable reputation on account of his sarcastic wit. He died at Aschaffenburg, on the 29th of June 1842. In his earliest poems the peculiarities of the 'romantic school' of his time are carried to excess. His dramatic productions, such as *The Merry Musicians, a Musical Drama* (Frankfort, 1803), in which there are some gems of lyric poetry, *Ponce de Leon* (Göttingen, 1804), &c., are characterized by great dramatic power, amusing though rather far-fetched wit, and a wonderful flow of humour. Perhaps his most successful piece as a drama is *The Founding of Prague* (Pesth, 1816). B. was most successful in his smaller novels, particularly in the *History of Caesar the Brave and the Fair Anerl* (2d edit. Berlin, 1831), which German critics call a 'chef-d'œuvre in miniature.' His last work, the legend of *Gokel, Hinkel, and Gakelis* (Frankfort, 1838), was intended as a satire upon the times in which he lived. He has received the grateful acknowledgment of his countrymen for his renovation of the good old history of George Wickram of Kolmar, which he published under the title of *The Thread of Gold* (*Der Goldfaden*, Heidalb. 1807).

BRENTFORD, the county town of Middlesex, on both sides of the Brent, at its confluence with the Thames, 7 miles west-south-west of London, and where the Thames is crossed by a bridge leading to Kew. It consists chiefly of one long irregular street. Pop. (1871) 11,091. It has large gin-distilleries, a soap-work, and the works of the West London Water Company. There are many market-gardens in the vicinity. Here Ironside defeated the Danes in 1016, after expelling them from London; in 1558, six martyrs were burned at the stake; and in 1642, the Royalists under Rupert defeated the Parliamentarians under Colonel Hollis.

BRESCIA, a city of Italy, capital of the province of the same name, in Lombardy, about 60 miles east-north-east of Milan. It is romantically situated on the rivers Mella and Garza, in a wide fertile plain, at the base of several hills. The railway from Milan to Venice passes through Brescia. The city is for the most part regularly built, and, besides two cathedrals, the old and the new, it has numerous ancient churches, adorned with pictures and frescoes, including many by masters of the Venetian school. Several interesting antiquities have been discovered. It has a valuable public library, the *Biblioteca Quiriniana*, founded and nobly endowed about 1750, by Cardinal Quirini, a munificent encourager of

literature. It contains upwards of 30,000 volumes, with many rare manuscripts. The population in 1872 was 38,906. B. has manufactures of woollen, silk, leather, paper, &c., and its wine is of good quality. The old name of B. was *Brixia*, and its inhabitants were allied with the Romans when Hannibal crossed the Alps. It was captured by the Huns during their migrations, and afterwards passed through the hands of the Longobards, Charlemagne, the Franks, and the Germans. It was taken by the French under Gaston de Foix, in 1512, when it is stated that more than 40,000 of the inhabitants were massacred. The city never fully recovered from the effects of that inhuman sack and pillage. In March 1849, B., as the only important town opposed to Austrian rule in Lombardy, was besieged by Haynau, and forced to capitulate.

BRESLAU, the capital of the province of Silesia, Prussia, is situated at the confluence of the Ohlau and Oder. Next to Berlin, it is the most populous city in Prussia, its inhabitants numbering (1871) 207,997, more than the half of whom are Protestants. The Oder divides it into two parts, which are connected by numerous handsome bridges. The fortifications have been converted into beautiful promenades, and the ditch has been transformed into an ornamental sheet of water. The streets of the new portion of B. are spacious and regular, and the houses stately and handsome, affording a pleasant contrast to the sombre, massive structures of the old town. Educational institutions are numerous, including a university founded by the Emperor Leopold I. in 1702, and now accommodating from 900 to 1000 students. The library contains 300,000 volumes. B. has many churches, the most remarkable being the Protestant church dedicated to St Elizabeth, with a steeple 364 feet in height (the highest in Prussia), and a splendid organ. The position of B., in the centre of the manufacturing districts of the province, secures it a large trade, which its railway connection with all the important cities on every side, in addition to the facilities of communication which the Oder affords, enables it to turn to the best account. It has manufactures of linen, woollens, cotton, silks, lace, jewellery, machines, earthenware, soap, alum, starch, &c., and upwards of 100 distilleries; and a trade in corn, coal, metals, timber, hemp, and flax. B. is a city of Slavonic origin, and was for many centuries occupied alternately by the Poles and the Bohemians. It afterwards passed to Austria, from which it was taken by Frederick II. of Prussia, in 1741. Six years afterwards, it was captured by the Austrians, after a bloody battle, but retaken by Frederick in about a month. From that time until 1814, when its fortifications were completely demolished, it was frequently besieged.

BRESSAY, one of the Shetland Isles, east of the Mainland, and separated from Lerwick by Bressay Sound. It is 8 miles long and 2 broad, and is composed of Devonian rocks. It supplied Lerwick with peat until the proprietor, fearing that the peat might be exhausted, stopped exportation; and it continues to supply the Shetland Isles with slates. Pop. (1871) 878, chiefly fishermen. Bressay Sound is one of the finest natural harbours in the world, and is a rendezvous for herring-boats, and for all whalers and other vessels proceeding north. East of B., and separated from it by a narrow and dangerous sound, is a rocky isle, called Noss, 6 miles in circuit, girt on all sides by perpendicular cliffs, and rising abruptly from the sea to the height of nearly 600 feet, with a flattish top. A detached rock, or holm, on the south-east side of the Noss, is communicated with by means of a cradle or wooden chair run on strong

ropes, stretched across a yawning gulf, and admitting a man with a sheep to be drawn over at a time.

BREST, a strongly fortified city, in the department of Finistère, France, and one of the chief naval stations of the empire, is situated in lat. 48° 24' N., and long. 4° 29' W., on the north side of the Bay or Road of Brest, which forms one of the finest harbours in the world, having ample room for 500 ships of the line. The only entrance to the bay is by a narrow channel called *Le Goulet*, which is scarcely a mile wide, and is strongly defended by batteries; the difficulty and danger of access to hostile ships being increased by certain rocks which, rising in the centre of the channel, oblige vessels to pass close in front of the guns of the forts. The small river Penfle flows through the town, which is, on the whole, irregularly built on an uneven site, and has steep, narrow, dark, and very dirty streets. In some parts, communication between the lower and upper parts of the town can be effected only by stairs. The new quarter, the parade, and the quays, are more cleanly. B. has extensive ship-building yards, rope-walks, store-houses, &c.; its industry, indeed, is confined entirely to the equipment of the navy in its various branches. The Bagnes (q. v.) or hulks no longer exist, the prisoners having been removed to the penal colony of Cayenne. Pop. (1872), exclusive of garrison, 50,883. B. is a very ancient place, but it was not of much importance until the 17th century. Its splendid position made it an object of contention to French, English, and Spaniards. In 1631, Cardinal Richelieu resolved to make it a naval station, and commenced the fortifications, which were completed by Vauban, but have since been greatly extended. In 1694, the English under Lord Berkley were repulsed here with great loss. In 1794, the French fleet, under Admiral Villaret-Joyeuse, was defeated off B. by the English fleet under Admiral Howe, who captured six ships of the line, and sank another.

BRETAGNE, or BRITTANY (*Britannia Minor*), a peninsula in the north-west of France, formerly a province, and now divided into the departments of Finistère, Côtes-du-Nord, Morbihan, Loire-Inférieure, and Ille-et-Vilaine, is surrounded by the sea on the N., W., and S. W. Though the height of the mountains is nowhere considerable, their structure gives to the peninsula a wild and savage aspect. Clay-slate forms the centre of the country, and masses of granite rise in the north and the south. The climate is often foggy, and subject to violent storms of wind. Large tracts of land lie uncultivated; but in the well-watered valleys, vegetation is luxuriant. In ancient times, B., under the name of Armorica, was the central seat of the confederated Armorican tribes, who were of Celtic and Kymric origin. Traces of them still remain in the old Kymric dialect of the three most westerly departments, and in the numerous so-called Druidical monuments. The name *Armorica* was changed for that of B., in consequence of the numerous immigrations from Great Britain in the 5th and 6th centuries. The peculiar, shut-in situation, and the characteristics of soil and climate in B., seem to have had a powerful effect on the character of its people. The Breton has generally a tinge of melancholy in his disposition; but often conceals, under a dull and indifferent exterior, a lively imagination and strong feelings. 'The tenacity with which the Breton clings to the habits and belief of his forefathers, is apparent by his retention of the Celtic language almost universally in Basse B., and by his quaint costume, which in many districts is that of the 16th century.' The greater number of the people are found to be ignorant and coarse in their

manners, and their agriculture is of a very rude character, by no means calculated to develop the natural resources of the country. Until within recent years, B. had escaped the observation of tourists; but it has now been found out, and seems likely to be considerably run upon, as well as to have a pretty extensive literature of its own. It will be some time yet before it is exhausted, and apart from the beauty of its scenery, it possesses great interest, as the only place where men can be seen living and acting much as our forefathers did three centuries ago. Under the Romans, the country, after 58 B.C., was made the *Provincia Lugdunensis Tertia*; but its subjugation was hardly more than nominal, and it was entirely liberated in the 4th c., when it was divided into several allied republican states, which, afterwards, were changed into petty monarchies. B. became subject to the Franks in the reign of Charlemagne, and was handed over by Charles the Simple to the Northmen in 912. After some fierce struggles, the Bretons appear to have at length acknowledged the suzerainty of the Norman dukes. Geoffroi, Count of Rennes, was the first to assume the title of Duke of Bretagne in 992. The duchy of B. was incorporated with France in 1532, by Francis I., to whom it had come by marriage, and subsequently shared in the general fortunes of the empire, but retained a local parliament until the outbreak of the Revolution. During the Revolution, B., which was intensely loyal, was the arena of sanguinary conflicts, and especially of the movements of the Chouans (q. v.), who reappeared as recently as 1832. Darn, *Histoire de B.* (Par. 1826); Roujoux, *Histoire des Rois et des Ducs de B.* (Par. 1829); Courson, *Histoire des Peuples Bretons dans la Gaule et dans les Iles Britanniques*. (Par. 1847).

BRETIGNY, a village of France, in the department of the Eure-et-Loir, about 6 miles south-east of Chartres, on the railway between Paris and Orleans. B. is celebrated as the place where, in 1360, Edward III concluded a peace with France, by which John II. of France was released from his captivity in England, on agreeing to pay 3 million crowns for his ransom, England renouncing her pretensions to Normandy, Anjou, Maine, and Touraine, and being confirmed in her possession of Gascony, Guienne, and several other parts in France recently acquired by conquest.

BRETON DE LOS HERREROS, DON MANUEL, the most popular of modern Spanish poets, was born 19th December 1800, at Quel, in the province of Logroño; received his earliest education in Madrid; and served as a volunteer in the army from 1814 to 1822. Subsequently, he held several situations under government, but always lost them on account of his expression of liberal opinion. As early as his 17th year, he wrote a comedy, entitled *A la Vieja Viruelas*, which, in 1824, was brought upon the stage with great success. Since then, he has furnished theatrical managers with more than 150 pieces, partly original, partly adaptations from the older Spanish classics, and partly translations from the Italian and French, most of which have been highly popular. In addition to these, B. has published *Poesías Suetas* (Madrid, 1831, and Paris, 1840); several volumes of satirical verse; a long humorous poem, called *La Desvergenza, Poema Jocoso* (Madrid, 1858), &c. All B.'s poems are remarkable for their singularly sweet, yet powerful diction, and for the harmony of the versification. His peculiar sphere is the comic and the satirical, in which the Spanish or national qualities of his genius find their freest expression, and in which also he displays most ease and self-reliance.

A complete edition of B.'s works, excepting *La Desverguenza*, was commenced at Madrid in 1850.

**BRETSCHNEIDER, HEINRICH GOTTFRIED**, a man remarkable for his unsettled life, eccentric habits, and satirical writings, was born at Gera, March 6, 1739. He was first sent for education to the Institute of Herrnhuters at Elbersdorf, and afterwards to the Gymnasium at Gera. He became captain of horse in a Prussian volunteer corps, in which service he was made prisoner, and retained in a French fortification till 1763. In 1775, B. visited England, France, and Holland; and in 1778 was nominated librarian to the university of Ofen, where he was persecuted by the Jesuits, whose hatred he had excited. This circumstance brought him under the notice of Joseph II., who, in 1782, appointed him one of the inspectors of studies. He died 1st November 1810. B. was the author of tales, poems, and satire. The latter are attacks upon every kind of injustice and falsehood. In his 'Almanac of the Saints (*Almanach der Heiligen*) for the year 1788, with Copper-plates and Music, printed at Rome, with the permission of the Principals,' the priesthood is severely attacked, and the legends of the monks ridiculed. Like Nicolai, B. was very bitter against the 'Werther' mania which was so prevalent in his time.

**BRETSCHNEIDER, KARL GOTTLIEB**, a distinguished German theologian, born 11th February 1776, at Gersdorf, in Saxony, studied theology at Leipzig, was appointed pastor at Schneeberg in 1807, general superintendent at Gotha in 1816, and in 1840 obtained the dignity of councillor of the Upper Consistory. He died 22d January 1848. B. has acquired a reputation for sober, reflective, rationalistic thought. The character of his intellect rendered him unable to enter into the profound speculations of men like Schleiermacher and Schelling; but nevertheless by his diligence, clear, incisive understanding, and strength of character, he has secured a permanent place in the history of German theology. His most important work in dogmatics is the *Manual of the Evangelical Lutheran Church* (2 vols., Leip. 1814—1818). In 1824, B. published *Lexicon Manuale Greco-Latinum in Libros Novi Testamenti* (2 vols., Leip. 1824). In 1832, appeared *Der Simonismus und das Christenthum*; in 1835, *Die Theologie und die Revolution*. B. has also published many sermons, which have been well received, and in other departments of theology and literature he is considered to have done important service.

**BRETTEN**, a town of Baden, about 13 miles east of Carlsruhe, chiefly noteworthy as the birth-place of Melanchthon. The house in which he was born is pointed out to travellers. Pop. about 3000.

**BRETT'S AND SCOTS, THE LAWS OF THE** (*Lat. Leges inter Bretos et Scotos, Old Fr. Lusage de Scotts et de Bretons*), the name given, in the 13th c., to a code of laws in use among the Celtic tribes in Scotland. The 'Scots' were the Celtic people dwelling in the western and more mountainous districts north of the Forth and the Clyde, who, when it became necessary to distinguish them from the Teutonic inhabitants of the low country, received the names of 'the Wild Scots,' 'the Irishry of Scotland,' and, more recently, 'the Scotch Highlanders.' The 'Bretts' were the remains of the British or Welsh people, who were at one time the sole or chief inhabitants of the region now divided into the shires of Dumbarton, Renfrew, Ayr, Lanark, Peebles, Selkirk, Roxburgh, Dumfries, and Cumberland. This province was for some centuries an independent kingdom, known by the names of 'Cambria,' 'Cumbria,'

'Strathclyde,' and 'Strathclyde and Reged.' It became, about the middle of the 10th c., a tributary principality held of the king of the English, by the heir of the king of the Scots. It so continued till after the beginning of the 12th c., when Cumberland having been incorporated with England, the gradual absorption of the rest of the territory into the dominions of the king of the Scots seems to have been imperceptibly completed. The last 'Prince of Cumbria' named in record was the brother and heir of King Alexander I. of Scotland, 'the Earl David,' as he was called, who, on his brother's death in 1124, himself became king of the Scots. No more is heard of Cumbria as a principality; but the 'Welsh' continue to be named among its inhabitants, in the charters of King David's grandsons—King Malcolm the Maiden (1153—1165), and King William the Lion (1165—1214). And they seem to have retained more or less of their ancient Celtic laws until after the beginning of the 14th century. It was not until the year 1305 that an ordinance of King Edward I. of England, who appeared then to have reduced all Scotland to his subjection, decreed 'that the usages of the Scots and the Bretts be abolished, and no more used.' It is unknown how far this prohibition took effect. Of the code which it proscribed, only fragment has been preserved. It was first printed by Sir John Skene, in his *Regiam Majestatem* (Edin. 1609). But by far the best edition is that of Mr Thomas Thomson and Mr Cosmo Innes, in the *Acts of the Parliaments of Scotland*, vol. i., pp. 299—301 (Edin. 1844), where the laws are given in three languages—Latin, French, and English. The French version, which is the oldest, is printed from a manuscript of about 1270, formerly in the public library at Bern, in Switzerland, now in the Register House at Edinburgh. The fragment of the 'laws of the Bretts and the Scots' thus published, is of much the same nature as the ancient laws of the Anglo-Saxons, the Welsh, the Irish, and other nations of Western Europe. It fixes the *cro*, or price at which every man was valued, according to his degree, from the king down to the churl, and which, if he were slain, was to be paid to his kindred by the homicide or his kindred. The *cro* of the king was 1000 cows; of the king's son, or of an earl, 150 cows; of an earl's son or of a thane, 100 cows; of a thane's son, 66½ cows; of the nephew of a thane, or of an ogthiern, 44 cows and 21½ pence; and of a villain or churl, 16 cows—all persons of lower birth than a thane's nephew, or an ogthiern, being accounted villains or churls. The *cro* of the married woman was less by a third than the *cro* of her husband. The *cro* of the unmarried woman was as much as the *cro* of her brother. Other chapters fix every man's *kelchyn* or *gelchach*, *gallnes*, and *enach*—Celtic terms not yet satisfactorily interpreted, but apparently equivalent to the *fythiroile*, *mund*, and *manbot* of the Anglo-Saxons, as the *cro* of the Bretts and Scots appears to answer to the *vergild* of the English. A chapter 'of blood-drawing'—corresponding with the *blodwyte* of the Anglo-Saxons—fixes the fine to be paid for a blow to the effusion of blood, according to the degree of the person wounded and the place of the wound.

**BREUGHEL**, the name of a famous family of Dutch painters.—**PETER B.**, the head of the family, was born in the village of Breughel, near Breda, in 1510 (or, as others say, 1530), and died at Brussels in 1570 or 1590. He was a scholar of Peter Koeck van Aelst, travelled through Italy and France, and on his return, fixed his residence at Antwerp. He painted chiefly the pleasures of rustic life, for which he himself had a great relish, and which he transferred to his canvas with clear insight and vivid

colouring, though unnecessarily exceeding at times the coarseness of his subject. He also executed several historical pieces, such as his 'Building of the Tower of Babel,' now preserved in the gallery at Vienna.—His son, PETER B., distinguished by the strange title 'Hellish Breughel'—because he loved to paint scenes in which the leading characters were devils, hags, robbers, &c.—was born about 1569, and died 1625. His paintings of 'Orpheus' and the 'Temptation of St Antony' are the most remarkable of his pieces.—JAN B., brother of the preceding, and on account of the splendid apparel which he wore when he became rich, usually called Velvet B., was born 1568 or 1575, and died 1625 or 1640. He was an industrious painter, distinguished for his landscapes and for his minute finish of small figures. In concert with Rubens, who supplied the two chief figures, he painted 'Adam and Eve in Paradise,' and 'Vertumnus and Bellona.' These, with the 'Four Elements,' are his chief works.—Other members of the same family were known as painters: AMBROSE B., director of the Academy of Painting, Antwerp, between the years 1635 and 1670; ABRAHAM B., a painter of fruits, flowers, and birds, lived long in Rome and Naples, where he died in 1690; JAN BAPTIST B., born in Rome, died 1700; and finally, CASPAR B., both of whom were flower-painters.

BRIEVE. See ANT-CATCHER.

BRIEVE, a note in music, which, in the old notation of Guido d'Arezzo, had the value of two whole bars. It is written thus,  $\boxed{|\text{---}|}$  or  $|\text{---}|$ , or  $||\text{---}||$ . The note for a whole bar in modern notation is called semibreve, and has the value of four crotchets. In triple time, the B. contained three semibreves. The B. is now only used in *a la capella* movements, psalm-tunes, and fugues, or at the close of a composition.

BRIEVE, or BRIEVE, in the practice of the Scotch law, is a writ issuing from Chancery in the name of the crown, to a judge, ordering him to try by jury the points or questions stated in the breve. In ancient times, these writs appear to have been the foundation of almost all civil actions in Scotland; but they are now only used in the following cases: 1. B. of Inquest, now, however, superseded by a petition of service, according to the 10 and 11 Vict. c. 47. The object of the proceeding is judicially to ascertain the heir of a deceased person. 2. B. of Tutory, the purpose of which is the appointment, as guardian to a pupil, of the nearest agnate or person most nearly related through the father. 3. Breves of Idiocy and Furiosity, by which the mental condition of a party may be determined for the appointment, in case of ascertained insanity, of a guardian or curator. In the B. of idiocy, the direction is to inquire whether the person is of unsound mind, furious, and naturally an idiot. In the breve of fury, it is, whether he be of unsound mind, prodigal, and furious. 4. B. of Terce. The object of this writ is to 'cognosce the widow to her terce'—that is, to enable her to recover her terce or dower. It is issued to the sheriff of the county, and the jury under his presidency are directed to inquire whether the claimant was the lawful wife of the deceased, and whether the husband died intestate in the lands from which the terce is claimed. The verdict of the jury gives the widow her terce, and the judge then 'kens' her to it. See TERC, and KENNING TO THE TERC. 5. B. of Division amongst heirs-portioners. By means of this B., an heir-portioner—that is, one of two or more sisters succeeding in equal portions to a landed estate—may have her share of the lands separated or set apart by a judge, who appoints an inquest, or jury of fifteen persons,

324

to measure the land, and make a division; the jury report to the judge; and lots being cast for the different shares, the judge decides accordingly. This form is, however, now seldom used, an arbitration being more generally resorted to. See INHERITANCE, SUCCESSION, HEIRS-PORTIONERS.

BREVET (Fr. a writ or warrant), in the British army, is a promotion of officers, now strictly limited in its application, but before 1854 a recognised, though occasional mode of conferring a large measure of general promotion throughout the army. It took place under various circumstances. If no special cause interfered, a general promotion by B. used in former times to be made once in about six years; but in more recent years it was limited to very special occasions, as a coronation, the birth of an heir to the throne, the termination of some great war, &c., and was limited to officers who had some particular claim to promotion. The officers so promoted obtained an increase of rank, and in some cases pay, even if they had never served in the field. A B. was determined on by the cabinet, and carried out by the commander-in-chief. The officers expected it, as one of the implied conditions on entering the service, and it had formed part of the British military system ever since the time of James II.; but it was unsatisfactory, because the flow of promotion caused by it was arbitrary, uncertain, and much liable to abuse. There were brevets, arising out of the various circumstances above indicated, in 1837, 1838, 1841, 1846, 1851, and 1854. On these occasions, lieutenant-generals, major-generals, colonels, lieutenant-colonels, majors, and captains received a promotion of one grade in rank. On one of these occasions, 200 colonels were at once made major-generals. The higher the rank, the higher the pay, as a general rule; and therefore the cost to the nation is always increased for a time after each brevet. Thus the B. of 1837 occasioned an annual increase of £11,000; that of 1838, £7000; of 1841, £15,000; of 1846, £21,000, &c.; but it must not be forgotten that death and sales had in the intervals cleared off perhaps an equal number of officers at the higher rates of pay. In 1854, the new major-generals alone involved an additional charge of £18,000 a year.

The above description applied before 1854. In that year, general brevets were abolished—a fixed establishment of general officers being substituted. The only brevets now are obtained by service of five years as lieutenant-colonel (making the officer brevet-colonel, without increase of pay); by distinguished service in the field, applicable to lieutenant-colonels, majors, and captains (carrying the substantive pay of the higher rank, except in the case of the lieutenant-colonel); and by succession, when a death occurs among the establishment of general officers. In this last case there is no brevet promotion to the rank of colonel, but the senior major in the whole army and marines becomes a brevet-lieutenant-colonel without increase of pay, and the senior captain a brevet-major with 2s. a day extra. Officers become major-generals, in accordance with their seniority as brevet-colonels, and it will be seen, from the above description, that the brevet rank of colonel which is the stepping-stone to major-general, is obtainable *by service only*.

Other matters having reference to this subject will be found treated under the article COMMISSIONS, ARMY.

As brevet-rank was neither purchasable nor saleable, the abolition of the purchase-system made no alteration.

There is no B. promotion in the navy.

BREVIARY. By this title we are to understand

an abbreviation, as well as an amended arrangement of the more ancient offices used at the Seven Canonical Hours, which are Matins, Prime, Tierce, Sext, Nones, Vespers, and Compline. See CANONICAL HOURS. The books in which these offices were contained were formerly distinct—viz., 1. The *Psalter*, which included the Psalms of David according to St Jerome's Galbian version, the Te Deum, the Athanasian Creed, &c.; 2. The *Bible*; 3. The *Antiphonarium*, containing the anthems and responsories; 4. The *Hymnarium*; 5. The *Collectarium*, or the collects to be said at the end of the services; 6. The *Homilarium*, *Passionarium*, and *Martyrologium*, containing the comments of the Fathers upon the gospel of the day, and accounts of the martyrdoms of the saints for each distinct festival. Out of all these separate books, the B. was compiled, about the 11th c., by Pope Gregory VII., as is supposed; the lessons, anthems, hymns, and responsories for the different days of the year being all arranged, in their proper places, in the same volume with the psalter, prayers, &c. In later times, the B. was divided into two parts, one for each half of the year, as was the case with those of Salisbury, York, and Hereford, used in England; and afterwards into four parts, so as to be more portable, whence it was also called *Portiforium*. It may perhaps be necessary to inform our Protestant readers, that the B. is an entirely distinct book from the Missal (q. v.), the latter containing the proper offices for the service of the sacrifice of the mass.

The last settlement of the B. was under the pontificate of Pius V., and his bull of 1568 is that by which the present daily office of the Roman Church is authorized. This edition was compiled by the College of Sacred Rites at Rome, in conformity with the decrees of the Council of Trent, because of the variety of *Usee*, as they were called, which at that time existed in different dioceses. The bull of Pius V. abolished the use of all breviaries, except such as could prove a prescription of 200 years. This exception would have extended to the breviaries of Salisbury and York, if the Church of England had not already thrown off Rome's supremacy, and compiled a new Book of Common Prayer for herself. After this, in 1602, Clement VIII. had a standard edition printed at the Vatican, to which all future editions were to conform; and again, in 1631, Urban VIII. caused the metres of the hymns and the Latinity of the whole to be carefully revised. It is perhaps hardly necessary to state that the B. is in Latin, portions of it being sometimes translated for the use of the unlearned. It is necessarily a very bulky volume, when complete; and although some of the legends of the saints and martyrs may be of doubtful authenticity, yet it is a mine of interesting and devotional reading. Its general contents may be judged of from what has been already stated as to the sources from which they were drawn, every saint in the calendar having his proper services for the different canonical hours. The festivals of the Roman Church have their services, according to their importance, duplex, semi-duplex, or simplex—i. e., double, semi-double, or simple: these, again, are further distinguished, so that there are no less than 9 classes of services—the Ferial or ordinary week-day, the simple, the day with an octave, the semi-double, the Dominical or Sunday, the double, greater double, double of the second class, double of the first class. Indeed, so elaborate and perplexing are the rubrical directions, that it is impossible to form any idea of them without consulting the B. itself, and there are probably but few of the priests who are thoroughly conversant with their own ritual.

The B. contains, besides an office for the dead

and other smaller offices, three kinds of office in honour of the blessed Virgin Mary—viz., 1. The full office, said on such festivals as the Purification, Annunciation, Immaculate Conception, Assumption, &c.; 2. The office of the Virgin Mary on Saturdays; 3. What is called the 'little office,' or the Hours of the Virgin. This last was in use as early as the 7th c., and was enjoined by the Council of Claremont, 1096, to be said by the clergy daily, and by the laity on Saturdays, but the bull of Pius V. removed this obligation except as to clergy in choirs. The Roman Church enjoins, under pain of excommunication, all 'religious' persons—i. e., all persons, male or female, who have taken vows in any religious order—to repeat, either in public or private, the services of the canonical hours as contained in the breviary. For the influence of the old breviaries on the English Common Prayer-book (q. v.), consult Palmer's *Antiquities of the English Ritual*, and Maakell's *Monumenta Ritualiæ*. The matins or morning-prayer of the English Prayer-book is an abridgment, with many omissions and additions, of the matins, lauds, and prime of the B., whilst the office of even-song, or evening-prayer, is in like manner an abridgment of the ancient vespers and compline.

**BREVIPENNES** (Lat. short-winged), in Ornithology, according to the system of Cuvier, that tribe of the order *Grallatores* (q. v.) in which the ostrich, cassowary, rhea or nandou, emu, and apteryx are comprised, and also the extinct dodo. See these articles. The B. are characterised by a shortness of wing which incapacitates them for flight, but use their wings to aid them in running, which they do with great rapidity. Their *sternum* (breast-bone) has no ridge or keel. They constitute the family *Struthionidae* of many ornithologists, and are by some placed among Gallinaceous (q. v.) Birds, to which they are allied by the form of their bill and their choice of food. They are, however, very different from all other birds, and whether ranked among Grallatores or Gallinaceous Birds, do not seem to form a natural part of the order. The gigantic *Dinornis* (q. v.) and other fossil birds of great interest exhibit the characters of the *Brevipennes*.

Gigantic birds, of which the footprints appear imprinted on sandstones in the valley of the Connecticut and elsewhere, seem also to have belonged to this tribe. No remains or traces of such birds are, however, found nearly so ancient as many remains of quadrupeds. But to whatever geological period the commencement of their existence is to be referred, a peculiar interest is attached to them, because its close may be regarded as probably near. There is no tribe of birds that more generally shuns man, or disappears before the increase of population and the progress of colonisation. The cassowary and the emu are rapidly becoming rare. The ostrich, the rhea, the apteryx, the notornis, &c., are only found in deserts or other deep solitudes.

**BREWING.** For the process of B. see BEER. The legal requirements for the B. of beer for sale will be found in many acts of parliament, from the 12 Chas. II. c. 24, to 33 and 34 Vict. c. 32 s. 10., changes being of late frequent. Instead of licences to brew, as formerly, duties are levied on the quantity of beer brewed, according to a scale which ranges from a quantity not exceeding 20 barrels to one that shall exceed 40,000 barrels, the duty itself beginning at 10s., and rising up to £75, according to the quantity. In the case of that kind of beer called *Table Beer*, it is provided that the duty on such shall in no case exceed £2, no matter how large the quantity brewed may be. Brewers are not to retail or sell beer at any other

place than their licensed B. premises, and if they wish to sell beer at other places, they must get a licence for these places also; but it is provided that the taking orders for the sale of beer in any quantity amounting to or exceeding four and a half gallons, or two dozen reputed quart bottles at one time, sent to the purchaser direct from the B. premises, shall not be deemed a selling of beer at any other place. Several of the above acts (the 13 and 14 Vict.) contain provisions respecting the duties to be levied on sugar used in B., providing that such duties shall be at the rate of 1*s*. 4*d*. for every hundredweight of sugar; and brewers are to make true entry, in the book kept for that purpose by the Excise, of the quantity of sugar in pounds-weight avoirdupois, used in B., under a penalty of £200, over and above any other penalties to which they may be liable. The acts contain numerous other regulations, too minute for further detail here. See BEER, BEER ACTS, LICENCES.

Anciently, in Scotland, the privilege of B. was given by a licence from the superior or lord, in whose deed of gift or charter to his vassals there was generally a clause *cum brenviis*. But these forms have long been dispensed with. It appears, however, that a person with a right of barony may prevent a feuar, that is, a tenant of property within the barony, or a stranger, from importing and vending ale within the baronial limits without his licence.

BREWSTER, SIR DAVID, an eminent natural philosopher and eloquent writer, was born at Jedburgh, December 11, 1781. He was educated for the Church of Scotland at the university of Edinburgh, where he highly distinguished himself. In 1808, he undertook the editorship of the *Edinburgh Encyclopedia*, to which he contributed many important scientific articles. Previous to this, he had entered deeply on the study of optics, with which his name is now enduringly associated. The beautiful philosophical toy, called the kaleidoscope, was invented by him in 1816. In 1819, in conjunction with Professor Jameson, he established the *Edinburgh Philosophical Journal*; and in 1831 he was one of the chief originators of the British Association for the advancement of Science. The honours conferred on this distinguished man make up a long catalogue. In 1815, he obtained the Copley medal of the Royal Society for one of his optical discoveries, and soon after was elected a Fellow; in 1816, he received half the physical prize bestowed by the French Institute for two of the most important scientific discoveries made in Europe during the two preceding years; in 1819, the Royal Society awarded him the Rumford gold and silver medals, for his discoveries on the polarisation of light; in 1825, he became corresponding member of the Institute of France; in 1832, he was knighted, and had a pension conferred upon him; in 1838, he was chosen Principal of the united colleges of St Leonard and St Salvador, St Andrews; in 1849, on the death of Berzelius, in the preceding year, he was elected one of the eight Foreign Associates of the French Institute, the highest scientific distinction in Europe. Sir David was also a member of the Imperial and Royal Academies of St Petersburg, Berlin, Copenhagen, and Stockholm; presided over the British Association, and in 1851, over the Peace Congress held in London. In 1859, on the death of Dr John Lee, he was chosen Principal of the Edinburgh University. His principal work is his *Life of Newton*, first published in 1828, in the Family Library, and issued in a totally new and greatly enlarged form in 1855. Among his other works are his interesting *Letters on Natural Magic*, addressed to Sir Walter Scott,

also published in the Family Library; *More Worlds than One* (1854); his treatises on the Kaleidoscope and on Optics (*Cabinet Cyclopaedia*); his *Martyrs of Science*; and his treatises in the *Encyclopædia Britannica* on Electricity, Magnetism, Optics, the Stereoscope, &c. Among other periodicals to which he contributed largely are the *Edinburgh and North British Reviews*. He died Feb. 1863.

BRIAN BOROIMHE (pron. *boru'*), a famous king of Ireland, ascended the throne of both Munsters—answering to the present counties of Tipperary and Clare—in 978. Some time afterwards, he deposed O'Maelachaghlin, and became supreme ruler of Ireland. The surname, Boroimhe, signifying tax, was given him in consequence of the tribute in kind he levied from the various provinces. King Brian supported a rude but princely state at his chief castle at Kincora, a place in the neighbourhood of the modern town of Killaloe, and he had also seats at Tara and Cashel. The vigour of his reign brought prosperity to his country. He defeated the Danes in upwards of 20 pitched battles, restricting their influence to the four cities of Dublin, Wexford, Waterford, and Limerick alone. In the battle of Clontarf (1014), in which he was killed, he gained a signal victory over a united army of revolted natives and Danes, the power of the latter receiving a shock from which it never recovered.

BRIANCON (ancient *Brigantium*), a town of the department of the Hautes-Alpes, France, on the right bank of the Durance, about 35 miles north-east of Gap. It is the highest town in the French empire, being situated at an elevation of nearly 4300 feet above the sea-level. As the principal arsenal and dépôt of the French Alps, B. is very strongly fortified, while several forts guard the approaches, and every height in the vicinity is a point of defence. It is considered impregnable. Troops can readily be marched from it on to the passes of the Simplon, St Bernard, Mont Cenis, and the Col de Tende. Mont Genève affords a practicable passage into Italy from the town itself. B. has some manufactures of cotton-goods, hosiery, cutlery, crayons, &c. Pop. (1872) 14,665.

BRIANSK, a town of Russia, in the government of Orel, 70 miles west of the city of that name. It is situated on the right bank of the Desna, is surrounded with earthen ramparts, and has a considerable trade in grain, hemp, wax, linen, cables, cordage, iron, &c., with Kherson, Odessa, and other ports on the Black Sea. B. has also imperial building-yards, and a cannon-foundry in the vicinity. Pop. (1867) 13,881.

BRIARE, a town in the department of Loiret, France, situated on the right bank of the Loire, at the point where the Canal de Briare enters that river, about 43 miles south-east of Orleans. The canal, which unites the Loire and the Seine, is remarkable as the first that was constructed in France, having been begun by Sully, and finished in 1642. B. has a considerable trade in wine, wood, and charcoal. It is supposed to occupy the site of the ancient *Briodurum*. Pop. (1872) 3799.

BRIERY. The corrupt practices known by the term B. might well form the theme of an extended essay. Here we can point only to a few of the more conspicuous features of this grave social disorder, and chiefly as concerns B. at elections.

*Election B.*, a well-known form of corruption, may be called the cancer and disgrace of constitutional government. Individuals, with little to recommend them but wealth, and it may be some local distinction, wishing to be elected representatives in the legislature, do not scruple, through various devices,

## BRIBERY—BRICK.

to buy the votes of the meaner order of electors by bribes. B. at elections is perhaps more openly and audaciously practised in various parts of the United States than it is in England; nor are base influences of this kind unknown in connection with the more meagre constitutional forms of some continental states. But in the eye of the world, England had the unavoidable notoriety of being the country in which B. was reduced to a regular and continuous, though covert, system. It had been demonstrated by parliamentary inquiry, that masses of the population in certain towns—more particularly the class called freemen—look upon the franchise as a privilege which, for personal benefit, entitles them to exact so much money for their votes. Public considerations had no weight with them whatever. It seemed to them to be alike their duty and their interest to sell their votes to the highest bidder. The Earl of Dundonald mentions in his *Autobiography*, that when, as Lord Cochrane, he offered himself as a candidate for Honiton, he was barefacedly told by one of the electors, ‘that he always voted for Mister Most’; and not choosing to bribe, he lost his election. The amount of bribe ordinarily paid at elections in this venal class of boroughs, varied from £1 to £10, according to circumstances; as high a sum as £20, and even £50, had been known to be given in the extremities of a contest. For these corrupting and disgraceful practices, the law threatens certain penalties; but to avoid incurring these, as well as for the sake of decency, the candidates employed a mean class of agents, or were in some obscure way assisted by confederates, of whose proceedings it was difficult to substantiate any guilty knowledge on their part. The agents more immediately concerned did the business of bribing in private, sometimes in darkened apartments, where no one could be seen. Formerly, the treating of voters in taverns was added to other varieties of corruption, and the demoralisation that ensued on occasions of this kind amounted almost to a universal saturnalia. The law having interposed to check this gross form of B., the evil had latterly subsided into a commonplace routine of secret money-dealings. Of course, by this illegal expenditure, along with the necessary outlays which the law allows, the cost of an election was in many cases enormous. Few seats of English borough members cost less than £1800; but double and triple this sum was a common outlay. It is a well-known fact, that for certain boroughs any man—no matter what be his political opinions or private character—might be returned by advancing £4000, and asking no questions as to what was done with it. As the B. was on both sides, it may be safely averred that the money spent at some contested elections amounted to £10,000. As regards elections for counties, the influences brought to bear are ordinarily of a different kind; but though morally wrong, they do not come within the scope of the present article. The Scotch have some reason to boast that their country is comparatively exempt from this social disorder—that their representatives are not so depraved as to offer, nor the electors so weak and needy as to accept, money-bribes. Such may be said as a general truth. Unfortunately, however, the national integrity is in this respect not quite unblemished, for the member returned for the Falkirk burghs in 1857 was unseated for bribery. To avert every form of corrupt influence, the Ballot (q. v.) was long vehemently urged; and that, coupled with the improved mode of trying election petitions by judges, must soon bear fruit. An act to secure the use of the ballot in parliamentary and municipal elections throughout Great Britain and Ireland

was finally passed in July 1872. The law on this subject will be found under CORRUPT PRACTICES ACT (q. v.); see also PARLIAMENT.

**BRIBERY IN MUNICIPAL ELECTIONS.** By the Corrupt Practices (Municipal Elections) Act, 1872, the offence of B. is put on the same footing as in parliamentary elections. The guilty person is forever disabled from voting at other municipal elections, and also from holding any office or franchise in the borough. See MUNICIPALITY.

**BRIBERY OF CUSTOM-HOUSE AND EXCISE OFFICERS.** By the Customs Consolidation Act, the 16 and 17 Vict. c. 107, s. 262, every person who shall give or offer any bribe, or make any collusive agreement with any officer of Customs or Excise, or other person employed for the prevention of smuggling, in order to induce him to neglect his duty, shall forfeit the sum of £200. A former act, passed in 1827, the 7 and 8 Geo. IV. c. 53, s. 12, still in force, specially enacts in the case of the Excise, that persons in such service taking money or reward, or entering into any collusive agreement contrary to their duty, shall for every such offence forfeit the sum of £500, and be incapable of serving the crown in any office or employment; and any person giving or offering money or reward to Excise officers, in order to corrupt and prevail upon them, shall forfeit the like sum of £500, but simply and without any further penalty of disqualification.

**BRIBERY OF JUDGES.** This offence in the old Scotch law was called BARRATRY (q. v.).

**BRICK.** The earliest examples of this branch of the ceramic art were doubtless the sun-dried bricks of Egypt, Assyria, and Babylonia. Remarkable to say, many of these, which, in a northern climate, the frosts of a single winter would destroy, have been preserved for some 3000 years by the dry, warm atmosphere of those countries. Sun-baked bricks of ancient date are also found in the mud walls of old towns in India. Kiln-baked bricks must have been the products of a later time; but they are found in all the chief ruins of ancient Babylonia, where they were often used to face or bind together walls of sun-dried bricks, and occasionally they were even ornamented with enamelled colours. Burnt bricks were employed in the foundations of the Tower of Babel (Gen. xi. 3). These ancient bricks, whether baked by the sun or by fire, were all made of clay mixed with grass or straw. The ancient Greeks, probably owing to their possessing plenty of stone, cared little for building with burned clay; but most of the great ruins in Rome are built of brick, and the Romans appear to have introduced the art into England. Interesting historical information has been obtained from the impressions on Roman, and especially on Babylonian bricks. In many instances, the Roman bricks found in England have been removed from their original position, and employed in the construction of buildings of later date. The earliest instance in which bricks of the modern or Flemish make occur in England, is Little Wenham Hall, in Suffolk, 1260.

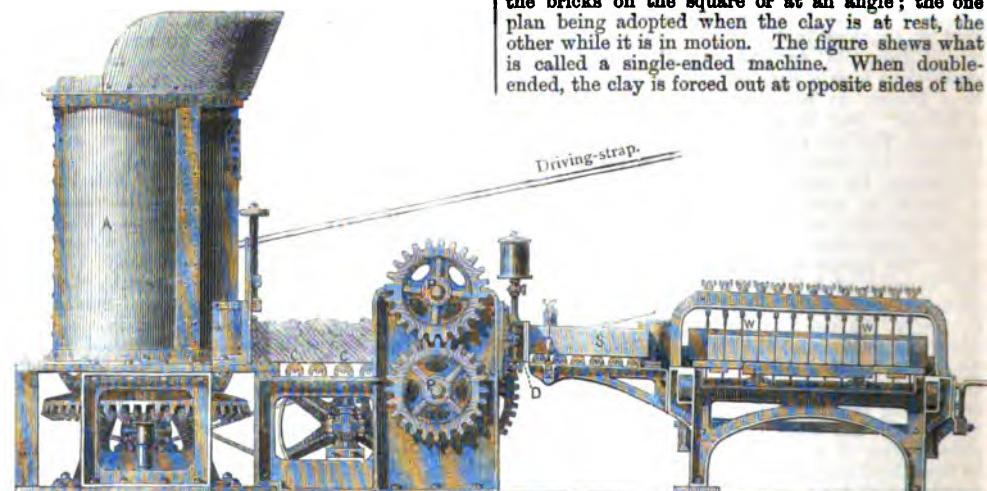

**Manufacture of Bricks.**—Clay suitable for the manufacture of common bricks is an abundant substance, but there is a great difference in the nature and quality of the clays found in various localities. The basis of clay consists of hydrated silicate of alumina, with a varying proportion of other mineral matters, chiefly free silica (sand), iron, lime, magnesia, and potash. Great advantage is derived from digging clay in autumn, and exposing it all winter to the disintegrating action of frost. This is not always attended to, but when neglected, the bricks made from it are apt to be unsound and faulty in

shape. The next process is that of tempering or mixing the clay into a homogeneous paste, which is sometimes done by the spade, but more commonly in the pug-mill (see vol. vii., p. 726) or by crushing between a pair of rollers; often, indeed, both are employed. In making bricks by the old hand process, the shape is given by a mould either entirely of wood, or of wood faced with metal, and without top or bottom. This admits of the clay being pressed into it by a tool called a plane, which is also used to produce an even surface on the upper and lower beds of the brick, by working off the superfluous clay. Sand is used to part the wet clay from the mould and the table on which it rests.

Although hand-made bricks are still very common, yet machinery is now always employed when large quantities are required. Brick-making machines are of two leading kinds; one class of them being constructed to work the clay in a wet plastic state, the other class requiring it to be in a semi-dry condition. Of the two sorts, the wet-clay machines are the simpler, cheaper, and can be worked by less-skilled workmen. On the other hand, the dry-clay

machines, which make the bricks by forcing the clay into moulds by strong pressure, shorten the process, as no time is required for drying them. The bricks so made, too, are not only of a more perfect shape, but they can be moulded into any form, and may even be made highly ornamental at a very slight additional cost.

As might be expected, both the dry and the wet-clay machines of different makers vary considerably in their details. Since we have not room for two figures, we give one, which will convey a good idea of the general plan on which most of the wet-clay machines work. The machine is driven by steam, and the clay is fed by a hopper into the pug-mill A, on the central shaft of which strong pugging blades are placed in a spiral manner. These prepare and force the clay out at the bottom, whence it passes over the carrying rollers, C, to the pressing rollers, PP, which force it through a die at D, in a rectangular stream, S, so exactly shaped to the required size that nothing more is necessary than to cut it into single bricks by the wires, W. These are set in a rocking frame, which can be so adjusted as to cut the bricks on the square or at an angle; the one plan being adopted when the clay is at rest, the other while it is in motion. The figure shews what is called a single-ended machine. When double-ended, the clay is forced out at opposite sides of the

Brick-making Machine.

pugging cylinder, and there is then, of course, a cutting-table at either side, instead of only one, as shewn in our cut. Some of these machines are provided with a pair of powerful crushing rollers, which reduce any hard lumps or stones before the clay enters the pug-mill. One of the best known wet-clay machines is that made by Clayton, Son, & Co., London. When of a size which can be worked by a steam-engine of 16-horse power, it produces from 20,000 to 30,000 bricks per day, and its price in 1871 was £330. The one shewn in our figure is Murray's patent. Drain tiles are made by the same kind of machinery, with a peculiarly constructed die, so as to make the clay into a hollow tube; so also are hollow bricks, with again an alteration in the shape of the die. Hollow bricks having less body than those which are solid, are more easily, and usually more thoroughly fired. On account of this, as well as by reason of their admitting of a current of air through them, they form, as a rule, dryer walls.

The green bricks, after being carefully dried, either in the sun or by artificial heat, are usually baked in a kiln with a suitable arrangement of fires and flues. Kilns are of many forms, and the time required for firing in them varies from 40 to 60

hours for common red and white bricks, while for some fire-bricks 150 hours are necessary. Where kilns are not used, bricks are burned in clamps, the clay requiring to be mixed up, in the process of tempering, with a quantity of ground coal sufficient to burn them. A good test of the character of a clay is obtained by the result of firing. The average contraction in the kiln for prepared clays is  $7\frac{1}{2}$  per cent. If a brick contracts much more than this, the clay is too fusible; if less, then it is likely to be of an open porous body, which retains its shape well during the firing process.

All brick clays contain iron, and the colour of a burned brick almost entirely depends on the amount of it which is present; thus clays containing less than 1 or  $1\frac{1}{2}$  per cent. of iron, change in the kiln to various shades of cream colour and buff, whilst those containing more than 2 per cent., range in colour from yellowish-fawn to dark red. Blue bricks are made from the same clay as the red by controlling in a peculiar way the supply of air in firing, and by carrying the heat slightly further. It is asserted by some that the red is changed to the black oxide of iron in the process.

Fire-bricks are made from clay as free as possible from oxide of iron and alkaline substances, so that

## BRICKLAYING, BRICKWORK.

there may be no tendency to fuse in the kiln, however high the heat. Fire-clays are abundant in the coal-measures, some of fine quality being found about Newcastle and Glasgow, but the most celebrated is that of Stourbridge, which is exported to all parts of the world. See FIRE-CLAY.

Much attention has been paid of late years to the manufacture of fine bricks and terra cotta, which is only another name for ornamental bricks of various shapes, or architectural enrichments of the same material. The effect of some of the public buildings recently erected in London and elsewhere, in which terra cotta has been used, is really beautiful. Although it cannot be said to equal sandstone in appearance, it has yet the advantage of giving a much greater variety of colour, and is infinitely better and more enduring than a facing of stucco or cement.

The duties formerly levied on bricks were wholly repealed in 1850.

**BRICKLAYING, BRICKWORK.** The material of which a town is built depends mainly on the geology of the surrounding district. In a mountainous country like Scotland, cities of stone, such as Edinburgh, Glasgow, and Aberdeen naturally abound; while London, and most of the great towns of England, situated in alluvial valleys and plains, are built of bricks derived from the alluvial clay beneath and around them. In Holland, where the whole country is but the delta of the Rhine, and no stone is to be found, brick is universal, even to the paving of the streets.

The standard size of English bricks being 9 inches by  $\frac{4}{5}$ , the thickness of walls is regulated thereby. They are either half-brick, 1 brick, 1 $\frac{1}{2}$ , 2, 3, or 4 bricks in thickness. In moderate-sized modern English houses, the inside partition-walls are usually half-brick, the outer walls, 1 or 1 $\frac{1}{2}$ . In larger houses of superior construction, a thickness of two or three bricks is sometimes used. This latter thickness is seldom exceeded, except in large public works. Modern brick-houses are, for the most part, far less substantial than those erected by our forefathers. Building leases being usually granted for ninety-nine years, at the expiration of which term, the whole property reverts to the freeholder, the object of the builder is merely to make a house that shall stand for that period, and not to expend any money for the sake of further stability. Garden-walls are commonly built but half-brick in thickness; these, however, are strengthened by 9-inch piers at intervals of 10 or 12 feet. In laying the foundations of walls, the first courses should be thicker than the intended superstructure, and the projections thus formed, usually of quarter brick on each side, are called 'set-offs.' Before laying walls of houses, trenches are dug, and the foundation tried with a crowbar or rammer. If it is found to be loose, and the looseness due to superficial soil, this is removed, and its place supplied with fragments of stone and old broken bricks, which are closely rammed together. In some cases, inverted arches of brick are built for foundation, or a stratum of concrete laid down. See CONCRETE.

Mortar composed of lime and sand is the common cement for brickwork. It should be equally and carefully applied; and the bricks wetted, in order that the mortar may adhere more firmly, by being absorbed into their pores. The force with which good mortar is capable of adhering to bricks is very remarkable. It is found to be the greatest in old structures that have been exposed to the continuous action of water. Such is said to be 'water-bound' by workmen, and can scarcely be separated without breaking the bricks.

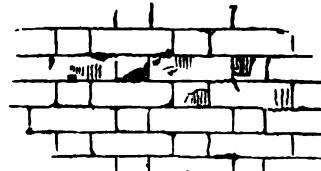

A fundamental principle to be rigidly observed in

laying all kinds of brick is, that *no two contiguous perpendicular joints shall fall immediately below each other*, or, to use the bricklayer's phrase, the work must 'break bond.' The mode of arrangement of the bricks to effect this is called the *bond*; a layer or stratum of bricks is called a *cource*. Bricks laid with their lengths in the direction of the course, and their sides to the wall-face, are called *stretchers*; those laid across the line of the course, with their ends forming the wall-face, *headers*; a layer of headers, a *heading course*; of stretchers, a *stretching course*.

The two kinds of bond almost exclusively used in England are the English and Flemish bond. English bond consists of alternate stretching and heading courses; Flemish bond, of a stretcher and header laid alternately in each course (see figures). English bond is the strongest; Flemish bond, the more ornamental; and they are used accordingly.

Old English Bond.

Flemish Bond.

There are two other kinds of bond occasionally used—*herring bond*, and *garden-wall bond*. The former is applied to form the core of thick walls, while Flemish bond is used for the facing. A course of bricks is laid obliquely at an angle of 45° to the face of the wall; then above it, another course at the same angle, but inclined in the opposite direction, so that the joints may cross the first. This is considered to add to the strength of Flemish bond, but is objectionable on account of the triangular interstices necessarily left between the oblique bricks and the bricks of the facing. Garden-wall bond is only used for 9-inch walls, and formed by laying three stretchers and one header, and so on in each course. In order to strengthen Flemish bond, bands of hoop-iron are sometimes laid flatwise between the courses. This 'hoop-iron bond' has superseded the old practice of using bond-timbers, which were inserted the whole length of the wall. The hoop-iron should be slightly rusted, to secure the complete adhesion of the mortar.

In constructing arches of brickwork, much care and skill are required. A wooden centring is always used; and when very rude work only is required, common bricks are laid upon the centring, and the gaping interstices at the upper ends filled with rough brick wedges. For better work, each brick has to be properly bevelled, according to the curve. When semicircular arches are made, all the bricks require an equal bevel, and therefore bricks moulded uniformly to the required angle may be used; but for other curves and for flat arches, each brick has to be separately shaped by the bricklayer. In order to do this, a drawing of the required arch is made of the full size on a board; the bricks are laid upon

this side by side, and shaped to the lines of the drawing ; they are then transferred to their corresponding place in the structure. The bricks are first rudely shaped by the *brick-axe*, then finished on the *rubbing-stone*, a piece of rough grained stone about 20 inches in diameter. In all kinds of B., the walls should be built up level throughout, in order that the *settlement* may be equal. An unequal settlement may produce a rupture of the wall.

B. is measured by the rod or by thousand. A rod contains 272 square feet of standard thickness—that is,  $1\frac{1}{4}$  brick. This is equal to 306 cubic feet, and will, on an average, require 4500 bricks, allowing for waste. The weight of a rod of B. containing 4500 bricks, 27 bushels of lime, and 3 single loads of sand, is about 13 tons. The bricklayer is always attended by a labourer or hodman, who carries his bricks and mortar in a 'hod'—a triangular wooden box, open at the top and one end, and supported on a round leg, by which the hodman holds it on his shoulder. A bricklayer's wages are considerably higher than those of the hodman. The labourers are generally Irishmen.

The surface of brickwork is sometimes ornamented by *pointing*. This is done by raking out the mortar of the joints to a small depth, and filling up again with blue mortar, and marking the courses with the edge of the trowel. This is called *flat-joint* pointing. When the courses are marked by a neatly pared raised line of white plaster of about half an inch in thickness, laid upon the blue mortar, it is called *tuck* or *tuck-joint* pointing. Coloured bricks, as a means of external ornament, have been extensively and most effectively used in North Italy and Germany. The works of Mr Ruskin, Mr Gally Knight, Webb's *Continental Ecclesiology*, Street's *Brick and Marble of the Middle Ages*, and Ferguson's *Hand-book of Architecture*, may be consulted for illustrated examples of these.

*Chromatic* brickwork is now becoming very extensively used in England, especially by architects who are endeavouring to revive the style of architecture called by themselves English Gothic, and by some others Venetian Gothic, in which the pointed arch, formed of coloured bricks, forms one of the prominent features. These architects maintain that, as they are compelled to construct with B., it is more honest to use bricks ornamentally, than by means of stucco to obtain an external imitation of stone ; and as B. admits of but little ornamentation in relief, they use variation of colour, of which B. is peculiarly susceptible, and thus produce a sort of architectural mosaic. The eloquent and popular advocacy of these views by Mr Ruskin, and the skill and enthusiasm with which many young and rising architects are carrying them out, seem likely to bring about a great development, almost amounting to a revolution in English domestic and ecclesiastical architecture.

#### BRICOLLE. See BALLISTA.

**BRIDE, BRIDAL.** The word Bride (the radical signification of which is thought by some to be 'appropriated,' 'owned') is common to all the Gothic languages, and also to Welsh (Ger. *braut*, Welsh *priod*), and signifies betrothed or newly married. Alone, the word denotes the newly married woman ; with the addition of the syllable *groom* (a corruption of *guma* = Lat. *homo*, a man), it denotes the newly married man (Ang. Sax. *brydguma*, Ger. *brautigam*). In Welsh, *priod-fab* (betrothed youth) is bridegroom, and *priod-ferch* (betrothed maid) is bride. Bride is the root of a variety of terms connected with marriage, as Bride-favours, Bride-cake, &c. Bridal is for *Bride-ale* (Ang. Sax. *bryd-eale*) the marriage-feast. Bride-

maids, or attendants on brides, appear to have been in use among the Anglo-Saxons, and are mentioned in early accounts of marriage-ceremonies. A part of their duty consisted in dressing and undressing the bride. Bridesmaids, as mere ceremonious attendants at marriages, are still in use in England. The husband had an analogous body of attendants, called bridegroom-men ; but they have disappeared in modern usage, and their only representative is one confidential friend in attendance. In Scotland, this personage is called the best man. One of his duties is to pull off the bridegroom's right-hand glove, while one of the bridesmaids does the same service for the bride, when the pair are requested to join hands.

**BRIDE-FAVOURS** are small knots of white ribbons, which are pinned to the breasts of all who are in attendance at weddings, nor are even the post-boys and their horses' heads left undecorated with these gay trappings. The origin of the bride-favour is said to be the true-lovers-knot—something symbolical of the union of hearts and hands on the occasion. In various old plays and poems there are allusions to bride-favours or ribbons, as that in Herrick's *Hesperides* :

What posies for our wedding-rings,  
What gloves we'll give and ribbonings.

The **BRIDE-CAKE** is also symbolical in its origin. The ceremony used at the solemnisation of marriage among the Romans was called *confarreatio*, in token of a most firm conjunction between the man and wife, with a cake of wheat or barley. This, Blount tells us, is still retained in part with us, by that which is called the bride-cake used at weddings.—Brand's *Popular Antiquities*. The old English and also Scottish custom of breaking a cake over the head of the bride on entering her new dwelling, perhaps points to a usage of the most remote antiquity—the sprinkling with wheat as a token of plenty. In modern times, the bride-cake is a stately piece of confectionary, consisting of a rich cake as a basis, on which is reared a castellated structure, with various fanciful devices, the whole being covered with a preparation of white sugar. This fabric is cut up and given in pieces to the guests, as part of the wedding jovialty.

**BRIDEWELL**, a well between Fleet Street and the Thames, dedicated to St Bride, which has given its name to a palace, parish, and house of correction. A palace, described as 'a stately and beautiful house,' was built here, in 1522, by Henry VIII., for the reception and accommodation of the Emperor Charles V. and his retinue ; and King Henry himself also often lodged here, as, for instance, in 1525, when a parliament was held in Blackfriars ; and in 1529, the same regal personage and his queen, Catharine, lived in the B. while the question of their marriage was argued. In 1553, Edward VI. gave it over to the city of London, to be used as a workhouse for the poor, and a house of correction 'for the strumpet and idle person, for the rioter that consumeth all, and for the vagabond that will abide in no place.' Queen Mary having confirmed the gift, it was formally taken possession of in 1555 by the lord mayor and corporation. The B. was afterwards used for other persons than the class above named, and at last became a place of punishment, as it now is. As a house of correction, it is not under the sheriff's charge, but is governed by a keeper wholly independent of that officer.

By the 15 and 16 Vict. c. 70, a new House of Correction is established for the city of London. See **CORRECTION, HOUSE OF**.

**BRIDGE** (Ang. Sax. *bryeg*; Dutch, *brug*; Ger. *brücke*) is a structure for carrying a road over a

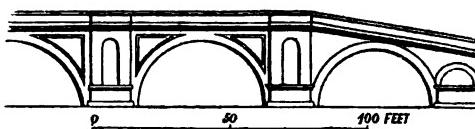

## BRIDGE.

stream, river, ravine, low ground, or other impediment to its course. A bridge for carrying a canal or other water-course, is called an aqueduct (q. v.); one for carrying a railway is sometimes called by the recently coined, though not very correct, word *viaduct*. Bridges are formed of stone, brick, cast-iron, or timber arches; of timber beams or framework, supported on piles or on masonry; of iron rods or chains, in which case they are called suspension-bridges; of lattice-work; or of cast or wrought iron girders. Sometimes a combination of beams and suspension-rods is used. Of late years, the plan of tubular or hollow wrought-iron girders has been frequently and successfully employed, the first great example being the Britannia Bridge (q. v.).

Bridges are either fixed or movable. Of movable bridges there are various kinds. *Flying-bridges* and *floating-bridges* are, in fact, mere ferry-boats (see FERRY) with gangways attached, and other provisions for safe and ready transport, and which are drawn across the stream by ropes. *Draw-bridges* and *swing-bridges* are constructed in two parts, that turn on pivots—in the former, the parts are lifted vertically; in the other, they are moved round horizontally. A *sliding-bridge* runs backward and forward on wheels or rollers. Another kind is much in use in low districts like Norfolk, where the water flows lazily, and almost on the land-level. These are sometimes called pontoon-bridges, from the movable roadway being balanced at a small height above the water-level on a pivot working in a large pontoon or hollow cylinder sunk in the bed of the river—the ends of the roadway of the B., when laid across the river, resting freely on piers on either side. There are several such bridges in use over the Ouse. The pivot is set in the centre of the stream, and, when necessary, the B. is turned round on it by machinery, till it lies parallel to the banks, and permits the passage of barges on either side. In a flat district, these bridges are exceedingly appropriate. See also BRIDGE, MILITARY.

Convenience must have led men in a very rude state of society to form bridges, in order to the easier communication between districts separated by rivers. On most streams there occur fords, but often these are not to be found where they would be most desirable. The most rudimentary form of a B. may be assumed to be a series of stepping-stones, such as are yet almost everywhere to be found on river-courses at some point. Large stones deposited in the streams at the shallows or fords, would first give a chance to a passenger of getting across dry shod; by and by, where one or two stones were wanting to complete the steps in the passage, they would be supplied. Next, it would naturally occur to give greater security to the passage, by laying planks or trees across the stepping-stones, so as to avoid the risks attending stepping or leaping from the one to the other. In the arrangement of planks resting thus on stones, we have the first advance in the art of B.-building, the suggestion at once both of piers and roadways; and beyond this stage, the art would appear not to have advanced for a very long period. From the Greeks, we have accounts of bridges built by Semiramis, Darius, Xerxes, and Pyrrhus; and in Egypt, necessity early compelled the formation of bridges in connection with the canals constructed for the purposes of irrigation. But all these would appear to have been rudimentary in form, and to have consisted simply of piers, with the intervals between them spanned by beams of timber or large flat stones. Sometimes boats moored in the stream served the purpose of piers, as was the case with the famous B. of Xerxes across the Hellespont. Bridges of boats are in use to this day. The

principle of the arch was long known before it was applied to the art of B.-building. See ARCH. That application we owe to the Romans, whose first great work in which the arch was employed, the Cloaca Maxima (q. v.), is referrible to the time of the Tarquins. The Ponte de Rotto, or Senators' B. (127 B. C.), erected by Caius Flavius, appears to have been the first instance of its application to

Ponte de Rotto.

bridges. In the course of the great engineering undertakings of the Roman empire under Augustus Caesar for the formation of roads and supply of water to Rome, its application became general; and afterwards, the empire having extended its bounds, the necessity for ready communication between its provinces, led to the erection of numerous splendid bridges therein, many of which, indeed, surpassed in their greatness those of Rome itself. But although the Romans have unquestionably the merit of having originated the art of B.-building proper in Europe, yet it seems doubtful whether the principle of the arch was not applied by eastern nations to B.-building, long before the dawn of the greatness of the Roman empire. The Chinese are said to have been before the West in this as in other arts, though the antiquity of some of the bridges on which this assertion is rested may well be doubted, considering the uncertainty which pervades the chronology of that extraordinary people.

It is impossible here to trace in detail the progress of the art. For a long time after the decay of the Roman empire, it made no progress. It revived in the 11th c., but again languished to the beginning of the 18th, when the formation of the corps de Ponts et Chausées in France favoured its further growth. Henceforth, many splendid bridges were erected both in Britain and the continent. In 1775, Mr Pritchard of Shrewsbury, introducing the use of cast iron in the erection of bridges, originated a valuable style of construction. The genius and works of Telford bring us to the present time. Within half a century, the use of steam, the development of the canal system, and the necessity especially for railway-bridges, with the immense amount of capital at the disposal of engineers for purposes of B.-building, have caused a rapid evolution of all the principles and possible modes of the art. Among the new forms called forth within the century by the increasing demand for facilities of communication, are the suspension B., the wrought-iron girder and tubular bridges, and the lattice-bridges. Several of the new bridges over the Thames are models of engineering skill and taste. The Menai and Britannia bridges were regarded when erected as perfect marvels of the art, and yet they have since been surpassed. In America, the B. of Trenton, over the Delaware, the great Portage viaduct, and the Niagara suspension B., are equal to any similar works in the world.

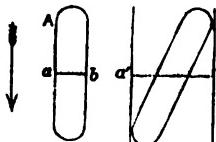

Perhaps no art has afforded greater scope for the application of mechanical science and engineering ingenuity than that of B.-building. The variety of complex structures of wood and of iron that now span streams and hollows is endless. For some of the more important forms, see FRAME, LATTICE, TUBULAR, and SUSPENSION BRIDGES. What follows here, relates chiefly to arched or masonic bridges,

and is confined to the more general and obvious conditions which such bridges must fulfil, avoiding the mechanical theory of their stability as too abstruse for popular exposition.

An arched B. rests between masses of masonry on opposite sides of a river, called its *abutments* (q. v.). The intermediate points of support of the arches are the piers (q. v.), which are rarely built so strong as to be able of themselves to resist the lateral thrust of the arches resting on them, if the thrust of one arch did not counteract that of another. The arch itself is the curved construction between adjacent piers. The chief terms used in speaking of the arch itself are explained under ARCH. In addition, may be noticed the *spandril*, the name given to the filling in above the extrados to the roadway. The *chord* or *span* is the distance between the piers; while the *rise* of the arch is the perpendicular distance between the level of the springing and the horizontal through the key.

When a B. has to be erected, the question of what form it should be falls to be settled by a variety of considerations. Regard to appearance affects the question, but the material points are its sufficiency for the purposes for which it is intended, and its security and durability. The nature of the embankments and of the soil in the water-bed, together with the nature of the water-shed, or country drained by the stream, may make it necessary that the B. should not be an arched bridge at all, but a suspension or tubular bridge. But if it is to be an arched B., then the most important questions respect the number of its piers and the form of its arches. If vessels must be free to pass under it, the arches must be lofty, and the abutments high; so also must they be if the river is exposed to sudden elevations of its level by floods. Formerly, a prejudice existed against laying a B. across a stream at any other angle than at right angles to its course. The reason was, that the theory of the skewed arch (q. v.) being unknown, the obliquity of the B. to the water-course involved a corresponding obliquity of its piers to the water, which greatly increased the risk of the B. suffering from floods. That

the pressure of the current on piers increased with their obliquity to its course, may be seen at once from the annexed figures, which represent the same section of a pier set first, as in A, dead up and down

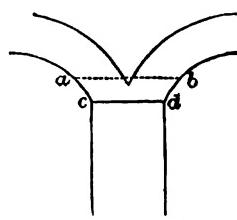

the stream, and next, as in B, obliquely to it. The mass of water which strikes B is equal in breadth to  $a'b'$ , the distance between lines through the extremities of B, parallel to the stream; while the mass which strikes A is in breadth only equal to  $ab$ , the thickness of the pier. But the skewed arch allows a B. to be thrown at any angle across a river, with its piers all parallel to the stream; and many an awkward turn in our public roads would have been spared us, had the skewed arch only been earlier known.

After making allowance for the requirements of position and traffic, the form next must be considered, more particularly in relation to the stream. The stream principally affects the form, through prescribing the number of piers. Each pier takes up so much of the water-course, and thus narrows the effective passage of the water. The immediate consequence of narrowing the channel is to increase the velocity of the stream. As the velocity of the stream increases, it tends more and more to carry off the soil in the neighbourhood of the piers, and finally, by deepening its course, to undermine them.

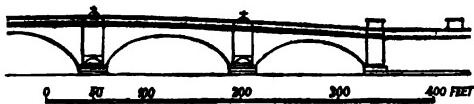

From this consideration, the effect of too many piers will be obvious; but indeed this is not matter of speculation, for many bridges—among others, a B. of Smeaton's at Harham—have been destroyed from this cause, thus falling from the very overabundance of support! To know how many piers may with safety be used, the volume of water that flows through the channel, both ordinarily and in winter-floods, must be ascertained, which can be done very nearly by calculating the mean of many soundings taken at different states of the river, and at a succession of points across its bed. There is another way in which the stream affects the form. If it is liable to floods, care must be taken to make the piers so high as to elevate the spring of the arches above the highest level attainable by the water. The annexed figure sufficiently shews how greatly the pressure of the water on the B. increases whenever it reaches above the pier-head—the breadth above the springing, as at  $ab$ , greatly exceeding the breadth of the pier itself. In connection with this part of the subject, it must be remembered, too, that floods are apt to carry down trees and other floating masses, which, if the arches do not afford them passage, become powerful levers for the destruction of the bridge.

The form of the B. being determined on, the remaining questions relate to its stability. This depends on the strength of the abutments and piers, and the balanced equilibrium of the arches. The importance of securing proper foundations for the abutments and piers cannot be overestimated, and very frequently their foundations, owing to the nature of the soil, have to be artificially constructed. See PILES, COFFER-DAM, and CONCRETE. In considering the stability of the B., the first thing is to ascertain the forces which will act to destroy it. This is ascertained by calculating the extreme passing load, and also the weight of the structure above the arches, and of the arches themselves. A scientific and skilled engineer is then able to judge what amount of strain or destructive pressure will be exercised by these weights on the several parts of the structure, and thus to adapt the strength at every point to the strain. As to the passing load, it is usual to calculate on 240 lbs. per foot, superficial, of the whole area in ordinary bridges, and on 960 lbs. in railway-bridges. The weight of the superstructure and arches is a question for practical measurement. As to the remaining pressure—viz., that of the stream—it must be ascertained for the highest floods. It is calculated from knowing the mean velocity of the stream, and the amount of surface exposed to it. The surface velocity is readily observed by means of floats; and when this is under 10 feet per second, the mean velocity is found to be about one-fifth less. The stress of the stream on the bridge is diminished by the expedient known as a cut-water, which is an angular projection from the pier, as shewn in the annexed figure. The best form for a cut-water has practically been ascertained to be an equilateral prism, presenting an angle of  $60^{\circ}$  to the water-course. In all bridges, these are to be found on the sides of the piers presented to the stream; and in tidal rivers, they are built on the lower side as well.

## BRIDGE-BUILDING BROTHERHOODS—BRIDGE-HEAD.

After the conditions already mentioned are satisfied, taste has more to do with the form of the arches than anything else. The forms in use are the old semicircular, the elliptical—usually got at by putting together several circular arches of different radii—and the segmental arch. The semicircular arch was almost exclusively used in the more ancient bridges. This arch is the most solid and most easily constructed, as all the voussoirs may be worked from the same mould. It requires, however, high banking, as its height is equal half its breadth; and where the water-level greatly changes, it is particularly unsuitable, from the great height necessary to be given to the piers, to carry the intrados out of water-reach. The elliptical arch and the segmental of 60° are, besides, far more pleasing in appearance.

**Elliptical Arches.—London Bridge.**

In possible extent of span, the masonic bridge is far exceeded by suspension and girder bridges. At Chester there is a stone arch with a span of 200 feet, perhaps the greatest in Britain; in the Britannia Tubular Bridge the span is 460 feet; in the suspension-bridge over the Menai Strait, 600 feet; and in the suspension-bridge at Freiburg, Switzerland, 870 feet.

It has been already mentioned that bridges are built of various materials—wood, iron, stone, and brick. The principal objection to the wooden B. is its liability to decay, besides which it is liable to warping, through the swelling and contracting of its beams. The latter objection applies also to iron bridges, but in their case, the contractions and expansions from heat and cold may be compensated for, as in the compensation-balance of a watch, or the compensation-pendulum.

Public bridges are maintainable at the expense of the counties in which they are situated; but in many cities and boroughs, the inhabitants have acquired by prescription a liability for this expense, and by the 13 and 14 Vict. c. 64, the management and control of such bridges is given to the council of the city or borough. If part of a public bridge be within one county or other place on which the liability rests, and the other part of the bridge be within another, each party or body shall repair that part of the bridge which is within its own boundaries. Besides the bridge itself, the county liable is bound by the 22 Henry VIII. c. 5, to repair 300 feet of the road either way from the bridge. And such is still the state of the law as to all bridges built prior to the passing of the Highway Act, 5 and 6 Will. IV. c. 50. But by that act it is provided that, in the case of all bridges thereafter to be built, the repair of the road itself passing over or adjoining to a bridge, shall be done by the parish, or other parties bound to the general repair of the highway of which it forms a portion—the county being still subject, however, to its former obligation as regards 'the walls, banks, or fences of the raised causeways, and raised approaches to any bridge, or the land arches thereof.' See Stephen's *Com.*, vol. iii. p. 234. The neglect to make such repairs is treated in law-books as a kind of negative offence; but there are positive offences against bridges, which in the statutes are called nuisances, as to which, see the 43 Geo. III. c. 59, s. 1, by which it is enacted that the surveyors of county bridges shall have the power and authority of removing all nuisances in the form of obstructions

or other annoyances. Private bridges are those erected and maintained under contracts authorised by private acts of parliament. See **ROAD**.

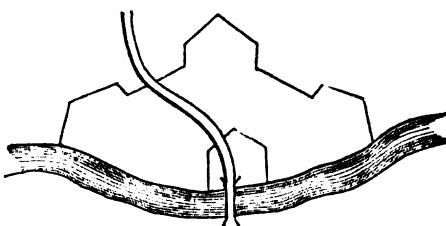

**BRIDGE-BUILDING BROTHERHOODS** (Fr. *Frères pontifes*; Lat. *Fratres pontifices*) were religious societies that originated in the south of France in the latter half of the 12th century. Their purpose was to establish hospices at the most frequented fords of large rivers, to keep up ferries, and to build bridges. The church during the middle ages regarded the making of streets and bridges as meritorious religious service. Whether or not the herdsman *Bénézet*, subsequently canonised, was the founder or only a member of this fraternity, is as uncertain as the tradition which attributes to him the completion of the bridge over the Rhone at Avignon in 1180. The fraternity was sanctioned by Pope Clemens III in 1189; its internal organisation was similar to that of the knightly orders, and the members wore as their badge or insignia a pick-hammer on the breast. In France, they laboured very actively, but were gradually absorbed into the order of St John. Similar associations sprang up in other lands, but under different names.

**BRIDGE, MILITARY**, is a temporary construction, to facilitate the passage of rivers by troops, cannon, and military wagons. The most efficient are described under **PONTOON**; but there are many other kinds. A *bridge of boats* is formed by small-craft, especially cargo-boats, collected from various places up and down the river; trestles are placed in them to bring their tops to one common level; the boats are anchored across the river, and banks of timber, resting on the trestles, form a continuous road from boat to boat across the whole breadth of the river; the boats ought to be of such size that, when fully laden, the gunwales or upper edges shall not be less than one foot above the water. *Rope-bridges* are sometimes but not frequently used by military engineers. A *boat-and-rope bridge* consists of cables resting on boats, and supporting a platform or road of stout timber. A *cask-bridge* consists of a series of timber-rafts resting on casks; the casks are grouped together in quadrangular masses; at certain intervals, timbers are laid upon them to form rafts, and several such rafts form a bridge; it is an inferior kind of pontoon-bridge. A *trestle-bridge* is sometimes made for crossing a small stream in a hilly country; it consists of trestles hastily made up in any rough materials that may be at hand, with planking or fascines to form a flooring, cables to keep the trestles in a straight line, and heavy stones to prevent them from floating. *Raft-bridges*, consisting of planks lashed together, are easily made of any rough materials that may be found on the spot; but they have little buoyancy, and are not very manageable. A *swing-flying bridge* consists of a bridge of boats, of which one end is moored in the centre of the river, and the other end left loose; this loose end is brought to the proper side of the river, the boats are laden, and they make a semicircular sweep across the river by means of rudders and oars, until the loose end of the bridge reaches the other bank. A *scut-flying bridge* is a boat or raft, or a string of boats or rafts, which is drawn across a river by ropes, in a line marked out and limited by other ropes.

**BRIDGE-HEAD**, or **TÈTE-DU-PONT**, in Military Engineering, is a fortified post intended to defend the passage of a river over a bridge. It is a field-work, open at the gorge or in the rear, and having its two flanks on the banks of the river. The most favourable position is at a re-entering sinuosity of

## BRIDGE OF ALLAN—BRIDGET.

the river, where the guns can work better with the supporting batteries opposite. Bridge-heads are

Bridge-head Defence Work.

usually temporary works, hastily constructed. Their most frequent use is to aid a retiring army to cross the river in good order, and to check an enemy pressing upon it. Openings are left to allow the retiring army, with guns and carriages, to file through without confusion; and parapets are so disposed as to flank and defend these openings.

**BRIDGE OF ALLAN.** See **ALLAN.**

**BRIDGEMAN, LAURA.** This famous blind mute was born in Hanover, New Hampshire, United States, on the 21st December 1829. She was a bright, intelligent child, but at two years of age was seized with a violent fever, which utterly destroyed both sight and hearing. For a time this so shattered her system, that there seemed no hope of recovery; but she rallied, and soon learned to find her way about the house and neighbourhood, and even learned to sew and to knit a little. A strong passion for imitation began to develop itself, and by assiduously cultivating this power, she was at last enabled to emerge out of her life of unbroken darkness and silence, and take her place among the educated people of the day. In 1839, Dr Howe of Boston undertook her care and education at the Deaf and Dumb School. The first attempt was to give her a knowledge of arbitrary signs, by which she could interchange thoughts with others. Then she learned to read embossed letters by the touch; next, embossed words were attached to different articles, and she learned to associate each word with its corresponding object. A pat on the head told her when she was right in her spelling-lesson. Thus far, however, the work was only an exercise of imitation and memory, roused into exertion by the motive of love of approbation, but seemingly without intellectual perception of the relation between words and things. It was like teaching a clever dog a variety of tricks. But at last the truth flashed upon her, that by this means she could communicate to others a sign of what was passing in her own mind. Her whole being seemed changed. The next step was to procure a set of metal types, with the letters cast at the ends, and a board with square holes for their insertion, so as to be read by the finger. In six months, she could write down the name of most common objects, and in two years had made great bodily and mental improvement. She grew happier, and enjoyed play like other children, amusing herself with imaginary dialogues, spelling old and new words, and with her left hand slapping the fingers of her right, if they spelled a word wrong; or giving herself a pat of approval, as the teacher did, when correct. Her touch grew in accuracy as its power increased; she learned to know people almost instantly by the touch alone. In a year or two more, she was able to receive lessons in geography, algebra, and history. She received and answered letters from all parts of the world, and was always employed, and therefore

always happy. Her brain seems to have been unduly excited for a blind person; she not only held imaginary dialogues with herself, but dreamed incessantly by night; and during these dreams, while asleep, talked much on her fingers. She learned to write a fair, legible, square hand, and to read with great dexterity, and at last, even to think deeply, and to reason with good sense and discrimination. Keen, sensitive, and lively, in various occupation, her days now pass rapidly and pleasantly, mainly owing to the unremitting skill and kindness of Dr Howe. She was saved by him from a life of hopeless, helpless darkness; educated and trained to take her part in the world; and now, as a teacher of the blind and deaf and dumb, is conferring on them the blessings she has herself received. She is probably among the most skilful of Blind teachers.

**BRIDGENORTH,** a town of Salop or Shropshire, on both sides of the Severn, 20 miles south-east of Shrewsbury. It consists of an upper and lower town, connected by a bridge over the Severn. The larger part of the town is on the right bank, and is built on a sandstone rock rising 60 feet above the river. Pop. in 1871, 7317. It returns two members to parliament. The navigation of the Severn formerly employed many of the inhabitants, but the traffic has been greatly injured by the introduction of railways. The town, which was at one time called *Bruges* or *Brug*, is said to be of Saxon origin. In the beginning of the 12th c. the Earl of Shrewsbury defended the town unsuccessfully against Henry I. It was besieged in the same century by Henry II.; and during the civil wars it resisted the Parliamentary forces for three weeks. A great portion of the town was on this occasion destroyed by fire. It has carpet and worsted manufactoryes. Bishop Percy was born here.

**BRIDGEPORT,** a seaport of Connecticut, U.S., at the mouth of the Pequannock, which empties itself into an inlet of Long Island Sound. It is in lat. 41° 11' N., and long. 73° 12' W., being 178 miles to the south-west of Boston, and 68 to the north-east of New York. In 1870, the population was 19,835, having gained 6536 in 10 years. B. is connected by railways both with the interior and with the other places generally on the seaboard. Though the harbour does not admit large ships, having only 13 feet on the bar at high-water, yet B. has a considerable coasting-trade, and a number of vessels engaged in the whale-fishery. Its manufactures are extensive, particularly of carriages and harness.

**BRIDGET,** St (or, more properly, *Birgit* or *Brigite*), a famous Roman Catholic saint, was born in Sweden about the year 1302. Her father was a prince of the blood-royal of Sweden. When only sixteen, she married *Ulf Gudmarson*, Prince of Nericia, a stripling of eighteen, by whom she had eight children, the youngest of whom, named Catherine, born in 1336, died in 1381, became *par excellence* the female saint of Sweden. Her husband and she now solemnly vowed to spend the remainder of their lives in a state of continence, and, to obtain strength to carry out their severe resolution, made a pilgrimage to the shrine of St Jago de Compostella in Spain. On their return, *Ulf* died in 1344, and B. founded about the same time the monastery of *Wadstena*, in East Gothland. Sixty nuns and twenty-five monks were its first inmates. They received the rule of St Augustine, to which St B. herself added a few particulars. They constituted a new order, sometimes called the order of St B., sometimes the order of St Salvator, or the Holy Saviour, which flourished in Sweden until the Reformation, when it was suppressed, but it still possesses some establishments in Italy,

## BRIDGETON—BRIDGEWATER TREATISES.

Portugal, and elsewhere. Subsequently, St B. went to Rome, where she founded a hospice for pilgrims and Swedish students, which was reorganised by Leo X. After having made a pilgrimage to Palestine, she died at Rome on her return, 23d July 1373. Her bones were carried to Wadstena, and she herself was canonised in 1391 by Pope Boniface IX. Her festival is on the 8th of October. The *Revelationes St Brigitte*, written by her confessors, was keenly attacked by the celebrated Gerson, but obtained the approval of the Council of Basel, and has passed through many editions. Besides the *Revelationes*, there have been attributed to this saint a sermon on the Virgin, and five discourses on the passion of Jesus Christ, preceded by an introduction which was condemned by the congregation of the Index.

Not to be confounded with this Swedish saint is another St Bridget, or St Bride, as she is more commonly called, a native of Ireland, who flourished in the end of the 5th and beginning of the 6th c., and was renowned for her beauty. To escape the temptations to which this dangerous gift exposed her, as well as the offers of marriage with which she was annoyed, she prayed God to make her ugly. Her prayer was granted; and she retired from the world, founded the monastery of Kildare, and devoted herself to the education of young girls. Her day falls on the 1st of February. She was regarded as one of the three great saints of Ireland, the others being St Patrick and St Columba. She was held in great reverence in Scotland, and was regarded by the Douglases as their tutelary saint.

**BRIDGETON**, a port of entry in New Jersey, U.S., about 40 miles south of Philadelphia. It occupies both banks of the Cohansey Creek, about 20 miles above its entrance into Delaware Bay, its two divisions being connected by a wooden drawbridge. The town contains a public library, two newspaper-offices, an iron foundry, a rolling-mill, a nail-factory, a woollen-factory, and a glass-work. It likewise owns upwards of 15,000 tons of shipping. Pop. in 1870, 6820.

**BRIDGETOWN**, the capital of Barbadoes (q. v.). It stands on the west coast of the island, stretching along the north side of Carlisle Bay, which forms its roadstead. It contains 21,384 inhabitants, its lat. being  $13^{\circ} 4' N.$ , and long.  $59^{\circ} 37' W.$  It is the residence of the Bishop of Barbadoes and of the Governor-general of the Windward Islands. B. was founded about the middle of the 17th c., taking the name of Indian Bridge, and subsequently its present appellation, from a rude aboriginal structure which spanned a neighbouring creek. The existing city, however, is less than 100 years old, its predecessor having been almost utterly destroyed by fire in May 1766. It also suffered very severely from fire in 1845. With the exception of Broad Street, the thoroughfares are very irregular; and the shops, from the want of windows in front, look heavy and unattractive.

**BRIDGEWATER**, a town and port of Somersetshire, on both sides of the Parret (which is here spanned by an iron bridge), 6 miles in a direct line, and 12 by the river, from the Bristol Channel, and 30 miles south-west of Bristol. It stands on the border of a marshy plain which lies between the Mendip and Quantock Hills, but the country around is well wooded. It is chiefly built of brick. St Mary's Church has a remarkably slender and lofty spire. The Parret admits vessels of 200 tons up to the town; it rises 36 feet at spring-tides, and is subject to a bore or perpendicular advancing wave, 6 feet high, often causing much annoyance to shipping. Pop. in 1871, 12,101. B. returns two

members to parliament. Bath or scouring bricks, peculiar to B., are made here of a mixture of sand and clay found in the river. Admiral Blake was a native of this town, which suffered severely in the civil wars, when it was besieged by Fairfax, and ultimately forced to surrender, the castle being dismantled by the conqueror. The unfortunate Duke of Monmouth was proclaimed king by the corporation of B., before the battle of Sedgemoor, which occurred in 1685, 5 miles south-east of B., and in which he was defeated by the royal army. In 1869, 138 vessels, of 11,843 tons, belonged to the port; and in the same year the number of vessels entering was 4144, with an aggregate burden of 217,987 tons; of vessels clearing, 1378; burden, 76,245 tons.

**BRIDGEWATER**, FRANCIS EGERTON, DUKE OF, styled the 'Father of British Inland Navigation,' youngest son of Scroop, fourth Earl and first Duke of B., was born in 1736, and succeeded his elder brother, second duke, in 1748. In 1758–1760, he obtained acts of parliament for making a navigable canal from Worsley to Salford, Lancashire, and carrying it over the Mersey and Irwell Navigation at Barton by an aqueduct 39 feet above the surface of the water, and 200 yards long, thus forming a communication between his coal-mines at Worsley and Manchester, on one level. In this great undertaking he was aided by the skill of James Brindley (q. v.), the celebrated engineer, and expended large sums of money. He was also a liberal promoter of the Grand Trunk Navigation; and the impulse he thus gave to the internal navigation of England, led to the extension of the canal-system throughout the kingdom. In politics, though he took no active part, B. was a friend to the Pitt administration, and a contributor to the Loyalty Loan of no less than £100,000. He died unmarried, March 8, 1803, and with his death the dukedom became extinct. Before he began to realise profits from his great work, B. lived in privacy, and restricted himself to the simplest fare; and after his death his great wealth was distributed among collateral branches of his family. A monument was erected to his memory in Manchester.

**BRIDGEWATER**, FRANCIS HENRY EGERTON, EARL OF, son of John Egerton, Bishop of Durham, grandnephew of the first Duke of B., succeeded his brother as eighth earl, October 21, 1823. Educated for the church, he had previously been prebendary of Durham. He died unmarried, in February 1829, and the title became extinct. By his last will, dated February 25, 1825, he left £8000, invested in the public funds, to be paid to the author of the best treatise 'On the Power, Wisdom, and Goodness of God, as manifested in the Creation,' illustrating such work by such arguments as the variety and formation of God's creatures in the animal, vegetable, and mineral kingdoms, the effect of digestion, the construction of the hand of man, and by discoveries, ancient and modern, in arts, sciences, and the whole extent of literature. The then president of the Royal Society of London, Davies Gilbert, to whom the selection of the author was left, with the advice of the Archbishop of Canterbury, the Bishop of London, and a noble friend of the deceased earl, judiciously resolved, that instead of being given to one man for one work, the money should be allotted to eight different persons for eight separate treatises, though all connected with the same primary theme (see next article). B. also left upwards of £12,000 to the British Museum, the interest to be employed in the purchase and care of MSS. for the public use.

**BRIDGEWATER TREATISES**, eight celebrated works 'On the Power, Wisdom, and Goodness

of God,' by eight of the most eminent authors in their respective departments, published under a bequest of the last Earl of Bridgewater (q. v.), whereby each received £1000, with the copyright of his own treatise. They are: 1. *The Adaptation of External Nature to the Moral and Intellectual Constitution of Man*, by Thomas Chalmers, D.D. (Lond. 1833, 2 vols. 8vo). 2. *Chemistry, Meteorology, and the Function of Digestion, considered with Reference to Natural Theology*, by William Prout, M.D. (Lond. 1834, 8vo). 3. *On the History, Habits, and Instincts of Animals*, by the Rev. William Kirby (Lond. 1835, 2 vols. 8vo). 4. *On Geology and Mineralogy*, by the Rev. Dr Buckland (Lond. 1837, 2 vols. 8vo). 5. *The Hand, its Mechanism and Vital Endowments, as evincing Design*, by Sir Charles Bell (Lond. 1837, 8vo). 6. *The Adaptation of External Nature to the Physical Condition of Man*, by John Kidd, M.D. (Lond. 1837, 8vo). 7. *Astronomy and General Physics, considered with Reference to Natural Theology*, by the Rev. William Whewell (Lond. 1839, 8vo). 8. *Animal and Vegetable Physiology, considered with Reference to Natural Theology*, by Peter Mark Roget, M.D. (Lond. 1840, 2 vols. 8vo). All these works have since been republished by Bohn.

BRIDLINGTON, or BURRLINGTON, a sea-coast town in the East Riding of Yorkshire (including Bridlington Quay, a port and bathing-place about 1 mile to the south-east), 6 miles west of Flamborough Head, and 40 miles east-north-east of York. B. is situated on a gentle slope in a recess of a beautiful bay. The country is hilly to the north, but subsides to the south into a flat alluvial and fertile tract called Holderness. It has the aspect of an old town with narrow irregular streets. Pop. in 1871, 6203. It has a considerable trade in corn, and also some soap-boiling and bone-grinding works. B. is supposed to have been the site of a Roman station. The Danes had strongholds in this vicinity for nearly 300 years, and many engagements between them and the Saxons and Normans occurred here. Great numbers of ancient tumuli or barrows still exist. An Augustine priory of immense wealth, and which subsisted for 400 years, was founded here by a grand-nephew of the Conqueror, and obtained many privileges from Henry I., and also from King John. Some parts of it yet remain. In 1642, Henriette, queen of Charles I., landed here with arms and ammunition from Holland bought with the crown-jewels. Bridlington Quay has a chalybeate mineral spring, as well as an intermitting one of pure water. B. is noted for its chalk-flint fossils. In the lacustrine deposits near B. were found, some years ago, the bones of a large extinct elk, with branching horns, measuring 11 feet from tip to tip.

BRIDPORT, a town in Dorsetshire, in a vale at the confluence of the Asker and the Birt, or Brit, or Bride, 16 miles west-north-west of Dorchester, and 2 miles from the English Channel. It stands on an eminence surrounded by hills, and consists chiefly of three spacious and airy streets. Pop. (1871) 7670. The registered elector number 983, including 15 freemen. They return one member to parliament. The chief manufactures are twine, shoe-thread, cordage, fishing-nets, and sail-cloth; and ship-building is carried on to some extent. The vicinity is celebrated for its cheese and butter. B. was a considerable town before the Norman Conquest, and had a mint for coining silver. In 1872 there entered into this port 72 vessels whose tonnage was reckoned 6875; and there cleared it 18 vessels of collectively 1840 tons. On the coast near, are sandy cliffs, 200 feet high, abounding in fossils.

BRIEF, or BREVE, PAPAL (Lat. brevis, short),

a word which, in the corrupt Latinity of the early ages, was made to signify a short letter written to one or more persons (hence the German *brevi*, a letter). It is now used to denote certain pontifical writings, which, however, do not receive their name from the brevity of the composition, but from the smallness of the calligraphy. The papal B. differs from the papal bull (q. v.) in several points. It gives decisions on matters of inferior importance, such as discipline, dispensations, release from vows, indulgences, &c., which do not necessarily require the deliberations of a concclave of cardinals. Still, it is not to be confounded with the *motus proprii*, or private epistles of the pope as an individual, as its contents are always of an official character. His holiness speaks, as it were, with a kind of familiar parental authority, and the B. is consequently superscribed *papa*, while the person to whom it is addressed is termed *dilecte fili* (beloved son). It is signed not by the pope, but by the *Secretario de' Brevi*, an officer of the papal chancery, with red wax, and only with the pope's private seal, the fisherman's ring; hence it concludes *Datum Roma sub annulo piscatorio* (Given at Rome under the ring of the fisherman). Like the bull, it is written on parchment, with this difference, that the bull is written on the rough side, and in ancient Gothic characters, while the brief is written on the smooth side, and in modern Roman characters.

BRIEF, in the practice of the English bar, is the name given to the written instructions on which barristers advocate causes in courts of justice. It is called a B. because it is, or ought to be, an abbreviated statement of the pleadings, proofs, and affidavits at law, or of the bill, answer, and other proceedings in equity, with a concise narrative of the facts and merits of the plaintiff's case, or the defendant's defence. But it is also used in forensic business generally, being applied, not only in the courts of law and equity, but also in all other tribunals, whether inferior or superior, original or appellate. In Scotland, the corresponding term is *Memorial*. The skill of the attorney or solicitor is shewn in the preparation of this important document, which should be characterised by arrangement and compression, without any material omission.

BRIEG, a town of Silesia, Prussia, about 27 miles south-east of Breslau. It is situated on the left bank of the Oder, and on the railway between Breslau and Vienna, and is surrounded with walls, which have been partly converted into promenades. The streets are wide and regular, and commercially B. is a thriving town, its manufactures including linens, woollens, cottons, hosiery, ribbons, lace, leather, and tobacco. The battle-field of Mollwitz (q. v.) lies a little to the west of Brieg. Pop. (1871) 15,367.

BRIEL, BRIELLE, or THE BRILL, a fortified seaport town, on the north side of the island of Voorne, Holland. It is situated near the mouth of the Maas, about 14 miles west of Rotterdam, in lat. 51° 54' N., and long. 4° 10' E. B. possesses a good harbour, and is intersected by several canals. It has a population of about 5000, the male portion of which are chiefly engaged as pilots and fishermen. B. may be considered as the nucleus of the Dutch republic, having been taken from the Spaniards by William de la Marck in 1572. This event was the first act of open hostility to Philip II., and paved the way to the complete liberation of the country from a foreign yoke. In 1585, B. was one of the towns made over to England as security for certain advances made to the states of Holland; it was restored to the Dutch in 1616. B. was the first

town of Holland which, without extraneous aid, expelled the French in 1813. The celebrated admirals De Witt and Van Tromp were natives of this place.

**BRIENNE-LE-CHATEAU**, or **BRIENNE-NAPOLEON**, a small town in the department of Aube, France, on the right bank of the river Aube, and about 14 miles north-west of Bar-sur-Aube. It is celebrated as the place where Napoleon I. received his earliest military education, he having entered the school here in 1779, when he was 10 years old, and remained until 1784. It is also remarkable on account of the battle fought here between the French and the allies in 1814. On the 29th of January, Bonaparte, who had collected his forces in the vicinity of B., with a view to check the advance of the allies on Paris, attacked Blucher, who was stationed in the town, and drove him out with considerable loss. In the struggle, the town, which was chiefly composed of wood, was almost reduced to ashes. On the 30th, the contest was renewed, and Blucher was forced to retreat to Trannes. On the following day, Napoleon deployed his forces in the plain between La Rothière and Trannes, and on February 1, the corps of the Crown-prince of Württemberg and Count Giulay, and the Russian reserves of grenadiers, having joined Blucher, Prince Schwarzenberg gave orders to renew the combat. After a sanguinary struggle, during which Napoleon, feeling the importance of the contest, exerted all his influence over his troops, led several charges in person, and frequently exposed himself to danger, victory at length declared decisively for the allies at every point. During the night of February 1 and the morning of the following day, the French troops retreated from Brienne-le-Chateau. The loss on both sides was about equal, consisting of nearly 5000 killed and wounded. The allies took 9000 prisoners, and 70 pieces of artillery. This victory at B. opened the way to Paris, and led to the fall of the empire.

**BRIENZ**, a town of the canton of Bern, Switzerland, beautifully situated at the foot of the Bernese Alps, on the north-east shore of the lake of the same name, and about 30 miles east-south-east of Bern. Its cheese is held in high repute. Pop. (1870) 2605.—The lake of B., which is about 8 miles long and 2 in breadth, is formed by the river Aar, at the foot of the Hasli valley, and by the same river it discharges its surplus waters into Lake Thun. The lake is situated at an elevation of 850 feet above the sea; its average depth is about 500 feet, but in some places it is said to have a depth of more than 2000 feet. It is surrounded by elevated mountains, the principal of which is the Rothorn, from which splendid views of the whole range of the Bernese Alps are obtained. A small steamer plies daily on the lake between B. and Interlaken, touching at the celebrated Giessbach Fall every trip.

**BRIEUC**, St, a seaport town, in the department of Côtes-du-Nord, France, situated on the right bank of the Gouet, about 2 miles from its mouth in the Bay of St B., a part of the English Channel, in lat. 48° 31' N., and long. 2° 45' W. The town is said to owe its origin to an Irishman, St Brieuc, who built a monastery here in the 6th century. St B. has the ruins of an old tower that formerly defended the entrance to the river, but was partially blown up by order of Henri IV. in 1598, and a cathedral, part of which dates from the 11th century. The ramparts were destroyed in 1788, and their site has been converted into a pleasant promenade, terminating in a terrace that commands a fine view of the Channel. St B. has manufactures of woollen stuffs, linen,

cotton, leather, paper, &c.; it has also ship-building yards, and a trade in agricultural produce. Pop. (1872) 10,718.

**BRIG, BRIGANTINE**. A brig is a square-rigged vessel with two masts. A brigantine, or hermaphrodite brig, is a two-masted vessel, with the mainmast of a schooner and the foremast of a

Brig.

brig. A brig's mainsail is the lowest square sail on the mainmast, whereas the mainsail of a brigantine is a fore-and-aft sail like that of a schooner.

**BRIGADE**, in the military service, is a group of regiments or battalions combined into one body. When a British army takes the field, it is customary for three battalions to form a *brigade*, and two brigades a *division*. Thus, at the battle of the Alma, each of the five divisions of British infantry comprised two brigades; and of these ten brigades, nine consisted of three battalions each, the tenth being somewhat stronger. It is nothing more than a temporary grouping, which can be broken up whenever the commanding officer thinks fit. The household troops, comprising the Horse Guards, Life Guards, and Foot Guards, are sometimes called the *Household Brigade*.

**BRIGADE MAJOR** is a military officer who exercises duties, in a brigade, analogous to those of the adjutant of a regiment. He attends to matters of discipline, and to the personal movements of the men. When regiments or battalions are brigaded, a *brigade-major* is appointed, usually from among the captains. He conveys orders, keeps the rollster or roster, inspects guards and pickets, and directs exercises and evolutions; but he nevertheless remains on the books of a particular regiment, and returns to his regimental duties when the B. is broken up.

**BRIGADIER, or BRIGADIER-GENERAL**, is an officer of a regiment (usually a colonel or lieutenant-colonel), who, for a limited time and for a special service, is placed upon brigade duties. He is then a general or commander of a brigade, which usually contains his own regiment as one of the number. When the brigade is broken up, he falls back to his colonelcy, unless his services lead to his promotion to the rank of Major-general.

**BRIGANDINE**, among the articles of armour worn during the middle ages, was an assemblage of small plates of iron, sewed upon quilted linen or leather, and covered with a similar substance to hide the glittering of the metal. It formed a sort of coat or tunic. The B. was named from the *Brigans*, a kind of light-armed irregular corps, employed something like the Cossacks and Bashi-bazouks of

recent days, and, like them, addicted to marauding and pilfering ; hence the word *Brigand*.

**BRIGANTES.** See BRITANNIA.

**BRIGANTINE.** See BRIG.

**BRIGGS, HENRY**, a distinguished mathematician, was born in 1561, at Warleywood, near Halifax, Yorkshire, and studied at St John's College, Cambridge. In 1596 he was appointed first reader in geometry at Gresham House (afterwards College), London, and in 1619 first Savilian professor of geometry in Oxford. This office he retained till the time of his death, which took place at Oxford, January 26, 1631. B. made an important contribution to the theory of logarithms, of which he constructed invaluable tables. Napier the inventor had, in 1614, published a table of the so-called natural logarithms, when B. observed that another system, in which the logarithm of 10 should be taken as unity, would afford great facilities of calculation. Napier admitted the improvement on his own system, and intended to assist in carrying the plan into effect ; but died in 1618, when the whole work was left to Briggs. In the same year he published his *Chilias Prima Logarithmorum*, containing the first thousand natural numbers calculated to eight decimal places, and in 1624 published his *Arithmetica Logarithmica*, the fruit of many years of unwearyed application, and giving the logarithms of natural numbers from 1 to 20,000, and from 90,000 to 101,000, with fifteen places. His system of logarithms is that now commonly adopted. Leaving others to carry out his calculations, for which he had provided every facility, he next employed himself on a Table of Logarithms of sines and tangents, carried to the hundredth part of a degree, and to fifteen places, which, with a table of natural sines, tangents, and secants, was posthumously published at Gouda, in Holland, 1633, under the title of *Trigonometria Britannica*.

**BRIGHT, JOHN**, a popular politician, first brought into notice by the Anti-Corn-Law agitation, son of Jacob Bright, a Quaker cotton spinner and manufacturer at Rochdale, Lancashire, was born at Greenbank, near that town, November 16, 1811. In 1835, he made a foreign tour, which included a journey to Palestine, and, on his return, delivered before a literary institution at Rochdale, of which he was one of the founders, lectures on the subject of his travels, and on topics connected with commerce and political economy. When the Anti-Corn-Law League was formed in 1839, he was one of its leading members, and, with Mr Cobden, engaged in an extensive Free-trade agitation throughout the kingdom. In the spring of 1843, he offered himself as a candidate for the representation of Durham, and, though at first unsuccessful, he became, in July of the same year, M.P. for that city. At all times an animated and effective speaker, B. was incessant, both at public meetings and in parliament, in his opposition to the Corn Laws, until they were finally repealed. In 1845 he obtained the appointment of a select committee of the House of Commons on the Game Laws, and also one on the subject of cotton cultivation in India. An abridgment of the evidence taken before the former, published in one volume, contained from his pen an *Address to the Tenant Farmers of Great Britain*, strongly condemning the existing Game Laws. At the general election of 1847, he was elected one of the members for Manchester. He co-operated with Mr Cobden in the movement in favour of financial reform. On the formation of the first Derby ministry, February 27, 1852, B. aided in the temporary re-organisation of the Corn-Law League, in favour of the principles of Free Trade ; and at the

general election which followed, was re-elected for Manchester. A member of the Peace Society, and strenuously opposed to the war with Russia in 1854, B. was one of the meeting of the Society of Friends, by whom a deputation was sent to the Emperor Nicholas to urge upon him the maintenance of peace ; and the following year he took a prominent part in energetically denouncing the Crimean war. A severe illness compelled him to withdraw for a time to the continent, and in his absence he was rejected by Manchester. Elected in 1857 for Birmingham, he seconded Mr Milner Gibson's motion against the second reading of the Conspiracy Bill, which led to the overthrow of Lord Palmerston's government. Since then, his name has been chiefly associated with the movement for reforming the electoral representation, which resulted in the act of 1867. During the war in America, he was a strong advocate of the North. In 1868 he accepted office under Mr Gladstone as President of the Board of Trade, but in December 1870 was again obliged to resign, in consequence of severe illness.

**BRIGHTENING**, in Calico-printing, is the operation of rendering the colours of printed fabrics more bright or brilliant, by boiling them in solutions of soda and other materials.

**BRIGHTON**, originally Brighthelmstone, a town and a celebrated watering-place on the sea-coast of Sussex, 50½ miles south of London. It is built on a slope ascending eastward to a range of high chalk-cliffs (backed by the South Downs), bounding the coast as far as Beachy Head ; to the west, these hills recede from the coast, and leave a long stretch of sands. Anciently, Brighthelmstone was a mere fishing-village on a level under the cliff ; and more than once it was burnt and plundered by French marauders. It was fortified by Henry VIII., and more strongly by Elizabeth ; but the sea proved more dangerous than the French, and now washes over the site of the village of those days. The inroads of the sea in 1699, 1703, and 1705, undermined many cliffs and destroyed many houses. Its further inroads are prevented by a sea-wall of great strength (60 feet high, 23 feet thick at the base, and 2 miles long), extending along the cliffs, and built at the cost of £100,000. The writings of Dr Russel, a celebrated physician of George II.'s time, first drew public attention to B. as an eligible watering-place, and the discovery of a chalybeate spring in the vicinity increased its popularity. The visit of the Prince of Wales in 1782, and his subsequent yearly residence there, finally opened the eyes of the fashionable world to its immense attractions, and B. thenceforth became the crowded resort of a health-seeking population. Its progress has been very rapid, and the town is still steadily increasing. B. is for the most part extremely well built, as becomes a favoured retreat of wealth and aristocracy. It mostly consists of new and elegant streets, squares, and terraces. The hotels are magnificent. A range of splendid houses fronts the sea for nearly 3 miles, including the famous sea-wall, and the beach is easily accessible by gaps in the chalk-cliffs. Formerly, trees were a great rarity in B. ; but within the last twelve years they have been planted both in and around the town, and are now to be seen of considerable size in the North Steyne Enclosures, the Level, and the Queen's Park. Pop. in 1801, 7339 ; in 1821, 24,429 ; in 1851, 65,569 ; in 1871, 90,011. B. returns two members to parliament. The population is greatly increased during the fashionable season by the influx of visitors. The town was incorporated in 1854. Living and house-rent are about a third higher than in London.

Near the centre of the town is the Pavilion or Marine Palace, a fantastic Oriental or Chinese structure, with domes, minarets, and pinnacles, and Moorish stables, begun for the Prince of Wales in 1784, and finished in 1827. It is now the property of the corporation of B., and with its fine pleasure-grounds of above seven acres, it is devoted to the recreation of the inhabitants. It stands in the Steyne, an open space between the east and west parts of the town. The Marine Parade, a fine terrace, extends about a mile along the margin of the cliff, between the Steyne and Kemp Town, a handsome district on the east. Westward, there is a similar parade or promenade, extending a great length in front of the more modern part of the town, and here there is daily a large and fashionable concourse. There are two piers—a Chain Pier on the east, opposite the Marine Parade, and a broad wooden pier on piles on the west; both are used for promenading. A magnificent aquarium, 715 feet in length, was opened in 1872. B. has no maritime trade. It is reputedly a town for recreation and sea-bathing. Its only defect is a want of trees to shade the promenades; the sea-breeze being adverse to the growth of trees. B. possesses several large public hotels, and is more particularly noted for its excellent private hotels or boarding-houses, locally known as 'Mansions.' B. is connected with London, and also with the towns along the coast, by railways. From its salubrity, the town abounds in boarding-schools.

**BRIGHT'S DISEASE** (of the kidneys), so called after the English physician, Dr Bright, who first investigated its character, consists of a degeneration of the tissues of the kidney into fat, and will be better understood after the anatomy of the organ has been studied. Suffice it to say now, that this degenerated condition impairs the excreting powers of the organ, so that the urea is not sufficiently separated from the blood. The flow of the latter, when charged with this urea, is retarded through the minute vessels, congestion ensues, and exudation of albumen and fibrin is the result. When we apply heat to the urine from a kidney so affected, it becomes opaque, shewing that it contained *albumen* (q. v.); and on examining a drop of it under the microscope, we observe the exuded lymph mixed with epithelium in the form of casts of the small ducts of the diseased organ. The patient presents a flabby, bloodless look, is drowsy, and easily fatigued. The disease may succeed any of the eruptive fevers, and is frequently associated with enlargement of the heart.

The causes of this terrible malady are any which cause congestion of the kidneys—indulgence in strong drinks, long-continued suppuration, exposure to wet and cold, the exanthematic fevers, and pregnancy. The indications for treatment are, to remove any of those causes which may be present, rectify the other secretions, relieve any temporary congestion of the kidneys, at the same time endeavouring to increase the number of red blood globules by the administration of iron and vegetable bitters. And in the advanced stages, when the blood is poisoning the nervous centres, attempts should be made to restore the secretion of urine by administering diuretics (q. v.), by giving hydrochloric and vegetable acids, sponging the patient with vinegar, and relieving the congestion of the brain by purgatives and local bleeding.

**BRIGNOLES**, a town in the department of Var, France, beautifully situated in a fertile valley, surrounded by forest-clad hills, and watered by a stream called the Calami, about 22 miles west-south-west of Draguignan. B., which is a very

salubrious place, has manufactures of broad-cloth, silk twist, soap, leather, pottery, &c.; and a trade in wines, brandy, olives, and prunes. Pop. (1872) 4626.

**BRIHUEGA**, a town of New Castile, Spain, 20 miles east-north-east of Guadalajara, is situated on the Tajufa, and was formerly surrounded by walls, of which traces still exist. The remains of an old Moorish fortress now serve as a cemetery. B. has manufactures of woollens, linen, glass, and leather. Pop. 4500. Here, in 1710, during the War of the Succession, the English general Stanhope, owing to the dilatoriness of his allies in affording him support, was defeated by the Duke de Vendôme, and compelled to surrender, with all his force, amounting to about 5500 men.

**BRIL**, the name of two Dutch painters.—**MATTHEUS B.**, born at Antwerp, 1550, went during his youth to Italy, and, under the patronage of Pope Gregory XIII., painted several frescoes in the Vatican. He was also distinguished as a historical and landscape painter. He died in 1584.—His more celebrated younger brother, **PAUL B.**, born 1554 or 1556, received instruction under Matthaeus in Rome, and soon excelled his master. His pieces were at first conceived in the fantastic style which then prevailed; but gradually his style increased in power and beauty, until it exerted a striking influence over landscape-painting. The works of his riper age exhibit high poetical qualities, and a fine appreciation of the effects of light in the sky, which have been described as but little inferior to those of his great successor, Claude Lorraine. They have a character of solemn rest and calmness, and at times even an elegiac tone of melancholy, which well accords with representations of the glories of fallen Rome. A collection of excellent landscapes by B. is found in the palace Rospigliosi in Rome, and two beautiful landscapes enrich the gallery of the Pitti Palace, Florence. Besides landscapes, B. painted scenes from biblical history; among them, the 'Tower of Babel,' now in the Berlin Museum. Other pictures by B. are found in the galleries of Munich, Vienna, and the Louvre. He died at Rome in 1626.

**BRILL** (*Rhombus vulgaris*), a fish of the same genus with the turbot (q. v.), found in considerable abundance on some parts of the British coasts, and common in the markets of the larger towns. It resembles the turbot more than any other British species of this genus, but is at once distinguished by its inferior breadth, which (excluding the fins) is only equal to half its entire length; by the want of tubercles on the upper surface; by a few of the most anterior rays of the dorsal fin being elongated beyond the membrane; and by the colouring, which is reddish sandy-brown on the upper side, variegated with darker brown and sprinkled with white pearly spots, the under side being (as in the turbot) white. The B. is taken both in sandy bays and in deep water. Although considered very inferior to the turbot, it is yet much esteemed for the table. It seldom or never attains so great a size as the turbot, rarely exceeding 8 lbs. in weight.

**BRILLIANT** is a popular name given to the diamond when it is cut in a particular way. See DIAMOND.

**BRIMSTONE** (Saxon, *Brenne-stone*, a stone that burns) is the vulgar name for sulphur (q. v.).

**BRINDISI** (the ancient *Brundisium* or *Brundusium*), a seaport town of Southern Italy, in the province of Lecce, is situated on a small promontory in a bay of the Adriatic Sea, about 45 miles east-north-east of Taranto. B. is a city of very great antiquity. It was taken from the Sallentines by the Romans 237 B. C., who some twenty years

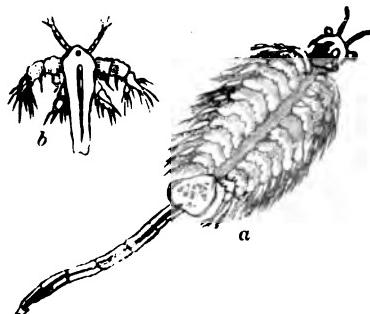

later established a colony here. The town, partly owing to the fertility of the country, but chiefly on account of its excellent port—consisting of an inner and outer harbour, the former perfectly landlocked, and capable of containing the largest fleets and of easy defence on account of its narrow entrance, and the latter also very well sheltered—rapidly increased in wealth and importance. It soon became the principal naval station of the Romans in the Adriatic. In 230 B.C., B. was the starting-place of the Roman troops that took part in the first Illyrian War; and from this point the Romans nearly always directed subsequent wars with Macedonia, Greece, and Asia. And when the Roman power had been firmly established beyond the Adriatic, B. became a city second to none of South Italy in commercial importance. Horace, who accompanied Antony in a hostile movement on B., in 41 B.C., has made the journey the subject of one of his satires (*Sat. i. 5*). Virgil died here, in 19 B.C., on his return from Greece. The city appears to have retained its importance until the fall of the empire, but it suffered greatly in the wars which followed. When the Normans became possessed of it in the 11th c., the Crusaders made it their chief port for embarkation to the Holy Land; but with the decline of the crusades, B. sank into comparative insignificance as a naval station. The city subsequently suffered greatly from wars and earthquakes. The principal buildings are the cathedral, where the Emperor Frederick II. was married to Yolanda in 1225; and the castle, commenced by Frederick II., and finished by Charles V. The district around B. is still remarkable for its fertility, olive oil being produced in large quantities. Some years ago, B. was constituted an entrepot for foreign goods. Since the establishment of the overland route to India, B. bids fair to become of great importance, being the most convenient point of departure for the east from Northern and Central Europe. The extensive and well-sheltered harbour is undergoing great improvement, and a substantial bulwark has been built across the north arm to prevent it from being filled with sand. Pop. 9105.

**BRINDLEY, JAMES**, an eminent English mechanician and engineer, born in Thornsett, near Chapel-en-le-Frith, Derbyshire, in 1716. Apprenticed at 17 to a millwright, he afterwards became an engineer, and in 1752 shewed great ingenuity in contriving a water-engine for draining a coal-mine. A silk-mill on a new plan, and several others of his works, recommended him to the Duke of Bridgewater (q. v.), who employed him to execute the canal between Worsley and Manchester. Thenceforth he devoted his great skill and genius to the construction of navigable canals; commenced the Grand Trunk, and completed the Birmingham, Chesterfield, and others. Once, when under examination before a committee of the House of Commons, being jocularly asked for what purpose he supposed rivers to have been created, he is said to have replied: 'Undoubtedly to feed navigable canals.' He died in 1772.

**BRINE** is the term applied to water highly impregnated with common salt, and **BRINE SPRINGS** are those natural waters containing much salt, which in many parts of the world gush out from fissures in the ground. See **SALT**.

**BRINE-SHRIMP** (*Artemia salina*), a small crustacean, of the order *Branchiopoda* (q. v.), which, unlike the greater number of animals of that order, is an inhabitant not of fresh but of salt water, and is indeed remarkable, because it is to be found in myriads swimming about in the brine of salt-pans previous to boiling, when, having been concentrated

by exposure to sun and air for about a fortnight, it destroys the life of almost all other marine animals.

Brine Shrimp:  
a, mature; b, young.

The full-grown B. is about half an inch long. The little animal is almost transparent, and is extremely active and graceful in its movements. The workmen at salt-pans so confidently ascribe to it the rapid clearing of the brine in which it occurs, that when it does not appear in their salterns, they transport a few from other salterns. They multiply with extraordinary rapidity.

**BRINJAREE DOG**, a rough-haired or long-haired variety of greyhound (q. v.), used in the Deccan, and said to be the best of the hunting-dogs of India. It is said to be superior in size and strength to the Persian greyhound, but not to be equal to the British greyhound in swiftness. It is generally of a yellowish or tan colour.

**BRINVILLIERS, MARIE MARGUERITE, MARGUERITE DE**, notorious as a poisoner in the time of Louis XIV., was the daughter of Dreux d'Aubray, Lieutenant of Paris, and received a careful education. In 1651 she was married, while still young, to the Marquis de Brinvilliers. This nobleman seems to have been a gay and careless spendthrift, who allowed his wife to do very much as she pleased. He even introduced to her a young officer named Jean Baptiste de Gaudin, Seigneur de St Croix, who was exceedingly handsome, and who inspired her with a violent passion. Her easy husband, however, was wholly indifferent to his wife's conduct; but her father, who seems to have had a stricter sense of duty, caused St Croix to be arrested and imprisoned in the Bastile. It was here the latter learned the art of preparing poisons, from an Italian, and on his release he imparted his fatal knowledge to his mistress, who, during his incarceration, had affected the greatest piety, spending most of her time in visiting the hospitals and in attending the sick. The marchioness now resolved to destroy her father. St Croix eagerly abetted her, in the hope of obtaining a portion of the paternal inheritance; but in order to test the efficacy of the poison, she tried its effects upon the invalids of the Hôtel Dieu. Having satisfied herself, she commenced operations on her parent, kissing and poisoning him continually for eight months, until her diabolical patience was exhausted, and she was at last induced to administer a very violent dose. He died, and no one suspected the marchioness. With St Croix's assistance, and that of a domestic servant, Jean Amelin, alias Chaussee, she next poisoned, with the same fearful indifference to crime, her two brothers and her sisters; her object being to find means of supporting her extravagant style of living with her paramour. Several times she attempted to poison the marquis, her

husband; but he escaped, and, as was said, by means of antidotes given by St Croix, who dreaded that he should be compelled to marry the widow. St Croix died suddenly in 1672—his glass mask having fallen off while he was engaged in preparing a poison—leaving documents incriminating the marchioness. She was also accused about the same time by her accomplice Chausseé, who being arrested, confessed all, and was condemned to be broken alive. The marchioness escaped to England; afterwards she travelled into Germany, and next went to Liege, where she took refuge in a convent. From this, however, she was craftily decoyed by an officer of justice disguised as an abbé, and conveyed to Paris. Among her papers was found a general confession of her crimes, including the above-mentioned murders, and many others. One strange confession stated that, out of pity for a virtuous young lady who had been imprisoned in a convent, the marchioness had poisoned a whole family! It is a singular fact, that this infamous woman was a bigot in her religious tenets, and was quite exemplary in her attendance at church. At her trial in Paris, she at first denied all charges brought against her, and pretended that the 'general confession' had been written during the insanity caused by a fever; but after being put to the torture, she made a full confession, and was beheaded, July 16, 1676. Her career had excited such terror in France, that Louis XIV. instituted a distinct tribunal, the *Chambre Ardente* (q. v.), to investigate cases of poisoning by the 'succession powder' used by the marchioness.

**BRIOUDE**, a town of France, in the department of Haute-Loire, situated near the left bank of the river Allier, about 29 miles north-west of Le Puy. It occupies the site of *Brixia*, a town of the ancient Averni. Its principal buildings are the college and the church of St Julien, founded in the 9th c., on the site of a still more ancient edifice erected on the spot where the saint was martyred. B. has manufactures of linen and woollen, and a trade in the agricultural produce of the district. Lafayette was born here. Pop. (1872) 4484.

**BRISBANE**, a name applied to various localities in Australia in honour of Governor Brisbane (q. v.).—1. B., an inland county, about 120 miles to the north-north-west of Sydney.—2. B., a seaport, the capital of Queensland, about 640 miles to the north of Sydney. It stands near the mouth of a river of its own name, which falls into Moreton Bay. By various routes from it, the neighbouring interior is most easily entered. Steamers run twice a week to Sidney. The pop. is now computed to be upwards of 20,000; in 1868, it was 14,266.—3. B., the river just mentioned. It rises in the main ridge which divides the rivers of the interior from those of the coast.

**BRISBANE**, GENERAL SIR THOMAS MACDOUGAL, a distinguished soldier and astronomer, was born at Brisbane, the hereditary seat of his family, near Largs, Ayrshire, July 23, 1773. At the early age of 16 he entered the army as an ensign, and in the following year, when quartered in Ireland, he formed an intimate acquaintance with Arthur Wellesley, afterwards Duke of Wellington. With a company he had raised in Glasgow in 1793, B. took part in all the engagements of the campaign in Flanders; and in the West Indies, to which he was sent in 1796, he greatly distinguished himself under Sir Ralph Abercromby. He afterwards served in the West Indies as colonel of the 69th; and in 1812 obtained command of a brigade under the Duke of Wellington in Spain. For his conspicuous bravery at the battle of the Nive he received the thanks of parliament. When Napoleon abdicated, B. was sent

in command of a brigade to North America, from whence he was recalled in 1815, but too late to admit of his being present at Waterloo. In 1821, B., on the recommendation of his friend the Duke, was appointed governor of New South Wales, a position he held for four years, during which time he introduced many wise reforms, especially in penal treatment; secured at his own expense good breeds of horses for the colony; promoted the cultivation of the sugar-cane, vine, tobacco, and cotton; and left at the close of his administration—which was marked by perfect tolerance and protection of all classes of Christians—50,000 acres of cleared land where he had found only 25,000. But high as B. ranks as a soldier and administrator, as a man of science he holds a still higher place. While in Australia, he catalogued no less than 7885 stars, for which great work—known as 'the Brisbane Catalogue of Stars'—he received the Copley medal from the Royal Society. On his return to Scotland, he had an astronomical observatory established at his residence at Makerstoun, and devoted himself entirely to scientific pursuits. He entered warmly into the plans of the British Association for ascertaining the laws of the earth's magnetism, and in 1841 had a splendid magnetic observatory erected at Makerstoun, the observations made there filling three large volumes, published in the *Transactions of the Royal Society of Edinburgh*, of which he was president, having been elected on the death of Sir Walter Scott. He founded two gold medals for scientific merit—one in the award of the Royal Society, the other in that of the Society of Arts. He died January 27, 1860.

**BRISSOT**, JEAN PIERRE, one of the first movers in the outbreak of the French Revolution, and afterwards numbered among its victims, was born at Chartres in 1754, and educated for the bar. After completing his studies at Paris, he went into the office of a procurator, but quickly abandoned the legal profession for the more congenial one of authorship. From his earliest years he had devoted himself with passionate eagerness to literary studies, especially history, economy, and politics, and, among other lingual accomplishments, acquired a thorough mastery of English. His first work, *Théorie des Lois Criminelles* (1780), gained the approbation of Voltaire and D'Alembert, and was followed by his *Bibliothèque des Lois Criminelles*, which established his reputation as a jurist. Having removed to London, he there started a learned journal, under the title *Lycœn*, for which, however, he found no adequate support. He therefore returned to Paris, and soon afterwards was imprisoned in the Bastile, on a charge of having written against the queen a brochure, which, in fact, was penned by the Marquis de Pelleport. After four months in the Bastile, he was liberated through the intervention of Madame de Genlis and the Duke of Orleans. B. continued to write tracts on finance, &c., but his love of freedom and vehement hatred of despotism again involved him in danger, and, to escape from a *lettre-de-cache*, he was once more compelled to retire to England. He afterwards visited North America, as representative of the *Société des Amis des Noirs*. On his return to France, he zealously assisted in the outbreak of the Revolution, and was in consequence elected by the citizens of Paris their representative in the Constituent Assembly, where he exercised a predominant influence over all the early movements of the Revolution. He also established a journal, called *Le Patriote Français*, which became the recognised organ of the earliest republicans; and, through his superior knowledge of politics, and the usages of constitutional countries, he gathered

## BRISTLES—BRISTOL

round him all the young men of talent and spirit who were opposed to the court-theory of absolute sovereignty. It thus happened that, without his being formally considered the head of a party, all the movements of the early revolutionists were profoundly influenced by him, and he incurred the bitter hatred of the court reactionists, who affixed the nickname of Brissotins to all the advocates of reform. Afterwards, the Brissotins formed the Girondist party. In the Convention, B. was representative of the department of Eure-et-Loir. Here his moderation made him suspected as a friend of royalty, as he opposed the 'men of September' and the trial and condemnation of the king. When Louis XVI. heard his doom pronounced, he exclaimed: 'I believed that Brissot would have saved me!' But B. was weak enough to imagine that the best way to save the king would be to vote first for his death, and then appeal to the nation. B. and his party, which was perhaps the purest in principle and the weakest in action, ultimately fell before the fierce accusations of the Mountain, or Jacobin party, which believed, or at least pretended to believe, that the virtuous B. had received money from the court to employ against the Revolution. With 20 other Girondists, B. suffered death under the guillotine, October 30, 1793.

**BRI'STLES**, the strong hairs growing on the back of the hog and wild-boar, and extensively used in the manufacture of brushes, and also by shoemakers and saddlers. They form an important article of British import, between 2 and 3 million pounds being annually imported, chiefly from Russia and Germany; but they are also obtained from France and Belgium, and small quantities of inferior quality have recently been received from China. From Russia, the average annual value of B. imported into Britain is £350,000, Siberia alone supplying about £150,000. Russian B. vary in value from £6 to £60 per cwt. From Germany, about £100,000 worth per annum is received, varying from £6 per cwt. to £35 per cwt. From France and Belgium, about £20,000, varying in value from 2s. to about 4s. 6d. per pound. The quality of B. depends on the length, stiffness, colour, and straightness—white being the most valuable. The best bristles are produced by pigs that inhabit cold countries. The Russian hog is a long, spare animal, and the thinner the hog, the longer and stiffer the bristles. When the Russian hog is sent to the south and fattened, the B. become soft, and of course depreciated in value. In the summer, the hogs are driven in herds through the forests, to feed on soft roots, &c., when they shed their B. by rubbing themselves against the trees. The B. are then collected, sewed up in horse or ox hides, and sent to fairs, whence they find their way, through agents, to all countries.

**BRISTOL**, an important maritime city in the west of England, long. 2° 35' 28" W., lat. 51° 27' 6" N., upon the rivers Froom and Avon, and partly in the counties of Gloucester and Somerset, joined with the former for ecclesiastical and military purposes, but otherwise a city and county in itself. The rateable value in 1872 was £851,048. The ancient portion of B. consists almost entirely of shops, warehouses, offices, manufactories, and other commercial buildings. The streets are, with few exceptions, narrow and irregular; but great improvements have been effected in them recently at a cost of half a million sterling, and there are many handsome shops, and other buildings of a superior character. Among the latter may be especially mentioned the banking-house of the West of England Company, the Assize Court and Guild Hall, Bank of England, General Hospital, Colston Hall, and Victoria Rooms. A

great Central Terminus is (1875) in course of erection for the various railways. The most remarkable modern structure, however, is the suspension bridge over the Avon, at Clifton, which is 702 feet in span, and 245 feet above high water. Among the ancient buildings are the Church of St Mary Redcliffe, the Cathedral, and Temple Church, remarkable for its leaning tower. Some remains still exist of the ancient castle and walls, traces of British encampments at Clifton and Leigh, and considerable Druidic vestiges at Stanton Drew. The modern portions of B., including Clifton, Cotham, Redland, &c., consist of handsome residences, in squares, terraces, crescents, and detached villas, and some creditable specimens of architecture in churches, chapels, assembly and club rooms. The population of B. proper was, in 1871, 62,662, and of the suburban districts, 141,378—total, 204,040, steadily increasing; total included in the municipal boundary, 182,562. The floating harbour and quays extend for more than a mile through the city, and are formed by embanking and locking the old courses of the rivers, which now flow through a new channel cut at a cost of about £600,000. There were entered inwards with cargoes during the year 1872, 1091 vessels, with a tonnage of 386,357, engaged in the foreign, and 8012, of 639,907 tons, in the coasting trade, making a total of 9103 vessels, and 1,025,264 tons. The clearances outwards with cargoes for the same year shew 4618 vessels and 538,209 tons. The customs duties on imports produced £1,026,516. The chief trade is with Canada and the United States, West Indies and South America, Portugal, the Mediterranean, Russia, Mauritius, Turkey, France, and west coast of Africa. The principal exports are iron, tin-plate, copper and brass, coal, salt, and manufactured goods, to the annual value of about £400,000. The manufactures are chiefly cotton goods, glass, refined sugar, earthenware, lead, chemicals, leather, and floor-cloths. The ship-building yards have the reputation of turning out excellent sea-going vessels. The *Great Western*, the pioneer of steam-communication across the Atlantic, the *Great Britain*, and the ill-fated *Demerara*, were built here. The railways terminating in Bristol are—the Great Western from the east; the Midland from the north, with a branch to Bath; the Bristol and Exeter from the west; the North Somerset, from the south; the Great Western line communicating with South Wales, and short branches to Avonmouth and Portishead. B. returns two members to the House of Commons; the number of electors is 22,124. The municipal government is vested in a mayor, 16 aldermen, and 48 town-councillors, a lord-lieutenant, and lord high steward. The police arrangements are efficient, and the city has a large jail which is (1875) about to be reconstructed on a new site. The benevolent institutions of B. are numerous and well supported. The most important are the Infirmary, the General Hospital, the Blind Asylum, Orphan Asylum, Asylum for Deaf Mutes, alms-houses, reformatories, &c., and the extraordinary Ashley Hill Asylum, for 2050 orphans, built and maintained without any provision for meeting expenses, except the unsolicited contributions that happen to be sent to it. Among charitable institutions must also be reckoned the well endowed Colston, City, and Red Maida Schools, and other free schools. For the better classes, the educational establishments are Clifton College and the grammar school, and many proprietary and private schools; there are also a medical school, fine arts academy, and trade school. Of places of worship in B., 57 belong to the Church of England, 29 to Wesleyan communities, 24 to Independents, and about 36 to other sects. The

## BRISTOL BAY—BRITANNIA.

first records of the history of B. speak of it under the ancient British name of Caer-oder; it then became a stronghold of the Romans; on their departure, was again occupied by the Britons, until, in 584, the Saxons drove them out, and giving it the name of Brightstowe or Bricstowe, made it a thriving place of trade—aboriginal slaves being a principal item in the commerce. It was sacked by the Danes. Henry III. gave it the rights of a corporate town; Edward III., those of a city and county in itself. In 1247, the parishes of Redcliffe, Temple, and St Thomas were added to Bristol. During the Civil War, it was alternately taken by Royalists and Parliamentarians, and by the latter, the castle and fortifications were razed. It afterwards became the principal port for trade with the West Indies, and carried on a flourishing business in negro slaves. In 1793, the 'Bridge Riots' occurred. In 1804 the Docks were begun, and in 1809 they were opened to shipping. In 1831, the 'Reform Bill Riots' resulted in the destruction of the Bishop's Palace, Custom-house, Excise-office, jail, toll-houses, a number of private residences, and several lives. The bill itself, by the addition of Clifton, &c., gave the city its present municipal boundaries. Among the names of note identified with the history of B. are those of the Fitzhardinge family; William of Worcester; Canyng, the great merchant and restorer of Redcliffe Church; Colston and Whitson, the merchants and philanthropists; Sebastian Cabot, the navigator, said to have anticipated the discovery of America by Columbus; the poets Southeby and Chatterton; Lawrence and Baily, artists; Sydney Smith, canon of Bristol Cathedral; Robert Hall, Coleridge, and Hannah More; the Misses Porter; Dr Frichard, Dr Carpenter, and Miss Mary Carpenter.

**BRISTOL BAY**, an arm of the Pacific Ocean, in Russian America, lying immediately to the north of the peninsula of Alaska. B. B. receives the waters of two considerable lakes, which, communicating with each other, offer an opening into the interior.

**BRISTOL CHANNEL**, an inlet of the Atlantic Ocean, in the south-west of England, between South Wales on the north, and Devon and Somerset shires on the south; or it may be regarded as an extension of the estuary of the river Severn. It is about 80 miles long and 5 to 48 miles broad, the greatest breadth being between St Gowan's Head and Hartland Point, its most western and external points, this line passing through Lundy Isle. It is the largest inlet or estuary in Britain, having a very irregular coast-line of 220 miles, and receiving a drainage of 11,000 square miles. The chief rivers which flow into it are the Towy, Taff, Usk, Wye, Severn, Avon, Axe, Parrot, Taw, and Torridge. The tides in it rise to an extraordinary height—at Bristol, 35 feet; at King's Road, 40; and at Chepstow, sometimes 70. The rapid flow of the tides meeting the currents of the rivers produces, in the narrow parts of the Channel, and in the mouths of one or two of the rivers which enter it, the phenomenon of the bore, the tide advancing like a wall of water sometimes 6 to 9 feet high. The chief bays and harbours are, on the north, Caernarthen and Swansea Bays, Cardiff Roads, the mouths of the Usk and Wye, and the Severn estuary; and on the south, Bideford or Barnstaple, Morte, Ilfracombe, Combe Martin, Minehead, Porlock, and Bridgwater.

**BRITAIN, GREAT.** See **GREAT BRITAIN**.

**BRITAIN, NEW.** See **NEW BRITAIN**.

**BRITANNIA** (perhaps from Celtic *brith* or *bri*, painted, the ancient Britons being in the habit of

painting their bodies blue with woad), the ancient name of the island of Great Britain (see **BRITANNICAE INSULE**). The Romans under Julius Caesar (who wished to chastise the Britons for aiding the Veneti, a tribe in Gaul, against the Roman power) invaded Britain in 55 and 54 B. C., but they did not, for a hundred years afterwards, proceed with vigour to subdue the country. After a desperate resistance by the native British princes, especially Caractacus and Boudicea, the south half of Britain was conquered by Vespasian, and made a Roman province in the reign of Claudius, about 50 A. D. Agricola, sent by Nero in 79 A. D., consolidated these conquests, and extended the influence of Rome to the Firths of Forth and Clyde, between which, in 84 A. D., he erected a chain of forts to repel the inroads of the northern Caledonians, in the line of the stone Wall of Antoninus, afterwards erected, in 140 A. D., by Lollius Urbicus. Agricola was the first Roman to sail round the island, and the first Roman general to come in contact with the Caledonians, whom, under their leader Galgacus, he overthrew, in 84 A. D., at a hill called the Mons Grampius, the situation of which has not been satisfactorily determined. The Romans made many ineffectual attempts to subdue the Caledonian barbarians, and penetrated, for this purpose, through the north-east part of Scotland as far as the Moray Firth, as is attested by the remains of Roman camps and stations still existing along their line of march, and the relics of Roman art found in connection with them. Not only did the Caledonians on their own soil resist the Roman sway, but by constant inroads into the Roman territory south of the Wall of Antoninus, they so harassed the Romans themselves, that the latter were forced to abandon their conquests for 80 miles south of that wall, and to secure permanently their remaining conquests in South Britain by a line of defensive works between the mouth of the Tyne and the Solway Firth, called the Wall of Hadrian (q. v.), begun by Agricola in 80 A. D., strengthened by Hadrian in 121, and rebuilt and completed by Severus in 210 A. D. After this last date the Romans did not attempt to regain their lost provinces. Subject to these incursions of the Caledonians, the opposition of the native British princes, and the invasion of tribes from the opposite shores of the continent, the Romans held sway in Britain down to about 420 A. D., soon after which time the Saxons invaded south Britain, and ultimately subdued it. Britain, south of the Solway Firth and the mouth of the Tyne, in the reign of Claudius, formed one Roman province under a consular legatus and a procurator. Ptolemy mentions 17 native tribes as inhabiting this tract. Toward the close of the 4th c. A. D., Roman Britain constituted a diocese in the prefecture of Gaul, and was divided into five provinces, of which the boundaries, though uncertain, are supposed to have been as follows: B. Prima, England south of the Thames and the Bristol Channel; B. Secunda, Wales; Flavia Caesariensis, the country between the Thamea, Severn, Mersey, and Humber; Maxima Caesariensis, the rest of England to the Scottish border; and Valentia—soon abandoned by the Romans—or Scotland south of the Wall of Antoninus. At this time, also, the inhabitants of Roman Britain included Phoenician, Roman, and Germanic elements, which had become incorporated with the native Britons, who were of Celtic or Gaelic descent. The Romans governed Britain by a vicarius or vicegerent resident at Eboracum (York), under whom were consuls, presidents, and other subordinate officers. To insure the obedience of the natives, at least three Roman legions—chiefly composed of Gauls, Germans,

## BRITANNIA METAL—BRITANNIA TUBULAR BRIDGE.

Iberians, and but few pure Romans—were stationed in Britain; viz., at Eboracum, Deva (Chester), and Isca Damnoniorum (Exeter). Under the Romans, many towns (*colonies* and *municipia*)—56 are enumerated by Ptolemy—arose in Britain, and diffused Roman law and civilisation over the country. The towns of Eboracum (York) and Verulamium (near St Albans) had the privileges of Roman citizenship. The Romans made many roads or streets (*strata*), of which there are still numerous remains, across the country, all centering in London. They also developed it into a corn-growing country. Druidism was the religion of the Britons at their conquest by the Romans, but the latter introduced Christianity and Roman literature into the country. There are many remains still extant of the presence of the Romans in Britain, such as camps, roads, ruins of houses, baths, flues, altars, mosaic pavements, painted walls, metallic implements and ornaments, weapons, tools, utensils, pottery, coins, sculptures, bronzes, inscriptions, &c. These remains shew that the Romans wished to render their British conquests permanent, and that they had greatly improved the arts of the ancient Britons, as is evident on comparing the remains with the far ruder native antiquities of the British pre-Roman or pre-historic era, such as tumuli, barrows, earthworks, so-called Druidical monoliths and circles, cromlechs, cairns, pottery, weapons, tools, utensils, ornaments, &c. Many of the Roman remains in Britain also shew that the Romans had introduced into the country the refinements and luxuries of Rome itself.

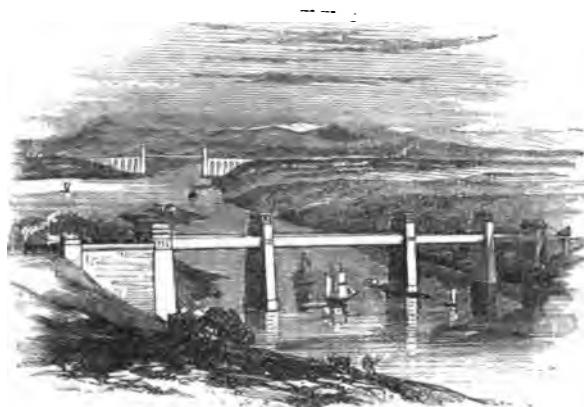

Under the term BRITANNIA, Great Britain has been personified in the fine arts as a female seated

on a globe or on an insulated rock, and leaning with one arm on a shield, the other hand grasping a spear or a trident. The first example of this personification is on a Roman coin of Antoninus Pius (died 161 A. D.). The figure reappears first on the copper coinage of England in the reign of Charles II. (1665); the celebrated beauty, Miss Stewart, afterwards Duchess of Richmond, is said to have served as model to the engraver, Philip Roettier. The Britannia that appears on the reverse of British copper coins since 1825 was the design of Mr W. Wyon. See COINAGE.

**BRITANNIA METAL** is an alloy very largely employed in the construction of the cheaper kinds of tea and coffee pots, tea-spoons, &c. The proportions of the metals used in its manufacture are various, but the average composition in 100 parts is: tin, 85 $\frac{1}{4}$ ; antimony, 10 $\frac{1}{4}$ ; zinc, 3; and copper, 1. B. M. is harder than pewter (q. v.), hence vessels or spoons made of it are not so liable to lose their shape, or to be indented with a slight blow. A variety of B. M., called Queen's Metal, is also extensively used for similar purposes, and it ranks intermediate in hardness between pewter and ordinary B. Metal. Queen's Metal is composed of—tin, 9; antimony, 1; bismuth, 1; and lead, 1.

**BRITANNIA TUBULAR BRIDGE**, a railway bridge over the Menai Strait, remarkable alike for its gigantic dimensions, and as being the first construction of the kind ever undertaken. With a view to facilitate communication with Ireland via Holyhead, the directors of the Chester and Holyhead Railways in 1845 sought the aid of Mr Robert Stephenson, the great engineer, to bridge the strait with such a structure as should admit of the safe passage of heavily laden trains without in any way interfering with the navigation of the channel. About a mile above the suspension-bridge, and nearer Carnarvon, a rock in the middle of the strait rose ten feet above the water at low tide; and on this site, provided by nature, it was resolved to erect the bridge in the form of a rectangular tube, composed of wrought-iron plates riveted together in a manner to combine the greatest strength with the greatest lightness. See STRENGTH OF MATERIALS and TUBULAR BRIDGES. In the spring of 1846, the undertaking was commenced;

Britannia Tubular Bridge.

by the 22d of June 1849, the Britannia Tower on the rock in the centre of the strait was completed (height, 191 feet 6 inches above high-water mark). Other two towers, some 18 feet lower, were

erected on each side of the Britannia Tower; thus dividing the space into four spans, of which the two centre ones are 460 feet each, the other two being comparatively narrow. The short tubes

## BRITANNICÆ INSULÆ—BRITISH ARMY.

between the abutments and the shore towers were constructed, by means of strong scaffolding and stages, in the places they were to occupy when finished; the long central tubes were built at the water-edge, from whence they were floated off on pontoons to the base of the towers, which had grooves or recesses made to receive them, and then elevated gradually (supports being built under their ends as they ascended) by powerful hydraulic presses to the requisite height, 102 feet above high-water mark. On the 13th of October 1849, the first long tube, 472 feet in length (12 feet being allowed for the rest at both ends), and about 1800 tons in weight, was safely fixed at its proper height above the sea. The other centre tube was got up by December; and on the 5th of March 1850, a train swept through, and the bridge was open for traffic. In August the parallel line of tubes was completed, and the up and down trains could now pass over the Menai with as little delay and danger as over any other part of the line. The total length of the bridge is 1841 feet, of the tubes, 1513 feet. The extreme height of the tube at the Britannia Tower is 30 feet, diminishing to 22 feet 9 inches at the abutments, 'the difference being made to give a true parabolic curve to the top while the bottom is straight.' Inside, the width is 13 feet 8 inches throughout, and the height 26 feet at the middle, and 18 feet 9 inches at the ends. To provide for the expansion and contraction of the metal, the bed-plates in the shore towers and in the abutments, on which the tubes rest, are made to move freely on cast-iron rollers and balls. This precaution, for securing free movement to the tubes, was not unnecessary, as it has been found that between the expansion of summer and contraction of winter there is a difference of fully 12 inches. The total weight of iron used was nearly 12,000 tons, of which the tubes contain 9360 tons of malleable iron, 1015 tons of cast iron, and 175 of permanent railway. In their fabrication 186,000 different pieces of iron, fastened together by more than 2,000,000 rivets, were used; and in the towers, abutments, &c., there is 1,492,151 cubic feet of masonry. The total cost was about £602,000. The whole structure was completed in less than five years. See TUBULAR BRIDGE.

**BRITANNICÆ INSULÆ**, a term used by ancient classic writers previous to Caesar for the British Isles, including Albion (England and Scotland), and Hibernia or Ierne (Ireland), with the smaller isles around them. Aristotle, in the beginning of the 3d c. B.C., knew only of Albion and Ierne. Caesar, about 54 B.C., was the first to apply the name Britannia to Albion. Ptolemy, in the 2d c. A.D., is the first to apply Little Britain to Ierne or Ireland, and Great Britain to Albion or England and Scotland. Herodotus, in the 5th c. B.C., is the first writer to mention Britain with any sort of definiteness; previous Greek writers speak of Britain only in connection with the Phoenician tin trade carried on with the Cassiterides or Tin Isles (the Scilly Isles and Cornwall), which they often confound with the Azores. The Phoenician trade with the British Isles began about 1000 B.C., the Phoenicians giving the native Britons salt, skins, and bronze vessels in exchange for tin and lead. Ptolemy enumerates 52 different Celtic or Gaelic tribes as inhabiting Britain in his time. See CELTIC NATIONS.

**BRITISH ARMY.** In ARMIES, MODERN, a succinct account is given of the relative strength and organization of the chief European armies, with the exception of that of the British empire, reserved for consideration in the present article.

Like other modern armies, the British army originated in the feudal system (q.v.). When

regal power, tempered by a parliament, superseded that system, the people, according to their rank in life, were expected to provide themselves with certain kinds of weapons and defensive armour. The justices of the peace were empowered to see to these military duties of the people. When the nation was either actually engaged in war, or apprehensive of invasion, the sovereign issued commissions to experienced officers, authorising them to draw out and array the fittest men for service in each county, and to march them to the sea-coast, or to any part of the country known to be in most danger. See ARRAYER. It was in the time of Henry VIII that lord-lieutenants and deputy-lieutenants of counties were first appointed as standing-officers for assembling and mustering the military force. During the earlier years of the Tudors, contracts were made by the king with 'captains,' who undertook to provide, clothe, and feed so many fighting-men, for a given money-allowance; but the power intrusted to the lord-lieutenants gradually changed this system, in relation at least to home-defence. In the reign of Charles I., the important question arose, whether the king of England did or did not possess the right to maintain a military force without the express consent of parliament; and this question was all the more bitterly discussed when the king billeted his soldiers on the people. After the troubles of the civil wars and the Commonwealth, Charles II. found himself compelled to agree, on his Restoration, to the abandonment of all the army except a kind of body-guard or household brigade of 5000 men, sanctioned by the parliament. In the 13th year of his reign, he succeeded in obtaining a statute, declaratory that 'the sole and supreme power, government, command, and disposition of the militia, and of all forces by sea and land, and of all forts and places of strength, is the undoubted right of his majesty; and both or either of the Houses of Parliament cannot nor ought to pretend to the same.' Both Charles II. and James II. found, however, to their mortification, that this statute did not in effect give them so much real military command as they had wished and intended—because the Commons, by holding the purse, virtually held the power.

It was in the time of William and Mary that the real basis for the modern B.A. was laid. The DECLARATION OF RIGHTS (q.v.) settled, in positive terms, 'that the raising and keeping of a standing army in time of peace, without consent of parliament, is contrary to law.' The first MUTINY ACT (q.v.) was passed in 1689, to last for six months only; but it has been annually renewed ever since, except in three particular years; and it constitutes the warrant on which the whole military system of England is exercised by the Sovereign, with the consent of parliament. During a period of 172 years, with only three interruptions, the ministers of the crown have annually applied to parliament for permission to raise a military force, and for money to defray the expenses. The Sovereign can make war, and can bestow military employments and honours; but the steadiness with which the Commons have always regarded themselves as the representatives of the tax-paying nation has, in however imperfect a degree, provided a check, even in the worst of times, on the grasping by courtiers of lavish military privileges.

The great distinction between the B.A. and that of almost every other state in Europe, is that the service is voluntary. The subjects of the crown engage, by free choice, to serve in the army for a definite number of years. In the rare cases where forced service by ballot is obtained, it is in the militia, not the regular army. See MILITIA. The British soldier has much hard colonial life to bear,

## BRITISH ARMY—BRITISH ASSOCIATION.

and many long voyages to make; he is, moreover, almost entirely shut out from the chance of being a commissioned officer. As a consequence, the ranks are mostly filled from the more necessitous classes of the community—by those who from want of steady habits, or of education, are the least fitted for industrious pursuits; whereas in France and many other foreign countries, the profession of arms is regarded as an honourable one, of which even the private soldier feels proud. Mr Fonblanque, comparing the peace establishments of the chief European armies in 1857, found that of England to be the smallest in ratio to population, but the most costly in relation to its strength. The English ratio was 1 in 128; the French, 1 in 95; the Prussian, 1 in 80; the Russian, 1 in 72; the Austrian, 1 in 68. English soldiers, officers, and men together, cost the country £52 each per annum; French, £36; Prussian, £31; Austrian, £18, 10s.; Russian, £13, 5s. The English cost per man is still higher now than it was in 1857, on account of increased attention being paid to the wellbeing of the soldier.

The B. A., in all its completeness, is supposed to be commanded by the Sovereign, assisted by the Secretary of State for War in some matters, and by the Commander-in-chief in others. The component elements are the household troops; the infantry of the line; the cavalry of the line; the ordnance corps, comprising artillery and engineers; and the marines. There are also certain corps raised in and belonging to the principal colonies; other bodies of troops, maintained out of the revenues of India; the militia; the yeomanry cavalry; the army of reserve; the volunteer artillery and rifles; the enrolled pensioners; and sometimes during war, foreign legions. The 'peace establishment' of the B. A. varies according to the political aspect of affairs abroad, and to the strength of the economising principle at home. In 1814, when England was engaged in tremendous contests abroad, the regular army reached 200,000 men, exclusive of fencibles, foreign legions, and militia. In the first few years after the termination of the great war against Napoleon, the reductions in the B. A. involved the compulsory retirement of no less than 10,000 military officers, who thereupon went on half-pay; these, by filling vacancies, transfers, and deaths, have nearly disappeared. The elasticity which permits the enlargement or contraction of the army arises from varying, not so much the number of regiments, as the number of battalions in a regiment, of companies in a battalion, or of men in a company. If we compare the strength of the regular army at various periods between 1820 and 1873, we shall find that the actual number of regiments has varied but little, the difference of strength being made up in the three modes just mentioned.

The strength of the B. A. declined from 1815 to 1835, since which last-mentioned year it has undergone many augmentations. These augmentations have been occasioned partly by the contests in China, India, Kaffraria, Persia, and the Crimea; and partly by a sense of the insecurity of many of our coasts and colonies. In comparing the strength of the forces at different periods, much confusion is apt to arise from different modes of interpreting the words 'British army.' This designation may include the whole of the royal troops in India, whether supported out of imperial or of Indian revenues; it may include the militia, the volunteers, the enrolled pensioners, the yeomanry cavalry, the foreign legions—or it may exclude any one or more of these. The 'British army,' and the 'military force of the British empire,' are often treated as convertible terms: to the production of much confusion where actual

numbers are given. We shall here, selecting the official year 1873—1874, shew of what component elements the B. A. now consists. The militia and the volunteer corps are not here included.

### BRITISH ARMY VOTED FOR 1873—1874.

	Home and Colonies.	India.	Total British Army.
Cavalry, . . .	12,942	4,330	= 17,273
Infantry, . . .	76,433	4,504	= 122,391
Artillery, . . .	22,547	12,234	= 34,781
Engineers, . . .	5,247	402	= 5,649
Staff, Depots, &c., .	11,798	....	= 14,541
	128,968	62,954	= 191,922

Under the column 'India,' are included only those troops of the royal army which are sent to India, and paid for out of Indian revenues; the other military forces in that region are enumerated under EAST INDIA ARMY. Of the total 191,922 forming Her Majesty's forces, 9895 are officers; 20,767 non-commissioned officers, drummers, and trumpeters; and 161,230 rank and file. There are voted for the use of this army, 26,445 horses. The total cost cannot well be estimated per head; because, besides pay and sustenance for the soldiers, there are stores and wages for fortifications and military buildings, military weapons and combustibles, and the various kinds of half-pay and pensions. The total expenditure sanctioned by parliament may, however, conveniently be thrown under four headings, and given in round numbers as follows:

Pay and Allowances of Combatants, . . .	£5,394,000
Administration, . . .	752,000
Stores and Works of every kind, . . .	4,572,000
Auxiliary Forces, . . .	1,448,000
Pensions, retired Pay, &c., . . .	2,350,000
	£14,416,000

—being the charge for a peace establishment, in which, to admit of expansion for actual war, the upper ranks (which cannot be summarily created) are disproportionately large.

All the component elements of the army, in personnel and matériel, and the organisation and duties of the troops, will be found noticed under their proper headings. The military forces actually within the United Kingdom—including all the various kinds of force, but excluding the troops in the East Indies and 22,960 in the colonies—comprise the following (1873):

Regulars, . . . . .	106,008
Militia, . . . . .	129,000 Effective.
Yeomanry Cavalry, . . . . .	18,000 "
Army Reserve Force, . . . . .	35,000 "
Volunteer Rifles and Artillery, . . . . .	160,750
	443,758

If to these be added all the troops in India and abroad, and all the forces maintained by the colonies, the total swells up to little short of a million men trained or training to arms—of whom, however, the regulars of the home army, actually available for field-service, are only about 100,000.

**BRITISH ASSOCIATION.** An Association whose object is, by bringing together men eminent in all the several departments of science, to assist the progress of discovery, and to extend over the whole country the latest results of scientific research. A prevailing impression that England had fallen behind other countries, both as to the general estimation in which scientific men were held, and the prosecution of science itself, led to its formation. It was thought that an imposing union of men of science with the nobility, gentry, and clergy

## BRITISH EMPIRE—BRITISH MUSEUM.

might tend to revive the philosophic spirit of the country. Such meetings had already taken place in Germany, and probably suggested the idea of this institution. Many leading-men of the age took part in its formation, but the honour of being its founder must be ascribed to Sir David Brewster. By his exertions the first meeting of those who were favourable to the design was held at York in the year 1831. The Archbishop of York, the mayor and council of the city, entered warmly into the project. At this meeting the constitution of the society was determined, the several sections had their provinces assigned to them, and subjects were proposed on which reports were to be drawn up and read at the ensuing meeting. This took place at Oxford in 1832. The university had cordially welcomed the new Association, the papers which were read gave it at once the high character it has since sustained, and from this date it may be said to have been in complete and successful operation. An enumeration of the several sections of the society, each of which has its own committee and president, will shew the wide range of topics it embraces: Section A., Mathematical and Physical Science; B., Chemistry; C., Geology; D., Zoology and Botany, including Entomology; E., Geography and Ethnology; F., Economic Science and Statistics; G., Mechanical Science.

At the close of each meeting, it is determined at what town in the United Kingdom the next shall be held, and a president of the whole Association is appointed, who delivers an inaugural address, in which he is expected to present a general survey of the latest advances of science. The rules and by-laws of the society, it is not necessary here to particularise; but it should be mentioned that the subscriptions of a continually increasing membership have placed at its disposal a large fund, which has been expended in the prosecution of science. In many cases, as in long astronomical calculations, or extensive meteorological observations, the labour of subordinates is required, and a certain apparatus, and it is in defraying such expenses that the funds of the B. A. are very wisely employed.

Besides the immediate ends sought to be obtained by such an Association, its utility will be evident if we reflect on the intimate connection that exists between the several branches of science, and the impossibility there is that any one mind can be thoroughly conversant with them all. He who now hopes to make discoveries in science must limit himself to a few chosen studies; and yet such is the interlacing of all the several branches of inquiry, that he must often find it indispensable to know the last results of each. The botanist or the physiologist must consult the accomplished chemist; the chemist must call in the aid of those who have specifically studied the action of heat, light, and electricity; the geologist needs them all, and is in turn consulted by all. Thus, a certain brotherhood of science is formed, in which each has his specialty, and yet each leans upon his brother.

In ancient times it was otherwise. The facts on which a philosopher speculated were those which lay open to the eyes of all. A Thales could see the rain fall and plants grow, and forthwith pronounce that the vital energy of all things was to be found in water. He could exercise his imagination in perfect independence of the labour of all other men. The philosopher of modern times cannot move a step without a careful consideration of the theories of his predecessors and contemporaries; he has to take notice of the innumerable facts brought to light by various observers, aided by those artificial arrangements which convert observation into experiment.

Two classes of men, of the most opposite character,

are greatly aided by an Association such as this. The humble and plodding workmen are taught where their patient industry will most avail; they are cautioned against re-discoveries; they are told where their love of collecting or experimentalising may be best applied. And that other class of men, who love to generalise, who ever seek to embrace all the multifarious facts of science under a few great laws—these are provided with the very last intelligence from every department of inquiry, and may forthwith proceed to weave it into their own comprehensive scheme. Nor are we to overlook the benefit which the whole community derives from the rapid dissemination of the latest results or speculations of philosophy. Not only do our idle and fashionable, as well as our manufacturing towns and our universities, welcome the meetings of the B. A., but from this *Parliament of Science* the utterance of scientific opinion goes forth over the whole kingdom through the agency of the press. Within three days after one of its meetings, there is not a workshop or a tea-table in the country that has not derived from it a new topic of conversation. This kindling of an interest in science, through the whole population, we regard as amongst the greatest advantages of the British Association.

**BRITISH EMPIRE.** See GREAT BRITAIN and IRELAND.

**BRITISH GUM, DEXTRINE, or LEI'OCOME,** is a substance extensively employed by calico-printers and others for the thickening of colours, instead of the much more expensive gum arabic. It is prepared from potato-starch (q. v.) or sago-starch by passing the grains through iron cylinders at a temperature about 500° F. It differs from starch in giving no blue colour with tincture of iodine, and in being readily soluble in water, and thus yielding a thick liquid resembling in consistence mucilage (strong solution of ordinary gum). B. G. is the material which is produced by baking in the crusts of loaf-bread (q. v.), and which communicates to them their very agreeable taste.

**BRITISH MUSEUM.** The British Museum, an important national institution in London, originated in a bequest of Sir Hans Sloane, who, during a long lifetime, gathered an extensive and, at the time, unequalled collection of objects of natural history and works of art, besides a considerable library of books and manuscripts. These, in terms of his will, were offered, in 1753, to the government, on condition that £20,000 should be paid to his family, the first cost of the whole having amounted to more than £50,000. The offer was accepted; the necessary funds were raised by a lottery; and the collection, along with the Harleian and Cottonian Libraries, were arranged in Montague House, which had been purchased for £10,250. The new institution, thenceforth called the BRITISH MUSEUM, was opened in 1759. From time to time, purchases and donations succeeded each other rapidly. Montague House sufficed for the reception of all these acquisitions, till the Egyptian antiquities arrived in 1801. The purchase of the Townley marbles in 1805, necessitated the erection of a gallery for their reception. This, however, did not meet the increasing demand for space. The old house was condemned, and plans were prepared by Sir R. Smirke for new buildings; but none were undertaken till 1823, when the eastern wing of the present building was erected for the reception of the library of George III., which had been presented to the Museum by George IV. The subsequent progress of the works was very slow. The building was completed in 1847. It is a hollow square, whose sides are opposite to the four points of the compass.

Throughout the exterior of the building, the Grecian Ionic is the order of architecture adopted. The principal front is towards the south, facing Great Russel Street, and presents an imposing columnar facade, 370 feet in length. The great entrance-portico, in the centre, is composed of a double range of columns, 8 in each range. The columns are 5 feet in diameter at their base, and 45 feet in height. The tympanum of the portico is ornamented with an allegorical sculpture by Westmacott, typical of the progress of civilisation. On either side of the Museum, there is a semi-detached house, containing the residences of the chief officers of the establishment. These give an additional length of 200 feet, making the whole length of the structure 570 feet. The interior of the building is admirably adapted to the purposes for which it is devoted. Some of the galleries, from their size and dimensions, have a very imposing appearance, as the King's Library, the Bird Gallery, &c. The grand entrance-hall is a noble and lofty apartment, built in the massive Doric style: it contains a statue of Sir Joseph Banks by Chantrey, and an ideal representation of Shakespeare by Roubiliac.

Scarcely had Smirke's plans been carried out, when demands were made from several of the departments for more accommodation. Additions have accordingly been made, rooms having been provided for the print department, and several new galleries for the recent acquisitions of antiquities; but the most important addition, is the magnificent reading-room which has been erected in the internal quadrangle. In no department of the Museum was additional accommodation more needed than in the library. The number of readers had increased beyond the means of accommodation, and so short of space were they for books, that the estimates for purchases were restricted to only the half of the sum which the trustees considered desirable, for the sole reason that the library would be inadequate for the reception of extensive additions. After considerable delay, and the consideration and rejection of several plans, nothing was done till Mr Panizzi, at that time keeper of the printed book department, suggested a plan which promised to meet the important requirements of speedy erection and economy in cost. The plan was at length adopted, and the result is a building than which none are better, few perhaps so thoroughly adapted to the purposes for which it is intended. Parliament voted the first grant for it in 1854. It was opened in 1857. The total cost was about £150,000, which included the fittings and furniture, and the necessary shelves for immediate use. The building was erected in the interior quadrangle, which it completely occupies, with the exception of an interval of about 28 feet all round, necessary for lighting and ventilating the surrounding building. The reading-room is circular. It is constructed principally of iron, with brick arches between the main ribs. The dome is 106 feet in height, and its diameter 140 feet, being second only to the Pantheon of Rome, and that but by two feet. The use of iron has economised the space to an extraordinary degree, for while the piers which support the Pantheon fill 7477 feet, those on which the reading-room rests occupy only 200 feet. Equally remarkable has been the saving of space in the fitting up of the library. The shelves are formed of galvanised iron plates, edged with wainscot, and covered with leather, and are supported on malleable iron standards. In all the cases except against the external walls, the bookcases are double, a lattice of iron-work being fixed for the longitudinal separation of the books. Thus, throughout the whole interior of the new building, walls are dispensed with, the

divisions being in all cases formed of the double ranges of books. The building contains three miles lineal of bookcases eight feet high. Assuming them all to be spaced for the average octavo book size, the entire ranges form 25 miles of book-shelves, and would accommodate 1,000,000 such volumes. In addition to this, the dome-room, which is the reading-room, has accommodation for 60,000 volumes. This magnificent room contains ample and comfortable accommodation for 300 readers. Each person has a space of 4 feet 3 inches long. He is screened from the opposite occupant by a longitudinal division, which is fitted with a hinged desk, graduated on sloping racks, and a folding shelf for spare books. In a recess between the two are placed an inkstand and penholders, thus leaving the table unencumbered. By an ingenious contrivance, one part of the iron framework is made to distribute fresh air in the summer and heated air in the winter. The vitiated air is conveyed through apertures in the soffits of the window, into one of two separate spherical and concentric chambers which extend over the whole surface of the roof, and escapes through outlets around the lantern. The other chamber, between the external covering of copper and the brick vaulting, has for its object the equalisation of temperature, during extremes of heat and cold out of doors. Every modern improvement, in short, has been applied, when it could be serviceable for the comfort or convenience of the readers. Much praise is due to the architect and builder, but a larger share is owing to Mr (now Sir A.) Panizzi, who not only supplied the original design, but daily, almost hourly, superintended the progress of the work, continually suggesting little improvements, and in the end, producing a room which is admired by all, especially those who daily use it.

This building, while supplying amply the demands of the printed book department, did nothing to meet the requirements of the other departments. Various schemes have been suggested; the best, and perhaps in the end the cheapest, of securing the ground immediately around the Museum, has been given up, and the trustees have resolved to erect a building, to be devoted entirely to Natural History—that is to say, to the departments of Botany, Zoology, Geology, and Mineralogy—on the site occupied by the International Exhibition of 1862. Parliament voted in the year 1873 £30,000 for this purpose, and a beginning has now been made by the contractor, who undertakes to finish the building by the end of 1875. The building will be an accommodation of the Gothic to the purposes of a museum, from designs by Mr Carpenter.

*Contents.*—At first, the contents of the Museum were arranged under three departments—Printed Books, Manuscripts, and Objects of Natural History. Under the last head were included the antiquities, works of art, &c., comprised in the Sloane collection, their number being too scanty to entitle them to constitute a separate department. The progress of the Museum has caused a more precise division of its contents. From time to time, the number of the departments has been increased, so that, instead of three, there are now twelve—viz., Printed Books, Maps, Manuscripts, Prints and Drawings, Oriental Antiquities, Greek and Roman Antiquities, Coins and Medals, and British and Mediæval Antiquities and Ethnography, Zoology, Botany, Geology, and Mineralogy. In noticing the contents of the Museum, we shall refer to them in this order. We can but allude here to the most important portions of the collection, and must refer for more particular information to works specially devoted to this

subject ; such as the various handbooks and catalogues prepared by the officers of the Museum.

*Printed Books.*—This is the largest department in the Museum. It occupies the whole of the ground-floor on the north and east sides, the new building erected in the quadrangle, and a considerable portion of the basement of the Museum. The keeper of the department has the help of three assistant-keepers and 43 assistants. There are in addition 54 attendants.

The original bequest of Sir Hans Sloane consisted of 50,000 volumes. When these were placed in Montague House, a small collection of 2000 volumes, bequeathed to the nation by Major Edwards in 1738, was added to them. In 1757, George II. presented the library of printed books which had been collected by the kings of England since Henry VII., and which included the libraries of Cranmer and Casaubon. He also annexed the important privilege, which the Royal Library acquired in the reign of Queen Anne, of being supplied with a copy of every publication entered at Stationers' Hall. By this means, the library has been supplied with the current British literature without expense or trouble, and the trustees have been able to devote the funds of the Museum to the purchase of the earlier literature of the country and foreign publications. Among subsequent additions to the library, may be mentioned the voluminous collection of pamphlets, &c., relating to the civil wars of England between 1640 and 1660, presented by George III.; the musical libraries of Sir J. Hawkins and Dr C. Burney; Garrick's collection of old English plays; Dr Bentley's collection of the classics, annotated by his own hand; the law library of F. Hargrave; Sir J. Banks's valuable and extensive collection on natural history; and a large mass of tracts and pamphlets relating to the French Revolution, purchased from J. Wilson Croker, and of very great value. The most important addition was made in 1823, when George IV. presented the splendid library that had been collected by his father during his long reign, at an expense of little less than £200,000. This library, which, from the terms of the gift, cannot be mixed with the general collection, occupies a large and handsome hall, extending along the whole of the ground-floor of the eastern side of the Museum. It is undoubtedly the finest and most complete library ever formed by a single individual. 'It contains,' says Sir H. Ellis, 'selections of the rarest kind, more especially works of the first ages of printing; it is rich in the early editions of the classics; in books from the press of Caxton; in the history of the states of Europe, in the languages of the respective countries; in the transactions of academies; and in a grand geographical collection.' The magnificent library of the Right Honourable Thomas Grenville, in importance second only to the King's Library, was bequeathed to the Museum in 1846. It consists of 20,240 volumes, which cost upwards of £54,000. In the same year was obtained also the extensive collection of Chinese works, amounting to 11,509 volumes, which belonged to Robert Morrison. By purchases, bequests, and donations, the library has become one of the first in the world, containing now upwards of a million volumes. See LIBRARIES. But even this figure, large though it is, does not represent the immense collection of separate and distinct articles in tracts, pamphlets, and manuscripts. The British Museum library is, without doubt, the largest collection of printed literature in the world. Since the opening of the new reading-room, and the consequent acquisition of the book accommodation, the want of which for several years had hindered the proper increase of the library, the

rate of increase has been enormous. During the year 1872, there were added 29,853 volumes, including music and volumes of newspapers, of which 1364 were presented, 19,801 purchased, 8345 acquired by home copyright, and 353 by international copyright. The number of parts of volumes was 30,564. In addition, the library had accumulated numerous broadsides, and miscellaneous articles, variously obtained. The numbers of the pieces of music alone added were 4844 complete works, besides 1790 parts and numbers of works in progress. The total number of articles received during the year amounted to 66,278.

A catalogue of the printed books, in seven octavo volumes, was published in 1812—1819. So great have been the additions to the collection since the publication of that catalogue, that the interleaved copy of it, in which the new entries were made, had expanded in 1846 into 82 folio volumes. This is now superseded by one general MS. catalogue, contained in upwards of 1600 folio volumes. There are separate catalogues of the Grenville Library, in 6 volumes; of music, in 126 volumes; of newspapers, in 4 volumes; of the pamphlets in the King's Library, in 9 volumes; and of the pamphlets published during the Civil War and Commonwealth, called the 'Thomason Collection,' in 12 volumes, all folio. These various catalogues are placed in the central circular stands in the reading-room, for consultation by readers. Here also are copies of the catalogue of the books of reference, arranged around the wall of the room, to which the readers have free access without the intervention of an official. These books, forming a library of 20,000 volumes, have been carefully selected to represent all the different branches of knowledge. The facility of consultation has been increased by the employment of different colours in the binding, corresponding to the colours of a hand-catalogue scattered throughout the room. Thus theological works are bound in blue, historical in red, philosophical in green, and so on.

The right of access to the library is easily obtained. Any person desiring it, is 'to apply in writing, addressed "To the Principal Librarian of the British Museum," and not otherwise, specifying his description and place of abode, and accompanying his letter with a written recommendation, satisfactory to an officer of the Museum; and thereupon, the principal librarian may grant him admission for a term not exceeding six months, or refer the application to the trustees at their next meeting. Any reader once admitted, may apply at the close of his term for the renewal of his ticket, without a fresh recommendation, but producing his last ticket of admission.'

*Maps.*—The maps, charts, plans, and topographical drawings were separated from the library, to form a distinct department, in 1867. There are over 50,000 published and 20,000 manuscript maps in the Museum. Many of the latter have thrown much light on the history of early geographical discovery.

*Manuscripts.*—The manuscripts are contained in several rooms in the south-east angle of the building. The work of the department is carried on by a keeper, assistant-keeper, a keeper of oriental manuscripts, and nine assistants. The manuscripts are for the most part bound in volumes, and placed in cases around the rooms. The collection consists of : 1. The Sloanean manuscripts, relating chiefly to medical and natural history subjects. 2. The Cottonian manuscripts, rich in documents referring to the history of Britain, including two of the originals of *Magna Charta*, in registers of English monasteries, and in original letters of royal and illustrious personages. This collection contains the

*Durham Book*—a copy of the Latin Gospels, with an interlineary Saxon gloss, finished in the year 720. 3. The Harleian manuscripts, a collection rich in illuminated MSS., in ancient, civil, and ecclesiastical records, in manuscripts of the classics, among which is one of the earliest known copies of the *Odyssey*, and in early English poetry. 4. The manuscripts of the Ancient Royal Library. These were collected by our kings, from Richard II. to George II.; many of them were obtained from the monasteries, on their destruction. Amongst the most valuable treasures here are the *Codex Alexandrinus*, a manuscript of the Bible written in uncial Greek, before the close of the 5th c.; and the *Basilicon Doron* of James I., in his own handwriting. 5. The Lansdowne manuscripts. This collection comprises the Burghley and Caesar papers, the manuscripts of Bishop Kennett, and numerous valuable historical documents and state papers. 6. The Hargrave manuscripts, almost exclusively connected with law. 7. The Burney manuscripts, containing a large collection of the Greek and Latin classics. Among them is a copy of the *Iliad*, answering that of the *Odyssey* in the Harleian collection. 8. The Howard-Arundel manuscripts, obtained from the Royal Society. This collection is singularly rich in materials for the history of our own country and language. 9. The Oriental manuscripts, a collection composed of several purchases and bequests. It includes the manuscripts acquired by Mr Rich while consul at Bagdad, and consists of numerous Syriac, Arabic, Ethiopic, and other oriental codices. A large series of Ethiopic manuscripts was obtained at Magdala, on the occasion of the Abyssinian War. 10. Additional manuscripts. This collection consists of innumerable bequests, donations, and purchases, which from the establishment of the Museum have been and are still being acquired. Among recent additions may be specified a charter of William the Conqueror; the original mortgage-deed of a house in Blackfriars, dated 11th March 1612, and signed by William Shakespeare; the holograph manuscript of Scott's *Kenilworth*, and of many of Burns's poems, including the *Cotter's Saturday Night*, and the songs published in Johnson's *Scots Musical Museum*; an extensive series of papal bulls; several *Books of Hours*, including the famous *Bedford Missal*; and a large collection of original letters and papers relating to the affairs of Scotland during the 16th and 17th centuries. Catalogues of the complete collections have at different times been published. The additions to the ever-increasing Oriental and Additional collections are at intervals published in supplements to each of the original catalogues. Copies of all these, with manuscript lists of the annual additions, are placed in the reading-room for consultation.

Supplementary catalogues were printed up till 1853; since then the additions have been kept up in manuscript catalogues. A general class catalogue, embracing all the collections, has been commenced, and the printing of portions of it will soon be begun. The first part will be a catalogue of ancient and illuminated manuscripts, illustrated with photographic *fac-similes*.

The right of using the reading-room includes the privilege of consulting the manuscripts. During 1872, the number of deliveries of manuscripts to readers in the reading-room amounted to 21,709. To artists and others in the rooms of the department, 1751 deliveries were made. These numbers do not include the volumes exhibited to visitors on private days.

*Prints and Drawings*.—The collections of this department, managed by a keeper and two assistants, are kept in rooms in the north-west angle of

the building. They consist of prints and drawings bequeathed to the Museum, in 1799, by the Rev. C. M. Cracherode; of those bequeathed in 1824 by Mr Payne Knight; and of numerous smaller bequests and donations. No purchases were made for this department until about 1840, when a sum was first included in the estimates for this purpose. Since that time, the prints and drawings have been increasing at a rate equal to any of the other departments of the Museum. The collection is arranged in schools. 1. The Italian school, containing original drawings by Leonardo da Vinci, Raphael, Correggio, Tintoretto, Paul Veronese, Michael Angelo, Guido Reni, Salvator Rosa, and others. 2. The German school, containing drawings by Albert Dürer, Hans Holbein, Dietrich, Hollar, and others; and engravings by Lucas Cranach, Martin Schon, Gauer, and others. 3. The Dutch school, containing several superb originals of Rubens, an extensive and nearly complete set of the works of Rembrandt, with many drawings by A. Cuyp, Teniers, Van Dyck, &c.; and engravings and etchings by Bergheem, Lucas van Leyden, Rembrandt, Ostade, &c. 4. The French school, with drawings by Watteau, Claude Lorraine, &c., and etchings and engravings by Bourdon, Bois-seaux, Le Prince, &c. 5. The Spanish school, represented by some drawings of Murillo, and others of less note. And, 6. The English school, containing drawings by R. Wilson, Wilkie, Stothard, Calcott, Gibson, &c.; a splendid collection of Hogarth's prints, and specimens of the works of Barlow, Gaywood, Rimbach, Finden, Worlidge, Geikie, &c.

This department contains also an extensive and very valuable collection of works in Niello; a beautiful silver cup, designed and carved by Benvenuto Cellini; and a wonderful stone-carving in alto-rilievo by Albert Dürer, representing the birth of St John.

*Oriental Antiquities*.—Within the last ten years the objects in the Museum, included under the name Antiquities, have been divided into four departments. The first of them includes the Egyptian and Assyrian antiquities. The Egyptian monuments date from a period as remote as 2000 years before the Christian era, and come down to the Mohammedan invasion of Egypt, 640 A.D. The collection has been obtained chiefly from these sources: the antiquities which fell into the hands of the British army at the capitulation of Alexandria, presented by George III.; presents from General Vyse, the Duke of Northumberland, the Marquis of Northampton, Sir Gardner Wilkinson, and others; and acquisitions from the Earl of Belmore, Mr Salt, and M. Anastasie. The sculptures are formed of granite and basalt; they represent human and allegorical figures, sometimes of colossal size. There are several beautifully sculptured sarcophagi. Most of the monuments are inscribed with hieroglyphics (q. v.). The key to this dead and forgotten language was furnished by the celebrated Rosetta Stone (q. v.), which is placed in the centre of the gallery. The smaller Egyptian remains are exhibited in a gallery on the upper floor; they consist of objects relating to religion, as representations of divinities and sacred animals, in wood, metal, stone, and porcelain; of objects relating to civil and domestic life, as dress, personal ornaments, household furniture, artistic and writing implements, armour, and weapons of war, &c.; and of objects relating to death and burial, as mummies and coffins, with the scarabæi, amulets, and other ornaments found with them. A collection of papyri is exhibited on the north-west staircase, containing extracts from the ritual of the dead.

## BRITISH MUSEUM.

The Assyrian antiquities are contained in a suite of rooms recently erected on the outside of the Egyptian Gallery, and in a spacious room on the basement. The collection consists of sculptures excavated at Nimrud, Khorsabad, and Koyunjik by Layard in 1847—1850, and more recently by Rassam and Loftus, under the direction of Sir H. C. Rawlinson. The Nimrud sculptures are the oldest, belonging to a period ranging from 930 B.C. to 747 B.C. Those obtained from Khorsabad seem to have been executed under a monarch who reigned about 747—721 B.C., while the collection from Koyunjik belong to the time of Sardanapalus, apparently 721 B.C. and 625 B.C. The monuments consist chiefly of slabs of gypsum, alabaster, and limestone sculptured in low relief, the subjects being the exploits of the king whose palace walls they ornamented. Many of the sculptures are covered with Cuneiform (q.v.) writing, which, by the labours of Rawlinson, Hincks, and Smith, has been deciphered, giving us a history of this remarkable people, and corroborating the narrative of the sacred Scriptures whenever they refer to the same event. See **ASSYRIA**. Besides the series of sculptures, the Assyrian collection includes a variety of smaller but highly curious and instructive objects, discovered at Nimrud and Koyunjik.

**Greek and Roman Antiquities.**—This collection occupies four apartments, which run parallel to the Egyptian Gallery. The Lycian Gallery contains a series of architectural and sculptural remains from ancient cities in Lycia, obtained by Sir C. Fellows in 1842—1846. In the next gallery are the remains of the famous Mausoleum (q.v.) at Halicarnassus, erected in honour of Mausolus by his widow Artemisia. These remains were discovered by C. T. Newton, Esq., in 1857—1859. In the same room are some remains of the Temple of Athene Polias at Priene, including the stone on which its dedication by Alexander the Great is inscribed. The Elgin Gallery contains the sculptures from Athens and Attica, the greater portion of which were obtained by the Earl of Elgin, and purchased from him by parliament in 1816 for £35,000. The most important series in the gallery is the decorations of the Parthenon (q.v.), which, notwithstanding their dilapidated condition, form the most valuable monument of Greek art which has descended to modern times. The gallery contains also sculptures and casts from the Temple of Wingless Victory, the Temple of Theseus, and the Erechtheum, at Athens. In an extension recently made to this gallery, are a colossal lion from Cnidus, and a drum of a sculptured column, and other remains, from the Temple of Diana at Ephesus. The Hellenic Gallery contains a number of antiquities brought from Greece and its colonies at different times. The most important are 23 slabs of a frieze sculptured in mezzo-rilievo, which, from the locality where they were found, are called the 'Phigalian Marbles.'

The gallery on the south side of the building is occupied with the Roman and Greco-Roman sculptures. The bulk of the collection was formed by Charles Townley, Esq., and purchased in 1805 for £20,000. Subsequent additions have been made by the bequest of the collection of R. P. Knight, Esq., in 1824, and by various purchases and donations. The collection contains an interesting series of Roman portrait sculptures, and a very extensive mythological series, amongst which are some of universal fame—the Venus, Clytie, the Discobolus, and many others. A room on the basement is appropriated to mosaics and miscellaneous monuments, such as representations of animals, architectural and decorative fragments, and sacred and domestic implements. A fine collection from

Southern Italy, exhibiting specimens of the arts of the Etruscans, Greeks, and Romans, was bequeathed to the Museum by Sir William Temple in 1856.

The collections of smaller remains are placed in a suite of rooms on the upper floor. They consist of—1. An extensive series of vases, commonly, though not correctly known as Etruscan, formed from the collections of Sir W. Hamilton and Mr Burdon, from purchases at the sales of the Prince of Canino, M. Durand, and others; and from excavations in Sicily, Rhodes, and on the sites of Greek colonies in Cyrene and elsewhere. 2. A miscellaneous collection of terra-cottas, mural paintings, and other objects. 3. Bronzes of Greek, Etruscan, and Roman workmanship, consisting of sculptures and various domestic and other articles, as candelabra, lamps, vases, horse-trappings, armour, &c. 4. The collection of engraved gems and gold ornaments now, since the addition of the Blacas and Castellani collections, perhaps the richest in the world.

**Coins and Medals.**—The very large collection of these objects is arranged in chronological order under five great divisions, viz.: Greek, Roman, Medieval and Modern, English, and Oriental. The department is under the care of a keeper, assistant-keeper, and four assistants.

**British and Medieval Antiquities and Ethnography.**—The British collection is arranged in chronological order. The oldest series contains the antiquities of the Stone and Bronze Periods, consisting of celts, daggers, swords, shields, and early pottery. The British-Roman antiquities comprise specimens of earthenware, lamps, and miscellaneous articles. A small collection of sepulchral urns, weapons, and personal ornaments represents the Anglo-Saxon period. The antiquities found in London, and belonging to the late C. R. Smith, have been recently added to this collection. The Ethnographical collection contains antiquities, as well as objects of modern use, belonging to all nations not of European race.

In 1855 the extensive collections of antiquities and ethnography, belonging to Henry Christy, became the property of the Museum, having been bequeathed by their proprietor. From the want of space, they are at present accommodated in a house rented for the purpose in Victoria Street, Westminster. Felix Slade bequeathed his valuable collection of glass to the Museum, and it is now arrayed so as to shew the different phases through which the art of glass-blowing has passed, as well as the history of glass in all its branches.

**Natural History.**—In 1856 the trustees united the Natural History departments under Professor Owen, who was then appointed superintendent of Natural History. The new building now erecting at Kensington is intended to accommodate this section of the present Museum.

**Zoological Department.**—To give an idea of the contents of this and the other natural history departments, would be to write an epitome of the various sciences they illustrate. This department contains a collection of animals arranged in systematic order in the galleries, comprising stuffed mammals, birds, reptiles, and fishes, and the hard portions of radiate, molluscan, and articulate animals. A room is specially devoted to the fauna of Britain. In rooms on the ground and basement floors are arranged the collections of insects, of osteology, and of specimens preserved in spirits. An idea of the extent of the collection may be formed from the fact, that 142 separate publications, illustrative of the contents of the department, in the shape of catalogues, lists, &c., have been issued under the superintendence of the present indefatigable keeper, Dr Gray. During the past year, there were added to this

## BRITISH MUSEUM—BRITISH NAVY.

collection 7524 specimens of animals, of which 2964 were vertebrates, 2886 mollusca and radiata, and 1674 annulosa. In 1873 the unique and extensive collection of birds formed in the Eastern Archipelago by Wallace, was acquired by purchase.

*Botanical Department.*—The herbarium of Sir H. Sloane, the nucleus of this collection, consisted of about 8000 species, bound in 262 volumes. In 1820, the magnificent herbarium of Sir Joseph Banks was bequeathed to the Museum, and under the superintendence of the late Robert Brown, was transferred to two rooms prepared for it in the south-east angle of the building. The collection has since been rapidly increasing : during the year 1872, 12,030 species of plants were added ; and in the year 1873, the late William Wilson's herbarium of British and foreign mosses was acquired by purchase. The collection contains an extraordinary number of typical specimens—the identical plants from which the original descriptions were taken by Linnaeus, Aublet, Jacquin, Brown, Bentham, Bennett, and others. The exhibition rooms contain a series of specimens illustrating the most striking characteristics of the great divisions of the vegetable kingdom, arranged in order ; and a series of fossil plants, the value of which is increased by the transparent sections shewing their structure, which are placed beside them.

*Geological Department.*—This collection occupies the wall-cases of the principal gallery on the north side of the Museum. It contains an extensive series of the fossil remains of plants and animals from the various fossiliferous strata ; it is especially rich in the fossils of the secondary formations. Amongst its more valuable contents may be mentioned the collections of Dr Mantell, the Tertiary fossils collected by Dr Falconer in India, and the remarkable fossil birds from New Zealand.

*Mineralogical Department.*—The minerals are contained in the table-cases in the Geological Gallery. They are arranged according to a chemical classification. Many valuable and unique specimens exist in the collection, which is rapidly increasing. In the year 1872, the number of specimens added was 1499.

The expenses of the Museum are paid by grants of public money. According to the estimates £102,961 were required during 1873—1874.

Admission to the Museum was at first obtained by printed tickets, which were delivered by the porter to persons making a written application. There could be no more than 45 visitors, at the utmost, per day, under the regulations then in force. Now, all who present themselves are freely admitted ; and every open day (every Monday, Wednesday, and Friday) the Museum is visited by large numbers : as many as 43,000 holiday-folk have recently passed through the building in one day.

**BRITISH NAVY.** Under NAVIES, MODERN, will be found a brief description of the chief navies belonging to the continent of Europe, and to the United States of America. The R. N. is separately treated in this place.

While the Romans occupied Britain, they were obliged to maintain a fleet of war-vessels on the coasts, to protect it from the ravages of the Saxons, who were the pirates and buccaneers of those times. When the Romans had departed, and the Saxons became dominant, the coasts were infested by another naval power—the Scandinavian Vikings. It was Alfred the Great who first established what may be called a navy in this island, consisting of efficient vessels well manned, for protection, and not aggression. Ethelred made the building of a ship a condition for holding a certain acreage of land. William the Conqueror strengthened the navy by the

institution of the CINQUE PORTS (q. v.). During the first three centuries after the Conquest, we read of British fleets of 240, 400, and even 730 sail—a proof that the vessels must have been very small even if there were no exaggeration of numbers. Until 1485, the fleets were collected just as wanted ; but in this year, Henry VII. conceived the idea of a permanent navy, to be ready at all times. He built the largest ship of the age, the *Great Harry*. Henry VIII. pursued the course established by his father, and still further strengthened the navy by instituting the Admiralty, the Navy Office, the Trinity House, and the dockyards at Woolwich, Portsmouth, and Deptford. The *Henry Grace de Dieu*, the largest ship built by him, was of 1000 tons burden ; but most of the vessels were high, unwieldy, and narrow, with the guns nearly down to the water's edge. The ships of the navy presented an aggregate tonnage of 12,000 tons at the period of Henry's death. Elizabeth made a large increase in the navy ; but they were not all royal ships which were sent to struggle against the Spanish Armada. James I. made many improvements in ship-building, by encouraging a distinguished naval architect, Phineas Pett. Charles I., who built the *Sovereign of the Seas*, of 100 guns, was the first to group the royal ships into rates and classes. Cromwell brought up the navy to the strength of 154 sail, including a large number of two-deckers. Charles II. allowed it to fall into decay for a time ; but his brother, the Duke of York, who afterwards became James II., not only restored it, but brought it to a higher state of efficiency and strength than ever. When William of Orange became king of England, he found a navy carrying 7000 guns and 42,000 seamen ; he built many additional ships, some with as many as 80 guns, and established Plymouth dockyard. Queen Anne succeeded to the possession of a fine navy ; which at her death had increased to 198 ships, mounting 10,600 guns, with a tonnage of 157,000 tons. George I. attended to the navy chiefly in repairing the ships after a period of war, and in supplying a new armament. George II. greatly added to the number of ships, established a naval uniform, and increased the renown of the R. N. during the war against Spain.

The long and eventful reign of George III. was especially distinguished by the achievements of the navy. When he came to the crown in 1760, he found himself in possession of 127 ships of above 50 guns, and 198 of 50 guns and under, manned by 70,000 seamen. These numbers, by building and by capture, were increased to 174 and 203 respectively, by the end of the American war. Throughout the European struggle, from 1793 to 1815, the R. N. exhibited a spectacle, for vastness and achievements, which had never before been equalled in any country. In the first nine years of this period, between 1793 and 1802, England lost by war 5 ships of the line and 46 smaller vessels ; but she captured from the French, Dutch, Spaniards, and Danes, in various battles, 74 ships of the line and 519 smaller vessels ; or rather, four-fifths of this number were captured, and one-fifth destroyed. Besides these, more than 800 privateers were taken and destroyed by the English. Of the total number of captures, 144 ships of war were at once converted into British ships, and added to our navy. When war recommenced in 1803, England had 189 ships of the line, and 781 smaller ships of war ; during the next seven years, the seamen varied from 100,000 to 120,000, and in 1810 the number was raised to 140,000. At all times, many of the ships of the royal navy are unemployed or out of commission : but it frequently happened during that great war, that England had 450 liners, frigates, and sloops, besides

## BRITTANY—BROAD-BOTTOM ADMINISTRATION.

smaller armed vessels, employed simultaneously. The conquered vessels added to the navy between 1803 and 1815 were upwards of 100 in number.

After the termination of the great European struggle, a large number of ships of war were put 'in ordinary,' or out of commission, and their officers placed on half-pay. In 1820, the vessels in commission, in ordinary, and building, comprised 127 ships of the line, 311 frigates and sloops, and 27 smaller vessels; but in this total of 465, there were only 113 in commission. In the nineteen years that next followed, almost wholly years of peace, the total number of ships of the line, frigates, and sloops, decreased; the gun-brigs, schooners, and cutters increased in number; while the first germs of a new element, a *steam navy*, made their appearance.

The year 1839 must be viewed as a turning-point in the history of the British navy. Twenty-four years of peace had thrown the memory of warlike achievements into the background; and the House of Commons had insisted on the lessening of those estimates which provide for armies and navies. It was now found, however, that both Russia and France had accumulated formidable navies. From that year to the present, the B. N., in common with the navies of other powers, has been undergoing a series of 'reconstructions.' First, ships of larger size, and carrying heavier guns, were built. These ships were of immense power in the days of wooden broadsides, but are now useless for purposes of war. The next stage, from about 1853 to 1859, was the conversion of our force from a sailing to a steam navy. This became the era of great steam frigates of about 5000 tons, and of heavy armaments in a few great guns, of which the *Mersey*, 36 guns, may be taken as a leading specimen. With the introduction of rifled guns, of force hitherto undreamt of, came the necessity for armour-plated sides. The fighting part of the navy (*i. e.*, the line of battle) changed once more after 1860 to low-sided vessels, clad in thousands of tons of iron plates. The *Warrior* was the first ship so built in England, and she was followed by a whole squadron similarly protected. Guns, however, went on increasing in offensive power; and whereas 5-inch plates were at first thought sufficient, now, in 1873, 10-inch, 12-inch, and 14-inch plates are necessary to exclude shot. Such a vast weight of armour all over a ship would sink any vessel of moderate dimensions. The principle of turret-ships is therefore becoming predominant, in which the greater part of the vessel, clad in comparatively light armour, is under water, or only just visible above the surface. The earliest formidable turret-ship was the ill-fated *Captain*, which, in 1870, capsized in the Bay of Biscay, and entombed 600 brave seamen, with the inventor, Captain Coles. Ships of analogous construction, with lower freeboard, have been since built; and now the *Devastation*, of 9188 tons, carrying 4 guns of 35 tons (700-pounder projectiles), is probably the most powerful war-ship that ever floated.

The expenditure on the B. N. greatly increased between 1839 and 1873, on account of the changes just adverted to. In 1839, the number of men and boys voted was little over 25,000; in 1873, it was about 60,000. Even as late as 1852, the expenditure was only £6,500,000, against £9,873,000 in 1873.

The strength of the B. N. is at present 308 fighting vessels, larger than gunboats, of which 55 are ironclads; and of the 55, 13 are turret ships. The 253 unarmoured ships comprise cruisers, despatch vessels, gun-vessels, and several large old-fashioned two-deckers. There are, in addition, 5 steam troop-ships for Indian reliefs, 71 screw gun-boats, 34 tugs, &c., and a large number of old wooden vessels for harbour service generally.

All matters about ships, seamen, &c., will be found under their proper headings. See *TURRET-SHIP*; also *ARMOUR-PLATES* and *WAR-SERVICES* in SUPP., Vol. X.

**BRITTANY.** See *BRETAGNE*.

**BRITTON, JOHN**, an eminent English topographical and antiquarian writer, the son of a small farmer and village shopkeeper, was born July 7, 1771, at Kingston-St-Michael, near Chippenham, Wiltshire, and, losing his parents young, received but a scanty education. Some short notices which he had contributed to the *Sporting Magazine* brought him into acquaintance with its publisher, Mr Wheble, who employed him to compile the *Beauties of Wiltshire*, which he did in conjunction with a young literary friend named E. W. Brayley. They also prepared the *Beauties of Bedfordshire* in the same manner. B. afterwards issued a more elaborate work, entitled the *Architectural Antiquities of England*. One of the most important of his subsequent publications was *The Cathedral Antiquities of England*, 14 vols. fol. and 4to, 1814—1835, with upwards of 300 highly finished plates. Altogether, his illustrated works in the department of architectural and topographical description and antiquities, number 87, besides others of a similar kind, of which he was editor.

**BRIVE**, a town of France, in the department of Corrèze, pleasantly situated in the midst of vineyards, and shut in by a fine circular avenue of elms, about 15 miles south-west of Tulle. It has manufactures of woollen, cotton-yarn, &c. Pop. (1872) 8016.

**BRIZA.** See *QUAKING GRASS*.

**BRIZURE, BRIZÉ or BRISÉ**, terms used in heraldry to indicate that a charge is bruised or broken. See *ROMPU*.

**BROACH, or BROCHE**, an old English term for a spire springing directly from a tower without any intermediate parapet. Such spires are common in England, and in some places in Scotland, particularly in Fife.

Broach.

**BROAD ARROW**, a government mark, thus stamped, cut, or otherwise fixed on all solid materials used in Her Majesty's ships or dock-yards, and on government stores generally, in order to prevent embezzlement. The origin of the mark is obscure. Previous to the year 1698, the naval authorities prosecuted a dealer in marine-stores, for having in his possession certain stores bearing the B. A. of his majesty. The defendant allowed the evidence against him to go on, and when asked what he had to say, replied, that it was *very curious* that the king and he, as a dealer, should both have the same private mark on their property! The receiver of stolen goods was acquitted, and this led to the passing of the act 9 and 10 Will. III. c. 41 (1698), which enacts that persons in possession of naval stores, or goods of any kind marked with the B. A., or other marks therein mentioned, and usually employed in marking naval stores for the navy, shall forfeit all such goods and £200, and also pay costs. The mark is for iron, wood, &c., what the colour-thread is for sailcloth and ropes, which enables the government to identify the smallest piece of such articles.

**BROAD-BILL.** See *SHOVELLER*.

**BROAD-BOTTOM ADMINISTRATION**, a name derivatively applied to the ministry formed by Henry Pelham in 1744, because it professed to

include all parties of weight and influence in the state in a grand coalition, and comprised no less than nine dukes—viz., Dorset, Newcastle, Montagu, Bedford, Grafton, Richmond, Argyle, Devonshire, and Bolton, the first seven of whom were of the cabinet. Besides the prime minister, Pelham, the other principal members of the cabinet were Earls Gower and Harrington, the Marquis of Tweeddale and Lord Hardwicke. From this B. B. A. the particular adherents of Pulteney (newly created Earl of Bath) and Lord Carteret were carefully excluded. The ministry was dissolved in 1754, by the death of Pelham, though several of its original members had seceded long before that time.

**BROADSIDE**, in naval warfare, is the simultaneous discharge of all the guns on one side of a ship of war. The fighting-power of a ship is sometimes estimated by the weight of her broadside; i. e., the weight of all the shot and shell that can be fired off at once from one side or half of the ship. Thus, the broadside of the *Duke of Wellington*, 131-gun war-steamer, amounts to 2400 lbs. One among the reasons why a paddle-steamer is not so good for war purposes as a screw-steamer, is because the paddle-boxes and wheels interfere with the broad-side.

**BROADSWORD** is a sword with a broad blade, for cutting only, not for stabbing, and therefore not sharp at the point, like a sabre. It is but little used in the British army.

**BROCADE**. This term is used to describe a silken fabric on which a figure of any kind is formed by the threads of the warp or weft being raised by the heddles, or, more generally, by the Jacquard-loom, in such order as to produce the pattern required. The word has much the same application to silk textures that *damask* has to linen textures or to worsted textures for upholstery uses. See *WEAVING*, and *JACQUARD-LOOM*.

**BRO'CAGE**. See *BROKER*.

**BROCAGE BONDS TO PROCURE MARRIAGE**, or **MARRIAGE BROCAGE BONDS**, as they are otherwise called, are void by the law of England, being against the policy of the law and the freedom of marriage. See *Hurlstone's Law of Bonds*, 1835, p. 15, and authorities there referred to. The Scotch law is the same.

**BROCCOLI**, a well-known and much esteemed garden vegetable, one of the many varieties which cultivation has produced of the *Brassica oleracea*, the common kale or cabbage. B. is said to have been originally brought to Italy and other parts of Europe from the isle of Cyprus about the middle of the 16th century. Its name is probably of Italian origin. It differs little from cauliflower (q. v.), of which it may be considered a mere variety, having coloured instead of white heads, and a deeper tinge of colour in the leaves, being also more hardy, the character from which its chief importance is derived, as it can be readily obtained at seasons when there is no cauliflower in the open garden. It is perhaps inferior to cauliflower, however, in delicacy of flavour. There are many subvarieties, the number of which is, of course, continually increasing; and some of these are preferred for early spring sowing, with a view to an autumn crop; others for later sowing, with a view to a crop in the following spring. The subvarieties differ in size, in their more cut or entire leaves, in the greater or less degree of colour—generally purple—with which the leaves are tinged, in the more or less compact form of the whole plant, in the more or less green, yellow, or purple colour of the head, &c. Some of the kinds

of B. preferred for late sowing and spring use are known by the general name of Cape B., the first of them being said—but on doubtful authority—to have been introduced into Britain from the Cape of Good Hope. The mode of cultivation of B. pretty much resembles that of cauliflower, except as to the times of sowing and transplanting, and that it is generally—even in Scotland—sown in the open ground, and not in a hotbed. A similar richness of soil is required. Various modes of protection in winter are adopted. In mild winters, protection is scarcely or not at all needed, but precautions are generally employed against severe weather. It is found very advantageous to plant in trenches of 6 inches deep, and to earth up the plants, as they are thus not only in some measure preserved from frosts, but also from the winds of winter, which are apt to shake and loosen plants, so as to cause their destruction. It is a common practice to take up some of the most advanced plants in the beginning of winter, and to lay them in a sloping position with their heads towards the north. The heads produced in this way are not in general so large as they might be, but they are sometimes procured when otherwise they probably would not.

**BROCHURE**, a French word (from *brocher*, to stitch), equivalent to the English word Pamphlet (q. v.).

**BRO'CKEN** (*Mons Bructerus*, *Melibocus* of the ancient Romans), popularly known as the *Blockberg*, is the highest summit of the Harz Mountains. It is situated in the province of Saxony, Prussia, about 20 miles west-south-west of Halberstadt, and has an elevation of 3740 feet above the sea. The mountain is very frequently veiled in mist and cloud-strata, and is celebrated for the phenomenon known as the *Brockengespenst* ('Spectre of the Brocken'), which is nothing more than the shadow of men, houses, or other objects thrown upon the misty eastern horizon by the light of sunset. (See *Gallery of Nature*, published by W. and R. Chambers.) In clear weather, a fine view is obtained from the summit of the Brocken.

**BROCKHAUS**, FRIEDRICH ARNOLD, the founder of the well-known firm of Brockhaus in Leipzig, and publisher of the *Conversations-Lexicon*, was born at Dortmund, May 4, 1772. In 1802, circumstances led him to Holland, where, however, his business schemes did not prosper. He returned to Germany in 1810, and in the following year commenced business in Altenburg. Before this, however (in 1808), B. had purchased the copyright of the *Conversations-Lexicon*, which had been commenced in 1796, and he completed the first edition, with the addition of two supplementary volumes, in 1809—1810. In 1812, a second improved edition of the work was commenced under the supervision of B. as editor. The peace of 1815 enabled B. to pursue prosperously his peaceful and civilising career. In 1817, his business had so increased, that he found it necessary to leave Altenburg for Leipzig, where, in the following year, he commenced book-printing in addition to book-publishing. In the course of a few years, the *Lexicon* passed through six editions; it has now arrived at the eleventh edition. Through all the enterprises of B. as a publisher, a zealous devotion to the cause of liberty and general enlightenment may be traced. He died August 20, 1823. B. was not only an able and assiduous man of business, but distinguished for his literary culture, his knowledge of the world, and his numerous social accomplishments. He was also eminently patriotic, and furthered many literary undertakings, simply through a pure love of 'fatherland.'

## BROCKVILLE—BROKEN KNEES.

The business was afterwards carried on by HEINRICH BROCKHAUS, second son of the former, who was born at Amsterdam in 1804, and died in 1874. Among the numerous publications issued by the house, may be mentioned the later editions of the *Conversations-Lexicon*, with an *Atlas*; the *Universal Encyclopædia*, by Ersch and Gruber; and the *German Penny Magazine*, founded in 1833.

BROCKHAUS, HERMANN, third son of F. A. Brockhaus, was born at Amsterdam, January 28, 1806; studied at Leipsic, Göttingen, and Bonn, and lived successively in Copenhagen, Paris, London, and Oxford. Since 1848, he has held at Leipsic the appointment of ordinary professor of the Sanscrit language and literature, to which his studies have been chiefly devoted. Among his several works on Oriental literature may be mentioned, the *First Five Books of the Large Collection of Fables, Kathâ Sarit Sägara, in Sanscrit and German* (1839); an edition of the drama *Prabodha Candrodaya*, by Krishna Misra, with Hindu scholia (1845); Nachschein's Persian version of the *Seven Wise Masters* (1845); and (in 1854) the Persian text of the *Songs of Hafiz*. Since 1856, he has been editing the *Universal Encyclopedia*. B.'s method of printing Sanscrit in Roman types is now generally adopted in Germany.

BROCKVILLE, a town of Upper Canada, or Canada West, taking its name from General Brock, who, during the last American war, died in the arms of victory on Queenston Heights, between the town and falls of Niagara. It stands on the left bank of the St Lawrence Proper, about 40 miles below Kingston, and about 160 above Montreal. Originally, its communications downward were interrupted by powerful and rugged rapids, which, however, are now, one and all, either avoided by canals or overcome by steam. B. is a thriving place, with about 6500 inhabitants.

BRODIE, SIR BENJAMIN COLLINS, BART., a distinguished surgeon, third son of the Rev. Peter Bellinger Brodie, rector of Winteralow, Wiltshire, was born there in 1783. He studied under Sir Everard Home at St George's Hospital, to which he was, in 1808, elected assistant-surgeon, and afterwards surgeon. He had previously lectured both on anatomy and on surgery. In 1810, he was elected a Fellow of the Royal Society, and in 1811 received their Copley medal for his physiological papers contributed to the *Philosophical Transactions*. In 1834 he was created a baronet, and he held the appointment of serjeant-surgeon to Queen Victoria, as well as that of first surgeon in ordinary to the Prince Consort. He was made D.C.L. of Oxford in 1850; was president of the Royal Society, a corresponding member of the Institute of France, and a foreign member of other learned societies and academies in Europe and America. Author of *Lectures on Local Nervous Affections* (1837, 8vo); *Hunterian Oration*, 1837; *Lectures Illustrative of Subjects in Pathology and Surgery* (1840, 8vo); *Introductory Discourse on the Duties and Conduct of Medical Students* (1843, 8vo); *Psychological Inquiries as to Mental Faculties* (3d ed., 1866), and several other practical medical works. He also contributed papers to the *Philosophical Transactions* and the *Transactions of the Royal Med. and Chir. Society*. He died in 1862.—B.'s son, B. C. BRODIE, F.R.S., was in 1855 elected Aldrichian Professor of Chemistry at Oxford, a chair suppressed in 1866.

BRO'DY, a town of Galicia, Austria, is situated on a swampy plain, surrounded by forests, about 58 miles east-north-east of Lemberg. B., which was made a free commercial town in 1779, has a large trade in the agricultural produce of the country with Russia, Poland, and Turkey. Its chief manu-

factures are leather and linen; jewellery, manufactured goods, and colonial produce are imported by way of Odessa. The trade is almost entirely in the hands of the Jews, who form so large a proportion of the inhabitants, that B. has been called 'The German Jerusalem.' Pop. 23,000.

BROG, or BROGUE, a rudely formed species of shoe, formerly in use by the aboriginal Irish and the Scottish Highlanders, and of which there were different varieties. See SHOES, SHOE-TRADE. The name has been applied to a modern kind of shoes, with some fanciful peculiarities.—The term Brogue is also used to signify the peculiar pronunciation of English that distinguishes natives of Ireland.

BROILING is a convenient and expeditious mode of cooking small pieces of meat, by laying them on a gridiron over a bright fire, or even on the coals themselves. This is perhaps the most primitive mode of preparing meat for eating, as may be supposed from the great ease and simplicity with which the operation is managed. B. is, in fact, a quicker sort of roasting. The albumen of the outside being sealed up at once, the meat is rendered extremely nutritious, and therefore this process is much to be recommended. But to broil meat so as to preserve its odour, juice, and fat, requires care. The meat should be prepared for the gridiron by being beaten slightly with the rolling-pin, trimmed of superfluous fat and skin, and cut so as to look well on the dish. The fire should be perfectly clear, and of a red-hot surface to answer to the size of the gridiron, that all parts of the meat may be equally cooked. Just before setting the gridiron over, some salt should be sprinkled on the fire to prevent the flare. The gridiron should be perfectly clean and smooth, being always rubbed when it is put away; and, before using, it should be warmed, greased with suet, and rubbed again with paper. When it is placed on the fire, the back should be higher than the front. The meat should never be touched with a fork, but turned rapidly with the broiling tongs; and when sufficiently done, should be served immediately on a very hot dish, being seasoned according to taste. In large ranges there should be a broiling stove, and an apparatus for B. suited to it; by this the heat of the fire can be easily regulated. But for all ordinary purposes, a fire of charcoal, or of common coal, and a grooved gridiron, to preserve the gravy, is all that is necessary. Sometimes a gridiron is used to hang before the fire, when a dinner is being dressed and the top of the fire occupied; this is convenient, but it is an inferior way of cooking, the meat being roasted rather than broiled.

Gridiron.

There is a gridiron sold in the streets which is very well adapted to small low fires, as it is easily put in between the bars (see fig.).

BROKEN KNEES. The part commonly termed the knee of the horse is the carpus or wrist of man, and from the peculiar conformation of a quadruped, is much exposed, and liable to serious injury. By broken knee is meant the abrasion or more serious injury of the joint by a fall; and even when the wounds are healed, the scar usually remains to indicate that the horse has once fallen, and is 'broken-kneed'—an animal is then regarded as unsafe, and seriously deteriorated in value.

*Causes.*—The fall is necessarily the immediate cause of the broken knee; as to the cause of the

## BROKEN WIND—BROKER.

fall, it is usually to be looked for elsewhere than in the horse himself. As a rule, the safety of a horse's action is very great, particularly about the age of from four to seven or eight years. Rarely does a horse at any age fall on his knees, unless his feet have suffered from improper shoeing; the animal then moves cautiously, and is very apt to 'stumble.' Undoubtedly, some horses of defective conformation and sluggish disposition are more likely to stumble and fall than a well made, high-actioned steed; nevertheless, the most perfect animal may gradually be rendered unsafe by improper shoeing. See SHOCKING OF HORSES.

**Symptoms.**—It is important, so soon as the injury is done, to determine the extent and depth of the wound. If it be merely a superficial wound, the case is a simple one; and unless the skin is much bruised, the hair will grow, and the animal not be permanently blemished. The sheath, however, through which the tendon over the joint passes, may be opened, and the tendon itself injured. The wound is then gaping, heals rather slowly, and sloughs have to be thrown off. Lastly, the joint itself may be opened, and this is indicated by a free discharge of the joint-oil or synovia, and by the bones being seen or felt on probing. The worst form of accident is that when the bones of the joint are fractured. The system suffers when the wounds are serious, and severe fever sets in.

**Treatment.**—Whatever may be the form of injury, the first injunction is to wash the wound thoroughly with cold water applied constantly for hours. The joint will swell, become hot and painful, and in some cases irritative fever occurs. Then the animal should be kept on low diet, and be purged with four, five, or six drachms of aloes, according to its size, &c. Should the wound be deep, much dirt remaining in the tissues, a large linseed-meal poultice should be applied over the joint for a day or two, until free suppuration sets in. If this is retarded, and in all cases when the poultice does not appear necessary, cold fomentations may be continued, using either some infusion of chamomile, or one part of tincture of arnica to twelve of water, or one part of Gouillard's Extract to a similar quantity of water. The severe symptoms speedily subside, unless the bones are fractured or the joint otherwise seriously injured. Usually, the wound heals rapidly, the joint-oil ceases to flow; and in order to insure a contraction of the wound, mild astringent or caustic applications should be used, such as tincture of myrrh, sulphate of zinc lotion, or sulphate of copper in crystal rubbed over it. When the wound is thoroughly healed, the hair may not grow rapidly, even in parts where it should form; in this case its production may be accelerated by the use of a very mild cantharidine ointment, which should act as a mild irritant, but not as a blister. In some cases of severe broken knee, it is advisable to fix the limb so that the animal may not move the joint much. In veterinary jurisprudence, a broken knee is regarded as a *blemish*, not as an unsoundness.

**BROKEN WIND**, a disease or unsoundness of the respiratory organs of the horse, which, from the French *pousse*, was termed, by some of the old English writers on farriery, *pursiness*. The Germans term it *Dämpfigkeit*, or asthma, though in many of their works it receives also the name of *Herzschlägigkeit*, from a belief that it consists in palpitation of the heart. The nature of the malady is not well understood, though it appears in the form of difficulty in the act of expiration, the horse making an extraordinary or spasmodic effort to expel from the lungs the air which has readily entered them in inspiration.

**Symptoms.**—A broken-winded horse is usually an animal that does not thrive, is lean, and has a dependent belly, the muscles of which are unusually active as expiratory muscles. The characteristic symptoms are best observed when the horse is exercised, the breathing becoming very laboured, the nostrils dilated, the eyes bloodshot, and even blue, shewing imperfect purification of blood in the lungs. On watching the chest and flank, the ribs are observed very actively moved, and after collapsing, when the air is expelled from the lungs, are further depressed by a spasmodic jerk brought about by the abdominal muscles. A broken-winded horse has a bad cough, of the kind referred to by veterinarians as characteristic of unsoundness, and termed a *hollow cough*. When the animal is oppressed by fast work, or dragging a load up a hill, the pulse is excessively rapid, and the heart beats energetically. From this circumstance, it is regarded by some as a disease of the heart. Others have believed the diaphragm affected, but in reality it is the lungs, or the apparatus for expelling the air from these organs, that is at fault. The diaphragm being a muscle of inspiration, it is probably in no way implicated. No doubt, when the heart is diseased, the function of breathing is sometimes much affected, but these are not the symptoms of true B. W., any more than when the lungs are in part rendered impervious to air, and the act of inspiration is rendered short. This condition constituted *thick wind*, and is often one of the remote results of inflammatory disease of the lungs.

**Causes.**—Low-bred horses are liable to B. W., especially if improperly fed on innutritious and bulky food, and at the same time kept at hard and fast work. Whatever may be the way in which the condition of the alimentary canal operates in producing B. W., of this we are certain, that the function of digestion is much impaired. Indeed, the term B. W. is believed to have had reference originally to the constant escape of flatus. B. W. is far more rare now-a-days than of old, and it is at present most common in those countries where horses are worst managed, and fed almost exclusively on coarse, indigestible, or innutritious kinds of hay and beans.

**Treatment.**—The treatment of B. W. is very unsatisfactory; and we can only hope for palliation of the symptoms by keeping the alimentary canal in proper order, administering occasional purgatives, and feeding on a proper quantity of the best oats, which should always be bruised; also allowing the horse the best hay in spare quantities—viz., from 10 to 12 lbs. daily. Some veterinarians have vaunted their powers in curing this disease, and recommended large doses of camphor, digitalis, and opium; but these potent narcotics only operate for a very short time, and as their effects pass off, the symptoms return, and often with increased severity. We may say that B. W. is incurable; and horses very frequently drop down exhausted when at hard work, and die either from congestion of the lungs, hemorrhage, or simple suffocation.

B. W. is so bad a form of unsoundness, that horse-dealers sometimes attempt, and even successfully, to hide the defect for the time they may be engaged in the sale of a horse, and this they do by causing the animal to swallow *shot* or *grease*. A certain portion of lead weighing in the stomach has a wonderful effect in diminishing the symptoms, which become again obvious enough a few hours after the ruse has been practised on some unwary purchaser.

**BROKER** (so called, from a Teut. and Slav. root, *brak* or *wrak*, signifying refuse, blemish; as if the function had originally been to select good articles of merchandise and reject blemished ones: the German term is *mäkler*, from *mäkeln*,

blemish), an agent employed to make bargains and contracts between other persons, in matters of trade, commerce, and navigation, for a compensation commonly called brokerage. Where he is employed to buy or sell goods, he is not intrusted with the custody or possession of them, and is not authorised to buy or sell them in his own name. In this respect, he differs from a factor, and he differs from an auctioneer in two particulars: A B. may buy as well as sell, but an auctioneer can only sell; a B. cannot sell personally at public auction, for that is the appropriate function of an auctioneer, but he may sell at private sales, which an auctioneer (as such) does not. A B. is strictly a middle-man, or intermediate negotiator between the parties, and for some purposes, he is treated as the agent of both parties, but primarily he is deemed merely the agent of the party by whom he is originally employed. There are several sorts of brokers, such as STOCK-BROKERS, SHARE-BROKERS, SHIP-BROKERS (q. v. in SUPP., Vol. X.), INSURANCE-BROKERS, and BILL-BROKERS (q. v.). Persons who appraise goods, sell or distrain furniture for rent, are also called brokers, although differing entirely in their occupations from the preceding commercial agents. The business of a Pawnbroker (q. v.) is also of a different nature.

Brokers, in London, must be admitted by the lord mayor and aldermen, paying £5 on admission, and a like sum annually, under a penalty of £100. They are also required to take an oath, and enter into a bond for the observance of certain regulations. A B. who is not duly qualified cannot recover any compensation—6 Anne, c. 16; 57 Geo. III. c. 60.

By the fraudulent Trustees' Act, the 20 and 21 Vict. c. 54, s. 2, it is enacted that any person, who, being a banker, merchant, B., attorney, or agent, and being intrusted for safe custody with the property of any other persons, shall in any manner convert or appropriate it to his own use, shall be guilty of a misdemeanour, and be liable to be kept in penal servitude for the term of three years, or to suffer such other punishment, by imprisonment for not more than two years, or by fine, as the court shall award. See FACTOR.

**BROKERAGE** is the remuneration or compensation allowed to a broker (q. v.).

**BROMBERG**, a town of Prussia, in the province of Posen, 69 miles north-east from the city of that name, is situated on the Brahe, about 6 miles from its junction with the Vistula. B. has manufactured of woollens, linen, chicory, tobacco, and Prussian blue; a large sugar-refinery, distilleries, breweries, potteries, and corn-mills. The *Bromberg Canal*, by uniting the rivers Netz and Brahe, connects the Oder and Elbe with the Vistula. Pop. (1871) 27,734.

**BROME-GRASS** (*Bromus*; Gr. *bromos*, a kind of oat), a genus of Grasses, very nearly allied to *Fescue* (q. v.), with flowers in lax panicles, glumes many-flowered, the outer palea bifid at the extremity, and awned beneath, and the very short stigma growing from the face of the germen, beneath its apex. The species are numerous, and some of them are very common British grasses—none more so than the **SOFT B.** (*B. mollis*), an annual or biennial, which has very soft downy leaves, grows well on poor soils, and is readily eaten by cattle, but is not much esteemed by farmers, either for the quantity or quality of fodder which it yields. Its seeds have also the reputation of possessing deleterious or poisonous properties: and those of two other species of this genus, *B. purpureus* and *B. catharticus*, the former a native of North America, and the latter of Chili, are said to be emetic and purgative. The

whole subject of the existence of poisonous properties in the seeds of any of these grasses, requires further investigation. Soft B., although now disliked by farmers, was formerly sown as a fodder-grass, and its large seeds were even regarded as making hay more nutritious; so that there are some who view its present proscription as a thing which ought to be reconsidered, and who deem it not improbable that its weighty produce, both in foliage and seeds, and its adaptation to poor soils, may yet recommend it to the favour of agriculturists. Very similar to it are **SMOOTH B.** (*B. racemosus*), **FIELD B.** or **MEADOW B.** (*B. communis* or *B. pratensis*, and *B. arvensis*), all of which seem very much to resemble it in their properties.—The **TALL B.** (*B. giganteus*, also known as *Festuca gigantea* and *Bucium giganteum*), a native of Britain, which reaches the height of four or even five feet, affords a great bulk of foliage, but is not much relished by cattle. Naturally growing in shady places, it succeeds even in dense woods, and is sometimes sown to form covert for game.—**Rye B.** (*B. secalinus*) is generally regarded as a troublesome weed, especially in fields of rye.

Rye Brome-grass (*Bromus secalinus*).

It is very abundant in some parts of Europe. In a young state it has a great resemblance to rye. Its seeds, which are large, retain their power of germination for years, and do not lose it by passing through the intestines of animals. Deleterious effects have been erroneously ascribed to bread made from rye, along with which these seeds have been ground; but poultry are very fond of them, as of those of other species of this genus.

**BROMELIACEÆ**, a natural order of monocotyledonous plants, allied to *Amaryllidæ* and *Iridæ*, stemless, or with short stems, and rigid, channelled, often spiny and scaly leaves. The flowers are in racemes or panicles; the calyx 3-parted or tubular, persistent, more or less cohering with the ovary; the petals three, withering or deciduous, equal or unequal, imbricated in bud. The stamens are six, inserted into the tube of the calyx and corolla, the anthers opening inwards. The ovary is 3-celled, the

style single, the fruit capsular or succulent, many-seeded; the seeds with a minute embryo lying in the base of mealy albumen.—The order contains about 170 known species, all natives of the warmer parts of America, although some of them are now naturalised both in Asia and Africa. The best known plant of the order, and the only one much valued for its fruit, is the Pine-apple (q. v.). B., with their strong spiny leaves, cover the ground in many places, so as to form impenetrable thickets. Many of them are epiphytic, or grow upon trees, without being parasites, particularly the species of *Tillandsia*, one of which is the New Orleans Moss, Long Beard, or Old Man's Beard of the West Indies and of the southern parts of the United States, hanging from the trees like the lichens of colder climates. The leaves of some are so formed and placed as to retain near their base a quantity of water, often affording a delicious refreshment to the traveller in a hot climate. The water is, perhaps, of use to the plant itself in droughts. Not a few of the B. are capable of vegetating long without contact with earth, and of sustaining long drought without inconvenience, for which reason, and because of their beautiful and fragrant flowers, some of them are very frequently suspended from balconies in South America as air-plants. But the plants of this order are more generally valuable for their fibres than upon any other account. *Tillandsia usneoides*, the New Orleans Moss already mentioned, yields a fibre, easily obtained, and in great abundance, which is used instead of hair for stuffing mattresses. The fibres of the leaves of the pine-apple, and of some other species of this order, have been made into fabrics resembling the finest white muslin, whilst they are found also to possess sufficient strength for cordage. It is supposed that the produce of different species of *Bromelia* is often included along with that of the American Aloe or *Agave* (q. v.), under the name of Pita fibre or Pita flax, the appearance and properties of the fibres being very similar, as well as those also of the fibres of the species of *Yucca*. The fibre of the pine-apple is, in some countries, very frequently twisted into fishing-lines, and made into nets and into ropes intended for immersion in water, being very little liable to injury from this cause. Abundant as the plant is in its native regions, and now so perfectly naturalised as to form thickets in many parts of the old world, there seems no limit to the quantity of this fibre which might be procured.—The Pine-apple cloth of the Philippines is called *Pina muslin* and *Batiste d'ananas*. It is also sometimes erroneously called Grass-cloth. With a magnifier, the fibres may be seen to be very numerous and fine, but not twisted at all, as in grass-cloth or the finest muslins and cambrics. The Philippine pine-apple fibre is obtained from a species called by the Spaniards *pigna* or *pina* (a cone), and which has by botanists been named *Bromelia Pigna*, although some regard it as a mere variety of the pine-apple, with small and rather dry fruit. It grows in great abundance in the Philippine Islands, and is cultivated by the Chinese near Singapore, and the fibre exported to China. This fibre is prepared also in Malacca, Java, Celebes, &c. When bleached, the pine-apple fibre can be spun like flax. A patent for this has been taken out in Britain by Mr Zincke.

The WILD ANANAS (*Bromelia Penguin*) of the West Indies, the *Bromelia Karatas*, common in South America, the *B. Sagenaria*, common in some parts of Brazil, and the *Bilbergia variegata*, which grows in wild luxuriance in Mexico, where it is called *Caroa*, often covering miles of country—all yield fibres which are used for cloth, cordage, nets, &c. The

fibre of *Bromelia Sagenaria* is known as *Curratow* fibre. Very strong ropes are made of it.

The genus *Bromelia* has a 3-parted calyx shorter than the corolla, and the fruit is succulent. The species are pretty numerous, the leaves of all of them are more or less characterised by spiny serrations. The fruit of *B. Penguin*, already mentioned, affords a cooling juice, which is used in the West Indies mixed with water, to make a drink for patients in fever and dysentery. It is said to be diuretic. A vinous liquor is sometimes made from it.

**BROMIC ACID** is the only known compound of bromine and oxygen. It is prepared by acting upon bromine (Br) by caustic potash (KO), when much bromide of potassium (KBr) is formed, accompanied by bromate of potash (KOB<sub>4</sub>O<sub>3</sub>), a compound of potash and B. acid. It likewise combines with silver, lead, and mercury, yielding salts, all of which are styled Bromates.

**BRO'MINE** (Greek, *bromos*, disagreeable smell), one of the chemical elements, occurs in combination in sea-water to the extent of about 1 grain to the gallon. It is found more abundantly in certain saline springs, especially those at Kreuznach and Kissengen in Germany. It is also present in water and land-plants and animals. In the extraction of B. from concentrated sea-water, from which common salt has been separated in quantity, and which is then called *bittern*, or from salt springs, the liquor—which contains the B., as bromide of magnesium (MgBr)—has a stream of chlorine gas (Cl) passed through it, which forms chloride of magnesium (MgCl), and liberates the bromine. The liquid thus becomes of a more or less yellow tint, and if it be then agitated with ether, and allowed to settle, the latter floats up the bromine. The ethereal solution is then treated with potash, which principally forms bromide of potassium (KBr), and fixes the B., so that the ether may be distilled off. The residue is then treated with oxide of manganese and sulphuric acid in a retort with heat, which results in the liberation and distillation of pure bromine. It exists as a deep red liquid of density 2.936 (nearly 3), which readily evolves red fumes of a very irritating and suffocating nature. It is very poisonous, actually destroying the animal tissues. It is sparingly soluble in water, more so in alcohol and ether, and its water solution possesses great bleaching properties. When raised to the temperature of 145° F., it boils, and reduced to 9° F., it becomes a red crystalline solid. B. combines with great rapidity with the metals, occasionally with ignition, as with antimony, and forms a class of salts. Treated with hydrosulphuric acid, B. yields hydrobromic acid (HBr), which is the analogue of hydrochloric acid, as B. is of chlorine.

**BRO'MSEBRO**, a village of Sweden, in the len of Calmar, and 29 miles south-west of the town of that name. It is celebrated as the place where treaties were entered into between Sweden and Denmark in 1541, 1641, and 1645.

**BRO'NCHI** are the subdivisions of the trachea or windpipe. Opposite the third dorsal vertebra, the latter divides into two branches or B., of similar structure to itself—namely, round and cartilaginous in front; and flat, with muscular and fibrous tissue behind, lined with mucous membrane. Of these B., one goes to each lung, the right being little more than an inch; the left, about two inches in length. On entering the substance of a lung, the B. divide into smaller branches, which again subdivide, until they are no larger in diameter than one-fiftieth to one-thirtieth of an inch, which give origin to, or terminate in, small polyhedral cells, which seem to cluster round their extremities, and open into them.

These are the air-cells; they consist of elastic tissue, with a lining of mucous membrane, and beneath the latter, a layer of minute blood-vessels of the lung. See RESPIRATION, ORGANS AND PROCESS OF.

**BRONCHITIS**, or inflammation of the lining membrane of the bronchial tubes, is a disease of very common occurrence in Great Britain, and one of the greatest importance, for, if neglected, it not only destroys life, but if carelessly treated, may lead to premature and miserable old age. The first symptoms are generally those which distinguish a common cold—viz., shivering, headache, and sense of weariness, with occasional cough; but the cough continues, and recurs in paroxysms; there is a feeling of oppression on the chest, and the person wheezes when he breathes. He also breathes more rapidly, six or ten respirations in the minute more than he did when in health, and his pulse is quicker; and the ear applied to his chest, after these symptoms have continued for two or three days, will hear a rattling, as if air was bubbling through thickish fluid, which is the case; he is breathing through an extraordinary amount of mucus secreted by the inflamed lining membrane of the tube. During his paroxysms of cough, this mucus is spit up. If the inflammation extend no further, it is termed *tubular B.*, and is seldom a fatal disease in the first attack; but, as may be expected, it will often extend, or, in some cases, begin in the small tubes—*vesicular B.*—when the symptoms just described will be present, but in a greater degree, the breathing being so embarrassed that the patient can no longer lie down, but required to sit or stand up, and use all his muscles of respiration. Though he coughs, he spits very little, till about the third day, when he expectorates large quantities of yellow fluid. At last, prostration becomes so complete that he ceases to spit, and dies suffocated by the accumulated mucus, from the fifth to the seventh day. In less severe cases, or those which yield to treatment, the delicate tubes may be permanently injured by the inflammation. They may be thickened, which narrows their calibre; this will prevent the proper passage of the air, and gives rise to wheezing on any exertion, and cough, especially in winter. Moreover, after repeated attacks, one of the tubes may be blocked up entirely, so that the portion of lung to which it ought to conduct air, is no longer filled, and consequently collapses and wastes. This compels the adjacent tubes and air-cells to dilate to receive more air at the expense of their elasticity (*emphysema*, q. v.); the air-cells may even burst, and so by degrees the apparatus for saturating the blood becomes less and less perfect. The treatment of B. must vary with the patient's constitution; but in most cases, counter-irritation, applied through the medium of mustard or hot turpentine fomentations, will be found very useful. These remedies act more rapidly than a blister, and may be frequently repeated. It should be remembered that patients suffering from B. are very easily depressed. Such medicines as ammonia should be given, to promote expectoration, combined with the liquor ammoniae acetatis, to produce perspiration. In very acute cases, after a brisk purge, salines, with ipecacuanha or squills, may be given, and an emetic will remove accumulations of mucus.

In the B. of old persons, chloric ether will be found very useful, and may be combined with sedatives, as henbane; but opium must be given with great caution, or not at all, as it tends to increase the congestion of the inflamed tubes. The paregoric elixir (compound tincture of camphor) is an old and popular remedy in B., but enough has been said to impress on the reader the danger of tampering with bronchitis. In every case where it is possible, a

skilled medical man should be employed, to determine, by the stethoscope, not only the disease but its exact situation; and as it is but too likely to recur at some future period, or symptoms caused by it to appear, a skilled opinion has a permanent value to the patient. See CATARRE.

**BRÖNDSTED, PETER OLUF**, a learned antiquary, born near Horsens in Jutland, November 17, 1780. On completing his course of studies at the university of Copenhagen, he, in 1806, went to Paris, where he remained two years. He afterwards visited Italy and Greece, where he made excavations which furnished valuable materials for the study of classical antiquity. B.'s principal work is *Travels and Researches in Greece* (2 vols., Paris, 1826), a translation of which into French appeared at the same time. In addition to several smaller archaeological papers, amongst which was one in English, entitled *An Account of some Greek Vases found near Vulci* (Lond. 1832), and another on the bronzes of Siris, which appeared at Copenhagen, 1837, B. also wrote some valuable contributions to Danish history from Mediæval Norman Manuscripts (2 vols., Copenh. 1817—1818), and *Memoirs of Greece during the Years 1827 and 1828* (Paris, 1835).

**BRONGNIART, ALEXANDRE**, an eminent French chemist and naturalist, born at Paris in 1770, is said to have delivered a lecture on chemistry before he was 15. In 1790, he visited England for a scientific examination of the Derbyshire mines and pottery-works, and, on his return to France, published a *Mémoire sur l'Art de l'Emailleur*. Appointed in 1800 director of the porcelain manufactory at Sèvres, he held that office for the remainder of his life, and revived the almost lost art of painting on glass. In his *Essai d'une Classification des Reptiles*, 1805, he established the four divisions of reptiles, and first gave them the names of *Saurians, Batrachians, Cheloniens, and Ophidiens*. His *Traité Élémentaire de Minéralogie*, published in 1807, at the instance of the Imperial University, became a text-book for lecturers. In 1814 appeared his *Mémoire sur les Corps Organisés Fossiles nommés Trilobites*, a name which, as well as a basis of classification for those singular crustacea, naturalists owe to Brongniart. In 1815 he was elected a member of the Academy of Sciences of the French Institute; he was also a member of the Royal and Geological Societies of London, and of other learned bodies. In 1845, appeared his *Traité des Arts Ceramiques*. He died 14th October 1847.

**BRONGNIART, ADOLPHE THEODORE**, son of the preceding, author of several botanical works held in high esteem, was born in 1801, and in 1834 was appointed professor of botany at the Jardin des Plantes, Paris, and member of the Academy of Sciences. In 1852 he was elected a foreign member of the Royal Society of London.

**BRONI**, a town of Northern Italy, in the province of Alessandria, about 11 miles south-east of Pavia, in a beautiful situation at the foot of the Apennines. It has a singular old church, some portions of which date from the 10th century. In its vicinity is the castle of Broni, celebrated in history as the place where Prince Eugene obtained a victory over the French in 1703. Pop. about 7000.

**BRONN, HEINRICH GEORG**, a German naturalist, was born at Ziegelhausen, March 3, 1800, and educated at Heidelberg University, where he devoted himself to the science of forests and natural history. In 1828, he commenced at Heidelberg a course of lectures on the physical and industrial sciences, and in 1833 was nominated ordinary professor of the same. After Leuckhardt's departure from Freiberg, B. was appointed to the zoological

lectureship. B. wrote several important scientific treatises. His first was *A System of Antediluvian Conchylia* (Heidelberg, 1824), which was followed by *A System of Antediluvian Zoophytes*. In 1824, he visited the southern countries of Europe; and in 1827, made a second journey to Italy. On his return, he published the Results of his Journey (2 vols., Heidelberg, 1825—1830). In 1834 appeared his most important geological work—*Lethaea Geognostica*; in 1841—1849, his *History of Nature*; and in 1850, his *Universal Zoology*, which was the first attempt to develop zoology in its entirety with reference to extinct organisms. B. died 1862.

BRO'NTÉ, a town in the province of Catania, Italy, situated at the western base of Mount Etna, about 22 miles north-north-west of the city of Catania. B. has manufactures of woollen and paper, and the district produces oil, almonds, wine, &c. But the town is celebrated chiefly for its connection with Admiral Lord Nelson, who was created Duke of B. by the Neapolitan government in 1779, with an annual income of 6000 *oncise* (about £3750). Pop. upwards of 10,000.

BRONTE, CHARLOTTE, one of the most distinguished of modern novelists, was born at Thornton, in the West Riding of Yorkshire, on the 21st of April 1816. Her father, a clergyman of Irish descent, removed, with six young children and an invalid wife, from Thornton to Haworth, in the same county, in 1821. Soon after their arrival, Mrs Bronte died, so that Charlotte, trying hard in after-life, could but dimly recall the remembrance of her mother. Her father, eccentric and solitary in his habits, and full of extravagant theories for making his children hardy and stoical, was ill fitted to replace a mother's love. When Charlotte was eight years old, she was sent with three of her sisters to Cowan's Bridge School, which, whether deservedly or not, had an unfortunate notoriety conferred upon it twenty-five years later in the pages of *Jane Eyre*. Her two eldest sisters falling dangerously ill, and dying a few days after their removal thence, and the low situation evidently disagreeing with Charlotte's health, she was sent home when little more than nine, and remained there, 'the motherly friend and guardian of her younger sisters,' till, in 1831, she was sent to Miss Wooler's school at Roe Head, where her remarkable talents were duly appreciated by her kind instructress, and friendships formed with some of her fellow-pupils that lasted throughout life. A few years later, she returned to Miss Wooler's school as teacher there, and also had some sorrowful experiences as governess in one or two families. It was with a view of better qualifying themselves for the task of teaching that Charlotte and her sister Emily went to Brussels in 1842, and took up their abode in a *pensionnat*. When Charlotte returned home in 1844, a new shadow darkened the gloomy Yorkshire parsonage. Her father's sight was declining fast, and her only brother was a source of continual anxiety. It now seemed plain that school-keeping could never be a resource, and the sisters turned their thoughts to literature. Their volume of poems was published in 1846; their names being veiled under those of Currer, Ellis, and Acton Bell, but it met with little or no attention. Charlotte's next venture was a prose tale, *The Professor*, and while it was passing slowly and heavily from publisher to publisher, *Jane Eyre* was making progress. In the August of 1847, it was submitted to Messrs Smith and Elder, and published by them two months later. It took the public by storm. It was felt that a fresh hand, making new harmonies, was thrown over the old instrument.

Henceforward, Charlotte B. had a 'twofold life, as author and woman.' Over the latter, the clouds closed thicker and thicker. Mr Bronte had indeed recovered his sight; but the sister Charlotte so intensely loved, and whose genius she ever delighted to exalt above her own, Emily—the Ellis Bell of *Wuthering Heights*—died in 1848. Her only brother also died in the same year; and Anne, the youngest of the family, following in 1849, Charlotte was left alone with her aged father in that dreary deserted home among the graves. Nevertheless, her energy never flagged. *Shirley*, begun soon after the appearance of *Jane Eyre*, was published in the autumn of 1849; and *Villette*, written under the frequent pressure of bad health and low spirits, came out in 1852. In the spring of 1854, Charlotte B. was married to her father's curate, the Rev. A. Nicholls, who had long known and loved her. It is a relief to find that a little bright sunshine was permitted to the close of a hitherto clouded life. It was, however, but brief; for serious illness set in, and on the 31st of March 1855 she died. A fragment of an unfinished novel appeared in the *Cornhill Magazine* for April, 1860.

BRONZE is a reddish-yellow, fine-grained alloy of copper and tin, in variable proportions. It was early known, and what is usually spoken of as brass in regard to the ancient nations, was in reality bronze. The brass or B. referred to in the Bible was probably composed of copper and tin, though some translators consider it likely to have been copper alone. The examination of the most ancient coins and metallic ornaments and implements leaves no doubt as to the acquaintance of the ancients with B.; so much so, that in the antiquarian history of European nations, there is a distinct period styled the *Bronze Period* (see next art.). At the present time, B. is largely used for house and church bells, Chinese gongs, ordnance or cannon metal, and speculum or telescope metal. In the preparation of the various kinds of B., great care must be taken to keep the tin from being burned away or wasted. To obviate this, it is customary to use much old B., as worn-out cannon, &c., and when that is fused in the furnace, to add the new copper and tin. The best Cornish and Banca tin are employed for the better kinds of castings, especially where strength of alloy is required. For inferior work, old scrap tin, which often contains lead, is used; and where strength of material is not an object, a little zinc and lead are added. In either case, during the fusion of the mixed metals in the furnace, at a high temperature, as little air as possible must be admitted to the furnace, otherwise the metals are oxidised, and the alloy is deteriorated. B., when well made, is, excepting gold, platinum, and some of the rare metals, the most durable metallic material with which we are acquainted; and this, coupled with its extreme hardness, rendering it difficult for time and ordinary wear and tear to efface inscriptions or medallions stamped on it, has led the mint in France, some years ago, to issue a bronze coinage in place of copper; and for the last twelve or fifteen years bronze coinage has taken the place of a copper coinage in Great Britain.

The principal varieties of B. have the following average composition :

	Copper.	Tin.
Brass ordnance or bronze cannon,	9	1
Bronze for toothed wheels,	10	1
" for mathematical instruments,	12	1
" for bearings of machinery,	8	1
Chinese gongs and cymbals,	5	1
Musical bells,	6	1
House bells,	4	1
Large bells,	3	1

## BRONZE.

	Copper.	Tin.
Telescope or speculum metal,	2	1
Mirrors,	2	1
Hard bronze,	7	1
Medium bronze,	8	1
Soft bronze,	9	1
Flexible bronze nails,	20	1

Recently, B. has been deposited on small statues and other articles, in greater or less thickness, by the electrotype process (see GALVANISM), forming very pleasing ornaments at a cheaper rate than ordinary B. ornaments can be purchased for. The same process has been suggested for coating those parts of machinery which are liable to rust.

**BRONZE, AGE OF** (Dan. *Bronzealderen*), a term used by many modern archaeologists to distinguish the second of the three successive periods into which, as they hold, the primitive or pre-historic antiquities of a country may be divided. They take for granted that among a rude or savage people, stone, being more easily fashioned, would come into use before any kind of metal; and that of metals, copper being oftener found ready for the hammer, would come into use before iron, which has generally to be smelted before it can be wrought. These assumptions—which, in so far, are only in accordance with what has actually been observed among uncivilised races—have obtained from a very early date. Lucretius, writing in the century before the Christian era, has recorded them with his usual vigorous precision :

*Arma antiqua, manus, ungues, dentesque fuerunt,  
Et lapides, et item sylvarum fragmina rami:  
Posterius ferri vis est serisque repata;  
Et prior seris erat quam ferri cognitus usus.*

*De Rerum Natura*, v. 1282.

Man's earliest arms were fingers, teeth, and nails, And stones, and fragments from the branching woods; Then copper next; and last, as later traced, The tyrant iron.—*Mason Good's Translation.*

More than one antiquary of the last century appears to have suggested the distribution of archaeological objects into eras of stone, of copper or bronze, and of iron. But the proposed classification received scarcely any attention until about forty years ago, when it was adopted and developed by Mr C. J. Thomsen, superintendent of the Ethnographical and Archaeological Museum of Copenhagen, in his *Ledetraad til Nordisk Oldkyndighed* (Kjøbenhavn, 1836), and by Mr Nilsson, professor of zoology in the university of Lund, in Sweden, in his *Skandinaviska Norden's Urinvonare* (Lund, 1838—1843). According to the theory of these writers—which is held by almost all archaeologists in Denmark, Sweden, and Norway, by many in Northern Germany and in Switzerland, and by a few in other parts of Europe—the first three stages in the progress of a nation from barbarism to civilisation are as clearly identified and defined by their relics of stone, of bronze, and of iron, as the comparative antiquity of geological strata, or periods of the world's creation, is determined by the fossils which they are found to contain.

The name of the 'age of stone' is given to the period when weapons and implements were made of stone, amber, wood, bone, horn, or some such easily wrought material, and during which very little or nothing was known of metals. During this era, the people, few in number, and savage in their habits, clothed themselves chiefly with skins of animals. They buried their dead in large sepulchral chambers, covered by what have been called *cromlechs*, or girdled round by the unhewn stone pillars called 'Druidical circles.' The bodies have most frequently been found unburned, and often with rude urns beside them.

During the 'age of bronze,' weapons and implements were made of copper or of bronze, and iron and silver were little or not at all known. The dead were burned, and their ashes kept in urns, or deposited in stone-chests, which were covered by conical mounds of earth or heaps of loose stones. In the urns, articles of gold and amber are found, but never of silver. Most articles of metal appear to have been cast; where marks of the hammer appear, it is contended that the forging or beating must have been by a stone hammer upon a stone anvil.

The 'age of iron' is the name applied to the third and last of the three supposed periods. During this era, it is conceived that iron displaced bronze in the manufacture of weapons and implements, and that silver and glass came into use. The dead were still occasionally burned; but they were frequently buried without burning, often seated on chairs, and, at times, with a horse in full war-harness laid beside the body of his master.

The Scandinavian and German antiquaries admit that their three periods run, more or less, one into another; that stone weapons continued to be used throughout the age of B.; that B. and gold were not unknown in the age of stone; and that weapons of stone and B. continued to be used in the age of iron. This admission obviously detracts very much from the practical value of the classification for chronological or other scientific purposes. But the late Mr J. M. Kemble, and other British antiquaries, have taken objections to the classification altogether, as irreconcilable with generally admitted facts, when carried out to its strict and necessary consequences. They point to the everyday discovery of objects of stone, B., and iron, in the same ancient urns, graves, and dwellings. They instance the case of the Huns, who had swords of iron, while they pointed their arrows with bones; the case of the Anglo-Saxons, who fought with stone mauls at Hastings; and the case of the Germans, who used stone-hammers in the Thirty Years' War. They shew stone weapons, in some of which the traces of metal are still fresh, while others attest for themselves that they could not have been cut but by a thin sharp metal point.\* They prove from Greek and Roman writers that the nations of the north and west of Europe used iron weapons during what must have been their B. age. And they repudiate the proposed appropriation of different modes of burial to the different ages—a point on which the supporters of the theory appear to be hopelessly divided among themselves—on the ground, that graves assigned to the B. period have been found to contain more iron than B., and that other supposed characteristics of sepulchres of the B. age are quite as common in sepulchres of the iron age. But although the threefold classification of the Scandinavian and German archaeologists cannot be relied upon for historical uses, it may be accepted as a very convenient mode of arranging archaeological

\* M. Frederic Troyon of Lausanne, one of the Swiss antiquaries who accept the three periods of their Scandinavian brethren, instances certain stone axes (now in the collection of Baron Renberg, at Prague), which were found, along with their cores, at the site of a primitive manufactory of these weapons in Bohemia. 'These cores,' he says, 'when replaced in the holes from which they had been taken (easily verified by the corresponding veins of the stone), left so little play-room, that it was evident they could only have been detached by a metal point, and not by a hollow cylinder, which could not have given to the hole its conical form, now quite apparent. Instead of the soft iron which is employed now-a-days in such operations, the ancients used copper or bronze; and, of course, water and alluvious sand were likewise employed in the process.'

## BRONZE-WING—BROOCH.

objects. It has been adopted, with some modifications, in the Gallery of British Antiquities in the British Museum at London, in the National Museum of the Antiquaries of Scotland at Edinburgh, in the Museum of the Royal Irish Academy at Dublin, and in other collections, where the articles are classed, for the most part, according to the materials of which they are made.

**BRONZE-WING, BRONZE-WINGED PIGEON, and BRONZE PIGEON**, names given in the Australian colonies to certain species of pigeon (see *Pigeon* and *COLUMBIDÆ*), chiefly of the genus *Peristera* of Swainson, on account of the lustrous bronze colour with which their wings are variously marked. They are otherwise also birds of beautiful plumage.—The COMMON B. or Bronze-winged Ground Dove (*Columba* or *Peristera chalcoptera*) is distributed over all the Australian colonies. It is often seen in flocks, feeds on the ground, and builds its nest chiefly on low branches of trees growing on meadow-lands or near water. It is a plump bird, often weighing fully a pound, and in acceptable at every table.—The BRUSH B. or Little Bronze Pigeon (*C.* or *P.* *degans*) is not so plentiful nor so widely distributed, chiefly inhabiting Tasmania and the southern parts of Australia. It inhabits low swampy grounds, never perches on trees, resembles a partridge in its habits, and makes a loud burring noise like a partridge when it takes wing on being alarmed.—The HARLEQUIN B. (*C.* or *P.* *histrionica*) is found in the north-western parts of New South Wales in great flocks, feeding on seeds.—Some of the species of *Geophaps*, another of the genera or sub-genera of the *Columbidae*, are also sometimes called Bronze-wing. Their partridge-like appearance and habits have gained for them the name of Partridge Pigeon (q. v.).

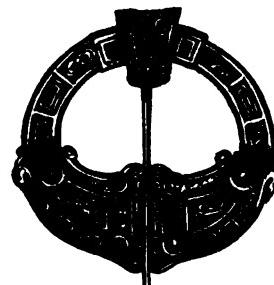

**BRONZING** is the process of covering plaster or clay figures, and articles in ivory, metal, and wood, so as to communicate to them the appearance of ordinary bronze. Several of the materials employed are of little value, whilst others are expensive. Thus, *gold powder* is used for the finer work, and is prepared by grinding gold-leaf with honey on a stone slab till a very fine state of division is attained, then washing out the honey, and drying the gold powder. Inferior gold-leaf, or that which contains much silver and copper, yields the *German gold powder* employed in bronzing. *Copper powder* is prepared by introducing an iron bar or plate into a solution of copper, when the latter metal is precipitated as a finely divided red powder. *Mosaic gold*, or *musivum*, is made by fusing 1 lb. of tin, introducing  $\frac{1}{2}$  lb. mercury, allowing the alloy or amalgam to cool, then pulverising and grinding up with  $\frac{1}{2}$  lb. sal-ammoniac, and 7 oz. sublimed sulphur. Ultimately, the whole is subjected to the process of sublimation, when the tin, as a brilliant yellow powder, resembling gold, is left in the subliming vessel. The colour of mosaic gold may be deepened by the addition of red oxide of lead, and it then assumes a copper tint. *Gold size* is prepared by heating 1 lb. of linseed oil, and gradually adding 4 oz. of gum animi in very fine powder. When boiled sufficiently, it assumes the consistence of tar, and may then be strained through cloth. When employed in bronzing, some vermillion is added, to make it opaque, and turpentine, to make it thin and limpid enough to be easily laid on the plaster cast or other article with a brush, and the object may ultimately be rubbed over with soft chamois leather, which is occasionally dipped into the gold size. The other B. powders are best laid on with a solution of gum-arabic or isinglass, either of which acts as a cement.

Gun-barrels are bronzed by acting upon them

273

with the chloride or butter of antimony (*bronzing salt*), or with hydrochloric or nitric acids, when the surface of the iron gets partially eaten into, and covered with a thin film of oxide; after which the gun-barrel is thoroughly cleaned, oiled, and burnished. A brownish shade is thus communicated to the barrel, which protects it from rust, and at the same time renders it less conspicuous to an enemy or to game. In the bronzing operation known as the Damascus, the barrel is treated with dilute nitric acid and vinegar, to which sulphate of copper has been added. The result is, that metallic copper is deposited irregularly over the iron surface; and when the latter is washed, oiled, and well rubbed with a hard brush, a very pretty appearance is communicated to the barrel. Articles in wood that require to be bronzed, are first coated with a mixture of size and lampblack, and dried, and then a bronze powder, consisting of very finely divided patent yellow, raw umber, pipe-clay, lampblack, and Prussian blue, is put on with a brush. After being dried again, the article is burnished with cloth or leather, covered with a layer of Castile soap, and, lastly, cleaned up with a woollen cloth. Copper vessels, coins, &c., are bronzed by heating them in a copper boiler containing vinegar, with 2 parts of verdigris, 1 of sal-ammoniac dissolved in it, when, after sufficient boiling, a pleasant reddish-brown hue is imparted. Bronze and copper articles may have an antique appearance communicated by applying a solution of sal-ammoniac 1 part, cream of tartar 3, common salt 6, hot water 12, and more or less nitrate of copper, when an ancient greenish hue is obtained.

**BROOCH** (from a root signifying to pierce; comp. Eng. *to broach*; Fr. *brocher*, to spit, or to stitch; Wal. *proc*, to stab), an ornamental pin or instrument for fastening the dress, consisting for the most part either of a ring or disc, or of a semicircle, there being a pin in either case passing across it, fastened at one end with a joint, and at the other with a hook. Brooches were much used in antiquity, and varied in form as much as in modern times. They were worn both by men and women, and with a view both to ornament and use, from the time of Homer to the fall of the Western Empire. Nay, in the early portion of the middle ages, and even amongst semi-barbarous tribes, the art of making

Hunterston Runic Brooch.

*fibulae* seems not only to have flourished, but to have attained marvellous perfection. Many of those found, both in Ireland and in Scotland, are wonderfully beautiful in workmanship, and still more so in design; and it is doubtful whether antiquity has left us anything in the way of personal ornament more perfect than the so-called Hunterston B., of which a wood-cut is subjoined. It was found in 1830, on the estate of Hunterston, in the parish of West Kilbride, Ayrshire, near to the scene of a conflict

which preceded the battle of Largs in 1262. It is of silver, richly wrought with gold filigree, and elaborately chased with lacertine and ribbon patterns. It is set with ornaments of amber; diameter,  $4\frac{1}{2}$  inches. On the reverse are runes, which have been variously read. Dr Wilson says, 'what is decipherable reads in good Scottish Celtic into what he explains to mean—Malbritha, his friend, in recompence to Maolfridi'—*Prehistoric Annals*. One of the most famous articles of the kind existing in Scotland is the *Brooch of Lorn*, in the

Brooch of Lorn.

possession of Macdougal of Dunolly, near Oban. It is believed to be identical with one torn from the breast of Robert Bruce by Alexander of Lorn, the ancestor of Macdougal, in a personal contest with the king. This interesting article is of silver, about 4 inches in diameter, with a circle of jewelled obelisks.

BROOKE, HENRY, dramatist and novelist, was born in 1706, in the house of Rantavan, county Cavan, Ireland. His father was a wealthy clergyman. Young B. was first sent to school to one Felix Somerford, where he so distinguished himself that his tutor, in the fulness of his heart, prophesied that he would play a great part in life. His talent for rhyming first made itself evident here, and it received further development while he resided at Dr Sheridan's school in Dublin. In 1724, he went to study law in London, and became the chosen friend of Pope and Lyttleton. From the heart of this brilliant literary society he was recalled to Ireland by a dying aunt, who left him guardian of her child, a girl of twelve. B. put the child to a Dublin boarding-school, and married her secretly two years thereafter. Four or five years subsequently, when his wife had borne him three children, he removed to London, and once more became a bright particular star in the galaxy of metropolitan genius. In London, he published a poem, entitled *Universal Beauty*, which Pope admired, and of which he perhaps turned a couplet here and there. Shortly after, B. returned to Ireland; but in 1736 he was again in London, and was introduced to the Prince of Wales, who cultivated his friendship, and made him presents of books and china. About this time, he published his play, entitled *Gustavus Vasa*, full of the noblest sentiments, and the most inconceivable characters. In 1740, B. was taken ill, and returned to his native country, where he published several books, and a tragedy, *The Earl of Westmoreland*, which was performed in Dublin. In his later years he removed to Dublin, and died there in 1783. The sonorous eloquence of his plays has not saved them from oblivion; and his novel, entitled *The Fool of Quality*, is the only work of his which is likely to meet the eyes of modern readers. It was originally published in five volumes, and was greatly admired by John Wesley. A new edition was published in 1859, with a preface by the Rev. C. Kingsley.

BROOKE, SIR JAMES, Rajah of Sarawak,

and Governor of Labuan—a man strongly imbued with the spirit of the old adventurers of the Elizabethan time—was born in Bengal in 1803. Being educated in England, he early entered the East India army, was seriously wounded in the Burmese war, and returning home on furlough, spent some time in travel on the continent. Shipwrecked on the voyage out to join his regiment, he was unable to reach India before his furlough had expired; his appointments consequently lapsed, and he quitted the service. He now conceived the idea of putting down piracy in the Eastern Archipelago, and of carrying civilisation to the savages inhabiting these islands. He purchased a yacht, which he manned with about twenty sailors, and after a three years' cruise in the Mediterranean, to test the sea-worthiness of his vessel and the seamanship of his crew, sailed from London for Sarawak, a province on the north-west coast of Borneo, October 1835. When he arrived there, Muda Hassim, the uncle of the sultan of Borneo, was engaged in a war with some rebel tribes. B. lent his assistance, and in return had the title of Rajah and Governor of Sarawak conferred upon him, the native governor being forced to resign. B. immediately set about reforming the government, instituted free trade, and framed a new code of laws. The murderous custom of head-hunting, prevalent among the Dyaks, he declared to be a crime punishable with death, and vigorously set about the extirpation of piracy. This was done so draconically as to occasion great dissatisfaction in this country; and the result was, that parliament abolished the 'head-money' that had been previously paid for the slaughter of pirates. Certain charges, however, brought against B. in the House of Commons, in connection with this matter, were declared by a Royal Commission to be unsubstantiated. The head-money was received, not by B. and his associates, but by the British ships-of-war that had co-operated with him. On his return to England, B. received a warm welcome, was created a Knight Commander of the Bath in the year following; and the island of Labuan, near Sarawak, having been purchased by the British government, he was appointed governor and commander-in-chief, with a salary of £2000 a year. In 1857, B., who had been superseded in the governorship of Labuan, but who still acted as Rajah of Sarawak for the sultan of Borneo, was attacked at night in his house by a large body of Chinese, who were irritated at his efforts to prevent opium-smuggling, and only escaped with his life by swimming across a creek. The Chinese committed great havoc on his property, but their triumph was short-lived. B. collected some natives, attacked the Chinese, defeated them in several successive fights, and ultimately forced them into the jungle, where they must have perished of starvation. Upwards of 2000 Chinese were killed, and all their flourishing settlements destroyed. Returning to England soon after this, B. lectured in several of the chief towns on the advantages likely to result to this country from a possession of Sarawak, and urged the desirableness of the British government taking it under its protection, as otherwise it was likely to fall into the hands of the Dutch. To enforce this view, an influential deputation waited upon the Earl of Derby (then head of the government) in November 1858, but he declined to entertain it. He returned to Borneo in 1861, but visited England again twice before his death, on the second occasion having the satisfaction of seeing the independence of Sarawak recognised by the English government. The town prospered greatly under his régime; he found it a place of some 1000 inhabitants, he left it a town of 25,000; and the exports to Singapore, which, on his instalment

as ruler, amounted to some £25,000, were in 1853 about £300,000. B. died in 1868.

**BROOKLIME** (*Veronica Beccabunga*), a species of Speedwell (q. v.) abundant in ditches, water-courses, and wet places near springs in Britain, common also in most parts of the continent of Europe. It is a perennial plant, with procumbent stems, rooting at the base; the leaves on short stalks, elliptical, obtuse, and slightly serrate, both stems and leaves smooth and very succulent; the small blue flowers, in form resembling those of the other Speedwells, in racemes, the stalks of which arise from the axils of the opposite leaves. The leaves and young shoots have a bland or a slightly bitter taste, and are a tolerable ingredient in spring salads. They are sometimes sold along with water-cresses.—See CRESS, WATER.—In Scotland, the plant is called *Water Purple*.

**BROOKLYN**, a city at the west end of Long Island, in the United States, belonging to New York state, in lat. 40° 42' N., 73° 59' W. B. is one of the five socially united municipalities which encircle the basin formed by the junction of Long Island Sound and the Hudson—the central emporium of New York city on the island of Manhattan, with two suburbs on Long Island, and two in New Jersey. It stands at the south-west extremity of Long Island Sound, which is here appropriately known as East River, partly in allusion to the narrowness of its channel and the rapidity of its tide, and partly in contradistinction to North River as a second name of the Hudson. Between B. and New York there are numerous ferries of about three-quarters of a mile in width, on which ply steam-boats every few minutes by day, and every half-hour by night. In 1850, the population was 96,838; in 1860, 266,661; and in 1870, 396,099. B. was founded by the Dutch in 1625, and is thus several years older than Boston; and in 1776, its neighbourhood was one of the principal seats of the revolutionary war. Occupying comparatively elevated ground, B. commands a complete view of the adjacent waters and their shores, while, notwithstanding its inequalities of surface, it consists chiefly of straight streets, crossing each other at right angles. It is divided into wards, and governed by a mayor and a board of aldermen. B. has nearly 200 churches, several flourishing banks, various literary institutions, and numerous seminaries of education—an ample share, in short, of all that characterizes a wealthy, populous, and intelligent community. It possesses also a national navy-yard, which embraces 40 acres of land, while to a private company it owes a wet-dock for the largest vessels, the most extensive in the Union.

**BROOM**, a name given to a number of species of shrubs of the closely allied genera *Cytisus*, *Genista*, and *Spartium*, of the natural order Leguminosæ, sub-order Papilionaceæ—all of them having long slender branches, along which are produced axillary flowers. The genera differ in the form of the standard (see PAPILIONACEÆ), which is roundish in *Spartium*, broadly ovate in *Cytisus*, and oblongo-ovate in *Genista*, whilst *Spartium* has also an acuminate keel, and that of *Cytisus* is very obtuse, that of *Genista* being oblong, and not wholly including the stamens and pistil. The legume is many-seeded in all, the calyx 2-lipped, and the filaments united in a tube.—**COMMON B.** (*Cytisus scoparius*, the trivial name being from the Lat. *scopæ*, long twigs, or a besom)—which has by different botanists been ranked in each of the genera just named, although it possesses the characters above assigned to *Cytisus*, but has recently been made the type of a new genus, under the

name of *Sarothamnus scoparius*, or *communis*—is a well-known native of Britain and of the continent of Europe, growing in dry soils, and ornamenting hedge-banks, hills, and bushy places, in May and June, with its large yellow flowers, which are on short stalks, drooping, solitary, but produced in considerable number along the straight slender branchlets. The whole aspect of the plant is graceful. The lower leaves have three oblong leaflets, the upper ones, or bracts, are simple; the branches are angular and of a very dark green, very tough, and much in use for making besoms. They have also been used for tanning and dyeing; and their fibre has been woven into a coarse strong cloth, and even made into paper. The whole plant is

Common Broom:

a, flowering branchlet; b, end of branchlet, not flowering, showing leaves with three leaflets; c, a pod; d, the tube of stamens cut open.

very bitter, with a peculiar nauseous taste and smell when bruised. The young tops and seeds are used in medicine, being powerfully diuretic, and very beneficial in some kinds of dropsy. They are also mildly laxative, and in large doses emetic. They are commonly administered in the form of a decoction. B. inhabits colder climates than furze, reaching to a greater elevation on mountains, and being found beyond the northern limit of furze. It varies in size from a very humble shrub to one of 20 or even 30 feet in height, and when it reaches this size, the wood is of great value for the finer purposes of cabinet-makers and turners.—**IRISH B.** (*Cytisus* or *Sarothamnus patens*), not unfrequent as an ornamental plant in British shrubberies, is not at all a native of Ireland, but of Spain and Portugal.—**PORTUGAL B.**, or **WHITE B.** (*Cytisus albus*), a native of the countries bordering on the Mediterranean, is very often planted in Britain as an ornamental shrub, and is much admired for the beauty of its fascicled white flowers, which are produced upon long filiform branches. Its leaves have three leaflets. It sometimes attains a height of 15 or 20 feet.—**SPANISH B.** (*Spartium junceum*) is

## BROOMRAPE—BROTHERHOODS.

a native of the south of Europe, generally growing in dry soils and rocky situations, and attaining a height of 8 feet or upwards. Its branches are upright, round, and rush-like, a characteristic of this genus. They are smooth, and bear only a few small simple leaves, which soon drop off. The fibre of the branchlets is much used in some parts of Italy, France, and Spain, for making cloth, ropes, &c. In the south of France, the plant is cultivated on dry unproductive soils. The branchlets are made into bundles, dried, beaten, steeped, and washed, in order to the separation of the fibre. It possesses medical properties similar to those of the common broom.—A white-flowered species (*S. monosperma*), occasionally to be seen in British shrubberies, grows abundantly on the loose sands of the coasts of Spain, and produces a similar fibre. It is mentioned by Barth as growing in great abundance in Africa to the south of the Great Desert. Many species somewhat resembling these are occasionally to be seen in Britain among ornamental plants, some of them often in greenhouses. The Canary Isles produce some remarkable for the fragrance of their flowers. The name B. is not given to those species of *Cytisus* (q. v.) and *Genista* (q. v.) which do not display in a marked degree the character of having long slender twigs.—BUTCHER'S B. (q. v.) is a plant of an entirely different family.

**BROOMRAPE.** See OROBANCHÉ.

**BRO'RA BEDS** are a series of strata occurring at Brora, a village in Sutherlandshire, of the same age as the inferior colite of Yorkshire. They are chiefly remarkable for the occurrence in them of a seam of coal of good quality 3*1*/<sub>2</sub> feet thick, being the thickest stratum of true coal hitherto discovered in any secondary strata in Britain.

**BROSSES, CHARLES DE**, a learned French historian, was born at Dijon, February 8, 1709. His first work was *Lettres sur l'Etat de la Ville d'Herculanum*, the result of a tour through Italy in 1739. At the suggestion of his friend Buffon the naturalist, he wrote the *Histoire des Navigations aux Terres Australes* (1756), in which he described the supposed great southern continent under the several names Magellania, Australia, and Polynesia. The last two of these names, now commonly used, were first employed by Brosses. His next work was *De Culte des Dieux Fétiches, &c.* (1760). It was followed by a *Traité de la Formation Mécanique des Langues* (1765), which, in spite of many errors, contains not a few novel and ingenious observations and conjectures. During the greater part of his life, B. was occupied in endeavouring to supply the lacunes in the works of Sallust; and having collected about 700 fragments by this historian, he published, with such interpolations as he deemed necessary, the *Histoire de la République Romaine dans le cours du Septième Siècle, par Salluste* (1777). B. died as president of the parliament of Burgundy, May 7, 1777. His letters from Italy, under the title *Italie il y a cent Ans*, were edited and republished by his son René, Count de Brosses, in 1834.

**BROTH** is an infusion or decoction of vegetable and animal substances in water. It is customary to use more or less meat, generally ox-flesh, with bone, and certain vegetables, as cabbage, greens, turnips, carrots, peas, beans, onions, &c. The whole are mixed together in cold water, heat slowly applied, and the materials allowed to simmer for some hours. The meat yields up certain ingredients, whilst others are retained in the residual flesh. The following table will illustrate this.

### Ox-flesh heated with water

Yields to the Water.	Leaves in the Boiled Meat.
Albuminous matter.	Fibrin.
Gelatina.	Coagulated albumen.
Kreatine.	Gelatinous tissue.
Extractive matters or Osmosome.	Fat.
Lactic acid.	Nervous matter.
Salts.	
Fat.	
Saccharine matter.	

The vegetables yield albuminous constituents, colouring and mucilaginous matter, and volatile oils and salts.

The real nutritive material present in broth is less than is generally thought, though it aids in satisfying the cravings of the appetite. To invalids, however, the form of broth known as Beef-tea (q. v.) is of great importance, as it affords the weak and sickly stomach a light palatable article of diet at a time when stronger food would do the weakened system much harm. See NUTRITION.

**BROTHERHOODS, RELIGIOUS.** These were societies instituted for pious and benevolent purposes, and were numerous in the middle ages. Their origin is probably to be traced to the desire which then prevailed to imitate the spiritual orders. They were usually founded at first without ecclesiastical authorisation, on account of which, several of the confraternities that either did not seek or did not obtain the recognition of the church, assumed the character of sects, and were suspected of heresy. To this class, among others, belonged the Beghards and Beguines (q. v.), the Brothers and Sisters of the Free Spirit (see below), the Apostolic Brethren (q. v.), the Flagellants (q. v.), who, tolerated by the church for a while, at last incurred its displeasure, and were severely persecuted. We may also reckon among religious B. the old building corporations, from which sprang the order of Freemasons, the religious character of whose secret societies indicated, in the opinion of the church, a peculiarly dangerous gnosis and symbolism. Others coming into existence under ecclesiastical oversight, or at least being confirmed by the church, had no *arcaea*, but were simply dedicated to the promotion of religion, either by the imposition of new penances, the acceptance of new and severer devotions, or the assisting of strangers, travellers, the unprotected, the oppressed, the destitute, and the sick. Nor can we refuse our admiration and approbation to such self-denying fraternities, when we remember how defective were the early communities in charitable institutions. They were most numerous in Italy, Rome alone boasting more than a hundred.

**BROTHERS AND SISTERS OF THE FREE SPIRIT,** a sect which sprang up in the Rhine country during the 13th c., and afterwards spread into France and Italy. It grounded its peculiarities on the biblical doctrine, that the Holy Spirit is a spirit of 'freedom'. Misunderstanding the true nature of spiritual freedom, the members of this sect conceived themselves released not only from the thraldom of the church, but also from the obligations of morality. They set aside the marriage-tie, and indulged in licentiousness. A few even maintained that the deeds of the body could not possibly affect the soul. Intellectually, they are said to have been given to Pantheism. The synods of Cologne in 1306, and of Treves in 1310, decreed their suppression, and in the persecutions which ensued, they appear to have been completely dispersed.

**THE BRETHREN OF SOCIAL LIFE, BRETHREN OF THE COMMON LOT, OR BRETHREN OF GOOD WILL** (also called HIERONYMITES and GREGORIANI, from

## BROTHERS.

Hieronymus and Gregory the Great, whom they claimed as patrons), a fraternity founded about 1376 by Geert Groot (b. at Deventer, 1340—d. 1384), and Florentius Radewin (b. 1350, at Leerdam, in South Holland—d. 1400). This society—which professed to be a copy of the earliest Christian communities, and was in several respects a fore-runner of the subsequently formed societies of United Brethren, now sometimes styled Moravians—was composed of persons who sought after pious and spiritual exercises without any conventional distinctions of order, &c. Community of goods, ascetic habits, industry, care of the education of young persons, and the use of the vernacular language in divine service, were some of the chief points insisted on by the brethren, who were not fettered by monastic or any other vows. Perfect community of goods was a rule of their societies. Despite the persecutions which they suffered from the mendicant friars, they were recognised and sanctioned by several popes and by the Council of Constance. They became most numerous in the Netherlands and North Germany, but also spread themselves in Italy, Sicily, and Portugal, so that, in 1430, they reckoned more than 130 societies. The last was founded at Cambrai in 1505. Several brotherhoods of Gregorians assisted in the Reformation. In other cases, their institutions fell into the hands of the Jesuits. Though the original founders of these societies were opposed to all learning and science which was not purely moral and practical, their followers rendered most important services to popular education, having free schools in connection with many of their houses, supporting students at other schools, and distributing useful books. They have, indeed, been not incorrectly described as pioneers of the Reformation. After the revival of learning in Italy, the Brethren of Social Life entered into the spiritual activity of the time. The most important and distinguished members of the society were Gerhard Zerbald of Zutphen, Thomas à Kempis, and the learned Cardinal Nicholas Cusa.—Female societies, of a similar character, sprung up at the same time with those of the Brethren of Social Life. At the head of each was a superior or directress, who was styled the *Martha*.

BROTHERS, a name given to a group of six or eight rocky islets immediately outside the Strait of Bab-el-Mandeb, varying in height from 250 to 350 feet. They lie off the African coast about 9 miles south of the island Perim, now occupied by England. Of the loftiest point, the lat. and long. respectively are, 12° 28' N., and 43° 22' E.—Brothers is also the name given to three isolated mountains near the coast of New South Wales, between Harrington Inlet to the south, and Port Macquarie to the north, or between lat. 32° and 31° S. They are valuable as landmarks.

BROTHERS, LAW OF DESCENT AMONG. In the law of England, this was immediate, without reference to the parent as the *commune vinculum*; but by the 3 and 4 Will. IV. c. 106, s. 5, it is enacted that no brother or sister shall be considered to inherit immediately from his or her brother or sister, but every such descent shall be traced through the parent. See INHERITANCE.

BROTHERS, LAY, an inferior class of monks, not in holy orders, but bound by monastic rules, and employed as servants in monasteries (q. v.).

BROTHERS AND SISTERS OF CHARITY. Under these names, there exist in the Roman Catholic Church two widely ramified beneficent societies, for the nursing of the poor and sick in hospitals, without distinction of faith, rank, or nation. The order of the Brothers of Charity, or Compassionate

Brothers, was established in 1540, at Seville, in Spain, by the Portuguese John di Dio (died 1550), who had served in Africa under Charles V. The funds for the purpose were obtained by begging. The primitive object of the society was the care of the sick, and the reformation of women of immoral character: it was composed of lay-members, under no rule. In the year 1572, the order received the papal recognition, and was subjected to the rule of St Augustine. All the privileges of the mendicant orders were conceded to it in the year 1624, and it was then divided into a Spanish congregation, with a major-general in Granada, and an Italian or extra-Spanish congregation, with a major-general in Rome. To the latter belong also the Brothers of Charity in Switzerland, Germany (where Austria is their chief seat), Poland, the Netherlands, France, and other countries. The European members of the order clothe themselves in black; the extra-European, who are under a separate general of their order in America, wear brown. Their services to distressed humanity continue to be held in high estimation. The Sisters of Charity, formerly also, on account of their dress, called *Gray Sisters*—independent associations of unmarried Christian females, for the alleviation of human suffering, especially for the tending of the sick and the poor—were first called into existence in France, in 1634, by Vincent de Paul (born 1576), greatly assisted by the noble-hearted and self-devoted widow, Le Graa, by birth De Marillac. The society was recognized in 1655 by Clement IX., and in 1685 already numbered 224 convents. The French Revolution sorely interrupted the abundant and benevolent labours of the Sisters of Charity by the suppression and proscription of their convents in France; but Napoleon restored the order in 1807 by the convocation of a General Chapter of the scattered sisters, under the presidency of the Empress Mother, and by the grant of the necessary funds; and there exist at present more than 300 associations in France, where, in the villages, elementary education is in great part conducted by them. They attend the sick in all the great hospitals. There exists in Germany a Roman Catholic association of unmarried females, not bound by conventional rules, and possessing the right of withdrawing from the association at pleasure, but placed under a strict supervision, and occupied in the same duties as the Sisters of Charity. The Institute of Deaconesses (q. v.) in the Protestant churches of the continent of Europe is of a very similar character.

BROTHERS, RICHARD, a fanatic, whose prophecies and writings excited an unusual sensation in his day, was at one time a lieutenant in the British navy, which he quitted in 1789. Refusing, from conscientious scruples, to take the requisite oath to enable him to receive his half-pay, he was reduced to great distress, and ultimately placed in the workhouse. Dating his first call from 1790, he announced himself, in 1793, the apostle of a new religion, 'the Nephew of the Almighty, and Prince of the Hebrews, appointed to lead them to the land of Canaan.' In 1794, he published a book, in two parts entitled *A Revealed Knowledge of the Prophecies and Times*, &c.; and, in 1795, an *Exposition of the Trinity*. He was the author of several other publications, marked by a strange mixture of reason and insanity. In consequence of prophesying the death of the king, and the destruction of the monarchy, he was committed to Newgate, but soon liberated. Some of his political predictions, especially in reference to the state of the continent, were either altogether or partially fulfilled; and many persons were induced to sell their goods, and prepare to accompany him to his New Jerusalem.

which was to be built on both sides of the river Jordan, where he was to arrive in the year 1795. His disciples were not confined to the poor and ignorant, but even men of ability and education were deluded into believing in him, two of the most eminent being Nathaniel Brassey Halhed, Esq., M.P., the orientalist, and Sharp, the celebrated engraver. As a dangerous lunatic, he was at length, by order of government, committed to Bedlam, but released April 14, 1806, and died January 25, 1824.

**BROUGHAM, HENRY, LORD BROUGHAM AND VAUX,** was born in Edinburgh, 19th September 1778. His father, Mr Henry Brougham, was the descendant of an ancient family in Westmoreland, and his mother, Eleonora Syme, who was a woman of much talent, was a niece of Robertson the historian. B. received his education at the High School, and afterwards at the university, of Edinburgh. He gave early promise of future ability, some mathematical papers written by him at the age of eighteen having been considered worthy of publication in the *Transactions of the Royal Society*. He spent some time in travelling on the continent, and in 1800 was admitted to the Scotch bar. In company with Jeffrey, Horner, and Sydney Smith, B.'s first public efforts were given to the service of the *Edinburgh Review*, and he contributed to it some of its most powerful articles. His liberal political views excluded him from the hope of promotion in Scotland, and a character which he had acquired for eccentricity and indiscretion, excluded him from all legal practice, except the unremunerative practice of the criminal courts. After seven years of vain attendance in the courts at Edinburgh, he betook himself to a field more worthy of his ambition, and in 1808 passed at the English bar.

In London, B. first attracted public notice by the admirable appearance he made at the bar of the House of Commons, when he was employed on behalf of certain Liverpool merchants to ask the repeal of the Orders in Council. Soon after this, in 1810, he entered parliament, and within a few months of the time of taking his seat, brought in and carried his first public measure—an act making participation in the slave-trade felony. He was welcomed by the opposition leaders, to whose party he had attached himself, as a most powerful assistant in their attacks upon the government. B. succeeded in carrying the repeal of the obnoxious Orders in Council shortly before the general election of 1812, and then ventured to contest, along with another Whig, the membership for Liverpool against Canning and another Tory. He was defeated, and remained without a seat in parliament till 1816, when he was returned for Winchelsea, and again became an active member of the opposition. By this time he had also established some reputation in the courts of law. He never, indeed, acquired a very large practice, but he repeatedly distinguished himself by speeches of great vigour and ability in the defence of persons prosecuted for libel by the crown. His most famous appearance as an advocate, however, was in defence of Queen Caroline, when, along with Denman, he defended the injured queen with unequalled courage and disinterestedness, at the cost, as both well knew, of exclusion, for years to come, from all professional advancement. But his eloquence and boldness, though they forfeited for him the favour of the crown, gained him that of the people, and for the ten years between 1820 and 1830, B. was the popular idol. He made no bad use of his power. In 1822, he used it, though in vain, in support of a scheme of national education; and to his activity

is owing, in great measure, the establishment of the London University, of the first Mechanics' Institute, and of the Society for the Diffusion of Useful Knowledge. In 1830, B. delivered a most powerful speech against slavery, and in consequence of it—as he himself believes—was invited to stand, and returned, as member for the great popular constituency of the county of York. The aristocratically disposed Whigs would—had they dared—have excluded B. from the Reform ministry; but, in addition to having enormous popularity, he was virtually their leader in debate in the Commons, and was thus, in spite of his unmanageableness, indispensable. After various intrigues, B. was offered, and was persuaded, against both his interests and his inclinations, to accept a peerage and the chancellorship. He took his seat in the Lords in November 1830, and assisted very materially in carrying through that House the great measures then proposed by the liberal ministers. He shared in the general unpopularity which afterwards attached to them, and when they were dismissed by William IV. in 1834, B. left office, never to return to it. After that time, he held in the Upper House a position as nearly analogous as may be to that formerly held by him in the Commons, criticising freely the conduct of successive administrations, and steadily forwarding every measure for social progress.

It will be as a law-reformer that B. will be best remembered. He took up Romilly's uncompleted task, of carrying into practice the ameliorations suggested by Bentham. His efforts in this direction began as early as 1816, when he introduced into parliament a bill to remove various defects in the law of libel. In 1827, in a memorable speech which occupied six hours in delivery, B. enumerated the defects in nearly every branch of English law, and made proposals for dealing with law-reform on a proper scale. These, as might have been expected, met with little encouragement. It has been the fortune of many of his measures to be carried afterwards, in a mutilated form, by other hands. After he left office, B. also succeeded in carrying various reforms in the law, among which may be noted some very extensive changes in the law of evidence. Among the measures proposed by B., but left for future law-reformers to carry, were bills for the codification of the criminal law, for the establishment in England of a system of public prosecutors, and for the giving of compensation to parties acquitted. Lord B.'s acts and bills, as well those regarding the slave-trade, education, and other public questions, as those touching on law-reform, have been collected and published by Sir J. E. Eardley Wilmot (Lond., Longman, 1857). The large well-filled volume which they form is the most fitting monument that could be preserved of the activity, perseverance, and public spirit of the man.

As an orator, more especially as a debater in parliament, B. was, among the men of his time, inferior only to Canning. He was wont, however, to indulge in his speeches in too large an admixture of exciting elements: argument was mingled with fiery declamation; ridicule, sarcasm, invective, were freely used; and these he dealt out with a vehemence and energy that at times carried him far beyond bounds. The power of ready, rapid, and forcible diction was eminently his. In many other fields besides oratory, B. has won a high reputation. He cultivated mathematical and physical science with success, and ventured upon the domain of metaphysics, and even of theology. His miscellaneous writings are of great extent, and upon an almost incredible variety of subjects. They were, however, intended more to serve

purposes of the moment, than as permanent additions to our literature; and though they display great powers of rapid comprehension and nervous clear exposition, it cannot be said that we are indebted to their author for any new truths in politics or morals, or any original discoveries in science. The honours due to men of letters B. did not fail to acquire, having successively been made Lord Rector of Glasgow University, President of University College, London, Member of the Institute of France, Chancellor of the University of Edinburgh, and lastly, D.C.L. of Oxford.

Lord B. took a warm interest in legal and social reform. While not engaged in parliament, he resided chiefly at Cannes, in the south of France, where he died, May 7, 1868. His lordship married, in 1819, Mary Anne Eden, the granddaughter of a baronet in the county of Durham. The issue of this marriage was two daughters, one of whom died in infancy, and the other before reaching womanhood. The patent of the title was extended, so as to make the peerage descend to the family of a brother of Lord Brougham.

BROUGHTY-FERRY, a town of Forfarshire, on the Firth of Tay, 4 miles east of Dundee. Pop. (1871) 5817. It is connected by a railway-ferry over the firth, here a mile broad, with Ferry-Port-on-Craig, in Fifeshire; by which communication the Dundee and Arbroath and the Edinburgh, Perth, and Dundee Railways are brought into conjunction. It is a watering-place, and has cod and other white fisheries. On the shore stands an ancient castle, long in ruins, but lately repaired as a means of defence for the entrance to the river Tay.

BROU'SSA, or BOU'RSA, the ancient *Prusa*, where the kings of Bithynia usually resided, situated in lat. 27° N., long. 40° E., at the foot of Mount Olympus, in Asia Minor. Prusa is said to have been built by Prusias, king of Bithynia, who waged war with Croesus or Cyrus. Seifeddulat, of the race of Hamadan, took it in 336 of the Hegira, but it was retaken by the Greek emperor in 947 A.D. In 1356, Orcan, son of Othman, the second emperor of Turkey, captured it, and made it the capital of his empire, and it continued so until the taking of Constantinople by Mohammed II. in 1453.

B. is most pleasantly situated, facing a beautiful and luxuriant plain, covered for many miles with plantations of mulberry-trees. The city and suburbs are about six miles in circumference. The town is divided from the eastern suburb by a deep channel or vale, over which there are several bridges, one of them—with shops on each side—being 90 paces long and 16 broad. The streets are remarkably clean, and the bazaars very good, being supplied with European goods from Constantinople. The population of B. amounts to 73,000 souls, of whom about 11,000 are Armenians. It contains a great number of mosques, some of which are very fine buildings. The silks of B. are much esteemed in the European markets, and great quantities are exported every year to France, Constantinople, and Smyrna. The inhabitants manufacture a kind of silk, like satin, mostly striped, which is used for the under-garment of the oriental dress; also a material from silk and flax used chiefly for shirts; and a sort of gauze, called 'brunjuke,' which is much worn by the Turkish ladies for under-garments. A great quantity of British manufactured goods, such as Manchester 'twists,' 'gray calicoes,' 'prints,' 'zebras,' &c., are imported into B., the goods being landed at Constantinople, and thence conveyed overland to Broussa. It is the official residence of a Turkish pasha, and the seat of a Turkish tribunal. B. is subject to frequent earthquakes. In ancient times,

it was famous for its thermal baths, or 'royal waters,' as they were called, which still exist.

BROUSSAIS, FRANÇOIS JOSEPH VICTOR, the founder of the school of medicine, was born at St Malo, December 17, 1772, and in early life, after studying at Dinon, served for a time first in the navy, and then in the army. In 1820, he was appointed first professor at the military hospital of Val-de-Grâce. In 1832, he became Professor of General Pathology and Therapeutics in the Faculty of Medicine in Paris, and afterwards was made a member of the Institute. He died at his country residence at Vitry, November 17, 1838. In 1841, a statue was erected to his memory in the court of Val-de-Grâce. B.'s peculiar views are ably explained in his chief works—the *Histoire des Phlegmasies ou Inflammations Chroniques* (1808), and *Examen de la Doctrine Médicale généralement adoptée* (1816), which assert the following principles: that life is sustained only by excitation; that this excitation may be either too strong (*surexcitation*) or too weak (*adynamie*), the latter case, however, being far less frequent than the former. These abnormal conditions of surexcitation and adynamie at first manifest themselves in a specific organ of the body; but afterwards, by sympathy, are extended to other organs; that is, all diseases are originally *local*, and become *general* only by sympathy of the several organs. The organs most subject to disease are the stomach and bowels, and therefore *gastro-enteritis* (inflammation of the stomach and the intestines) is the basis of pathology; consequently, B. resorted to local phlebotomy—especially the application of numerous leeches to the region of the abdomen—as a remedy in fevers and various diseases. His theory and practice gained many adherents in France, who took the name of the 'Physiological School.' But a more exact knowledge of physiology has demonstrated that the views of B. were one-sided and exaggerated. Yet they have not been without use in pathology, as they have led to a more careful study of pathological anatomy and physiological sympathies, and to more exact observation of the so-called specific morbid processes of which the existence was denied by B. and his followers. Montégre, *Notice Historique sur la Vie, les Travailz, et les Opinions de Broussais*.—His son, CASIMIR B., born 1803, professor at Val-de-Grâce (1833), is a zealous adherent of the Broussais system, and is the writer of a work, *Hygiène-Morale*, based on phrenology.

BROUSSONETIA. See MULBERRY.

BROWN, CHARLES BROCKDEN, a celebrated American novelist, was born at Philadelphia, January 17, 1771. His early education was carried on under the care of Mr Robert Froud, author of the *History of Pennsylvania*. Afterwards he studied for the law, but the licence which he had already given to his imagination induced an unconquerable aversion to legal pursuits, and he consequently betook himself to literature. The French Revolution exercised on him, as on many other ardent spirits, a considerable influence; several of his writings at this period being penetrated with the new thoughts and sentiments which sprung out of that great convulsion. In 1798, he published *Wieland*, the first of his remarkable fictions; and in 1799, *Ormond, or the Secret Witness*. His next production was *Arthur Mervyn, or Memoirs of the Year 1793*—the fatal year of yellow-fever in Philadelphia. In 1801 appeared *Edgar Huntly, or the Adventures of a Sleep-walker*, a romance presenting a greater variety of wild and picturesque adventure, with more copious delineations of natural scenery, than is to be found in his other works.—*Precott*. This was followed

in the same year by *Clara Howard*, and in 1804 by *Jane Talbot*, first printed in England. He died of consumption in 1810.

Besides the writings which have been enumerated, B. composed a number of political pamphlets, contributed to various literary magazines, and founded three or four periodicals himself. The author who exercised the greatest influence on the development of his genius was Godwin, whom he occasionally imitated, while Godwin himself, on the other hand, acknowledged his obligations to B., and warmly admired him. The most striking quality of his mind is its ingenuity, both imaginative and psychological. He invents incidents and analyses feelings with remarkable subtlety, but his success is somewhat marred by his extravagant departure from the realities of everyday-life.

BROWN, JOHN, of Haddington, once the most popular, and still among the most revered, theological writers in Scotland, was born in 1722 at Carpow, near Abernethy, in Perthshire. Deprived of both his parents when only 11 years of age, he became assistant to a venerable and pious shepherd, named John Ogilvie, who tended his flock among the neighbouring hills, and nursed the religious ardour of the boy's heart. B., however, aspired to be wise as well as good. His thirst for learning was insatiable, and the most romantic yet well-accredited stories illustrative of this are related by his biographers. While still a friendless 'herd laddie,' he had made great progress in a self-acquired knowledge of Greek and Latin. The extent of his acquisitions, even at this early time, may be estimated from the fact, that the country-people round about believed he was in league with the devil, and that he had pledged his soul for unhallowed lore. At a later period of his life, 'he knew nine or ten languages, classical, oriental, and modern, and had amassed vast stores of Puritan, Scottish, and Dutch divinity.' After a brief career as a pedlar—an employment which English readers will understand from Wordsworth's *Excursion* was neither mean nor degrading—B. became a volunteer in a regiment of militia raised in Fifeshire during the rebellion of 1745, and in 1747, schoolmaster in the neighbourhood of Kincraig. During the vacations of his school, he studied philosophy and divinity under the inspection of the Associate Synod, and the superintendence of the Rev. Ebenezer Erskine and James Fisher. In 1750, he was ordained pastor of the Secession Church at Haddington. Perhaps a more faithful, industrious, and holy minister never laboured in Scotland. David Hume was once prevailed upon to go and hear him, and the criticism of the great sceptic was: 'That old man preaches as if Christ were at his elbow.' Although self-educated, he had little of the narrowness which culture so obtained generally brings along with it; he corresponded on friendly terms with Episcopalian, and often expressed a warm affection for all true Christians. Although himself a sound Presbyterian, and a tolerably strict Calvinist, 'the love of the Lord' was his real and ultimate test of a man's orthodoxy. In 1758, B. first appeared as an author. His work was entitled *A Help for the Ignorant*, &c. In 1765, he published his famous *Christian Journal*, in which the common events of life are richly but quaintly, and perhaps somewhat artificially, spiritualised. In 1768, he was appointed professor of divinity under the Associate Synod, and in the same year issued his valuable *Dictionary of the Holy Bible*. In 1771 appeared his *History of the Church from the Birth of the Saviour*—a work good enough for cottage-reading, but possessing no merit otherwise; and in 1778, *The Self-interpreting Bible*. This last is B.'s *magnum opus*, and has been amaz-

ingly popular in Scotland; even high dignitaries of the English Church have praised and recommended it. Besides these works, B. published a great variety of sermons, tracts, &c., which had an extensive popularity. He died on the 19th June 1787.

BROWN, JOHN, D.D., grandson of the former, was born 12th July 1784, near Whitburn, Linlithgowshire. He studied at Edinburgh University, and afterwards at the theological hall of the Secession Church in Selkirk. In 1806 he was ordained to the pastorate of a church in Biggar, a small town in Lanarkshire, where he laboured for fifteen years, employing his leisure hours in those studies which subsequently enabled him to take a high rank as a biblical expositor. In 1822 he was transferred to Rose Street Church, Edinburgh, and in 1829 to Broughton Place Church in the same city. In 1834 he was appointed professor of pastoral and exegetical theology in connection with the Associate Synod. He died 13th October 1858. As a preacher, Dr B. was among the first of his time. For clearness of Scriptural exposition, chaste and powerful language, and majestic ardour and earnestness of manner, he had no equal in his denomination, and no superior in Scotland. The attractiveness of his delivery was heightened by a countenance singularly noble, tender, and sweet. Among his works are—*The Law of Christ respecting Civil Obedience*; *The Resurrection of Life*; and his important and scholarly *Expository Discourses on the Epistles of Peter, on the Epistles to the Galatians, and on the Epistle to the Romans*. See Dr Cairns's Memoir (1860).—JOHN BROWN, M.D., LL.D., son of the above (born 1810), has attained a distinguished place among the medical practitioners of Edinburgh. He has also abundantly inherited the paternal genius, though in him it has taken a literary rather than a theological direction. In 1858 he published *Hours Subseciva*, a volume of essays, most of which had previously appeared in periodicals. One of these, *Rab and his Friends*, has been since published separately, and has obtained a remarkable popularity. It excels in quaint fancy, rich delicate pathos, and abrupt but felicitous diction.

BROWN, SAMUEL, M.D., son of Samuel Brown (the founder of itinerating libraries, and grandson of the Rev. John Brown of Haddington), was born on the 23d February 1817, and entered the university of Edinburgh in 1832. He took his degree as M.D. in 1839, and immediately surrendered himself to the magical fascination of chemistry. One idea possessed him to the close of his life—the possibility of reconstructing the whole science of atomics. He never, in spite of crushing failures in experiment, abandoned his early conviction that chemical elements, usually considered simple, might be transmuted into each other. In 1843, he delivered in Edinburgh four critical lectures on the atomic theory. During the same year, he became a candidate for the chair of chemistry in the university of that city; but having perilled his claims on the experimental success of his fatal theory, and being again doomed to disappointment, he withdrew his application, and devoted himself with a kind of mournful austerity, and with more than the earnestness of a medieval alchemist, to the solitary work of his laboratory. In 1850 appeared his *Tragedy of Galileo*, a volume which indicates, but does not embody, the finely imaginative and philosophical genius of its author. B. died of consumption 20th September 1856. His fugitive essays were collected and published after his death; and though for the most part too comprehensive in their intent, they enable the public to understand why he was held in admiration by men like Hamilton, Ferrier,

## BROWN.

De Quincey, Wilson, Carlyle, Hare, Jeffrey, and Chalmers.

BROWN, SIR GEORGE, a distinguished British general, born at Linkwood, near Elgin, Scotland, in August 1790, entered the army in 1806, became lieutenant in 1807, and was present in the latter year at the capture of Copenhagen. He served in the Peninsular War. At the battle of Talavera he was severely wounded, and at the storming of Badajoz was one of the forlorn-hope. He was appointed major, May 26, and lieutenant-colonel, September 29, 1814, in which year he embarked in Major-general Ross's expedition against the United States of America, and was wounded at the battle of Bladensburg. From February 6, 1824 to 1842, he commanded a battalion of the Rifle Brigade. He was made adjutant-general of the forces, April 1850, and lieutenant-general, 1851. In the Crimean war, 1854—1855, B. commanded the Light Division. At the battle of Inkermann, November 5, 1854, he was severely wounded, and obliged to retire for a short time to Malta. In 1855 he was created a Knight Commander of the Bath. In the expedition to the Sea of Azof, he commanded the British troops; and in the first unsuccessful attack on the Redan of Sebastopol, he had the chief command of the storming-party. He was gazetted April 3, 1856, 'General in the army for distinguished service in the field.' He was a Knight of Hanover, received the Turkish Order of the Medjidie of first class in 1855; and the Grand Cross of the Legion of Honour, 1856. In 1860 he became commander-in-chief in Ireland, and in 1862 a privy-councillor. He died in 1865.

BROWN, THOMAS, a Scottish metaphysician, son of the Rev. Samuel Brown, was born in 1778 at the manse of Kirkmabreck, Kirkcudbrightshire. After being some time at school in England, he went to Edinburgh in 1792, and for several years attended the lectures of Playfair, Black, Robison, and Dugald Stewart. He began the study of law, but shortly abandoned it for medicine; and having taken his diploma of M.D. in 1803, he became (1806) the partner of Dr Gregory in his large practice. But his strong bent was for literature and philosophical speculation. At the age of 18, he had published a refutation of Darwin's *Zoönoma*; was a member of an Academy of Physics, or society for 'the investigation of the laws of nature,' formed in 1797, and embracing the names of Erskine, Brougham, Leyden, Jeffrey, Smith, and others; and contributed at the outset to the *Edinburgh Review*. In 1804 appeared his essay on *Cause and Effect*, in which he holds that there is nothing in a cause but the fact of immediate and invariable antecedence to the change called its effect. Dugald Stewart, professor of moral philosophy in the university, being obliged, from bad health, to retire in 1810, got Dr B. appointed assistant and successor, which office he continued to discharge till his death in 1820. He was popular as a professor; and his *Lectures*, published after his death, have gone through a great many editions, though of late they have somewhat fallen out of notice. He also wrote a good deal of poetry, which is now forgotten. Dr B. attempted to overturn the psychological system of his predecessors Reid and Stewart, and to substitute a new and simplified scheme of mental phenomena. The greater part of this new philosophy was the production of his first session as professor, the writing of each lecture being begun on the evening previous to its delivery. A philosophic system thus improvised could not but be crude and inconsistent, however acute and imaginative its author might be. B.'s chief contribution to psychology is the establishment of a sixth or *muscular sense*.

380

BROWN, JOHN, M.D., founder of the Brunonian system of medicine, the son of a day-labourer, and himself first intended for a weaver, born in 1735, in Bunkle parish, Berwickshire, was educated at the grammar-school of Dunse, in which he was subsequently an usher. After studying medicine at the Edinburgh University, he became tutor to the children of the celebrated Dr Cullen, and assistant in his university lectures. Conceiving himself alighted by Cullen, he commenced giving lectures himself upon a new system of medicine, according to which all diseases are divided into the sthenic, or those depending on an excess of excitement, and the asthenic, those resulting from a deficiency of it; the former to be removed by debilitating medicines, as opium, and the latter by stimulants, such as wine and brandy. His system gave rise to much opposition, but his partisans were numerous; for a time his opinions had some influence. In 1779, B. took the degree of M.D. at the university of St Andrews, and in 1780 published his *Elementa Medicinae*. He was also author of *Observations on the Old System of Physic*. In 1786, being overwhelmed with debt, he removed to London, where he died of apoplexy in 1788. His works, with a memoir by his son, Dr William Cullen Brown, appeared in 1804 (3 vols. 8vo).

BROWN, ROBERT, an English clergyman, founder of the sect of Brownists, born in 1549, the son of Anthony Brown, Esq., of Folthrop, Rutlandshire, was educated at Cambridge, and was at first a preacher at Bennet Church, then a schoolmaster in Southwark, and a lecturer at Islington. In 1580, he began to attack the order and discipline of the Established Church, and soon after formed a distinct church on democratic principles at Norwich. Committed by Dr Freake, bishop of that see, to the custody of the sheriff, he was released from prison through the influence of the lord-treasurer, Cecil, to whom he was nearly related. Having, in 1582, published a controversial work, entitled *The Life and Manners of True Christians*, with, prefixed, *A Treatise of Reformation without Tarrying for Any*, he was again arrested, but, through the lord-treasurer's intercession, again liberated. He afterwards formed several Congregationalist churches; but with many of his followers, was obliged to take refuge in Holland. In 1589, he returned to England, reconciled himself to the Established Church, and became rector of a church near Oundle, Northamptonshire. Of a very violent temper, he was, when 80 years old, sent to Northampton jail, for an assault on a constable, and died in prison in 1630. The Brownists continued, notwithstanding the defection of their leader, to subsist as a separate sect for some time both in Holland (among the English there) and in England. In the former country, they were at last absorbed in, or reconciled to, the Presbyterian Church in 1701; in the latter, they may be said to have given birth to the Independents (q. v.), who rose into great importance in the 17th century.

BROWN, CAPTAIN JOHN, the leader of the Harper's Ferry (U.S.) insurrection (1859), designed to incite the slaves of the southern states of America to rebellion, was descended from a Puritan carpenter, one of the *Mayflower* emigrants, and was born at Torrington, Connecticut, in the year 1800. He intended to enter the ministry, but had to abandon his studies on account of weak sight, and subsequently became a wool-dealer. In 1854, having imbibed an intense hatred of slavery, he went to Kansas, in order to vote, and, if need were, fight against the establishment of slavery in that territory. In many of the conflicts which ensued between the pro-slavery party from Missouri and the free settlers, B. played

a prominent part, and in one of these he had a son killed, a circumstance which deepened his hostility against the Southern party. After the agitation in Kansas was settled by a general vote, B. travelled through the northern and eastern states, declaiming against slavery, and endeavouring to organise an armed attack upon it. In October 1859, at the head of 17 white men and 5 blacks, he commenced active hostilities by a descent upon Harper's Ferry, a town of some 5000 inhabitants, at the confluence of the Potomac and Shenandoah, and possessed of an arsenal containing from 100,000 to 200,000 stand of arms. The arsenal was easily captured, and 40 or 50 of the principal inhabitants were made prisoners; but instead of retreating at once to the mountains with arms and hostages, as his original design had been—meaning to exchange the hostages for slaves—B. lingered on in the town until the evening, by which time 1500 militiamen had arrived. Next day, an attack was made on his position, which, after some loss of life, was carried. B. was captured, and shortly after was tried for treason, and executed. He is described as a singularly brave and honest man.

BROWN, ROBERT, an eminent botanist, the son of an Episcopal clergyman, was born at Montrose, Scotland, December 21, 1773, and educated at Marischal College, Aberdeen. Having studied medicine at the university of Edinburgh, he became, in 1795, ensign and assistant-surgeon in a Scottish Fencible regiment, with which he went to Ireland. Devoting himself to the study of botany, he resigned his commissions in 1800, and the following year was, on the recommendation of Sir Joseph Banks, engaged as naturalist in the expedition sent out under Captain Flinders for the survey of the Australian coasts. On his return in 1805, he brought home nearly 4000 species of Australian plants, a large proportion of which were new to science. Soon after, he was appointed librarian to the Linnean Society. To the *Transactions* of the Edinburgh Wernerian Society, and those of the Linnean Society, he contributed memoirs on *Asclepiadaceae* and *Proteaceae*, and published *Prodromus Flora Nova Hollandiae et Insula Van Diemen*, vol. i. 1810; a supplement to this work appeared in 1830, relating to the *Proteaceae* only. He also wrote the *General Remarks, Geographical and Systematical, on the Botany of Terra Australis*, attached to the narrative of Captain Flinders' expedition, 1814. His adoption of the natural system of Jussieu, the French botanist, led to its general substitution in place of the Linnean method. B.'s numerous memoirs in *Transactions* of societies, and other contributions to botanical science, secured for universal approval the title conferred on him by Alexander von Humboldt of *Botanicorum facile Princeps*. In 1810, B. received the charge of the library and splendid collections of Sir Joseph Banks, which in 1827 were transferred to the British Museum, when he was appointed keeper of the botanical department in that establishment. In 1811, he was elected F.R.S.; in 1832, D.C.L. of Oxford; and in 1833 was elected one of the 18 foreign associates of the Academy of Sciences of the Institute of France. In 1839, the Royal Society awarded him their Copley medal for his *Discoveries during a Series of Years on the Subject of Vegetable Impregnation*. He was president of the Linnean Society from 1849 to 1853. He died in London, June 10, 1858. A collected edition of B.'s works, in 5 vols. 8vo, has been published in Germany.

BROWN, WILLIAM, founder of the Free Public Library at Liverpool, born at Ballymena, Ireland,

in 1784; was educated at Catterick, near Richmond, Yorkshire; and in his 16th year accompanied his parents to the United States. Employed in the counting-house of his father, who was engaged in the linen trade in Baltimore, in a few years he was admitted a partner. Returning to England in 1809, he established a branch of the business at Liverpool, and laid the foundation of one of the largest mercantile firms in the world. Embarking in the American trade, he became an extensive importer of cotton, and by his rare energy, quick business habits, and sterling integrity, soon became distinguished for the magnitude of his dealings. A liberal reformer, he took a prominent part in local and public affairs, and unceasingly promoted the education of the people. In 1844, he contested South Lancashire upon the Anti-Corn-Law League interest without success, but was returned to parliament for that division of the county in 1846, and was subsequently three times re-elected. A series of letters in defence of free trade, which, in 1850, he contributed to the *Pennsylvanian* (Boston newspaper), attracted much attention. He was also an able advocate for the adoption of a decimal coinage. In 1857, he munitifly subscribed £30,000 for the establishment of a Free Public Library at Liverpool, and the noble building erected for the purpose owes its existence entirely to his generosity. He died in 1864.

BROWN COAL, a mineral substance of vegetable origin, like common coal, but differing from it in its more distinctly fibrous or woody formation, which is sometimes so perfect that the original structure of the wood can be discerned by the microscope, whilst its external form is also not unfrequently preserved. In this state, it is often called *Wood Coal*; and it sometimes occurs so little mineralised, that it may be used for the purposes of wood, as at Vitry, on the banks of the Seine, where the wood-work of a house has been made of it. From this to the most perfectly mineralised state, it occurs in all different stages. It is often brown or brownish black, more rarely gray. It burns without swelling or running, with a weaker flame than coal; emits in burning a smell like that of peat, and leaves an ash more resembling that of wood than of coal. Wherever it occurs in sufficient abundance, it is used for fuel, although very inferior to common coal. *Bovey Coal*, so called from Bovey Tracey, in Devonshire, where extensive beds of it occur, and where it has been long wrought, is B. C., and often exhibits the woody structure very beautifully. B. C. occurs in a number of other places in Britain, and more abundantly near Paris, and in Liguria and Hanover, where it forms thick beds in alluvial deposits.—The *Surturbrand* (q. v.) of Iceland is regarded as a variety of it. *Jet* (q. v.) is also sometimes regarded as a variety of brown coal. Although bearing the name coal, B. C. is rather a kind of *lignite* (q. v.) than of coal.

BROWN PIGMENTS, a term in art applied to those substances in which the three primary colours unite in unequal proportions, red being in excess. B. P. are chiefly mineral, and are used sometimes in a raw but usually in a burned state. The most important are bistre, asphaltum, umber, terra di sienna, Mars brown, Cassel earth, and brown madder.

BROWN SPAR, a name often given by mineralogists to certain varieties of Dolomite (q. v.), or magnesian limestone, of not unfrequent occurrence, distinguished by a brownish or reddish colour, and a pearly lustre, upon account of which they are also sometimes called *pearl spar*.

BROWNE, THOMAS, antiquary and physician,

was born in London, 1605. His father, a merchant, left him an ample fortune, and he was educated at Winchester and Oxford. He began the study of medicine, then travelled over France and Italy, and after taking the degree of M.D. at Leyden, returned and settled (1636) at Norwich, where he continued to practise as a physician. He was knighted in 1671 by Charles II., and died 1682. His chief works are : *Religio Medici* (1642), *Inquiries into Vulgar and Common Errors* (1646), and a *Discourse on Sepulchral Urns* (1648). He wrote also *The Garden of Cyrus, or the Quincunx Loxene*; besides a variety of tracts, published after his death. His writings are highly prized by many for their genial fancy, pleasing quaintness of style, and varied erudition.

BROWNIE, a domestic spirit of the fairy order in the old popular superstitions of Scotland. The common tradition respecting the B. is, that he was a good-humoured drudging goblin, who attached himself to farmhouses and other dwellings in the country, and occupied himself during night, when the family were in bed, in performing any humble kind of work that required to be attended to, such as churning, thrashing corn, &c.—a spirit not seen or spoken to, and only known by the obliging performance of his voluntarily undertaken labours—a most valuable adjunct to the domestic establishment, and unfortunately no longer obtainable by good housewives. In Cornwall, a goblin known as *Browny* is evoked to assist at the swarming of bees (*Borlace's Antiquities of Cornwall*). The resemblance of the Scotch B. to the *Robin Goodfellow* (q. v.) of the English, and the *Kobold* of the Germans, is also so conspicuous that we must necessarily refer the different fragmentary legends on the subject to one of the old superstitions generally prevalent in Europe.

BROWNING, ELIZABETH BARRETT, England's greatest poetess, was born in London about the year 1809. Her maiden name was *Barrett*. The culture which she received in her youth was of a kind far transcending the ordinary education even of 'ladies intellectual.' Classics, philosophy, and science were studied with enthusiasm and success. At a comparatively early period, she became a contributor to periodicals, and a series of articles on the Greek Christian poets indicated that she possessed both recondite learning and keen poetic insight. Her first important essay in authorship was a translation of the *Prometheus of Eschylus* in 1833. In 1838, appeared the *Seraphim, and Other Poems*, the external peculiarity of which was its endeavour to embody the ideas and sentiments of a Christian mystery in the artistic form of a Greek tragedy. Delicate health, arising from the rupture of a blood-vessel in the lungs, and the death by drowning of a favourite brother in the following year, compelled her to live in seclusion for a long time. At length her health was restored, and in 1846 she married Robert Browning (q. v.), himself a great poet. After their marriage, they resided chiefly in Italy, in whose welfare they were passionately interested. In 1850, Mrs. B. published her collected works, together with several new poems, among which was *Lady Geraldine's Courtship*. In 1851, appeared the *Casa Guidi Windows*, a poem whose theme was the struggle made by the Tuscan for freedom in 1849. *Aurora Leigh*, her longest production, was published in 1856. *Poems before Congress* appeared in 1860. Her poetry is distinguished by its depth of feeling, by its true pathos, by its noble and generous sentiments. Apparently she poured forth her verse with dangerous facility; and there are few of her poems which would not be improved by the simple process of curtailment. But there is not a

thought or a sentiment of the many she has so beautifully expressed which any one would wish expunged. No writer ever exerted a better, gentler, happier influence. She died in 1861.

BROWNING, ROBERT, a distinguished contemporary poet, born in the neighbourhood of London in the year 1812, and educated at the London University. The drama of *Paracelsus*, which first brought him into notice, was published in 1838. In the following year appeared his tragedy of *Strafford*, which was brought out upon the stage, but proved unsuccessful, though Macready himself personated the hero. *Sordello* and *The Blot in the Scutcheon* also failed, through lack of vivid and impressive incident. *Pippa Passes* secured a greater measure of popular approbation. In 1855, B. published *Men and Women*, one of his greatest works, containing poems which for depth and subtlety of conception, profound analysis of the human mind in its most delicate and impassioned conditions, and abstract speculative insight, are unsurpassed in the English language. If, as some think, in vigour and brilliancy of thought he is above Tennyson, he is as far beneath him in melody of versification and artistic beauty of style. Often he shews a morbid love of obscurity, deeply to be regretted, as on other occasions he exhibits a Shaksperian clearness of idea and emphasis of expression. Some of his *Dramatic Lyrics* are faultless. Among his other poems are *The Ring and the Book*; *Balaustion's Adventure* (1871); *Prince Hohenstiel-Schwangau* (1871); *Red Cotton Night-cap Country* (1873).

BROWNS on porcelain are generally imparted by a mixture containing more or less sulphate of iron, and which, when heated, leaves the red oxide of iron (rust) on the porcelain, forming a more or less deep-tinted ochre. See POTTERY.

BROWNS on cloth are communicated by arnotto (q. v.) and copperas, assisted by fustic, sumach, peachwood, logwood, and alum. See DYING.

BRUCE, the surname of a family illustrious in Scottish history, descended from Robert de Brus, a Norman knight, who accompanied William the Conqueror to England in 1066, and died soon after. His younger son, Adam, who acquired large possessions in Yorkshire, left a son, Robert de Brus of Cleveland, a companion in arms of Prince David of Scotland, afterwards David I., from whom he received a grant of the lordship of Annandale, held by the tenure of military service. At the commencement of the war in England between Stephen and Matilda, niece of the king of Scots, Robert de B. adhered to the former, and renounced his allegiance to David, resigning his lands in Annandale to his son Robert. In 1138 he was sent by the barons of the north of England to negotiate with David, who had advanced in support of his niece's claims as far as Northallerton, Yorkshire. In the battle of the Standard which followed, he took prisoner his son Robert, then fourteen years of age, who, as lord of Annandale, fought on the Scottish side. He died in 1141. His English estates were inherited by his eldest son, Adam, whose male line terminated in Peter de B. of Skelton, Constable of Scarborough Castle in 1271. Robert de B., second lord of Annandale, had two sons: Robert—who married a natural daughter of William the Lion, and died, without issue, before 1191—and William, whose son, Robert, fourth lord of Annandale, married Isobel, second daughter of David, Earl of Huntingdon and Chester, younger brother of William the Lion, and thus laid the foundation of the royal House of Bruce. He died in 1245.

BRUCE, ROBERT DE, fifth lord of Annandale, son of the fourth lord above mentioned, and the

competitor with John Baliol for the crown of Scotland, was born in 1210. On the death of his mother, the Princess Isobel, in 1252, he did homage to Henry III. for her lands in England, and in 1255 was made Sheriff of Cumberland, and Constable of the castle of Carlisle. About the same time he was appointed one of the fifteen regents of Scotland, in the minority of Alexander III. In 1264, he led, with Comyn and Baliol, the Scottish auxiliaries to the assistance of the English monarch at the battle of Lewes, where he was taken prisoner, but released after the battle of Evesham, the following year. On the Scottish throne becoming vacant at the death, in 1286, of Margaret, the 'Maiden of Norway,' granddaughter of Alexander III., Baliol and Bruce claimed the succession, the former as great-grandson of David, Earl of Huntingdon, by his eldest daughter, Margaret; the latter as grandson, by his second daughter, Isobel. Edward I. of England, to whom the dispute was referred, decided in favour of Baliol, 19th November 1292. To avoid swearing fealty to his successful rival, B. resigned Annandale to his eldest son, Robert de B., Earl of Carrick. He died at his castle of Lochmaben, Dumfriesshire, in 1295, leaving three sons and a daughter.

**BRUCE, ROBERT DE,** Earl of Carrick, eldest son of the preceding, accompanied King Edward I. of England to Palestine in 1269, and was ever after greatly esteemed by that monarch. On his return to Scotland, he married, in 1271, Martha Margaret, Countess of Carrick, and in her right became Earl of Carrick. Following the example of his father, to avoid doing homage to Baliol, he resigned the lordship of Annandale to his eldest son, Robert, the future king of Scotland, then a minor. Retiring to England, he was, on the death of his father, in 1295, appointed Constable of the castle of Carlisle; and in the following year, when Baliol renounced the authority of Edward, and assisted by the Comyns, had recourse to arms, B. fought on the side of the English. After the battle of Dunbar, in which the Scots were defeated, and Baliol compelled to relinquish the sovereignty, he made application to Edward for the vacant crown, but was refused it. He died in 1304.

**BRUCE, ROBERT,** the most heroic of the Scottish kings, eldest son of the preceding, was born March 21, 1274. In his youth he favoured the English interests, in the expectation, doubtless, of his father being preferred to the Scottish throne. In 1296, as Earl of Carrick, he swore fealty to Edward I. at Berwick, and the following year he renewed his oath of homage at Carlisle. Shortly after, he abandoned the cause of Edward, and with his Carrick vassals, joined the Scottish leaders in arms for the independence of their country. On the defeat of the Scots, a few months afterwards, at Irvine, B. made his peace with the English monarch. After Wallace's defeat at Falkirk, B. burned the castle of Ayr to the ground, to prevent its falling into the hands of the English, and retired into the recesses of Carrick. In 1299, the year after Wallace had resigned the regency, B., then in his 25th year, was admitted one of the four regents, who ruled the kingdom in the name of Baliol. In the three campaigns which subsequently took place, previous to the final subjugation of Scotland, B. continued faithful to Edward, and in 1305 was consulted in the settlement of the government. With John Comyn, called the Red Comyn, the nephew of Baliol, he appears to have entered into some agreement as to their rival claims to the throne. In an interview between them, in the church of the Minorite Friars, Dumfries, February 4, 1305—6, a quarrel took place, and B., in a paroxysm of

passion, stabbed Comyn with his dagger. Rushing out to his attendants, he exclaimed: 'I doubt I have slain the Red Comyn.' 'You doubt!' cried one of them; 'I mak sikker!' (i. e., sure), and running into the church with some others, slew Comyn and his brother, who attempted to defend him. B. hastened to Lochmaben Castle, assembled his vassals, and asserted his right to the throne. Two months after (March 27), he was crowned king at Scone. An English army, under the Earl of Pembroke, nominated by Edward governor of Scotland, took possession of Perth, and on the night of the 16th June, attacked B. in the wood of Methven, compelling him to retreat into the wilds of Athole. At Dalry, near the head of Loch Tay, B. was attacked by Alexander, Lord of Lorn, chief of the Macdougals, husband of the aunt of the Red Comyn, and compelled to retire. Sending his queen and her ladies to Kildrummy Castle, Aberdeenshire, under the charge of Nigel Bruce and the Earl of Athole, he, with 200 followers, crossed Loch Lomond, and had recourse for subsistence to the chase. B. next took refuge in the little island of Rathlin, on the north coast of Ireland, where he remained all winter, and was supposed to be dead. In his absence, the English took the castle of Kildrummy, hanged Nigel Bruce and other chiefs who had defended it, and tore the queen and Princess Marjory from the sanctuary of St Duthac, Ross-shire. All B.'s estates were confiscated, and himself and adherents excommunicated by the pope's legate at Carlisle. In the spring of 1307, with about 300 men, B. landed in Carrick, and at midnight surprised the English garrison in his own castle of Turnberry; but before a superior force he retired into the mountainous districts of Ayrshire. At Loudon Hill, May 10, 1307, he defeated the English under the Earl of Pembroke, and, three days after, overthrew another party under the Earl of Gloucester. In less than two years he wrested from the English nearly the whole of Scotland. His authority being now established, in 1309 B. advanced to Durham, laying waste the country. The same year, Edward II. of England invaded Scotland, but was compelled to retreat from Edinburgh to Berwick-upon-Tweed. In the harvest of 1312, the Scots again invaded England, but unsuccessfully. B. now reduced the Isle of Man also. On his return, in the autumn of 1313, he found his brother, Edward Bruce, engaged in the siege of Stirling Castle, held by Sir Philip Mowbray for the English. A treaty was entered into, by which Mowbray bound himself to surrender it, if not relieved before 24th June following. This led to the memorable battle of Bannockburn, 24th June 1314, at which B. commanded in person. The English, under Edward II., amounting, it is said, to about 100,000 men, were totally routed, leaving 30,000 dead upon the field; while the Scots, numbering only 30,000, and 15,000 camp-followers, lost about 5000. In 1317, B. passed over to Ireland, to assist his brother, Edward, elected king of that country, and defeated the Anglo-Irish under the Baron of Clare; and in the spring of 1318 the Scots army invaded England by Northumberland. Another invasion of Scotland by the English king, who was compelled to retreat, was followed by B. again marching into England. After besieging Norham Castle, he defeated Edward once more at Bland Abbey, Yorkshire. A truce was, in consequence, ratified between the two kingdoms at Berwick, June 7, 1323, to last for 13 years. On the accession of Edward III., in 1327, hostilities recommenced; and the Scots being again victorious, a final treaty was ratified in a parliament at Northampton, March 4, 1328, recognising the independence of Scotland, and

B.'s right to the throne. His warfare was now accomplished, and suffering under the disease of leprosy, he spent the last two years of his life at Cardross Castle, on the northern shore of the Firth of Clyde. He died June 7, 1329, in his 55th year, and the 23d of his reign. His heart, extracted and embalmed, was delivered to Sir James Douglas, to be carried to Palestine and buried in Jerusalem. Douglas was killed fighting against the Moors in Spain, and the sacred relic of B., with the body of its devoted champion, was brought to Scotland, and buried in the monastery of Melrose. B.'s body was interred in the Abbey Church of Dunfermline; and, in clearing the foundations for a third church on the same spot in 1818, his bones were discovered. He was twice married: (1) to Isabella, daughter of Donald, tenth Earl of Mar—issue, a daughter, Marjory, wife of Walter the High Steward, whose son ascended the throne as Robert II.; and (2) to Elizabeth, daughter of Aymer de Burgh, Earl of Ulster—issue, one son, who succeeded him as David II., and two daughters.

**BRUCE, EDWARD**, king of Ireland, brother to the above, a chivalrous but rash and impetuous prince, was actively engaged in the struggle for Scotland's independence; and in 1308, after defeating the English twice, made himself master of Galloway. In 1315, the chieftains of Ulster tendered to him the crown of Ireland, on condition of his assisting them to expel the English from the island. With a small army of 6000 men, he embarked at Ayr, and reached Carrickfergus, May 25th of that year, accompanied by Sir Thomas Randolph, Earl of Moray, Sir John of Soulis, Sir John the Stewart, Sir Fergus of Ardrossan, and other Scottish knights of renown. His rapid victories soon made him master of the province of Ulster, and he was crowned king of Ireland, May 2, 1316, but was slain at the battle of Dundalk, October 5, 1317.

**BRUCE, DAVID**, son of King Robert Bruce, succeeded his father, in 1329, as David II., when only five years old. In terms of the treaty of Northampton, he had married, when four years old, Joanna, daughter of Edward II. of England, and on 14th November 1331 he was crowned with her at Scone. In 1333, the success of Edward Baliol and the English party obliged David's guardians to send him and his consort to France; but on the dispersion of Baliol's adherents, David returned to Scotland in 1341. He made three unsuccessful inroads into England, and on a fourth invasion, in 1346, was taken prisoner at the battle of Neville's Cross, near Durham, and conveyed to the Tower of London. Thence he was removed to Odiham, in Hampshire, and not released till 1357, when his ransom was fixed at 100,000 marks. His queen dying in 1362, he married Margaret Logie, a Scottish gentlewoman of singular beauty, whom he divorced in 1370. He had no issue; and in his latter years, he was engaged in several intrigues with England, with the view of excluding his nephew, Robert, the Steward of Scotland, the next heir, from the throne. He died at Edinburgh Castle, February 22, 1371.

**BRUCE, JAMES**, a celebrated traveller, born at Kinnaird House, Stirlingshire, December 14, 1730, was the eldest son of David Bruce, Esq., of Kinnaird, and Marion Graham, of Airth. Educated at Harrow, he was sent, in the winter of 1747, to the university of Edinburgh, with the intention of studying law; but changing his views, he went to London, and having, in February 1754, married the daughter of a wine-merchant's widow, became a partner in the business. His wife dying within a year, he made a tour on the

continent, and on his father's death in 1758, he succeeded to the estate of Kinnaird. In 1761 he retired from the wine-trade, and in 1763 was appointed consul-general at Algiers. He remained there about two years, studying the oriental languages, and acquiring the rudiments of surgery. He then went to Aleppo, where he took further instructions in the medical art, being resolved to travel in the character of a physician. In June 1768, he proceeded to Alexandria, and from Cairo set out on his famous journey to Abyssinia, which forms an epoch in the annals of discovery. Sailing up the Nile to Syene, he crossed the desert to Cosseir, and arrived at Jeddah in April 1769. After various detentions, he reached Gondar, the capital of Abyssinia, in February 1770; and on November 14 of that year, succeeded in reaching the sources of the Abawi, then considered the main stream of the Nile. This accomplishment of the chief object of his journey filled him with the greatest exultation. He remained about two years in Abyssinia, and returning by way of Sennar and the desert of Assouan, after great hardship reached Alexandria, whence he embarked, March 1773, for Marseilles. In France he spent a considerable time, visiting the celebrated Count de Buffon, and other distinguished men, and in 1774 he returned to Scotland. In 1776, he married Mary, daughter of Thomas Dundas, Esq., of Fingask, by whom he had two sons and one daughter. His long-expected *Travels to Discover the Sources of the Nile, in the Years 1768–1773*, were published in 1790, in 5 large 4to vols., with plates and charts. The work contained such curious accounts of the manners and habits of the people of Abyssinia, that it startled the belief of many, and some of them were set down as fabrications. Among other doubters were De Tott in France, and Dr Johnson in England. Modern travellers, including Salt, Pearce, Burckhardt, Belzoni, and others, have, however, fully confirmed his statements. B. died April 27, 1794, at Kinnaird, of a fall down stairs.

**BRUCE, MICHAEL**, a minor Scottish poet, the son of a weaver, born at Kinneaswood, Kinross-shire, Scotland, March 27, 1746, was, in his younger years, employed as a herd-boy. In 1762, he was sent to Edinburgh University to study for the ministry, and when not at college, was engaged as a village schoolmaster. He had all his life to struggle with poverty, and his frame being weak, melancholy took possession of his mind, and his constitution began visibly to decline. He died of consumption, July 6, 1767, aged 21. His poems, few in number, and of a tender and pathetic description, were published by the Rev. John Logan, his fellow-student and associate at college, at Edinburgh in 1770. His last composition was a touching elegy on his own approaching death.

**BRU'CEA**, a genus of shrubs somewhat doubtfully referred to one or other of the allied natural orders *Rutaceæ* (q. v.), *Simarubaceæ* (q. v.), and *Xanthoxylaceæ* (q. v.)—*B. antidyserterica*, or *ferruginea*, is an Abyssinian species, the leaves of which are said to be tonic, astringent, and useful in dysentery. Those of *B. Sumatrana*, a native of the Indian Archipelago, China, &c., possess the same medicinal properties. They are intensely bitter.—The Abyssinian species acquired a factitious importance in the beginning of the 19th c., from a mistaken belief that it produced the dangerous False Angostura Bark (see ANGOSTURA BARK), and in this belief the name *Brucina* (q. v.) was given to an alkaloid really produced by the *Nux Vomica* (q. v.) and other species of *Strychnos* (q. v.).

**BRU'CHSAL**, a town of the grand duchy of

Baden, situated on the Salzbach, and on the railway between Heidelberg and Carlsruhe, 12 miles north-east of the latter place. B., which is a place of considerable antiquity, is surrounded by walls; the old castle of the prince-bishop of Speier, who took up their residence here early in the 11th c., is still standing, and in the church of St Peter are some ancient tombs. The grand dukes of Baden, who became possessed of B. in 1803, have a fine palace here. Pop. (1871) 9786, who are chiefly engaged in the wine-trade.

BRU'CINE is one of the Alkaloids (q. v.) present in *Strychnos Nux Vomica* along with strychnine, &c. It is not so abundant as the strychnine, nor is it so poisonous. It is mainly characterised by giving a blood-red colour with concentrated commercial nitric acid, and, indeed, the red colour always yielded by nux vomica, and occasionally by strychnine, when treated with nitric acid, is due to the presence of brucine.

BRÜCKNEAU, a village of Bavaria on the Sinn, 36 miles north-east of Würzburg. It is famous in connection with the baths of B., which are picturesquely situated in a beautiful part of the valley of the Sinn, about 2 miles west from the village. The grounds are tastefully laid out in gardens, and charming walks traverse the surrounding woods. The place is a favourite summer resort of the Bavarian court. B. has paper-mills, and a population of about 1500.

BRÜGES (Ger. *Brügge*), a city of Belgium, capital of the province of West Flanders, is situated on a fertile plain about 8 miles from the sea, with which it is connected by the three canals of Ghent, L'Ecluse, and Ostend. Lat. 51° 12' N., long. 3° 14' E. B. derives its name from its many bridges, 54 in number, all opening in the middle to admit of the passage of vessels. The city is surrounded by walls pierced for seven gates. The streets have a venerable and picturesque appearance, but they are greatly deserted, the population of the city being now scarcely a quarter of what it was during the middle ages. Among the most interesting buildings are the town-hall, with a lofty tower and a celebrated set of 48 bells; a Gothic senate-house, built about the close of the 14th c.; a court of justice, containing a famous carved chimney-piece of the date 1559; the church of Notre Dame, with its spire 450 feet high, its many valuable paintings, and a statue of the Virgin (said to be by Michael Angelo), for which Horace Walpole offered 30,000 florins, and its splendid monuments of Charles the Bold and his daughter Mary, wife of the Emperor Maximilian; the cathedral of St Sauveur, not remarkable for its exterior, but containing paintings by eminent masters; St John's Hospital, with celebrated pictures by Hemling, &c. The Academy of Painting contains several fine pictures by J. van Eyck. B. has manufactures of woollen, linen, cotton, lace, leather, cordage, and tobacco; and distilleries, sugar and salt refineries, and ship-building yards; but its industry is not nearly so extensive as it once was. Population (1869) 47,621, of whom more than a fourth are paupers. B. is a very ancient city. Here, it is said, St Chrysolus preached the gospel as early as the 3d century. In the 7th c., B. was the capital of the surrounding district called Flanders, and before the conquest of England by the Normans, its commercial importance was established. In the beginning of the 13th c., it became the central mart of the Hanseatic League; and in the following century it may be said to have become the metropolis of the world's commerce. Commercial agents from 17 different kingdoms

resided here, and no less than 20 ministers from foreign courts had mansions within its walls. Its population at this time amounted to upwards of 200,000. In 1488, the citizens rose in insurrection against the Archduke Maximilian, and with the harsh measures of repression which ensued, commenced the commercial decline of Bruges. Many of the traders and manufacturers, driven forth from their own country, settled in England, and from this time may be dated the beginning of English manufacturing superiority. In the 16th c., however, the tapestry of B. was still celebrated throughout Europe, and the famous Gobelin tapestry of Paris is said to owe its origin to a manufacturer of Bruges. The city was taken by the French in 1794, and soon after incorporated with the French empire; but in 1815 it was made a part of the kingdom of the United Netherlands, and in 1830 of the Belgian monarchy.

BRUGG, or BRUCK, a village of Switzerland, in the canton of Aargau, on the right bank of the Aar, and near the mouth of the Reuss, about 9 miles north-east of Aarau. It is interesting as occupying a part of the site of the ancient *Vitudorissa*, the strongest fortress, as well as the most important settlement of the Romans in Helvetia; and also as the cradle of the House of Hapsburg, to whom, in early times, it belonged. The remains of the castle of Hapsburg, founded by Count Radbot of Altenburg in 1020, are still to be seen on a wooded height, about 2 miles from the village. Nearer, is the Abbey of Königsfelden, founded in 1310 by the wife and daughter of the Emperor Albert, who, two years before, was murdered on the spot by his nephew and others, for which a terrible revenge was taken on the relatives of the murderers. In the vaults beneath the abbey are interred many of the members of the Austrian royal family. High conical roofed towers guard the exit and entrance to B., which has a population of some 800. Zimmerman was a native of this place.

BRÜHL, a town of Rhinish Prussia, about 9 miles south-south-west of Cologne, on the railway to Bonn. It is surrounded by old walls, and has a splendid château, erected in the early part of the 18th c. by the Elector Clement Augustus of Bavaria. There is also an ancient Franciscan convent, now converted into a seminary for Roman Catholic school-masters. After his banishment from France in 1651, Cardinal Mazarin took up his residence in Brühl. Pop. 2300.

BRÜHL, HEINRICH, COUNT VON BRÜHL, prime-minister of Augustus III., king of Poland, and Elector of Saxony, deserves a place in history as a signal example of an unworthy minister and venal statesman. He was born in 1700, at Weissenfels, and in early life entered, as a page, into the service of the Duchess of Sachsen-Weissenfels. His winning address and tact gained for him rapid promotion through several offices of state, until, in 1747, he became prime-minister to that idle and unpatriotic ruler, Augustus III. Never was a ruler more slavishly obeyed by a statesman. B. would follow the prince, as he strolled about smoking, without speaking a word for a whole day; or, when his majesty lazily inquired: 'Brühl, have you any money for me?' 'Yes, sire,' would be the constant reply; but in order to be able to give this answer as frequently as it was demanded, B. drained the coffers of the state, and burdened the country with debt. He, however, contrived to enrich himself, and to accumulate honours and titles. By Elizabeth of Russia, he was invested with the order of St Andrew, and by Charles VI. of Austria, he was made a count of the empire. He kept 200 servants,

paid his body-guard better than Augustus did his, furnished the costliest table, possessed the finest wardrobe, and in short, maintained the most splendid establishment in the kingdom. 'Of all statesmen,' said Frederick II., 'Brühl has collected the greatest quantity of fine clothes, watches, lace, boots, shoes, and slippers!' The effect of B.'s reckless robbery of the national finances to gratify the dissolute Augustus and himself, made itself felt at the outbreak of the Seven Years' War, when the country could only furnish 17,000 men to oppose Frederick of Prussia, who surprised and captured the whole Saxon army in its camp at Pirna. Augustus and B. fled to Warsaw. When peace was concluded, they returned to Dresden, where Augustus died on the 5th October 1763, and was followed by his worthless parasite on the 28th of the same month. B.'s palace still remains as one of the principal buildings in Dresden, and his library of 62,000 volumes forms a chief part of the Royal Library, Dresden.

**BRUMAIRE** (*Lat. bruma*, winter), a division of the year in the republican calendar of France. It includes the time from October 22 to November 20. The celebrated 18th B., which witnessed the overthrow of the Directory and the establishment of the sway of Napoleon, corresponds with November 9, 1799, of the Gregorian calendar.

**BRUNCK**, RICHARD FRANÇOIS PHILIPPE, one of the most ingenious critics and philologists of modern times, was born at Strasburg, December 30, 1729. He was educated under the Jesuits in Paris; but abandoned his studies, and for some time was engaged as a military commissary during the Seven Years' War. A professor in Giessen, with whom B. happened to lodge while the army was in winter-quarters, revived in him the love of classical studies. Returning to Strasburg, he devoted all his spare time to Greek, and soon distinguished himself as an able but adventurous critic and emendator. His belief that all inaccuracies in ancient Greek writings were introduced by copyists, often led B. astray; but, since the revival of learning, few critics have done more for the progress of Greek literature. His first work, *Analecia Veterum Poetarum Graecorum* (1772—1776), was followed by several editions of *Anacreon* (1778—1786), and editions of *Apollonius Rhodius* (1780) and *Aristophanes* (1781—1783), *Poetae Gnomici* (1784), *Virgil* (1785), and *Sophocles* (1786—1789). The last of these established a new era in the criticism of the tragic writers. The outbreak of the French Revolution interrupted B.'s studies. He ardently attached himself to the popular side. During the Reign of Terror, he was imprisoned, but was liberated after the downfall of Robespierre. His means, however, had been so much reduced, that he was compelled to sell his valuable library. From this time, 1801, he turned his attention from Greek to Latin literature, and published editions of *Plautus* and *Terence*. He died June 12, 1803.

**BRUNE**, GUILLAUME MARIN ANNE, a French marshal of the first empire, was born at Brives-la-Gaillarde, 13th March 1763. His education brought him at an early period into connection with the men of the revolution. Along with Danton, he helped to establish the Cordeliers' Club. After the conquest of Belgium, he was sent as civil commissary to that country, but his warlike aspirations soon induced him to enter the military service. In 1797, he became brigadier under Napoleon in the army of Italy, and distinguished himself at Aroola and Rivoli, where he was made general of division and leader of the advance-guard. Sent by the Directory to Switzerland in 1798, he executed his orders

with brilliant success. In 1799, he was appointed to the command of the army of Holland, where he achieved the reputation of being one of the best generals of his age. He vanquished the Anglo-Russians at Bergen on the 19th of September 1799, and on the 19th of October, forced the Duke of York, commander-in-chief of the combined armies, to capitulate at Alkmaar, under humiliating circumstances. In 1803, he was named ambassador to the Ottoman Porte, and was received by Selim III. with great distinction. In 1804, he obtained the dignity of marahal, and in 1805 returned to France. Two years afterwards, B. became governor-general of the Hanseatic towns, and was charged with the conquest of Pomerania; but circumstances having occurred which unnecessarily excited the distrust of Napoleon, he was recalled, and his future services dispensed with. After the fall of the emperor, he declared for the Bourbons, but his offers were rejected, and, in consequence, he joined Napoleon after his return from Elba. He was now made a peer, but the battle of Waterloo completely destroyed his prospects. He again made his submission, but was barbarously assassinated at Avignon, 2d August 1815, by the populace, who were infuriated against him on account of certain crimes laid to his charge, of which, however, he seems to have been entirely guiltless.

**BRUNE ISLAND** lies off the south part of the east coast of Tasmania, from which it is separated by D'Entrecasteaux Bay. It has a length of 32 miles, with a breadth varying from 1 to 6 miles; and its east or outside coast is indented by a bay, which takes its name from the *Adventure*, one of Cook's two vessels during his second voyage.

**BRUNEL, SIR MARK ISAMBARD**, the celebrated engineer of the Thames Tunnel, son of an agriculturist, was born at Hacqueville, near Rouen, in France, April 25, 1769. He early shewed an inclination for mechanics, and at school preferred the study of the exact sciences to the classics. In 1786, he became a sailor in the French navy. In the revolutionary period of 1793, having compromised himself by his political opinions, he escaped from Paris to the United States. His career as an engineer began in 1794, when he was appointed to survey for the canal which now connects Lake Champlain with the river Hudson at Albany. He afterwards acted as an architect in New York. On his return to Europe in 1799, he married the daughter of William Kingdom, Esq., Plymouth, and settled in England. A plan submitted by him to government for making block-pulleys for ships by machinery was adopted, and he was for many years employed in carrying it into execution in Portsmouth dock-yard. He was also successful in the construction of other public works—in Woolwich arsenal and Chatham dockyard, &c. His most remarkable undertaking was the Thames Tunnel, formed beneath the bed of the river, and which, commenced in March 1825, was opened to the public in March 1843. Assisted by his son, the subject of the next article, he for ten years pursued a course of experiments for employing carbonic acid gas as a motive power, but the cost of the machinery prevented its introduction as a substitute for steam. Among the less important of B.'s inventions, were machines for making wooden boxes; for ruling paper; for shuffling a pack of cards without using the hands; for the manufacture of nails; and for making seamless shoes for the army—the latter, tried for two years, was abandoned from economical motives. Elected a Fellow of the Royal Society in 1814, he was appointed Vice-president in 1832. He was knighted in 1841; and died, December 1849, in his 81st year.

BRUNEL—BRUNNOW.

**BRUNEL, ISAMBARD KINGDOM**, an eminent engineer, son of the preceding, born at Portsmouth, England, in 1806, was educated at the college of Henri Quatre, Caen, in France. He commenced practical engineering in 1826, under his father at the Thames Tunnel, and in the progress of that great work was often exposed to danger from the water breaking in and flooding the excavations, having more than once to save his life by swimming. He assisted in his father's experiments for making carbonic acid gas a motive power, and was designer and civil engineer of the *Great Western*, the first steamship built to cross the Atlantic; and of the *Great Britain*, the first ocean screw-steamer. The *Great Eastern*, the largest vessel ever built in the world, was erected under his sole direction. In 1833, B. was appointed chief-engineer to the Great Western Railway, and designed and constructed the whole of the tunnels, bridges, viaducts, and arches on this line, and extension branches. Among other docks at English seaports, in the improvement and construction of which he was engaged, may be mentioned the Bute docks at Cardiff, and the old North Dock at Sunderland. In 1842, he was employed by government to construct the Hungerford Suspension-bridge across the Thames at Charing Cross, London. In 1850—1853, he constructed the works of the Tuscan portion of the Sardinian railway. Made a Fellow of the Royal Society in 1830, he was chosen on the Council in 1844. He was also Vice-president of the Institution of Civil Engineers, and of the Society of Arts; a Fellow of the Astronomical, Geological, and Geographical Societies, and Chevalier of the Legion of Honour. He died suddenly, September 1859.

**BRUNELLESCHI, FILIPPO**, one of the greatest Italian architects, was born at Florence in 1377. He first learned the art of a goldsmith; next, that of a sculptor; and finally devoted himself to architecture. He also studied zealously both mechanical and mathematical science, and is reckoned the first who established, on a sound basis, the theory of perspective. When still a young man, B. went to Rome, where he acquired a profound knowledge of ancient architecture, the result of which was, that two ideas completely possessed his mind: the one was, to revive the ancient style of architecture; the other was, to make himself master of the mechanical knowledge of the ancient architecta. In 1407, he returned to Florence. In 1420, it was proposed to complete the structure of the cathedral of Santa Maria del Fiore, founded in 1296, and now only wanting a dome. A great assembly of architects from all quarters was convened to determine how it might be practicable to cover the vast octangular area. While the debate was going on, B. was earnestly elaborating his own designs; but when he first came forward and proposed his plan, it was so ill received, on account of its supposed absurdity, that B. was 'lifted off his legs, and carried out of the room.' He, however, obstinately persisted in explaining his scheme, and at last succeeded in convincing every one of its feasibility. The work was intrusted to him, and finished, with the exception of the lantern, with which he intended to crown the whole, but was prevented by his death in 1444. B.'s dome, measured diametrically, is the largest in the world, and served as a model to Michael Angelo for that of St Peter's. Besides this *chef-d'œuvre*, B. executed several other great works, such as the churches of San Spirito and San Lorenzo, as well as the designs for the Pitti Palace, which originated the beautiful style of Tuscan palace-architecture in the 15th century.

**BRUNI, LEONARDO**, a native of Arezzo, and

hence styled *Arezino*, was born in 1369. His merits notice as one of the most learned men who flourished during the epoch of the revival of Greek learning in Italy. He first studied law at Florence and Ravenna, but afterwards turned his attention to classical literature. He then went to Rome, where he filled several offices at the papal court. In 1414, he attended John XXII. to the council of Constance. On the deposition of that pope, he returned to Florence, where he was of service to the republic in several important matters. His *Historia Florentina* procured for him the rights of citizenship, and, at a later period, through the favour of the Medicane family, he was appointed state-secretary. He died 9th March 1444. Florence and Arezzo vied with each other in the splendour with which they celebrated his obsequies.

B. aided in advancing the study of Greek literature mainly by his literal translations into Latin of Aristotle, Demosthenes, Plutarch, and others. Of his original works, which are very numerous, many have never been printed, and most are nearly forgotten. We may mention *Commentarius Rerum suo Tempore Gestarum* (Ven. 1476), *De Origine Urbis Mantua*, *De Roma Origine, Epistola Familiare*, and *Vite di Dante e del Petrarca*.

**BRÜNN**, a fortified city of the Austrian empire, capital of the government of Moravia, is beautifully situated, partly on the slope of a hill, and partly in a pleasant valley, at the confluence of the Schwarzwasser and the Zwittawa, in lat. 49° 12' N., and long. 16° 37' E. Behind the city, on an eminence, is situated the castle of Spielberg, formerly the citadel, but now used as a state-prison, and noteworthy as the place in which Silvio Pellico was confined from 1822 to 1830. Among the most interesting buildings of B. are the cathedral of St Peter; St James's Church, a Gothic edifice, with a tower 276 feet in height, and a valuable collection of ancient printed books; the Church of the Minorites; and the Augustine convent. There are also several fine palatial residences belonging to the old nobility. B. is one of the most important manufacturing towns in the Austrian dominions. Its woollens are specially celebrated, and it has also manufactures of cotton, silk, ribbons, yarns, glass, leather, soap, tobacco, and dye-stuffs. Pop. (Dec. 31, 1869) 73,464. Napoleon made B. his headquarters before the battle of Austerlitz.

**BRUNNEN**, a village of Switzerland, in the canton of Schwyz, of which it forms the port, near the mouth of the Muotta, in the Lake of Lucerne. It is beautifully situated at the southeastern bend of the lake, and is celebrated in history as the place where, in December 1315, the deputies of the Forest Cantons, who, eight years before, had formed a plan for the liberation of their country from the Austrian yoke, laid the basis of the Helvetic Republic.

**BRUNNOW (COUNT), ERNEST PHIL. VON**, a Russian diplomatist, was born at Dresden, 1797, and studied at the university of Leipzig. At the time of the Congress of Aix-la-Chapelle, he entered the Russian service, and the ministers Nesselrode and Capo d'Istria recognised at once his fitness for a diplomatic career. Among other posts, he attended the congresses of Troppau and Laybach, acted one year as secretary to the embassy in London, went to the congress of Verona, and then occupied for a time a high office in St Petersburg. He was present, in a civil capacity, in the campaigns of 1828 and 1829 against the Turks. In the autumn of 1839, he was sent on a special mission to London, to take advantage of the unpleasant feeling between Great Britain and France for

## BRUNO—BRUNSWICK.

drawing the cabinets of St Petersburg and London closer together, and in the following spring was accredited as permanent ambassador. In this capacity he soon acquired distinction as a diplomatist. After retiring from London on the outbreak of the war in 1854, he represented Russia in Frankfort, and, along with Count Orloff, was sent to the conference of Paris, February 1856. Immediately after the treaty of peace had been concluded, he was sent on a special mission to London, to re-establish friendly relations between the courts of St Petersburg and St James's. He was afterwards appointed to the court of Prussia; but in 1858 he returned to his old place in London, where he was a great favourite. He represented Russia at the conferences in London in 1864 and 1871. In recognition of his services, he was raised by the emperor of Russia to the rank of count in April 1871. In 1874, he retired to Darmstadt, where he died in the following year.

**BRUNO, GIORDANO**, the precursor of the school of modern Pantheistic philosophers, was born at Nola, in the kingdom of Naples, about the middle of the 16th century. He entered, at an early age, the order of the Dominicans, but soon began to express his doubts in regard to the doctrines of Transubstantiation and of the Immaculate Conception, in consequence of which he was obliged to flee from his convent. Henceforth, his life was unsettled. In 1580, he went to Geneva, where he spent two years, but having excited the suspicion and dislike of the strict Calvinists of that city by his general scepticism, he judged it prudent to betake himself to Paris, where he delivered prelections on the 'Great Art' (Logic) of Raymond Lully. His disputes with the bigoted Aristotelians of the university of Paris compelled him, however, to leave France. He passed over into England, where he resided for two years in comparative quiet, enjoying the friendship of Sir Philip Sidney and the protection of the French ambassador, Michel de Châteauneuf de la Mauviâtre. Here he composed his most important works, but at last, having incurred the displeasure of the clergy by his vehement denunciation of the Aristotelian philosophy, and other grave heresies, he returned to Paris in 1585. In 1586, he proceeded to the university of Marburg, where he matriculated; and to Wittenberg, where he became professor; but being asked to join the Lutheran communion, he refused. On his departure from the city, he pronounced an impassioned panegyric on Luther. After spending some time in Prague, Brunswick, Helmstadt, and Frankfort-on-the-Main, he resolved to go back to Italy. He fixed his residence at Padua; but after a stay of two years, he went to Venice, where he was arrested by the officers of the Inquisition, and conveyed to Rome in 1598. He was now subjected for two years to persecution, in the vain hope that he would recant; but when all the endeavours of his enemies proved ineffectual, he was brought to the stake on the 17th February 1600, and burned as an obstinate heretic.

B.'s writings, of which the most valuable are composed in Italian, display throughout a strong, courageous, excitable soul, susceptible of deep enthusiasm, but vainly labouring to attain perspicacity. The *Cena delle Ceneri*, or Evening Conversations on Ash-Wednesday, is an apology for the Copernican astronomy; the *Spaccio della Bestia Trionfante*, or Expulsion of the Triumphant Beast (Par. 1584), is a satirical but somewhat heavy allegory in the style of the times. His greatest works are metaphysical, such as the *Della Causa Principio ed Uno* (On the One Sole Cause of Things), and the *Del Infinito Universo e Mondi* (On the Infinity of the Universe and of Worlds).

228

The doctrine enunciated in these is Pantheistic. B. held that the infinite soul of God did not merely inhabit or pervade the universe, but that the universe was simply a manifestation of Him, and therefore itself divine. God was therefore, in the most literal and physical sense, all in all. B.'s philosophy, in later times, was quite unappreciated, and even neglected, until Jacobi drew public attention to it in his *Letters on the Doctrine of Spinoza*. Both Spinoza and Descartes were much indebted to Bruno. His influence is also discernible in the Pantheistic speculation of modern Germany. Original editions of B.'s works are very rare. Dr Wagner published, along with a life of the author, those written in Italian, under the title *Opere di Giordano Bruno Nolano*, &c. (Leip. 1830).

**BRUNO, THE GREAT**, Archbishop of Cologne, and Duke of Lorraine, one of the most eminent men of his time, was born about 928 A.D. He was the third son of Henry the Fowler, and the brother of Otto I., Emperor of Germany. Baldwin, Bishop of Utrecht, and afterwards Israel Scotigena, and others, were his tutors. His surprising knowledge, sagacity, and eloquence secured for him an immense influence over the bishops and clergy, while, on the other hand, his liberality, meekness, and great earnestness of heart, won the affections and reverence of the laity. Summoned by Otto to the imperial palace, he quickly assumed an influential position among the chroniclers, poets, and philosophers of the court. At a later period, he was appointed Archbishop of Cologne, and Lord High Chancellor of the empire. He accompanied Otto to Italy in 951, and honourably distinguished himself by his fidelity to his brother, when Otto's own son, Conrad, and others of his kindred rebelled against him. As a reward, the emperor appointed him Duke of Lorraine. B. died at Rheims, 11th October 966. He wrote a commentary on the Pentateuch, and several lives of saints.

**BRUNO, SAINT**, the founder of the Carthusian order of monks, was born at Cologne 1051, and received his earliest education in the school attached to the Collegiate Church of St Cunibert. Subsequently, he studied at Rheims, where he distinguished himself so greatly, that Bishop Gervasius appointed him director of all the schools in his diocese. B., however, soon began to be troubled by the wickedness of his time, and, anxious to escape from what seemed to him the general pollution, he took refuge, along with six pious friends, in a desert place near Chartreuse, in the diocese of Grenoble. Here, in 1086, he founded one of the most austere of all the monkish orders, which received its name from the locality whence it had sprung. See CARthusians. B. and his companions had each a separate cell, in which they practised the severities of the rule of St Benedict, keeping silence during six days of the week, and only seeing one another on Sundays. Pope Urban II., who was one of B.'s most eminent scholars, in 1089 summoned the saint to Rome. B. obeyed the call reluctantly, and steadily refused all offers of preferment. In 1094, he established a second Carthusian monastery, called La Torre, in a solitary district of Calabria, where he died in 1101. He was not canonised until 1628. B. left no written regulations for his followers. These first made their appearance in a complete form in 1581, and were enjoined on all Carthusians by Innocent IX.

**BRU'NSWICK, DUCHY OF** (Ger. *Braunschweig*), a state of Northern Germany, consisting of three larger and five smaller distinct parts, and lying mostly within lat.  $51^{\circ} 38'$ — $52^{\circ} 28'$  N., and long.  $9^{\circ} 23'$ — $11^{\circ} 30'$  E. Its entire area amounts to about 1425 square miles. Pop. in 1871, 311,764. For

administrative purposes, B. is divided into six circles—viz., Brunswick, Wolfenbüttel, Helmstedt, Gandersheim, Holzminden, and Blankenburg. Of the three larger parts, the principal one, forming the circle of Wolfenbüttel, and including the capital, lies between Prussia and Hanover; the second, extending east and west from Prussia to the Weser, divides Hanover into two parts; and the third, forming the circle of Blankenburg, lies to the south-east between Hanover, Anhalt, and Prussia. The smaller parts are the isolated bailiwicks of Calvörde in the east, Thedinghausen in the west (not far from Bremen), and some very small demesnes in the Hanoverian boundaries. B. belongs mostly to the basin of the Weser, which serves as a boundary on the west. The surface is mostly mountainous, particularly in the southern portions of the country, but B. has nevertheless level tracts of considerable extent. The rivers, with the exception of the Weser, are comparatively unimportant, though advantage is taken of one or two for the transport of timber. The climate in the low lands resembles the general climate of Northern Germany; but in the Harz district it is so much colder, that harvest is generally a month later than in the plains.

The mines and quarries of B. produce marble, alabaster, limestone, gypsum, alum, iron, copper, lead, sulphur, and salt in large quantities, with some portions of gold and silver. Agriculture, which is carried on with intelligence and energy, constitutes the chief wealth of the duchy. The products include, beside the ordinary cereals, large quantities of leguminous plants, potatoes, tobacco, and hops. The pasture-land is extensive, and great attention is paid to the rearing of cattle, and especially to the breeding of sheep, wool being an important article of commerce. A large number of persons are employed in the cutting and preparation of timber. The chief manufactures of B. are of linen, stockings, woollen cloth, metals, porcelain, paper, sugar, glass, beer, &c.

The inhabitants are mostly Saxons, and, with the exceptions of about 22,000 Reformed, 5000 Roman Catholics, and 1100 Jews, all adhere to the Lutheran Church. The people in the rural districts speak a very broad Low-German dialect; but good High-German is spoken by the educated classes. Education is well looked after by the government, which is a limited monarchy, the duke being head of the state, and his power restricted by the legislature, which is partly hereditary and partly elective. As a state of the German empire, B. has two votes in the Bundesrath (confederate council), and sends three deputies to the Reichstag or parliament.

Taxes are voted triennially in Brunswick. The estimated revenue for the three years ending 1872 was 7,196,400 thalers (about £1,080,000). The public debt in January 1871 amounted to 23,765,768 thalers, of which 19,670,700 thalers were borrowed for the construction of railways. The civil list of the duke is not comprised in the budget, being paid out of a special fund consisting of the revenues of the state domains, which amount to 220,722 thalers, and other receipts amounting to 22,333 thalers.

B. was included, as a part of Saxony, under the empire of Charlemagne. In 1235, B., with Lüneburg, was made a duchy under Otto, who died in 1252, and was succeeded, in 1267, by his son, Albrecht, founder of the older line of Wolfenbüttel. John, another son of Otto, was the founder of the older Lüneburg line, which became extinct with William of Lüneburg in 1369. In 1569, Henry, who styled himself Duke of Brunswick-Lüneburg-Dannenberg, founded the new House of Brunswick-Wolfenbüttel; and his brother William founded the new line of Brunswick-Lüneburg, which, in

1815, became the kingdom of Hanover. See HANOVER.

**BRUNSWICK**, the capital of the duchy of Brunswick, is situated on the Oker, in a level and fertile district, in lat. 52° 46' N., and long. 10° 4' E. B., which is a very old place, is supposed to have been first walled about the 9th c., by Bruno, Duke of Ostfalen. But Henry the Lion, in the 12th c., so greatly beautified and extended the city that he may be almost said to be its founder. In the 13th c., B. became a member of the Hanse League, and soon attained considerable commercial prosperity, but its importance declined with the decay of the League. The town is most irregularly built, with narrow and crooked streets, but possesses the advantages of good canals and an abundant supply of water. The cathedral—in which are preserved some interesting relics brought by Henry the Lion from the Holy Land—with the churches of St Martin, St Catharine, and St Andrew, with its steeple 316 feet high, are among the principal buildings. In the museum, are some interesting antiquities and works of art by Jan Steens, Albert Dürer, Holbein, Rembrandt, Raphael, Guido, Ruydael, Michael Angelo, and Benvenuto Cellini. The industry of B. consists chiefly in manufactures of woollen and linen, chioory, beet-sugar, tobacco, *papier-mâché*, lacquered wares, &c. Its great annual fair, founded in 1498, is important. The old fortifications of B. have been demolished, and their site converted into pleasant promenades. A fine avenue of linden-trees leads to the duke's palace, an imposing edifice, built since 1865. Pop. (1871) 57,782.

**BRUNSWICK, NEW.** See NEW BRUNSWICK.

**BRUNSWICK BAY**, on the north-west coast of Australia, in long. 125° E., and about lat. 15° S. It receives Prince Regent River.

**BRUNSWICK BLACK** is a varnish employed for coating over coarsely finished iron grates, fenders, &c. It is mainly compounded of lamp-black and turpentine, and when applied with a brush, quickly dries, and leaves a shining jet-black surface.

**BRUNSWICK GREEN** is a pigment used in the arts, and consisting of the hydrated chloride and oxide of copper ( $CuCl_3CuO_4HO$ ). It may be prepared (1) by acting upon metallic copper with common salt and diluted sulphuric acid, (2) by acting upon metallic copper with moistened sal-ammoniac, or (3) by mixing sulphate of copper and common salt into a paste with water. It is found native at Atacama, in Peru, in the form of a green sand, hence the name Atacamite (q. v.).

**BRUSSELS** (Fr. *Bruxelles*), the capital of Belgium, is situated on the small river Senne, a tributary of the Dyle, in lat. 50° 51' N., and long. 4° 21' E. It communicates with Antwerp and the Baltic Sea, by means of the Scheldt canal, and railways connect it with Germany, France, and Holland, as well as with all the principal towns of Belgium. The city is built partly on the side of a hill, and partly on a fertile plain; and though some of the streets are so steep that they can be ascended only by means of stairs, B., on the whole, may be pronounced one of the finest cities in Europe. The Upper Town, situated on the side of the hill, is the newest and most fashionable, and is the residence chiefly of the great and wealthy. The king's palace, public offices, chief hotels, and mansions of foreign ministers are here. It is also much more healthy than the Lower Town, which, stretching along the canal and the Senne, is greatly subject to fog. But the latter, with its numerous handsome old buildings, formerly belonging to the Brabant nobility, but now occupied by merchants

and traders, has a fine picturesque appearance, while some of its public edifices are unrivalled as specimens of Gothic architecture. This part has also several noble churches, but it is now wholly given over to trade. French is spoken in the upper part of B.; but in the lower, Flemish is prevalent, and in one quarter the Walloon dialect is spoken. The English language, owing to the large number of English who reside in B. for economy, is also very common. The walls which formerly surrounded B. have been removed, and their place is now occupied by pleasant Boulevards, shaded by alleys of trees, extending several miles. The *Allée Verte*—a double avenue along the Scheldt canal—forms a splendid promenade, and leads toward the palace of *Laken*, the suburban residence of the royal family, three miles north of the city. Besides the fine park in the Upper Town, covering an area of some seventeen acres, ornamented with fountains and statues, and surrounded by the king's palace, the 'Palace of the Prince of Orange,' the Chamber of Representatives, and other buildings, B. has several other squares or places, among which the most noteworthy are—the *Place Royale*, with its colossal monument of Godfrey of Bouillon; the *Grand Place*, in which is situated the Hôtel de Ville, a splendid Gothic structure, erected in the beginning of the 15th c., with a pyramidal tower 364 feet high, surmounted by a statue of St Michael, the patron saint of B., and where, in 1568, the patriot counts, Egmont and Horn, were beheaded by order of the Duke of Alba; and the *Place des Martyrs*, where a memorial has been erected to those who fell here in the revolution of 1830. Among the churches of B., the largest and finest is the cathedral of St Gudule, which dates from the 12th c., and is built in the pointed Gothic style, with two towers of more modern date, rising on each side to a height of 264 feet, many richly painted windows, a pulpit considered the master-piece of Verbruggen, and monuments of the Dukes of Brabant and other distinguished persons. In the *Palais des Beaux Arts* is the picture-gallery, containing the finest specimens of the Flemish school of painting; the public library with its 234,000 volumes, and its 20,000 MSS., collected by the Dukes of Burgundy—MSS. interesting and valuable not only for their contents, but for the beautiful miniature paintings with which the scholars of Van Eyck adorned them. The Observatory is one of the finest in Europe, and is under the charge of the celebrated mathematician Quetelet. The educational establishments of B. are numerous, the principal being the free university, founded in 1834, with four faculties—viz., law, medicine, mathematical and physical sciences, and belles-lettres, and having a special school of pharmacy attached. It has also numerous charitable and benevolent institutions; and is the seat of the provincial government of South Brabant, as well as of the general government of the kingdom. B. is one of the chief centres of the industry of the country. Its lace is particularly famous. Of the esteemed carpets which pass under the name of B. carpets, only a few are manufactured here, most of those of Belgian make being produced at Tournai. It has also manufactures of damask, linen, ribbons, paper, jewellery, hats, soap, porcelain, mathematical and musical instruments, &c. Carriage-building is also an important branch of industry. Printing and lithographic establishments are numerous; and about a dozen newspapers are published daily. Pop. in 1870, 176,806.

As early as the 8th c., we find B. (*Bruscella*), then probably a villa of the Frank kings, mentioned in old chronicles, and that a church existed here

320

in 966 is proved by a deed of the Emperor Otto I. Under Charles V., B. was made the court-residence in the Netherlands, and became afterwards, under Philip II., the chief arena of the revolution, and of the atrocities committed by the Duke of Alba and the Inquisition. B. suffered greatly in the war of Spain against Louis XIV.—in whose reign it was bombed by Marshal Villeroi and upwards of 4000 buildings destroyed—and in that of Austria against Louis XV.; but still more from the continual prevalence of party animosities caused by the policy of Austria. Under the mild rule of Maria Theresa, B. flourished greatly, and in this time, many of its best institutions and public buildings were founded. In 1789 occurred the Brabant revolution under Joseph II.; and scarcely had Austrian rule been re-established, after a brief time of independence, when B. fell into the hands of the French, 1792. After other changes of fortune, B., with the other parts of Belgium, was incorporated with the kingdom of the Netherlands in 1815, and so remained until the revolution of 1830, by which it became the capital of the independent kingdom of Belgium.

#### BRUSSELS CARPETS. See CARPETS.

**BRUSSELS SPROUTS**, one of the many cultivated varieties of *Brassica oleracea* (see BRASSICA and CARRAGE), distinguished by producing, in the axils of the leaves, little clusters of leaves which close together and form miniature cabbages. These are used, like other greens of this species, for the table, and are very delicate. The plant is cultivated much in the same way as cabbage or kale, requiring, however, less space than most of the varieties. It may be planted in shady situations, or between the rows of crops, such as peas, beans, scarlet-runners, &c., which are to be removed from the ground in autumn. The sprouts are fit for use chiefly in winter and spring. The stem sometimes attains a height of four feet, and the head resembles a small imperfectly boiled savoy; but there is a subvariety with shorter stems, preferable for many situations. In some places, it is customary to remove the head early in winter, in order to promote the development of the lateral shoots in spring; but if the head is allowed to remain, the plant becomes taller, and new shoots are formed as the lower ones are removed. The seed is sown in February or March. Seed is very generally imported from Belgium, as this vegetable is said to degenerate in Britain. Its use has of late rapidly extended, and none of the many varieties of the species to which it belongs is better deserving of cultivation.

**BRUTUS, LUCIUS JUNIUS**, figures in the legendary history of early Rome, as the hero who overthrew the monarchical, and established the republican form of government. The legend runs that he was the son of a rich Roman. On his father's death, Tarquin the Proud took possession of the property, and put an elder brother to death, and B. himself only escaped the same fate by feigning idiocy (hence the name *Brutus*, stupid). The oracle of Delphi foretold that he should govern in Rome. Remembering his own wrongs, and gifted with the strength and wisdom of one who was fulfilling the decrees of fate, B., when the foul rape committed by one of the royal family upon Lucretia had shocked the people, convoked them, placed himself at their head, and drove the kings from Rome. He is said to have been then elected one of the two first consuls (509 B.C.). That his character as a stern old Roman hero might be complete, the legend adds that he sacrificed to the new republic his own sons, detected in a conspiracy to restore the monarchy;

and that at last he fell in mortal combat repelling an attack led on by one of the sons of Tarquin. Little more, however, can be said to be established upon sufficient historical evidence with regard to B., than that there existed a person of that name who held high office in Rome at a very early period.

**BRUTUS, MARCUS JUNIUS**, born 85 B. C., appears to have spent the early years of manhood in exclusive devotion to literary pursuits, and not to have taken part in the political dissensions agitating Rome till he had attained a mature age. When the civil war broke out between Pompey and Caesar, he sided with the former; but after the battle of Pharsalia, made his submission to the latter, and, in the following year, was appointed governor of Cisalpine Gaul. On returning to Rome, he divorced his wife, in order to marry Portia, the daughter of Cato, of whose principles in politics he professed to be a disciple. The influence of Cassius prevailed upon him to join the conspiracy which ended in the murder of Caesar. The efforts of B. to retain popular favour afterwards being unavailing to counteract the effects of the eloquence of Antony, he was forced to leave first Rome, and then Italy. The remainder of his life was spent partly in Athens, partly in Asia Minor, and partly as the leader of a marauding force which maintained itself by plundering the inhabitants of the eastern shores of the Adriatic. Defeated by Antony and Octavianus (Augustus) at the battle of Philippi (42 B. C.), he terminated his life by falling upon his sword.

**BRÜX**, a town of Bohemia, situated on the Bila, about 14 miles north of Saatz. In its vicinity are extensive coal-mines, and the famous mineral springs of Pullna and Seidlitz, from which the inhabitants of B. prepare a considerable quantity of salts. Pop. (Dec. 31, 1869) 6308.

**BRUYÈRE, JEAN LA.** See LABRUYÈRE.

**BRYANT, JACOB**, an eminent English scholar, was born at Plymouth in 1715. He was educated at Eton and King's College, Cambridge, where he took his degree of M.A. in 1744. In 1756 he became private secretary to the Duke of Marlborough, and accompanied his Grace to the continent. Substantial proofs of the duke's esteem raised him above the region of pecuniary cares, and enabled him to devote his whole life to letters. He died 14th November 1804. Among his numerous publications, may be mentioned: *Observations and Inquiries relating to various Parts of Ancient History* (Cambridge, 1767); *A New System or Analysis of Ancient Mythology* (1774—1776); *Vindicia Flaviana* (a defence of Josephus's testimony in regard to Christ), (1780); *Treatise on the Authenticity of the Scriptures and the Truth of the Christian Religion* (1792); *A Dissertation concerning the War of Troy, &c.* (1796); *The Sentiments of Philo-Judaüs concerning the Logos* (1797); and a variety of Dissertations on the Difficult Passages of Scripture (1803). B. was a man of great and varied learning, but his intellect, although acute, was neither philosophical nor comprehensive enough to enable him to handle in a satisfactory manner the important questions on which he wrote.

**BRYANT, WILLIAM CULLEN**, a distinguished American poet and journalist, was born in Hampshire, Mass., November 3, 1794. At the early age of 10, he published translations from some of the Latin poets; at 13, he wrote a terse and vigorous political poem, entitled *The Embargo*; and at 18, he composed his *Thanatosis*, a poem full of beauty. In 1815 he was admitted to the bar, and for ten years practised with diligence and success. In 1825

he removed to a more congenial sphere, and in association with a friend, established *The New York Review*, to which he contributed many of his best poems. In 1826 he became principal editor of *The Evening Post*, the leading democratic paper of New York, which he still continues to conduct with a manliness and purity of tone of which the examples among his professional brethren might be increased with advantage. The first collected edition of his poems appeared in 1832. They were soon after republished in Britain, and were regarded as the highest efforts, up to that time, of the American Muse. In 1842 he published *The Fountain, and Other Poems*. B. visited Europe in 1834, and again in 1844 and 1849. The result of his observations was, *Letters of a Traveller in Europe and America*. In 1858 appeared a new edition of his poetical works, with 71 engravings. In 1869, he published a metrical translation of the *Iliad*, followed in 1871 by a similar one of the *Odyssey*. Although the popularity of B.'s writings has been eclipsed by that of Longfellow and Poe, he has still a large circle of readers and admirers.

**BRY'ONY** (*Bryonia*), a genus of plants of the natural order *Cucurbitaceæ*, distinguished by tridentalous stamens, with distinct anthers, a trifid style, and a few-seeded fruit destitute of hard rind. The stems climb by means of lateral tendrils, the leaves are angular or 3-5-lobed, and the flowers campanulate, 5-partite, unisexual, and generally yellow. The COMMON BRYONY (*B. dioica*), the only British species, is frequent in hedgerows in England, but is not indigenous to Scotland. It has cordate palmate leaves, axillary bunches of flowers, and red berries about the size of a pea. It abounds in a fetid and acrid juice. The root is perennial, very large, white and branched, has a repulsive smell, and is acrid, purgative, and emetic. *B. alba*, common in the middle parts of Europe, possesses similar properties.

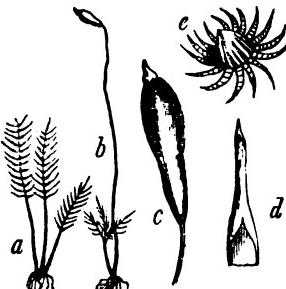

Common Bryony.

The root of both is applied topically to bruises, and was formerly very much in use as a purgative. It is now again much employed in homeopathic practice. A decoction made of 1 lb. of the fresh root is said by Withering to be 'the best purge for horned cattle.' It contains a bitter extractive, called *Bryonine*, to which it seems to owe its properties. The young shoots of both species are, however, so free from acrid and dangerous qualities, that they may be used as pot-herbs.—The roots of other species of the genus are also acrid and purgative; but it is said that the root of *B. Abyssinica*, when cooked, is eaten without danger.—**BLACK BRYONY** (*Tamus communis*) is a plant of a different natural

order (*Dioscoreaceæ*, q. v.). The genus is distinguished by an inferior ovary and succulent fruit. Black B. has long twining stems, cordate undivided leaves, greenish flowers, and red berries. Its roots are very large and fleshy, black externally. The berries are unwholesome, and the whole plant is acrid, the roots so much so as to have been formerly employed for stimulating plasters. But the young suckers, in which the acrid principle is not much developed, are eaten in Greece as asparagus, after careful boiling with change of water, as are also those of *T. Cretica*. The plant is common in most parts of Europe, and is found in England, in hedges and thickets.

BRYOZO'A. See ZOOPHYTES.

BRY'UM (Gr. *bryon*, moss), a genus of Mosses (q. v.) distinguished by a terminal fruit-stalk, a double *peristome* (see MOSES)—the outer one of 16 teeth, the inner a membrane cut into 16 equal

*Bryum Longicollum*:

a, Sterile shoots with leaves; b, fertile plant, shewing the spore-case and its stalk; c, the spore-case or capsule, magnified; d, the calyptra, magnified; e, the top of the spore-case or capsule, shewing the double peristome, magnified.

segments—and a dimidiate *calyptra*. The species are very numerous, and many of them are natives of Britain. They are all small, their stems short, and their leaves forming little rosettes, from the centre of which the fruit-stalk springs. They very generally grow in dense patches, on wet rocks, wet earth, the bark of trees, &c., beautifully clothing them with bright green.

BRZESCO LITEWSKI, a walled town of Russia, in the government of Grodno, about 108 miles south from the city of the same name. Being advantageously situated on the right bank of the Bug, it has an extensive trade. It was the scene of a battle between the Russians and Poles in 1794. Pop. (1867) 22,493.

BRZE'ZAN, a town of Galicia, situated on the Zlota-Lipa, about 54 miles south-east of Lemberg. It has an old castle and a gymnasium, and manufactures of linen, sail-cloth, and leather. Pop. 7299.

BUA'CHE, or GARDEN ISLAND, an island of Western Australia, near the mouth of Swan River, in lat. 32° 10' S., and long. 115° 40' E. Though measuring only 6 miles by 1, it is yet important as sheltering from the open ocean the deep and spacious anchorage of Cockburn Sound, which flows between it and the mainland of the colony.

BU'AZE, a South African plant, of which the botanical characters and relations are not yet known, but which is likely to prove of importance on account of its fibre. Dr Livingstone found it growing in large quantities in the Maravi country, north of the Zambezi; but he could not procure any specimen in flower or fruit, and Dr Hooker did not recognise the specimens of branches and

leaves. It is not cultivated, and the only use to which it is put by the natives is to afford threads

Buaze.

for stringing beads on; but Dr Livingstone thinks its fibre stronger and finer than flax, and says that a firm thread of it feels like catgut in the hand, and would rather cut the fingers than break.

BUBALUS, BU'BALIS, or BU'BALÉ (*Antelope Bubalus*), supposed to be the *Bubalus* of the ancients—although that name is now generally appropriated to the buffalo (q. v.)—a species of antelope, of that section of the genus which is characterised as bovine or ox-like. The Arabic name is Bekker-el-Wash, which signifies wild ox. It is an animal about the size of a large stag, with very ox-like head and muzzle—the head, however, remarkably

Bubalis.

long; the horns about as long as the head, surrounded by a succession of thickened rings, curved so as somewhat to resemble the sides of a lyre, the points directed backward. The general colour is yellowish brown, but the tail is terminated by a black tuft. The B. is an animal of rather coarse appearance, very destitute of the gracefulness of the typical antelopes. It inhabits Barbary, and occasional wanderers make their way to the banks of the Nile. It is figured on the monuments of ancient Egypt. It is gregarious in its habits. It is said to be easily domesticated. The most nearly related species to this, of other antelopes known, is the KAAMA (q. v.) of South Africa.

BUBA'STIS, a goddess of the Egyptians, was, in their mythology, the child of Ius and Osiris, and the sister of Horus. She was identified by the Greeks with Artemis (Diana), though upon what grounds is unknown, as the best information with regard to her is, that she was the goddess who presided over pregnancy and childbirth. The chief temple erected to B. was at Bubastis (q. v.). B. is represented on monuments as having the head of a cat, an animal which was sacred to her.

BUBA'STIS (the *Pi-beeth* of Scripture, and modern *Tel Basta*), a ruined city of Egypt, about 14 miles north of Belbeys, in lat.  $30^{\circ} 36' N.$ , and long.  $31^{\circ} 33' E.$  B. derived its name from the Egyptian goddess Bubastis, in whose honour a temple was erected here, which, if not so large and magnificent as some Egyptian temples, was, according to Herodotus, one of the most beautiful, and vast numbers of persons were wont to make annual pilgrimages to it. Nothing but some stones of the temple, which are of the finest red granite, now remain. There are some other ruins, and mounds of great extent, consisting chiefly of the remains of brick-houses and heaps of broken pottery.

BUBBLE, as a term, is defined by Blackstone as an unwarrantable undertaking by unlawful subscriptions, subjecting the parties who originate and put them in operation to the penalties of *præmunire* (q. v.). The *South-sea Company* (q. v.) was a terrible example of such a bubble.—The BUBBLE ACT is the name given to the 6 Geo. I c. 18, 'enacted,' says Blackstone, 'in the year after the infamous South-sea project had beggared half the nation,' and which public fraud the act was intended to punish. But it was repealed by the 6 Geo. IV. c. 91, which at the same time left such companies to be dealt with by the common law.

BU'BLE SHELL. See BULLA.

BU'BO, an inflammatory tumour, seated in the groin or the armpit.

BU'BO. See OWL.

BUCANEE'RS, a celebrated association of piratical adventurers, who, from the commencement of the second quarter of the 16th c., to the end of the 17th, maintained themselves in the Caribbean seas, at first by systematic reprisals on the Spaniards, latterly, by less justifiable and indiscriminate piracy. The name is derived from the Caribbee *boucan*, a term for preserved meat, smoke-dried in a peculiar manner. From this the French adventurers formed the verb *boucaner* and the noun *boucanier*, which was adopted by the English; while, singularly enough, the French used, in preference, the word *flibustier* (see FLIBUSTERS), a corruption of our 'freebooter.' The B. were also sometimes called 'Brethren of the Coast.' The arrogant assumption by the Spaniards of a divine right—sanctioned by the pope's bull—to the whole New World, was not, of course, to be tolerated by the enterprising mariners of England and France; and the enormous cruelties practised by them upon all foreign interlopers, of which the history of that time is full, naturally led to an association for mutual defence among the adventurers of all other nations, but particularly among the English and French. The fundamental principles of their policy—for they, in course of time, formed distinct communities—were close mutual alliance, and mortal war with all that was Spanish. Their simple code of laws bound them to a common participation in the necessities of life; locks and bars were proscribed as an insult to the general honour; and every man had his comrade, who

stood by him when alive, and succeeded to his property after his death. The principal centre of their wild and predatory life was for some time the island of Tortuga, near St Domingo. When they were not hunting Spaniards, or being hunted themselves, their chief occupation and means of subsistence was the chase. From the flesh of wild cattle they made their 'boucan'; their skins and tallow they sold or bartered to Dutch and other traders. The history of these men embraces, as may be supposed, narratives of cruelty and bloodshed unsurpassed in the annals of crime. It has, however, not a few stories of high and romantic adventure, of chivalrous valour, and brilliant generalship. Among the 'great captains' whose names figure most prominently in the records of buccaneering, were the Frenchman Montbars, surnamed by the terrible title of 'The Exterminator'; his countryman, Peter of Dieppe, surnamed 'The Great'—as truly, perhaps, as others so distinguished—and L'Olonnais, Michael de Busco, and Bartolomeo de Portoguez, Mansvelt, and Van Horn. Pre-eminent, however, among them all was the Welshman, Henry Morgan, who organised fleets and armies, took strong fortresses and rich cities, and displayed throughout the bold genius of a born commander. He it was that led the way for the B. to the Southern Ocean, by his daring march in 1670 across the Isthmus of Panama to the city of that name, which he took and plundered after a desperate battle. This brilliant but most unscrupulous personage was knighted by Charles II., and became deputy-governor of Jamaica. A higher subordination of the love of gold to the passion for dominion in him, might probably have made him Emperor of the West Indies, some dream of which seems at one time to have occupied his mind. In 1680 and 1689, extensive buccaneering expeditions were made to the Pacific, even as far as the coasts of China, of which the best record is preserved in the lively pages of William Dampier, himself an important partner in these bold adventures. The war between France and Britain, after the accession of William III., dissolved the ancient alliance of the French and English buccaneers. After the peace of Ryswick, and the accession of the Bourbon Philip V. to the Spanish crown (1701), they finally disappeared, to make way for a race of mere cut-throats and vulgar desperadoes, not yet utterly extinct. The last great event in their history was the capture of Carthagena in 1697, where the booty was enormous.—See the *Histories* of Burney and Thornberry, Dampier's *Voyage*, and the *Narratives* of Wafer, Ringrove, and Sharp.

BUCCINATOR (from Lat. *buccinare*, to sound a trumpet), the name of a muscle, situated in the substance of the cheeks; it is so called because, when the cheeks are distended with air, the contraction of the B. muscles forces it out.

BUCCI'NO, a town of South Italy, in the province of Salerno, pleasantly situated on the Botta, which at this point is crossed by an old Roman bridge, about 14 miles east from Campagna. In its vicinity are quarries yielding fine marble. Pop. 5493.

BU'CINUM. See WHELK.

BUCCLEU'CH. The Scotts, Dukes of B., are one of the oldest and most distinguished families in Scotland. The family traces its descent from Sir Richard le Scott, in the reign of Alexander III. (1249–1285); but the ancestor who first becomes historically conspicuous is Sir Walter Scott of Branxholm and B., a brave and powerful chieftain on the border. B., which from this early period was

destined to be associated with the family title, is a lonely estate in the vale of Rankleburn, at the head of Ettrick, Selkirkshire. The Sir Walter alluded to flourished in the reign of James V., and on some incidents in his life, his great namesake founded the *Lay of the Last Minstrel*. Sir Walter fought bravely at the battle of Pinkie, 1547, and was slain in an encounter with Sir Walter Kerr of Cessford in the streets of Edinburgh, 1552. He was succeeded by his grandson, Sir Walter Scott of B., a knight 'wise, true, and modest,' who was succeeded by his only son, who bore the same name. This Sir Walter is celebrated for his military exploits on the border, not the least daring of his enterprises being the rescue of one of his attendants, Kimmont Willie, from the castle of Carlisle. (See *Minstrelsy of the Scottish Border*.) For his services to the state, in which is to be reckoned his carrying away of large numbers of the border marauders to foreign wars, he was raised to the peerage, 1606, as Lord Scott of Buccleuch. Dying in 1611, he was succeeded by his only son, Walter, who, in 1619, received an elevation in the peerage, as Lord Whitchester and Eakdale, and Earl of Buccleuch. Through his son Francis, the second earl, the family, by a grant, acquired the extensive domain of Liddesdale, formerly belonging to the House of Bothwell; also, by purchase, large territories in Eakdale; and in 1642, the barony of Dalkeith from the Morton family. Francis left only two daughters, the eldest of whom dying without issue, the titles and estates went to her sister, Anne, who, in 1663, was married to James, Duke of Monmouth, an illegitimate son of Charles II. In 1673, this pair were created Duke and Duchess of B., Earl and Countess of Dalkeith, &c. After a marriage of twenty-two years, the unhappy duke, on a charge of rebellion, was tried and beheaded, 1685; the duchess, however, retaining her honours, title, and estates, as in her own right. The duke left a family of four sons and two daughters. The duchess afterwards married Lord Cornwallis, by whom she had a son and two daughters, and died in 1732, at Dalkeith House, where she had occasionally resided in princely splendour. James, her eldest surviving son, pre-deceased his mother, and his son, Francis, by the death of his grandmother, succeeded to the title of Duke of Buccleuch. Notwithstanding the connection with the son of Charles II., the family still preserved the surname of Scott. Duke Francis, in 1743, obtained a restoration of his grandfather Monmouth's Earldom of Doncaster and Barony of Tynedale, and was hence a British peer. In 1720, he married a daughter of James, second Duke of Queensberry, and by this fortunate connection, a portion of the Queensberry estates, along with the dukedom, merged in the family of B. in 1810. Henry, third Duke of B., born 1746, was the greatest and most estimable of his family. He had for his tutor and friend Dr Adam Smith, and his benevolent talents were directed towards the improvement of his extensive estates in the south of Scotland. The amelioration of the soil, the planting of trees, the making of roads, the improving of the breed of sheep, and the social elevation of his numerous tenantry, uniformly engaged his attention. He died in 1812, and was succeeded by his eldest son, Charles, fourth duke, who, dying in 1814, was succeeded by his son, Walter Francis, born 1806, who bears the title of Duke of B. and Queensberry, Marquis of Dumfrieshire, Earl of Drumlanrig, B., Sanquhar, Dalkeith, &c., in the peerage of Scotland; and Earl of Doncaster, &c., in the peerage of England. His eldest son, William Henry, takes the courtesy title of Earl of Dalkeith. The duke, like his grand-

father, is noted for the improvement of his estates, which in Scotland are situated in Mid-Lothian, Dumfrieshire, Roxburghshire, Selkirkshire, Peeblesshire, Lanarkshire, and stewartry of Kirkcudbright; his farms everywhere being noted for their good steadings and thriving tenantry. As an heir, the number of churches and school-houses which the duke has been concerned in building is very considerable. He has one small possession in Fife—the island of Inchkeith (q. v.). The greatest public improvement ever executed in Scotland by an individual at his own private cost, has been carried by the Duke of B., after years of labour and at vast expense, to a successful issue. We allude to the creation of the deep-water harbour and port of Granton, on the Firth of Forth, two miles from Edinburgh—a work which, like the undertakings of the great Duke of Bridgewater, cannot fail to give lasting fame to its projector. The duke is lord-lieutenant of Midlothian and Roxburghshire, and captain of the Queen's body-guard in Scotland.

**BUCE'NTAUR**, the name of a ship which acquired much celebrity in Venice at the time when that state was a flourishing republic. A bucentaur was known as early as the end of the 12th c.; and a vessel of the same name was burnt when the French took Venice more than six centuries afterwards; but it is not certain whether this was the same vessel, maintained by being repeatedly patched up with new ribs and planking. The B. is described as having been a galley, about 100 feet long by 21 in extreme breadth; on a lower deck were 32 banks or rows of oars, manned by 168 rowers; and on an upper deck was accommodation for the illustrious visitors who occasionally came on board. The whole of the fittings were of the most gorgeous character. Although propelled mainly by oars, there were 40 mariners employed in other ways to manage the galley. The B. was employed only once a year, when the Doge 'married the Adriatic.' A splendid water-procession was formed, with the Doge and the chief notables in the B., and other distinguished persons in gondolas and feluccas; and when the vessels arrived at the mouth of one of the channels opening into the Adriatic, the Doge dropped a ring into the water, using the words: 'We wed thee with this ring, in token of our true and perpetual sovereignty.' This singular ceremony, which took place on Ascension Day, arose out of an honour or privilege conferred by the pope on the Doge in 1177, consequent on a splendid victory gained by the Venetians over the Emperor Frederick Barbarossa.

**BUCEPHALUS** (Greek, meaning 'ox-head'), the name of the favourite charger of Alexander the Great, was probably also the name of a peculiar breed of horses in Thessaly. According to tradition, Alexander in his boyhood was the first to break in the steed B., and thus fulfilled the condition stated by an oracle as necessary for gaining the crown of Macedonia.—The town **BUCEPHALIA**, on the river Hydaspes, in India, was founded near the grave of Bucephalus, which died during Alexander's Indian expedition.

**BUCE'R**, MARTIN, one of the church reformers of the 16th c., was born, 1491, at Schlettstadt, in Alsace. His real name was *Kuhhorn* (cow-horn), but in accordance with the fashion of his time among scholars, he changed it into its Greek equivalent; Bucer being derived from *bous*, an ox, and *keras*, a horn. At the age of 14, he entered the order of Dominicans. At the suggestion of his superior, he went to Heidelberg to study theology, devoting his attention, however, at the same time to the Greek and Hebrew languages. While

young, he was appointed chaplain to the Elector of the Palatinate. An acquaintance with the works of Erasmus had already inclined B. toward Protestantism, and his views were confirmed by the influence of Luther at the Heidelberg disputation in 1518. Following the example given by Luther at the Diet of Worms (1521), B. became one of the boldest and most decided of the German reformers. In 1523, he went to Strasburg, where he introduced the doctrines of the Reformation. In the disputes between Luther and Zwingli, he adopted a middle course, and endeavoured to make reconciliation between them; but his view of the sacraments, which approached that of Zwingli, exposed him to Luther's harsh reprobation. At the Diet of Augsburg, where he conducted himself with great circumspection and moderation, he generally accorded with the Lutheran views; but, along with other Strasburg theologians, declined to subscribe to the proposed confession of faith, and afterwards drew up the *Confessio Tetrapolitana*. An agreement, however, was subsequently entered into between B. and the Lutherans, and as a disciple of Luther, he appeared at the religious conference of the Reformers held at Leipzig. In consequence of his refusal to sign the *Interim* —a temporary creed drawn up by order of the Emperor Charles V.—B. found his situation irksome in Germany, and therefore accepted the invitation of Archibishop Cranmer (1549), and came to England to teach theology at Cambridge, and assist Paul Fagius and others in forwarding the Reformation. His modesty, blameless life, and great learning gained many friends in England; but his labours were soon interrupted by death, February 27, 1551. His remains were interred in a church at Cambridge with great solemnity; but during the reign of Mary, his bones, with those of Fagius, were taken from their graves, and burned in the market-place. His constant attempts to express himself in language agreeable both to Luther and Zwingli, induced in him at times an obscure, ambiguous, and elusive kind of thought, to which, perhaps, Bossuet refers when he stigmatizes B. as 'the great architect of subtleties.' B. was, of course, exposed to many censures and scandals by the assiduous malice of the Roman Catholic theologians, whose fertile imaginations during the Reformation period were exclusively devoted to the manufacture of indecent calumnies; but by Protestant writers he has been highly commended, and by some has been ranked above even Luther and Melanchthon. His best work is a translation and exposition of the Psalms, which he published under the pseudonym Aretinus Falinus (Strasburg, 1529). Hubert intended to edit the whole of B.'s writings in ten volumes, but only one volume appeared (Basel, 1577).

#### BUCEROS. See HORNBILL.

BUCH, LEOPOLD VON, one of the most celebrated German geologists, was born at Stolpe, in Prussia, in 1774 or 1777, and received instruction under Werner at the Mining Academy, Freiberg. He afterwards travelled in pursuit of his favourite science, through all the states of Germany, through Scandinavia as far as the North Cape, and through several parts of Great Britain, France, and Italy, visiting the Canary Islands in 1815. His chief writings are—*Geological Observations during Travels in Germany and Italy* (1802—1809), a *Physical Description of the Canary Islands* (1825), *Travels in Norway and Lapland* (1810), and essays *On the Jura in Germany* (1839), and *On the Mountain Systems of Russia* (1840), with several monographs on Ammonites (1832), and

other fossils. He was also the author of an excellent geological chart of Germany and its neighbouring states, published in 42 plates (2d ed., Berlin, 1832). He died in Berlin, March 4, 1853. B. has been described by an eminent scientific man as 'the only geologist who has attained an equal fame in the physical, the descriptive, and the natural history departments of his science. In all these, he has been an originator and a discoverer.'

BUCHAN, the north-east district of Aberdeenshire, consisting of about a fourth of the county, lying between the Ythan and the Dooveran. Its surface is undulating, the highest points being Mornmond Hill in the north, 742 feet, and Dudwick Hill in the south, 562 feet. Portions of the coast are bold and precipitous, especially for a few miles east of the Dooveran mouth, where Troup Head is 600 feet high, and south of Peterhead, where the coasts rise from 70 to 100 feet. Among the rocks five miles south of this town are the famous Bullers of B., a huge vertical wall in the granite margin of the sea, 50 feet diameter, and 100 feet deep, into the bottom of which the sea rushes by a natural archway, and, in storms, dashes up the sides with great violence. The eastern parts of B. consist chiefly of granite and gneiss, and the western of clay-slate and old red sandstone. The chief seats of population are Peterhead, Fraserburgh, Macduff, and Turriff. B. contains several so-called Druid circles, as well as the remains of the Abbey of Deer, and of several castles belonging to the Comyns, who held the earldom of B., but forfeited their title and property in 1309.

BUCHAN-NESS, the easternmost promontory of Scotland, in the north-east of Aberdeenshire, three miles south of Peterhead, in lat.  $57^{\circ} 28' N.$ , and long.  $1^{\circ} 46' W.$  A light-house, 130 feet high, with a revolving light, has been erected here. It may be stated that the low rocks at Peterhead stretch a little further east than the Buchan-neas. In the sea off the R. lie the Buchan Deeps, a great trough 50 to 90 fathoms deep, and 25 miles broad, and stretching south nearly as far as the Bell-rock. Outside lie the Long Forties, a bank at the depth of 35—45 fathoms, and 10—20 miles broad.

BUCHANAN, GENEZ, one of the most learned men of the 16th c., and a distinguished poet and historian, was born of poor parents at Killearn, in the county of Stirling, in February 1506. He was sent to the university of Paris by his uncle, who died two years afterwards, leaving B. without the means of prosecuting his studies. He returned home, served in one campaign against the English, and entered St Andrews University in 1524, where, in the following year, he took his degree of B.A. In 1526 he went to Paris, and became a student in the Scots College there. He subsequently obtained a professorship in the college of St Barbe, but returned to Scotland about 1537. During his residence on the continent, B. adopted the tenets of the reformed faith. A satire entitled *Sonsatum*, exposing the Franciscans, brought down upon him the wrath of the priests; and he had resolved upon seeking safety in his old college at Paris, when King James V. took him under his protection, and intrusted him with the education of one of his illegitimate sons. At the request of the king, B. wrote another and more pungent satire against the monks, entitled *Franciscanus*, increasing their anger, and rousing especially the bitter hatred of the powerful Cardinal Beaton, who, after a time procured B.'s arrest, and even went so far as to offer the king money for his life. Though to James was entirely due the publication of the offensive satire, he did not interfere to protect the 335

poet, who, however, contrived to effect his escape to Paris. After spending some years at Bordeaux and Paris in tuition, he accompanied the learned Portuguese, Gouvea, to the university of Coimbra, in Portugal, as one of his associates. After the death of Gouvea, B. was arrested as a heretic, and was for some time detained in a monastery, where he began his splendid Latin metrical version of the Psalms. In 1551, being restored to liberty, he went to England; but soon afterwards went to Paris. About 1560, he returned to Scotland, where he made an open confession of Protestantism. His reputation as a scholar gained for him a good reception at the court of the young queen, Mary, whose classical tutor he became. But his religious and political principles attached him to the party of the Regent Moray, by whose influence he was appointed Principal of St Leonard's College, in St Andrews University, in 1566. In the following year, he was chosen Moderator of the General Assembly—a very high honour for a layman. The doings of Mary, which scandalised the Scottish public, disgusted her tutor also, and he accompanied the Regent Moray to England, in order to give evidence against her before the commissioners appointed by Elizabeth to inquire into her guilt. His *Detectio Mariae Reginae*, laid before these functionaries, was industriously circulated by the English court. In 1570, B. was appointed tutor to the young king, James VI. (afterwards James I.), who owed to him all the erudition of which in later life he was so vain. No considerations of the future position of his pupil were allowed to interfere with B.'s treatment of him, which was strict, if not even stern; and in dedicating his *De Jure Regni apud Scotos* to the young monarch in 1579, he warned him against favourites with a freedom remarkable not only in a subservient but in any age. In 1570, B. was appointed director of Chancery, which he soon resigned, and in the same year was made keeper of the Privy Seal, an office which he retained until within a short time of his death. The latter years of his life were devoted to the composition of his *History of Scotland* (published in 1582). He died thirty days after its publication, on the 28th September 1582, and was buried in Greyfriars Churchyard, Edinburgh. As a scholar, B. was unrivalled in his age; and he wrote Latin poetry 'with the purity and elegance of an ancient Roman.' He was alike humorous, sarcastic, and profound. His *History*, written in Latin, is remarkable for the richness, force, and perspicuity of its style, though it has been found fault with for the partiality of its narration of contemporary events; and two years after the author's death, it, as well as *De Jure Regni*, &c., was condemned by the Scottish parliament, and every person possessed of copies was ordered to surrender them within 40 days, in order that they might be purged of 'the offensive and extraordinary matters' they contained. Two collected editions of B.'s works have been published—one by Ruddiman in 1715, 2 vols. folio; and another by Burman, Leyden, in 2 vols. quarto, in 1725. The translations that have yet appeared are far from doing justice to the original.

BUCHANAN, JAMES, a distinguished American statesman, was born in Franklin county, Pennsylvania, April 13, 1791. He was educated at Dickinson College, adopted the profession of the law, and, in 1814, was elected a member of the Pennsylvanian House of Representatives. In 1820, he was chosen a member of Congress, and remained so till March 4, 1831. In May of that year, he was nominated ambassador to Russia. He returned to the United States in 1834, and soon after was

elected a member of the Senate; he was re-elected in December 1836, and 1843. Appointed by President Polk, in March 1845, secretary of state, he held that office till the close of Polk's presidency. Ambassador to England in 1854, B. resigned that post the following year, and in 1856 was elected President of the United States. His administration was, on the whole, popular. He was in favour of the maintenance of slavery, but when the civil war broke out he warmly embraced Lincoln's policy. He died June 1, 1868.

BUCHANITES, an extraordinary sect of fanatics, which sprang up in the west of Scotland in 1783, but has now become extinct. The founder of the sect was Mrs or Lucky Buchan, born in Banffshire in 1738, of humble parentage. Her maiden name was Elspeth Simpson. She early fell into habits of vice, but with her licentiousness were combined a sort of religious fervour and extreme Antinomian opinions. In 1782, being resident in Glasgow with her husband, a potter, who ultimately divorced her, she became acquainted with the Rev. Hugh White, minister of the Relief congregation in Irvine, a weak vain man and coarse declamatory preacher, who adopted her opinions, for which he was deposed by his presbytery, and began along with her to found a new sect in Irvine. Popular tumults arose, which led to her expulsion from the town in May 1784. Mr White and his wife, with other devoted adherents, male and female, accompanied her, regarding her as a divinely commissioned person, and expecting her to lead them to the place where Christ was speedily to appear again on earth. She was addressed as 'Friend Mother in the Lord,' and among other more blasphemous pretensions, gave herself out to be the woman mentioned in Rev. xii., White being represented as the 'man-child' whom she had brought forth. She and her followers travelled towards Nithsdale, and found a resting-place in a barn at New Cample, near Thornhill, where they afterwards built for themselves a house of one apartment with a loft, in which they all dwelt, supported chiefly by the money of the more wealthy of their number. A few additional persons joined them. They lived in expectation of being translated to heaven without death; and on one occasion, after a fast of extraordinary duration, by which many of them were reduced to a very spectral condition, were led out by their prophetess to a hill-top to be immediately taken up, but returned disappointed. After this, dissensions began to arise among them; and some, recovering from their infatuation, left the society. Their expected heaven was one of mere sensual delights; and it is now sufficiently ascertained that they lived in unrestrained sexual intercourse—for they condemned marriage as unworthy of Christians—and that they systematically practised infanticide. Yet they were protected from the outbreaks of popular indignation, and no investigation was made by the authorities. On the failure of their means of subsistence, they took a farm in a moorish part of the stewartry of Kirkcudbright; and those who remained of them accumulated by their industry the means of purchasing a small property, on which was built the first house of the village of Crocketford, where they finally became extinct, the last of them surviving till 1846, full even in his old age of the strange delusions of his youth, and preserving in his house the bones of Lucky Buchan, which were buried with him in his grave.—See *The Buchananites from First to Last*, by Joseph Train. (Edin. 1846).

BUCHAREST, BUKHAREST, or BUKHOREST, the capital of Walachia, in a rich and

extensive plain on the Dumbovitz, a tributary of the Argish, in lat.  $44^{\circ} 26' N.$ , and long.  $26^{\circ} 5' E.$  It is a straggling and uninteresting town, with poor mean houses, many of them of mud; and unpaved and unlighted streets. There are, however, some handsome hotels; and the churches are numerous and many-spired, giving to the place a picturesque appearance. The hospodar's palace, a large structure in the centre of the town, has no claim to architectural beauty. The number of cafés and gambling-tables is excessive; and altogether B. has the unenviable reputation of being the most dissolute capital in Europe. The *cours*, or public promenade, is a miniature Hyde Park. B. is the entrepôt for the trade between Turkey and Austria, the chief articles of commerce being grain, wool, salt, honey, wax, building-timber, and cattle. It has some small manufactures of woollen cloths and carpets. B. has at various times suffered considerably at the hands of the Russians, and is remarkable as the place where in 1812 a treaty was concluded between Turkey and Russia, by which the former ceded to the latter the province of Bessarabia and a portion of Moldavia; Russia waiving her claim to all other territories she had conquered. This treaty also defined the Pruth as the boundary-line between the two empires. During the Crimean campaign, B. was successively occupied by Russians, Turks, and Austrians. Pop. (1866) 141,754; (1872) estimated at 221,000.

**BUCHEZ**, PHILIPPE BENJAMIN JOSEPH, a French physician, writer, and President of the National Assembly in 1848, was born in 1796 at Matagne la Petite, in the department of Ardennes, and studied medicine in Paris, 1815. He became involved in several plots against the Bourbons, was active in the conspiracy of the French Carbonari (q. v.), and supported the doctrines of St Simon (q. v.); but, after editing for some time the communist journal, *Le Producteur*, he separated from his colleagues. Curiously enough, during all his active career of underhand politics, he was prosecuting his learned studies, and in 1825, published a *Précis Élémentaire d'Hygiène*, besides editing the *Journal des Progrès des Sciences et Institutions Médicales*. After the revolution, 1830, B. established and conducted the journal *L'Européen*, the organ of Neo-Catholicism; and in concert with M. Roux Lavergne, began a republican history of the French Revolution. All his writings are marked by original views and arguments in favour of the belief in human progress. After the February revolution, 1848, B. was made President of the National Assembly; but, by his want of energy during the disturbance of May 15, he incurred the censure of all parties. On the inauguration of the Empire, B. returned to his studies. He died in 1866.

**BUCK**, a name sometimes distinctively appropriated to the male of the FALLOW DEER (q. v.), the female of which is a *Doe*. But the term B. is often also applied to the male of other species of deer, as of the ROEBUCK (q. v.), although never to that of the Red Deer (see DEER), which, when mature, is a STAG or a HAUL.

**BUCKBEAN**, or MARSH TREFOIL (*Menyanthes trifoliata*), a plant of the natural order *Genistaceæ* (q. v.), the only known species of its genus, widely distributed in all the colder parts of the northern hemisphere, and common in Britain. It has been described as 'perhaps the most beautiful' of all British plants. It grows in marshy places, its creeping root-stocks (or rhizomes) and densely matted roots often rendering boggy ground firm. The leaves are ternate, like those of the trefoils or clovers, and are supported on pretty long stalks.

The flower-stalk bears a compound raceme of 10—20 white flowers, externally tipped with red. The calyx is 5-parted; the corolla funnel-shaped, with a spreading 5-lobed limb, shaggy on the inner surface, with thick fleshy hairs. The fruit is a one-celled, two-valved capsule. The leaves are destitute of smell, but very bitter. From them is prepared a valuable bitter extract, which has long been used in

Buckbean.

cases of dyspepsia and disorders of the bowels, and which was also formerly employed in intermittent fevers. An infusion is also sometimes used, and sometimes the dried and powdered leaves. The whole plant seems to possess the same bitter and tonic properties. It is sometimes used in Germany as a substitute for hops. The root-stock, however, which is black and jointed, contains a considerable quantity of a kind of starch, which is separated from the bitter substance, and used as food in some of the northern parts of Europe.

**BUCKEYE**. See HORSE CHESTNUT.

**BUCK-HOUND**, a hunting-dog once common in Britain, when buck-hunting was a most fashionable amusement, but of which few packs now exist. The B. resembles a dwarf STAG-HOUND (q. v.), and possesses great strength and perseverance. Bucks are, however, often hunted by other kinds of hounds.

**BUCKINGHAM, DUKE OF**, GEORGE VILLIERS, the favourite of James I. and Charles I. of England, third son of Sir George Villiers, was born at his father's seat of Brookesley, Leicestershire, August 20, 1592. Knighted in April 1616, and sworn a gentleman of the bedchamber on January 1, 1617, he became Master of the Horse and a Knight of the Garter. Created the same year Baron of Whaddon and Viscount Villiers, and in January following Earl of B., and sworn of the privy-council, he was next made a Marquis, and appointed Lord-admiral of England, Chief-justice in Eyre of parks and forests south of the Trent, Master of the King's Bench Office, High Steward of Westminster, and Constable of Windsor Castle. In 1620, he married the daughter of the Earl of Rutland, the richest heiress in the kingdom. In 1623, while negotiations were in progress with the Spanish court for a marriage between the Infants and the Prince of Wales, afterwards Charles I., B. persuaded the latter to go himself to Madrid and prosecute his suit in person. The ultimate failure of the negotiations has been ascribed to B.'s arrogance. In his absence he was created a Duke, and on his return nominated Lord-Warden of the Cinque Ports, and Steward of the Manor of Hampton Court. By his advice, James declared war against Spain. On the accession of

## BUCKINGHAM—BUCKINGHAMSHIRE.

Charles I., in 1625, B. maintained his ascendancy at court, but after the ill-fated expedition against Cadiz, he became odious to the nation, and was saved from impeachment only by the king's dissolving parliament. The treaty for the marriage of Charles with the Princess Henrietta of France was concluded by him, but he was not allowed to return to Paris, in consequence of his audacity in lifting his eyes to the French queen. In 1627, with an armament of 100 sail and 7000 soldiers, he appeared before Rochelle, then in possession of the Huguenots, who refused him admission within the harbour. His troops then made an ill-conducted descent on the neighbouring Isle of Ré, and returned to England beaten and disgraced. He soon after undertook a second expedition to Rochelle, and proceeded to Portsmouth for embarkation, when he was assassinated by a discontented subaltern-officer, named Felton, August 23, 1628, in his 36th year.

**BUCKINGHAM**, 2d DUCHESS OF (GEORGE VILLIERS), a brilliant but profligate nobleman, son of the preceding, was born at Wallingford House, Westminster, January 30, 1627, and studied at Cambridge. On the outbreak of the civil wars, he served in the royal army; his estates were confiscated by the parliament, and he took refuge on the continent. He attended Charles II. into Scotland, and after the battle of Worcester, in 1661, went again into exile. Returning secretly into England, he married, in 1667, the daughter of Lord Fairfax, the parliamentary general, to whom his forfeited estates had been assigned. Arrested by Cromwell, and committed to the Tower, he was afterwards removed to Windsor Castle, but released on the abdication of Richard Cromwell. At the Restoration, he recovered his estates, and was made Master of the Horse, and sworn of the privy-council. He was mainly instrumental in the fall of the chancellor, Clarendon, whom he made an object of ridicule to the king, and was one of Charles's confidential ministers, who, from the initial letters of their titles, were called 'the Cabal.' Engaging in 1666 in some treasonable practices for effecting a change in the government, he was deprived of all his offices at court, but, on his submission, soon recovered them. In 1670, he was sent ambassador to France, and was employed on some other embassies. He was elected chancellor of the university of Cambridge in 1671. Supporting the nonconformists in 1674, he opposed the Test Act, and was deeply engaged in the Popish Plot. After Charles's death, in 1685, B. retired to his manor of Helmaley, in Yorkshire, and amused himself with the chase. He died at Kirkby-Moorside, April 16, 1688, and was interred in Westminster Abbey. The manufacture of glass and crystal is said to have been introduced into England from Venice by him. B. was the author of several stage-plays, of which the best is *The Rehearsal*, a comedy; *A Satire against Mankind*; and some poems.

**BUCKINGHAM**, JAMES SILK, a modern traveller and popular lecturer, the son of a farmer, born in 1786, at Fushing, near Falmouth, Cornwall; when a boy, went to sea, and made several voyages to Lisbon. After years of unsettled and wandering life, he, in 1816, established a journal at Calcutta, but the boldness of his censures on the Indian government led to his expulsion from the presidency of Bengal. His lectures, on his return to England, against the East India Company monopoly, and in support of opening the trade to China, tended greatly to direct public attention to the subject. In London, he established *The Oriental Herald*, and *The Atheneum*, now the leading weekly literary journal. Subsequently, he travelled through the United

States, and from 1832 to 1837 was M.P. for Sheffield. He was projector and secretary of the British and Foreign Institute, literary club, 1843—1846; and president of the London Temperance League, 1851. B. was the author of numerous works of travel on the continent, in the east, and in America. He was engaged on his autobiography, two volumes of which were published before his death, which took place June 30, 1855.

**BUCKINGHAM**, the old county town of Buckinghamshire, in the north part of the shire, is situated on the Ouse—which flows round the town, and has three bridges. B. is 61 miles north-west of London by rail. It returns 1 member to parliament. Pop. (1871) 7545. Bobbin lace is the chief manufacture, but it is on the decline. B. is a place of considerable antiquity. Edward the Elder fortified it in 978, and the Danes captured it in 1010. The Earls of Buckingham built a castle here soon after the Norman conquest. Edward III. made it a staple for wool. Here Catharine of Aragon received the news of the battle of Flodden, and Charles I. had his head-quarters in B. for a few days in 1644.

**BUCKINGHAMSHIRE**, a south-midland county of England, its greatest length being about 54 miles, its average breadth 18, and total area 738 square miles. The plastic clay tertiary strata occupy the southern parts of the county, which is finely diversified with hill and dale, wood and water. To the north is a broad chalk-band, including the Chiltern range of chalk-hills, which enter from Oxfordshire, and stretch across the county in a north-east direction into Bedfordshire, partly covered with heath and wood, and near Ivinghoe and Wendover, above 900 feet high. Sloping north from these hills, and crossed by narrower bands of greensand and oolite, is the extensive and very fertile vale of Aylesbury, watered by the Thame. The chief rivers are the Thame, bordering the county on the south-west, the Ouse, Ousey, Colne, and Thame, the latter two falling into the Thame. The Grand Junction Canal, and the Great Western and North-western Railways, intersect the county on the east and south. The climate of Bucks is mild and healthy; the soil is mostly good, chalk and clay predominating. About half the county is under tillage, the rest in meadow and pasture. The agriculture is not equal to the capabilities of the land, which is often overcropped and exhausted. The farms are generally small, averaging 200 acres. The cottages are generally good. Wheat and beans are the principal crops. The chief dairy product is butter, of which four to five millions of pounds are annually sold, chiefly in London. In the vale of Aylesbury, fattening of cattle is extensively carried on; the sheep are noted for their fine and heavy fleeces; and large numbers of ducks are reared for metropolitan consumption. In June 1873, the number of cattle in the county was 66,931; sheep, 288,341; and pigs, 43,301. Beech and oak are the chief timber-trees, but box and juniper are also grown. The chief manufactures are paper, straw-plait, and thread-lace. B. returns 8 members to parliament—3 for the county and 5 for the boroughs. The chief towns are Aylesbury, Buckingham, Marlow, and Wycombe. B. contains some Roman and British remains, as traces of Watling, Icknield, and Akeman Streets or Waya. The chief ecclesiastical ruins are those of Missenden and Notley Abbey, the latter of which has been converted into farm-buildings. There are many examples of early English and decorated architecture. The church of Chetwode, near Buckingham (13th c.), contains some very fine examples of ancient glass-staining. Many

events of historical interest occurred in this county. It was the scene of contest in the civil wars of Stephen and John. At Chalfont St Giles, Milton finished his *Paradise Lost*, and at Horton, he wrote *L'Allegro*. At Hampden lived the great patriot of that name; Waller was proprietor of Beaconsfield Manor; Atterbury was born at Milton; Stoke Poges Churchyard suggested Gray's *Elegy*, and is the place of his burial; at Olney, Cowper lived; at Gregories, near Beaconsfield, Burke died and was buried; Scott, the biblical commentator, was rector of Aston Sandford; Herschel's great telescope still stands at Slough, where he made most of his important discoveries; and at Stowe is a magnificent mansion—one of the finest in England, alike for its extent and architecture and the beauty of its site—formerly belonging to the Duke of Buckingham. Pop. (1871) 175,879.

**BUCKLAND**, WILLIAM, D.D., a distinguished geologist, whose labours tended greatly to the advancement of science, was born at Axminster, Devonshire, England, in 1784. Educated at Winchester and Oxford, he was appointed, in 1813, Reader in Mineralogy in Oxford University. The same year, he was elected a Fellow of the Geological Society, and he was twice its president. In 1818, he became Reader in Geology at Oxford, and was elected Fellow of the Royal Society. In 1822, he received the Copley medal, for an account of an assemblage of fossil teeth and bones of 22 different animals, discovered in a cave at Kirkdale, Yorkshire; and in 1823, he published a treatise founded on it, entitled *Reliquiae Diluvianae, or Observations on Organic Remains, attesting the Action of a Universal Deluge*, a theory which he afterwards saw cause to modify. In 1825, B. was appointed a canon of Christ Church, Oxford. In 1837, he was chosen a member of the Council of the Royal Society; in 1832, he was elected president of the British Association at Oxford, its second meeting; and in 1836, he published his Bridgewater Treatise, *Geology and Mineralogy considered with Reference to Natural Theology* (2 vols. 8vo). To the Transactions of the Geological Society he contributed many valuable papers; and his sketch of the structure of the Alps, in the *Annals of Philosophy*, is esteemed one of the most interesting of his geological writings. In 1845, he was made Dean of Westminster, and in 1847 a trustee of the British Museum. Under his great and continuous labours to benefit others, his mental faculties gave way some years before his death, which took place August 14, 1856.

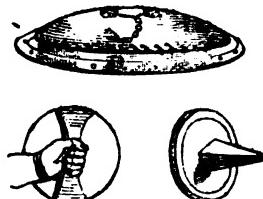

**BUCKLANDIA**, a magnificent and beautiful evergreen tree of the natural order *Hamamelidaceae* (q. v.), a native of the Himalaya mountains. It grows unbranched to the height of 40 feet, the trunk sometimes 21 feet in girth at 5 feet from the ground. The foliage is thick, bright, and glossy. The timber is not valuable. Dr Hooker thinks that this tree would probably succeed in the mild climate of the west of England.

**BUCKLE**, HENRY THOMAS, an author who attained a sudden notability in 1857 by the publication of the first volume of a work entitled *The History of Civilisation in England*. He was born at Lee, in Kent, November 24, 1823, and was for a very short time at Dr Holloway's school in Kentish-Town, near London. No other school and no university claims credit for his education, which nevertheless was in the highest degree liberal. An easy fortune, and a large library, enabled Mr B. to gratify, without any sort of impediment or restraint, an all-absorbing love of letters. After bringing out a second volume of his work in 1861, he undertook

a journey to the East, in order to restore his health and extend his knowledge. Having spent the winter in Egypt, he went over the desert to Syria, caught typhus fever by the way, and died at Damascus, May 1862.

B.'s plan involved, before tracing the particular history of English civilisation, a general consideration of the progress of those European countries, England, France, Germany, Scotland, Spain, and America, in which the elements of modern civilisation are originally found. The two volumes published are occupied with this preliminary examination, which they do not even complete. His objects, however, are clear. They are (1.) to discover what is the essential spirit of a nation's history apart from particular men and events, and (2.) to trace out the causes of the progress which has been made in England and France. Under the first head, B. endeavours to show that the spirit or character of a people is dependent on material circumstances, such as soil, climate, food, aspect of nature, and the like, and to be sought for in these; under the second head occurs the theory, the vigorous application of which by B. has startled and offended many readers—viz., that the progress of society depends upon scepticism; that the retarding force is credulity; and that the excessive 'protection' exercised by governments, the nobility, the church, &c., over the 'people,' has dwarfed and held back the spirit of freedom and civilisation. These, and other positions, are defended by B. with great vigour, ingenuity, and lucidity of argument and expression, and have been acknowledged, even by the adherents of an exactly opposite school, to contain much sound truth, which is too often overlooked. He is accused, however—and perhaps not without justice—of being often one-sided, and of drawing sweeping deductions from an imperfect survey of the facts. B. had the reputation of being one of the best chess-players in the world.

**BUCKLER**, in old armour, was a kind of shield worn on the left arm. The bucklers worn by the *hastati*, or spearmen, among the ancient Romans, were about 4 feet long, by 2½ in width, made of

Buckles.

boards, covered on the inside with linen and sheep-skin, and on the outside with iron-plate. In the middle ages, the B. was round, oval, or square in shape, and was frequently made of wicker-work or of hide, strengthened by metal-plates.

**BUCKLES**, metal instruments, consisting of a rim and tongue, used for fastening straps or bands in dress and harness. The use of B., instead of shoe-strings, was introduced into England during the reign of Charles II. They soon became very fashionable, attained an enormous size (the largest being called Artois buckles, after the Comte d'Artois, brother of the king of France), and were usually made of silver, set with diamonds, and other precious stones. In the latter half of last century the manufacture of B. was carried on most extensively in Birmingham, there being at one time

not less than 4000 people employed in that town and its vicinity, who turned out 2,500,000 pairs of B. annually, at the average value of 2s. 6d. per pair. When the trade was at its height, however, fashion changed, and in 1791 we find buckle-makers petitioning the Prince of Wales for sympathy, on the ground that the introduction of shoe-strings had nearly ruined their trade. The prince promised to assist them as far as he could, by wearing B. himself, and enjoining his household to do the same; but fashion was too strong even for him, and B. became almost extinct. The opportunity, however, as is remarked by a writer in *Notes and Queries* for 1854, 'which buckles afford of ornament and expense has preserved them as a part of the court-dress; and of late years they have appeared a little in private society. They are generally, though not always, worn when a prince of the royal family is of the party; and at the king's private parties, although the rest of the dress be that usually worn, buckles are almost indispensable.' Large shoe-buckles, of silver or other metal, are still worn by the clergy of several continental countries, as part of their ordinary costume.

BUCKSKIN is a fanciful name for a heavy-made, strong-twilled woollen fabric, for trouserings—highly milled to about the usual width for such goods—27 inches; and cropped and finished, with the pile or nap so shorn as to shew the texture through it.

BUCKSTONE, J. B., a distinguished comedian and dramatic writer, was born in the suburbs of London, in 1802. Preferring the excitement of the stage to the monotony of an attorney's office, he sought and soon found an opportunity in a provincial town for the display of his theatrical abilities. After a probation in the country, he appeared at the Surrey Theatre in 1823, and his success was so unequivocal, that he was soon engaged by the 'management' of the Adelphi Theatre, where he continued for many years as leading low comedian. He afterwards played at the Haymarket and Drury Lane Theatres. For 20 years he has been lessee of the Haymarket. B.'s acting is not more noted for its comicality and humour, which never degenerates into vulgarity, than for its distinct appreciation of the peculiar traits in each individual character he assumes. In all his delineations there is, as in the pictures of the old masters, the same broad general effect, but the details of each are wrought out with the care and minuteness of a pre-Raphaelite. But B. is fully more celebrated as an author than an actor. He has written more than 150 pieces for the stage, many of which enjoy a rare popularity. Among the best known are, *The Green Bushes*, *The Flowers of the Forest*, *Luke the Labourer*, *The Wreck Ashore*, *The Rough Diamond*, *Good for Nothing*, *The Irish Lion*, and *The Alarming Sacrifice*.

BUCKTHORN (*Rhamnus*), a genus of shrubs or small trees of the natural order *Rhamnaceæ* (q. v.), distinguished by a bell-shaped 4-5-cleft calyx, which divides around the middle after flowering, the upper part falling away, and the base remaining and adhering to the fruit; which is globose, and sometimes succulent, sometimes rather dry or spongy, with 2-4 stones. The petals are sometimes wanting. Some of the species are dioecious, some hermaphrodite. They are numerous, and natives of most of the tropical and temperate regions of the world.—The COMMON BUCKTHORN (*R. catharticus*) is a deciduous shrub or low tree, frequent in England and in other parts of Europe and the north of Asia. The leaves are ovate, crenate, and bright green; the branches spiny; the flowers small, yellowish-green, and densely clustered; male and female flowers on

separate plants; the berries about the size of peas, globular, bluish-black, nauseous, and violently purgative. They were formerly much used in medicine, but now more rarely, and only in the form of a syrup prepared from their juice. They supply the *Sap Green* (q. v.) or *Bladder Green* of painters. The bark affords a beautiful yellow dye. The B. is sometimes planted for hedges, but is of too straggling a habit.—The ALDER BUCKTHORN, or BERRY-BEARING ALDER (*R. frangula*), is also a native of

Alder Buckthorn (*Rhamnus frangula*).

Britain, and is frequent in woods and thickets throughout Europe. It is a shrub, rarely a small tree, with spineless branches, oval entire leaves, and small, whitish, axillary flowers, which are in general somewhat clustered. The bark of the twigs is gray, and has a very disgusting smell and a nauseous bitter taste. It was formerly used in medicine, along with that of the last species, and has recently been recommended in many quarters as a remedy for intermittent fevers. It contains principally an acrid bitter extractive, a volatile oil containing hydrocyanic acid, and a yellow colouring matter called *Rhamnin*. The berries are small and black, and violently purgative. It is objected to their use in medicine that much sickness and thirst attend it. The charcoal of the wood is light, and is used for the preparation of gunpowder. The bark, leaves, and berries are used for dyeing; the bark for dyeing yellow, and with preparations of iron, black; the unripe berries to dye wool green and yellow; the ripe berries to dye it bluish-gray, blue, and green. The flowers are peculiarly grateful to bees.—DYER'S BUCKTHORN (*R. infectorius*) is a low shrub, abundant in the south of Europe, whose unripe fruit yields a brilliant yellow dye. The berries and inner bark of *R. tinctorius*, a native of Hungary, are also used in dyeing; and the berries of *R. sazatilis*, a procumbent shrub, growing amongst rocks as far north as Switzerland. The French Berries, Avignon Berries, or Yellow Berries of dyers, are the fruit of *R. infectorius*, *R. sazatilis*, *R. amygdalina* (or *oleoides*), and *R. Clusii*.—The SEA BUCKTHORN is a shrub of a different genus and order. See SALLOW-THORN.

BUCKU, a name common to several small shrubs of the genus *Bacoma* (formerly included in *Diosma*), natives of the Cape of Good Hope, the leaves of which are used in medicine—sometimes in the form of a powder, more generally of an infusion or a tincture—particularly on account of their powerful operation on the urinary organs, as in chronic inflammation of the bladder, urinary calculus, &c. They

## BUCKWHEAT—BUD.

are also used in dyspepsia, rheumatism, and dropsy; and are stimulant and antispasmodic, diuretic, diaphoretic, and tonic. They generally appear in commerce mixed with stalks and fruit. They are smooth, leathery, and shining, more or less crenated or serrated, and are much covered with pellucid dots, which are glands filled with a strongly smelling yellowish volatile oil. The strong odour of B. leaves is generally regarded as disagreeable, but the Hotentots perfume themselves with them. They have a warm taste, resembling that of mint.—The genus *Barosma* belongs to the natural order *Rutaceæ*, and is distinguished by regular flowers with 5 petals, 5 fertile and 5 abortive scale-like stamens, anthers bearing a minute terminal gland, and a 5-lobed ovary. The species principally yielding the B. leaves of the shops are *B. serratifolia*, *B. crenata*, *B. crenulata*, and *B. venusta*.

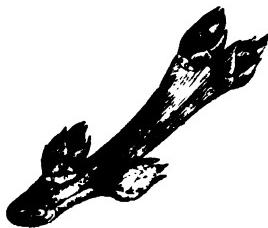

**BUCKWHEAT** (*Fagopyrum*), a genus of plants of the natural order *Polygonaceæ* (q. v.), or, according to many botanists, a subgenus of *Polygonum*, distinguished by the central embryo, and by racemes of flowers grouped in panicles. **COMMON B.** (*Fagopyrum esculentum*, or *Polygonum Fagopyrum*) is a native of the basin of the Volga, the shores of the Caspian Sea, and many parts of Central Asia, from which it is said to have been introduced by the Moors into Spain, and thence to have extended over Europe, in many parts of which, and in some places in Britain, it is now naturalised. Another account represents it as having been brought to Europe by the Crusaders. In France, it is called *Blé Sarrazin*, or Saracen wheat. It is cultivated on account of the farinaceous albumen of its seeds, which are used, as grain, for food of man and cattle. It is upright, branched, 1–3 feet in height; the leaves are between heart-shaped and arrow-shaped, the flowers pale red, the seed (nut) black and triangular, the angles even (not toothed). The resemblance of this seed in form to the beech-nut is supposed to be the reason of the German name *Buchweizen* (beech-wheat), from which the English name is derived. B. is a very common crop in some parts of Europe, and of the United States of North America; but is seldom sown in Britain, except as food for pheasants. It requires continued dry weather in autumn for profitable harvesting, and this in the climate of Britain cannot well be reckoned on. In Germany, B. is much valued as a crop, particularly for moor-lands and other poor soils. In Bretagne, also, it is as extensively cultivated as wheat. It yields very abundantly, and requires little attention and little manure. Forty bushels or more per acre may be expected, weighing 46 or 48 lbs. per bushel; and notwithstanding the resemblance of the seed to grain in its qualities and uses, wheat, or any other cereal crop, generally succeeds well after B., if care has been taken to keep the land clear by tilling. The seed is most frequently used in the shape of groats, or made into porridge, and in the United States thin cakes are very often made of it. It is very nutritious, containing about 10 per cent. of gluten and 52 per cent. of starch, besides about 6 per cent. of gum and sugar. It is said to be as good as barley for fattening cattle, and better for horses than oats. But as the seed is covered with a very hard rind or thin shell, it must always be shelled before being given to cattle. Poultry are very fond of it. Beer is sometimes brewed from it, and it yields a spirituous liquor of good quality; indeed, it is frequently used in gin-distilleries. As green fodder, the herbage of the plant is said to be more nutritious than clover; but it acts as a narcotic on sheep. Bees delight in its flowers, and in some parts of the United States it is sown on this account. In America the seed

is usually sown broadcast over the land which has been ploughed in autumn or early spring, and well scarified or harrowed. About a bushel and a half of seed is required when sown broadcast, but a bushel is sufficient if drilled with a machine. In the latter case it should not be sown in narrower drills than one foot apart, but two feet is recommended as being better for the succeeding crop, as the wider intervals can be properly cultivated. It should not be sown in England before the middle of May, as the least frost is injurious. When the lower seeds are ripe it should be mown, as they are easily shed out if allowed to stand too long. When bread made from B. forms the principal food of the people, it is thought to have an injurious action on the brain. As a supplementary article, however, it is a favourite among all classes where it is raised.—**TARTARIAN B.** (*F.* or *P. Tataricum*) is distinguished by the toothed edges of the seeds and its more vigorous growth. It is hardy, and adapted for cold situations. It is a native of Siberia. It is very productive, but the seed falls out when ripe more readily than that of the common species; and the flour is darker coloured, and somewhat bitter.—**NOTCH-SEEDED B.** (*F.* or *P. emarginatum*) is said to be a native of China. Its seeds are larger than those of Common B., and their angles are winged. When grown in Britain, many of its flowers are generally abortive.—**PERENNIAL B.** (*F.* or *P. cymosum*) is a native of Nepaul, very vigorous in its growth, but producing, at least in Britain, comparatively little seed.—The triangular black seed of Climbing B. or Blackbine (*F.* or *P. Convolvulus*), familiar to every one who has eaten oatmeal cakes or porridge, greatly resembles B., but is smaller. The plant—a very common weed in gardens and cornfields in Britain—also exhibits much similarity, notwithstanding its different habit and twining stem.—**DYER'S B.** is *Polygonum tinctorium*. See POLYGONACEÆ.

**BUCOLIC**, a term derived from the Greek, meaning 'belonging to herdsmen,' and equivalent to the Latin term *Pastoral*. See PASTORAL POETRY.

**BUD** (*gemma*), in Botany, that part of a plant which contains the rudiments of leaves or flowers prior to their development. Buds are distinguished into *leaf-buds* and *flower-buds*, the former producing leaves, and having a power of extension into a branch; the latter producing flowers only, and ordinarily destitute of this power of extension. The different parts of the flower being regarded, however, as *leaf-organs* or altered leaves (see FLOWER), the flower-bud may be regarded as merely a modified leaf-bud; and it is well known that by treatment which checks the luxuriant growth of a plant, it may be caused to produce flower-buds where only leaf-buds could otherwise have been expected to appear—a physiological fact, of which advantage is taken in various ways by gardeners, as by removing portions of the bark and even of the woody part of the stem, root-pruning, confining the roots in a flower-pot, &c. Buds usually appear in the axils of leaves, the terminal bud of a branch being no exception to this rule; and there is no leaf without one or more buds in its axil, although many never pass beyond the most rudimentary state. See BRANCH. In cold and temperate climates, buds are formed about midsummer, beginning to appear as soon as the young branch which bears them has itself been properly developed, and are generally covered with scales and often also coated with resinous matter, by which their tender contents are protected from the severity of winter; but in the trees of warm climates, the protection of scales is generally wanting. Within the leaf-bud, the future

leaves may be discovered, often very curiously folded or rolled up, and the different forms and positions which the leaves assume in the bud, are very characteristic of different kinds of plants. This is called the *vernation* (q. v.) of leaves, and is analogous to the *activation* (q. v.) of flowers.

Leaf-bud.

The buds of exogenous plants originate in cellular prolongations of the medullary rays bursting through the bark; those of endogenous plants are in communication with the cellular matter which lies between the bundles of woody tissue in the stem; and buds elongate into branches by the addition of new cellular matter to the extremity. Leaf-buds are capable of subsisting when separated from the parent plant and placed in favourable situations, developing themselves into new plants with the most exact correspondence in their characteristics to the parent plant; and of this gardeners avail themselves in the process of *budding* (q. v.), and in various ways for the propagation of plants. Some plants propagate themselves by a natural detachment of buds (*bulbils* or *bulblets*), modified into a character analogous to that of *bulbs* (q. v.); and bulbs themselves may indeed be regarded as subterranean leaf-buds with thickened scales. The eyes of the potato are also subterranean leaf-buds, the tuber being regarded as a thickened subterranean stem; and all plants with subterranean stems produce subterranean leaf-buds, sending above ground only herbaceous annual shoots, as Asparagus, the Banana, &c. Buds may be produced in exogenous plants from the extremity of any medullary ray, and may be made to spring from a leafless part of the stem by an incision, the effect of which is to direct a greater supply of sap to the part immediately beneath it. In a few plants, buds are produced on the edges, or even on the surface of leaves. In consequence of their power of independent existence, buds have been looked upon by some physiologists as distinct organised beings congregated in the tree or plant, a view which involves exaggeration, and therefore error.—Flower-buds cannot be used for budding, or otherwise for propagation of the plant, but when removed from their original stock, always die.

Some of the lowest animals propagate themselves by buds (*gemmation*), and many of the zoophyte systems or polypidoms extend in this manner. See *GEMMATION*, *REPRODUCTION*, *POLYPID*, and *ZOOPLANTAE*.

BUDA (Slavonic, *Bu'din*; German, *O'fen*), a city of Hungary, forming with Pesth (with which it is united by a magnificent suspension-bridge) the capital of the country, is situated on the right bank of the Danube, about 130 miles south-east of Vienna, in lat. 47° 29' N., and long. 19° 3' E. B. has a highly picturesque appearance, being built round the Schlossberg (Castle-hill) in the form of an amphitheatre, in the midst of a district covered with vineyards. Crowning this centre hill or rock, which has an elevation of 456 feet above the sea, is the citadel; the palace in which are preserved the royal insignia

of Hungary; and an old Gothic church. Behind, and towering above the rock, rises the Blocksberg, strongly fortified, with a precipitous face to the Danube, the slopes of the other sides being occupied with houses. B. has many educational and charitable institutions; and a fine observatory crowns the Blocksberg. It has some celebrated hot sulphur springs, with a temperature of 117° F., from which it derives its German name, Ofen (Oven). Three of the baths erected by the Turks are still in a perfect state of preservation, and are much frequented by the common people. B. has some manufactures of silk, velvet, woollen, cotton, leather, and gunpowder; and cannon and type foundries; but its chief trade is in wine, of which it produces between four and five millions of gallons annually. This is known as the 'Ofenerwein,' and is of excellent quality. Pop. (1869) 53,998. B. is a place of great antiquity, but its importance dates from 1240, when the fortress was erected on the Schlossberg. During the invasions of the Turks, it was regarded as the key of Christendom. It was captured by Solyman the Magnificent in 1526, but retaken in the following year by Ferdinand I., king of Bohemia. In 1614 it was again taken by Solyman, who introduced into it a garrison of 12,000 janizaries; and it remained in the possession of the Turks until 1686, when it was captured by the Duke of Lorraine. During the Hungarian struggle of 1848—1849, the city suffered considerably. The fortifications of B., within recent years, have been greatly strengthened.

BUDÆUS (the Latinised form of *Guillaume Bude*), one of the greatest French scholars of his age, was born in Paris in 1467. He studied there and at Orleans. His works on philology, philosophy, and jurisprudence display extensive learning, but the two best known are the *De Aree et Partibus eius* (Paris, 1514), which contains a very thorough investigation into ancient coins; and the *Commentarii Lingua Graeca* (Paris, 1519), which greatly advanced the study of Greek literature in France, and is still held in high estimation by classical scholars. B.'s knowledge of Greek was particularly good. His style both in Latin and French is nervous, but harsh, and abounds in Greek constructions. His abilities were manifested not only in literature, but in public business. Louis XII. twice sent him to Rome as ambassador; and Francis I. also employed him in several negotiations. At B.'s suggestion, Francis founded the *Collège de France*, and was also persuaded to refrain from prohibiting printing, which the bigoted Sorbonne had advised in 1533. During his life, B. held several important offices. He was Royal Librarian, Maitre des Requêtes, and Provost of Paris. He died 23d August 1540. A collected edition of his works appeared at Basel in 1557. B. was suspected of a leaning towards Calvinism. Certain circumstances render this highly probable. In his correspondence with his friend Erasmus, he repeatedly expresses his contempt for monks and ignorant ecclesiastics, and on one occasion terms the doctors of the Sorbonne 'prating sophists.' Besides, what is perhaps even more conclusive, shortly after his death, his widow and several members of his family went to Geneva, and openly abjured Catholicism.

BUDDHISM, BUDDHA. The religion known as Buddhism (from the title of 'The Buddha,' meaning 'the Wise,' 'the Enlightened,' acquired by its founder) has existed now for 2460 years, and may be said to be the prevailing religion of the world. In Hindustan, the land of its birth, it has now little hold, except among the Nepalese and some other northern tribes; but it bears full sway in Ceylon, and over the whole Eastern Peninsula; it divides

## BUDDHISM.

the adherence of the Chinese with the systems of Confucius and Lao-tse, claiming perhaps two-thirds of the population; it prevails also in Japan (although not the established religion); and, north of the Himalayas, it is the religion of Tibet (where it assumes the form of Lamaism), and of the Mongolian population of Central Asia, and extends to the very north of Siberia, and even into Swedish Lapland. Its adherents are estimated at 400 millions—more than a third of the human race. Yet, until within the last sixteen years, nothing was known in Europe respecting the nature and origin of this world-religion, beyond the vaguest notices and conjectures. About the year 1828, Mr R. H. Hodgson, British resident at the court of Nepal, where Buddhism prevails, discovered the existence of a large set of writings in the Sanscrit language, forming the national canonical books. These books have since been found to be the texts from which the Buddhist scriptures of Tibet, Mongolia, and China must have been translated. The books of the Ceylon Buddhists are in the language called Pali; and though not translations of the Nepalese standards, they are found to agree with them in substance, and to be only another and somewhat later version of the same traditions. Translations from the Ceylon standards are used by the Buddhists of Burma and Siam. Copies of the Sanscrit books of Nepal, having been sent by Mr Hodgson to the Asiatic Societies of London and Paris, engaged the attention of the eminent Oriental scholar, Eugène Burnouf, who published in 1844 his *Introduction to the History of Buddhism*; and this book may be said to have been the beginning of anything like correct information on the subject among the western nations.

The most diverse opinions had previously prevailed as to the time and place of the origin of Buddhism. Some looked upon it as a relic of what had been the original religion of Hindustan, before Brahmanism intruded and drove it out; a relic of a wide-spread primeval worship, whose ramifications it was endeavoured to trace by identifying Buddha with the Woden of the Scandinavians, the Thoth or Hermes of the ancient Egyptians, and other mythological personages. Others held that it could not be older than Christianity, and must have originated in a blundering attempt to copy that religion—so striking are the many points of resemblance that present themselves. Although the means are still wanting of giving a circumstantial history of Buddhism, the main outline is no longer doubtful. Oriental scholars now concur in fixing the date of its origin about the beginning of the 6th c. B.C., and in making it spring up in the north of Hindustan. According to the Buddhist books, the founder of the religion was a prince of the name of Siddhartha, son of Suddhodana, king of Kapilavastu, which is placed somewhere on the confines of Oude and Nepal. He is often called Sakya, which was the name of the family, and also Gautama, the name of the great 'Solar' race of which the family was a branch. The name Sakya often becomes Sakya-muni (*muni*, in San., means 'solitary,' and is allied to Gr. *monos*, the root of 'monk'), in allusion to the solitary habits assumed by the prince. To Gautama is frequently prefixed *Sramana*, meaning *ascetic*. Of the names, or rather titles, given to Siddhartha in his state of perfection, the most important is the *Buddha*,\* which is from

the root *budh*, to know, and according to Wilson, means properly, 'he to whom truth is known': it is indicative of the leading doctrine of his system. Others are—'The Blessed' (Bhagavat); 'the Venerable of the World'; 'the Bodhisattva,' the import of which will be afterwards explained. The history of this person is overlaid with a mass of extravagant and incredible legend; and at least one eminent Orientalist, Professor H. H. Wilson, thinks it still doubtful whether the Buddha was an actual historical personage, and not rather an allegorical figment. Agreeing that the doctrine was introduced about the time assigned, he thinks it more likely that it originated with a school formed of persons of various castes, comprising even Brahmins. But by Oriental authorities generally, the Buddha is received as the actual personal founder of the religion that goes by his name.

Assuming that the Buddha was a real person, and that there is a basis of fact under the mass of extravagant fable with which he is surrounded, the history of Buddhism may be thus briefly outlined: The Prince Siddhartha gives early indications of a contemplative, ascetic disposition; and his father, fearing lest he should desert his high station as Kshatriya (see HINDUISM and CASTE) and ruler, and take to a religious life, has him early married to a charming princess, and surrounded with all the splendour and dissipation of a luxurious court. Twelve years spent in this environment only deepen the conviction, that all that life can offer is vanity and vexation of spirit. He is constantly brooding over the thought that old age, withered and joyless, is fast approaching; that loathsome or racked sickness may at any moment seize him; that death will at all events soon cut off all present sources of enjoyment, and usher in a new cycle of unknown trials and sufferings. These images hang like Damocles' swords over every proposed feast of pleasure, and make enjoyment impossible. He therefore resolves to try whether a life of austerity will not lead to peace; and, although his father seeks to detain him by setting guards on every outlet of the palace, he escapes, and begins the life of a religious mendicant, being now about 30 years old. To mark his breaking off all secular ties, he cuts off the long locks that were a sign of his high caste; and as the shortened hair turned upwards, he is always represented in figures with curly hair, which induced early European writers to consider him as of Ethiopian origin. He commences by studying all that the Brahmins can teach him, but finds their doctrine unsatisfactory. Six years of rigorous asceticism are equally vain; and resolving to return to a more genial life, he is deserted by his five disciples, and then undergoes a fierce temptation from the demon of wickedness. But no discouragement or opposition can divert Sakya-muni from the search after deliverance. He will conquer the secret by sheer force of thinking. He sits for weeks plunged in abstraction, revolving the causes of things. If we were not born, he reflects, we should not be subject to old age, misery, and death; therefore, the cause of these evils is birth. But whence comes birth or continued existence? Through a long concatenation of intermediate causes, he arrives at the conclusion that ignorance is the ultimate cause of existence; and therefore, with the removal of ignorance, existence and all its anxieties and miseries would be cut off at their source. Passing through successive

\* There is a confusing variety in the modes in which this name is spelled by European writers. S. Hardy, in his *Manual of Buddhism*, gives more than fifty forms that have come under his notice. Some of the more common are: Bud, Bod, Buth, Budh, Boodh, Rhood,

Budo, Buddow, Boutta, Poota, Poth, Pot. The Chinese, owing to the meagreness of their articulations, seem to have been unable to come nearer to the real sound than Fo, Foe, or Fohi; from the same cause, they convert Brahma into Fan.

## BUDDHISM.

stages of contemplation, he realises this in his own person, and attains the perfect wisdom of the Buddha. The scene of this final triumph received the name of Bodhimanda (the seat of intelligence), and the tree under which he sat was called Bodhidruma (the tree of intelligence), whence Bo-tree. The Buddhists believe the spot to be the centre of the earth. Twelve hundred years after the Buddha's death, Hiouen-Thsang, the Chinese Pilgrim, found the Bodhidruma—or a tree that passed for it—still standing. Although the religion of Buddha is extinct in the neighbourhood, there are, about 5 miles from Gaya Proper, in Bahar, extensive ruins and an old dagoba, or a temple, which are believed to mark the place. Near the temple there flourished, in 1812, a peepul-tree, apparently 100 years old, which may have been planted in the place of the original Bo-tree.

Having arrived at the knowledge of the causes of misery, and of the means by which these causes are to be counteracted, the Buddha was now ready to lead others on the road to salvation. It was at Benares that he first preached, or, in the consecrated phrase, 'turned the wheel of the law';\* but the most important of his early converts was Bimbisara, the sovereign of Magadha (Bahar), whose dynasty continued for many centuries to patronise the new faith. During the forty years that he continued to preach his strange gospel, he appears to have traversed a great part of Northern India, combating the Brahmins, and everywhere making numerous converts. He died at Kusinagara (in Oude), at the age of 80, in the year 543 B.C.; and his body being burned, the relics were distributed among a number of contending claimants, and monumental tumuli were erected to preserve them. See *TUMULI*.

The most important point in the history of Buddhism, after the death of its founder, is that of the three councils which fixed the canon of the sacred scriptures and the discipline of the church. The Buddha had written nothing himself; but his chief followers, assembled in council immediately after his death, proceeded to reduce his teaching to writing. These canonical writings are divided into three classes, forming the Tripitaka, or 'triple basket.' The first class consists of the *Sutras*, or discourses of the Buddha; the second contains the *Vinaya*, or discipline; and the third the *Abhidharma*, or metaphysic. The first is evidently the fundamental text out of which all the subsequent writings have been elaborated. The other two councils probably revised and expanded the writings agreed upon at the first, adding voluminous commentaries. As to the dates of the other two councils, there are irreconcilable discrepancies in the accounts; but at all events the third was not later than 240 B.C., so that the Buddhist canonical scriptures, as they now exist, were fixed two centuries and a half before the Christian era. The Buddhist religion early manifested a zealous missionary spirit; and princes and even princesses, became devoted propagandists. A prince of the royal House of Magadha, Mahindo, carried the faith to Ceylon, 307 B.C. The Chinese annals speak of a Buddhist missionary as early as 217 B.C.; and the doctrine made such progress, that in 65 A.D. it was acknowledged by the Chinese

\* From a too literal understanding of this phrase have arisen, probably, those praying-wheels, or rather wheels for meditation, seen standing before Buddhist monasteries in Tibet and elsewhere. The doctrines of Buddha are inscribed on the wheel, which is then set in motion by a windlass, or even by horse-power. The individual monks have portable ones, with which they perform their devotions wherever they may happen to be.

emperor as a third state religion. The Chinese Buddhists have always looked on India as their 'holy land'; and, beginning with the 4th c. of our era, a stream of Buddhist pilgrims continued to flow from China to India during six centuries. Several of these pilgrims have left accounts of their travels, which throw a light on the course of Buddhism in India, and on the internal state of the country in general, that is looked for in vain in the literature of India itself. See *HIOUEN-THSANG*. As to the spread of Buddhism north of the Himalayan mountains, we have the historical fact, that a Chinese general, having about the year 120 B.C. defeated the barbarous tribes to the north of the Desert of Gobi, brought back as a trophy a golden statue of the Buddha.

A prominent name in the history of Buddhism is that of Asoka, king of Magadha, in the 3d c. of our era, whose sway seems to have extended over the whole peninsula of Hindustan, and even over Ceylon. This prince was to Buddhism what Constantine was to Christianity. He was at first a persecutor of the faith, but being converted—by a miracle, according to the legend—he became its zealous propagator. Not, however, as princes usually promote their creed; for it is a distinguishing characteristic of Buddhism, that it has never employed force, hardly even to resist aggression. Asoka shewed his zeal by building and endowing viharas or monasteries, and raising stupas and other monuments over the relics of Buddha and in spots remarkable as the scenes of his labour. Hiouen-Thsang, in the 7th c. of our era, found stupas attributed to Asoka from the foot of the Hindu Kush to the extremity of the peninsula. There exist, also, in different parts of India, edicts inscribed on rocks and pillars, inculcating the doctrines of Buddha. The edicts are in the name of King Piyadasi; but Orientalists are almost unanimous in holding Piyadasi and Asoka to be one and the same. Not a single building or sculptured stone has been discovered in continental India of earlier date than the reign of this monarch, whose death is assigned to 226 B.C. A remarkable spirit of charity and toleration runs through these royal sermons. The 'king beloved of the gods' desires to see the ascetics of all creeds living in all places, for they all teach the essential rules of conduct. 'A man ought to honour his own faith only; but he should never abuse the faith of others.... There are even circumstances where the religion of others ought to be honoured, and in acting thus, a man fortifies his own faith, and assists the faith of others.'

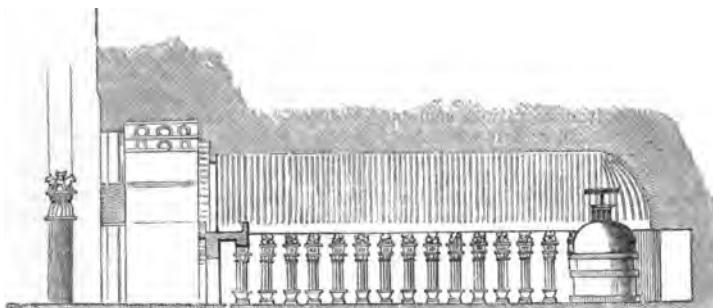

For the glimpses we get of the state of Buddhism in India, we are indebted chiefly to the accounts of Chinese pilgrims. Fa-hian, at the end of the 4th c., found some appearances of decline in the east of Hindustan, its birthplace, but it was still strong in the Punjab and the north. In Ceylon, it was flourishing in full vigour, the ascetics or monks numbering from 50,000 to 60,000. In the 7th c.—that is, 1200 years after the death of the Buddha—Hiouen-Thsang represents it as widely dominant and flourishing, and patronised by powerful rajahs. Its history was doubtless more or less checkered. The Brahmins, though little less tolerant than the followers of Buddha, seem to have been in some cases roused into active opposition; and some princes employed persecution to put down the new faith.

It was probably during the first four or five centuries of our era, and as a result of persecution, that Buddhists, driven from the great cities, retired among the hills of the west, and there constructed those cave-temples which, for their number, vastness,

## BUDDHISM.

and elaborate structure, continue to excite the wonder of all who see them. There are reckoned to be not fewer than 900 Buddhist excavations still

extant in India, nearly all within the presidency of Bombay. How the destruction of the Buddhist faith in Hindustan came about—whether from

Section of Buddhist Cave-temple at Karli—from Fergusson's *Handbook of Architecture*.

internal corruption, or the persecution of powerful princes, adherents of the old faith—we are utterly in the dark. But it is certain that from the time of Hiouen-Thsang's visit, its decay must have been rapid beyond precedent; for about the 11th or 12th c., the last traces of it disappear from the Indian peninsula.

What, then, is the nature of this faith, which has been for so long, and is still, the sole light of so many millions of human beings? In answering this question, we must confine ourselves here to a brief outline of the intellectual theory on which the system is based, and of the general character of its morality and ritual observances, as they were conceived by the founder and his more immediate followers; referring for the various forms which the external observances have assumed to the several countries where it is believed and practised. See BURMAH, CEYLON, CHINA, JAPAN, LAMAISM.

Buddhism is based on the same views of human existence, and the same philosophy of things in general, that prevailed among the Brahmins. It accepts without questioning, and in its most exaggerated form, the doctrine of the transmigration of souls, which lies at the root of so much that is strange in the Eastern character. For a particular account of this important doctrine or notion, which seems ingrained in the constitution of Eastern minds, and without a knowledge of which no phase of thought or feeling among them can be understood, the reader is referred to TRANSMIGRATION; while the peculiar cosmogony or system of the universe with which it is associated, and which is substantially the same among Hindus and Buddhists, will be described under HINDUISM. It is sufficient here to say, that, according to Buddhist belief, when a man dies, he is immediately born again, or appears in a new shape; and that shape may, according to his merit or demerit, be any of the innumerable orders of beings composing the Buddhist universe—from a clod to a divinity. If his demerit would not be sufficiently punished by a degraded earthly existence—in the form, for instance, of a woman or a slave, of a persecuted or a disgusting animal, of a plant, or even of a piece of inorganic matter—he will be born in some one of the 136 Buddhist hells, situated in the interior of the earth. These places of punishment have a regular gradation in the intensity of the suffering and in the length of time the sufferers live, the least term of life being 10 millions of years, the longer terms being almost beyond the powers of even Indian notation to express. A meritorious life, on the other hand, secures the next birth either

in an exalted and happy position on earth, or as a blessed spirit, or even divinity, in one of the many heavens; in which the least duration of life is about 10 billions of years. But however long the life, whether of misery or of bliss, it has an end, and at its close the individual must be born again, and may again be either happy or miserable—either a god or, it may be, the vilest inanimate object.\* The Buddha himself, before his last birth as Sakyamuni, had gone through every conceivable form of existence on the earth, in the air, and in the water, in hell and in heaven, and had filled every condition in human life. When he attained the perfect knowledge of the Buddha, he was able to recall all these existences; and a great part of the Buddhist legendary literature is taken up in narrating his exploits when he lived as an elephant, as a bird, as a stag, and so forth.

The Buddhist conception of the way in which the quality of actions—which is expressed in Pali by the word *Karma*, including both merit and demerit—determines the future condition of all sentient beings, is peculiar. They do not conceive any god or gods as being pleased or displeased by the actions, and as assigning the actors their future condition by way of punishment or of reward. The very idea of a god, as creating or in any way ruling the world, is utterly absent in the Buddhist system. God is not so much as denied; he is simply not known. Contrary to the opinion once confidently and generally held, that a nation of atheists never existed, it is no longer to be disputed that the numerous Buddhist nations are essentially atheist; for they know no beings with greater supernatural power than any man is supposed capable of attaining to by virtue, austerity, and science; and a remarkable indication of this startling fact is to be seen in the circumstance, that some at least of the Buddhist nations—the Chinese, Mongols, and Tibetans—have no word in their languages to express the notion of God. The future condition of the Buddhist, then, is not assigned him by the Ruler of the universe; the ‘Karma’ of his actions determines it by a sort of virtue inherent in the nature of things—by the blind and unconscious concatenation of cause and effect. But the laws by

\* One legend makes Bhagavat, in order to impress upon the monks of a monastery the importance of their duties, point to a besom, and, by his supernatural insight, reveal to them that it had once been a novice, who had been negligent in sweeping the hall of assembly; the walls and pillars, again, he told them, had once existed as monks, who soiled the walls of the hall by spitting upon them.

which consequences are regulated seem dark, and even capricious. A bad action may lie dormant, as it were, for many existences; the taint, however, is there, and will some time or other break out. A Buddhist is thus never at a loss to account for any calamity that may befall himself or others.

Another basis of Buddhism is the assumption, that human existence is on the whole miserable, and a curse rather than a blessing. This notion, or rather feeling, is, like transmigration, common to Buddhism and Brahmanism, and is even more prominent in Buddhism than in the old faith. It is difficult for a European to conceive this state of mind, or to believe that it can be habitual in a whole people; and many signal errors in dealing with the Indian nations have arisen from overlooking the fact. The cause would seem to lie chiefly in the comparatively feeble physical organisation of Easterns in general. With a vigorous animal vitality, there is a massive enjoyment in mere bodily existence sufficient to drown a large amount of irritation and suffering, leaving life still sweet and desirable; while the spontaneous activity attending this vigour, makes it a pleasure instead of a pain to contend with and conquer difficulties. The Indian, on the contrary, even when he looks robust, has little intensity of animal vitality; and therefore, bodily existence, in itself, has to him little relish. Tedium of life, it is well known, arises more from negative than positive sources; and it requires but little bitter added to make his cup disgusting. So far, again, from finding activity a source of enjoyment, exertion is painful, and entire quiescence is, in his eyes, the highest state of conceivable enjoyment. When to this we add that want of security and peace, and that habitual oppression of the many by the few, with all the attendant degradation and positive suffering, which may be considered the normal state of things in the East, need we wonder that to men so constituted and so circumstanced, life should seem a burden, a thing rather to be feared than otherwise? The little value that Hindus set upon their lives is manifested in many ways. The punishment of death, again, has little or no terror for them, and is even sometimes coveted as an honour. For, in addition to the little value of their present existence, they have the most undoubting assurance that their soul, if dislodged from its present tenement, will forthwith find another, with a chance, at least, of its being a better one.

In the eyes, then, of Sakyamuni and his followers, sentient existence was hopelessly miserable. Misery was not a mere taint in it, the removal of which would make it happy; misery was its very essence. Death was no escape from this inevitable lot; for, according to the doctrine of transmigration, death was only a passage into some other form of existence equally doomed. Even the heaven and the state of godhead which form part of the cycle of changes in this system, were not final; and this thought poisoned what happiness they might be capable of yielding. Brahman philosophers had sought escape from this endless cycle of unsatisfying changes, by making the individual soul be absorbed in the universal spirit (Brahm); Gautama had the same object in view—viz., exemption from being born again; but he had not the same means of reaching it. His philosophy was utterly atheistic, like that of the original Sankhya school of philosophy, whose views he chiefly borrowed, and ignored a supreme God or Creator; it did not leave even an impersonal Spirit of the universe into which the human soul could be absorbed. Gautama sees no escape but in what he calls NIRVANA, the exact nature of which has been

matter of dispute. According to its etymology, the word means 'extinction,' 'blowing out' as of a candle; and most Orientalists are agreed that in the Buddhist scriptures generally it is equivalent to annihilation. Even in those schools which attempt to draw a distinction, the distinction is of the most evanescent kind. See NIRVANA.

The key of the whole scheme of Buddhist salvation lies in what Gautama called his Four Sublime Verities. The first asserts that pain exists; the second, that the cause of pain is desire or attachment—the meaning of which will appear further on; the third, that pain can be ended by Nirvana; and the fourth shews the way that leads to Nirvana. This way to Nirvana consists in eight things: right faith, right judgment, right language, right purpose, right practice, right obedience, right memory, and right meditation. In order to understand how this method is to lead to the proposed end, we must turn to the metaphysical part of the system contained in the 'concatenation of causes' which may be looked upon as a development of the second 'verity'—namely, that the cause of pain is desire—or rather, as the analysis upon which that verity is founded. The immediate cause of pain is birth, for if we were not born, we should not be exposed to death or any of the ills of life. Birth, again, is caused by previous existence; it is only a transition from one state of existence into another. All the actions and affections of a being throughout his migrations leave their impressions, stains, attachments adhering to him, and the accumulation of these determines at each stage the peculiar modification of existence he must next assume. But for these adhesions, the soul would be free; not being bound down to migrate into any determinate condition of life, it would follow that it need not migrate at all. These adhesions or attachments, good and bad, depend upon desire, or rather, upon affection of any kind in the soul towards the objects; as if only what moved the soul to desire or avoidance could leave its impress upon it. We thus arrive at desire—including both the desire to possess, and the desire to avoid—as one link in the chain of causes of continued existence and pain. Beyond this the dependence of the links is very difficult to trace; for desire is said to be caused by perception, perception by contact, and so on, until we come to ideas. Ideas, however, are mere illusions, the results of ignorance or error, attributing durability and reality to that which is transitory and imaginary. Cut off this ignorance, bring the mind into a state in which it can see and feel the illusory nature of things, and forthwith the whole train vanishes; illusory ideas, distinction of forms, senses, contact, perception, desire, attachment, existence, birth, misery, old age, death!

*Morality and Religious Observance.*—The eight parts or particulars constituting the theoretical 'way' (to Nirvana), was developed by Gautama into a set of practical precepts enjoining the various duties of common life and of religion. They are all ostensibly intended as means of counteracting or destroying the chain of causes that tie men to existence and necessitate being born again, especially that most important link in the chain constituted by the attachments or desires resulting from former actions; although the special fitness of some of the precepts for that end is far from being apparent. It is easy to understand how the austerities that are prescribed might subdue the passions and affections, and lessen the attachment to existence; but how the exercise of benevolence, of meekness, of regard to truth, of respect to parents, &c., on which Gautama laid so much stress, should have this effect, it is difficult to conceive. Luckily for the Buddhist

world, Gautama's moral nature was better than his logic, or rather than the perverse assumptions from which his logic starts; and as he felt strongly—that all men have felt more or less—that these things are essentially right and good, he takes it for granted that they must contribute to what was in his eyes the chief good—escape from existence, or Nirvana. In delivering his precepts, the Buddha considers men as divided into two classes—those who have embraced the religious life (*Sramanas*), and those who continue in the world, or are laymen. These last are considered as too much attached to existence to feel any desire or have any hope of emancipation, at least at this stage. But there are certain precepts which it is necessary for all to obey, that they may not bring greater misery upon themselves in their next births, and rivet the bonds of existence more indissolubly. There are ten moral precepts or 'precepts of aversion.' Five of these are of universal obligation—viz., not to kill; not to steal; not to commit adultery; not to lie; not to be drunken. Other five are for those entering on the direct pursuit of Nirvana by embracing the religious life: to abstain from food out of season—that is, after mid-day; to abstain from dances, theatrical representations, songs, and music; to abstain from personal ornaments and perfumes; to abstain from a lofty and luxurious couch; to abstain from taking gold and silver. For the regular ascetics or monks, there are a number of special observances of a very severe kind. They are to dress only in rags, sewed together with their own hands, and to have a yellow cloak thrown over the rags. They are to eat only the simplest food, and to possess nothing except what they get by collecting alms from door to door in their wooden bowl. They are allowed only one meal, and that must be eaten before mid-day. For a part of the year, they are to live in forests, with no other shelter except the shadow of a tree, and there they must sit on their carpet even during sleep, to lie down being forbidden. They are allowed to enter the nearest village or town to beg food, but they must return to their forests before night.

Besides the absolutely necessary 'aversions and observances' above mentioned, the transgression of which must lead to misery in the next existence, there are certain virtues or 'perfections' of a supererogatory or transcendent kind, that tend directly to 'conduct to the other shore' (Nirvana). The most essential of these are almsgiving or charity, purity, patience, courage, contemplation, and knowledge. Charity or benevolence may be said to be the characteristic virtue of Buddhism—a charity boundless in its self-abnegation, and extending to every sentient being. The benevolent actions done by the Buddha himself, in the course of his many millions of migrations, were favourite themes with his followers. On one occasion, seeing a tigress starved and unable to feed her cubs, he hesitated not to make his body an oblation to charity, and allowed them to devour him. Benevolence to animals, with that tendency to exaggerate a right principle so characteristic of the East, is carried among the Buddhist monks to the length of avoiding the destruction of fleas and the most noxious vermin, which they remove from their persons with all tenderness.

There are other virtues of a secondary kind, though still highly commendable. Thus, not content with forbidding lying, the Buddha strictly enjoins the avoidance of all offensive and gross language, and of saying or repeating anything that can set others at enmity among themselves; it is a duty, on the contrary, especially for a *sramana*, to act on all occasions as a peacemaker. Patience under injury, and resignation in misfortune, are strongly inculcated.

Humility, again, holds a no less prominent place among Buddhist graces than it does among the Christian. The Buddhist saints are to conceal their good works, and display their faults. As the outward expression of this sentiment of humility, Gautama instituted the practice of confession. Twice a month, at the new and at the full moon, the monks confessed their faults aloud before the assembly. This humiliation and repentance seems the only means of expiating sin that was known to Gautama. Confession was exacted of all believers, only not so frequently as of the monks. The edicts of Piyadasi recommend a general and public confession at least once in five years. The practice of public confession would seem to have died out by the time of Hiouen-Thsang's visit to India.

Such are the leading features of the moral code of the Buddha, of which it has been said, that 'for pureness, excellence, and wisdom, it is only second to that of the Divine Lawgiver himself.' But the original morality of Buddhism has, in the course of time, been disfigured by many subtleties, puerilities, and extravagances, derived from the casuistry of the various schools of later times; just as the casuistry of the Jesuits, for instance, perverted many of the precepts of Christianity. The theory on which the Buddha founds his whole system gives, it must be confessed, only too much scope to such perversions; for, on that theory, truth is to be spoken, self to be sacrificed, benevolence to be exercised, not for the sake of the good thus done to others, but solely for the effect of this conduct on the soul of the actor, in preparing him for escape from existence. To teach men 'the means of arriving at the other shore,' was another expression for teaching virtue; and that other shore was annihilation. On this principle, the Buddhist casuist can, like the Jewish, render of none effect the universal law of charity and the duty of respecting and aiding parents, on which the Buddha laid such stress. Thus, a *Bikahu*—that is, one who has engaged to lead a life of self-denial, celibacy, and mendicancy, and is thus on the high road to Nirvana—is forbidden to look at or converse with a female, lest any disturbing emotion should ruffle the serene indifference of his soul; and so important is this, that 'if his mother have fallen into a river, and be drowning, he shall not give her his hand to help her out; if there be a pole at hand, he may reach that to her; but if not, she must drown.'—Wilson.

Contemplation and science or knowledge (i. e., of the concatenation of causes and effects) are ranked as virtues in Buddhism, and hold a prominent place among the means of attaining Nirvana. It is reserved, in fact, for abstract contemplation to effect the final steps of the deliverance. Thought is the highest faculty of man, and, in the mind of an Eastern philosopher, the mightiest of all forces. A king who had become a convert to Buddhism is represented as seating himself with his legs crossed, and his mind collected; and 'cleaving, with the thunderbolt of science, the mountain of ignorance,' he saw before him the desired state. It is in this cross-legged, contemplative position that the Buddha is almost always represented—that crowning intellectual act of his, when, seated under the Bo-tree (q. v.), he attained the full knowledge of the Buddha, saw the illusory nature of all things, broke the last bonds that tied him to existence, and stood delivered for evermore from the necessity of being born again, being considered the culmination of his character, and the highest object of imitation to all his followers.

'Complete' Nirvana or extinction cannot, of course, take place till death; but this state of preparation for it, called simply Nirvana, seems

## BUDDHISM.

attainable during life, and was, in fact, attained by Gautama himself. The process by which the state

Colossal Gautama near Amarapura, Burmah.

is attained is called *Dhyana*, and is neither more nor less than ecstasy or trance, which plays so important a part among mystics of all religions. The individual is described as losing one feeling after another, until perfect apathy is attained, and he reaches a region 'where there are neither ideas, nor the idea of the absence of ideas!'

The ritual or worship of Buddhism—if worship it can be called—is very simple in its character. There are no priests, or clergy, properly so called. The *Sramanas* or *Bikshus* (mendicants) are simply a religious order—a kind of monks, who, in order to the more speedy attainment of Nirvana, have entered on a course of greater sanctity and austerity than ordinary men; they have no sacraments to administer or rites to perform for the people, for every Buddhist is his own priest. The only thing like a clerical function they discharge, is to read the scriptures or discourses of the Buddha in stated assemblies of the people held for that purpose. They have also everywhere, except in China, a monopoly of education; and thus in Buddhist countries education, whatever may be its quality, is very generally diffused. In some countries, the monks are exceedingly numerous; around Lhassa in Tibet, for instance, they are said to be one-third of the population. They live in *viharas* or monasteries, and subsist partly by endowments, but mostly by charity. Except in Tibet, they are not allowed to engage in any secular occupation. The vow is not irrevocable. This incubus of monachism constitutes the great weakness of Buddhism in its social aspect. Further particulars regarding Buddhist monks and monasteries, as well as the forms of Buddhist worship generally, will be given when speaking of the countries where the religion prevails. See *LAMAISM*.

The adoration of the statues of the Buddha and of his relics is the chief external ceremony of the religion. This, with prayer and the repetition of sacred formulas, constitutes the ritual. The centres of the worship are the temples containing statues, and the topea or tumuli erected over the relics of the Buddha, or of his distinguished apostles, or on spots consecrated as the scenes of the Buddha's acts. The central object in a Buddhist temple, corresponding to the altar in a Roman Catholic church, is an image of the Buddha, or a dagoba or shrine containing his relics. Here flowers,\* fruit, and incense

are daily offered, and processions are made with singing of hymns. Of the relics of the Buddha, the most famous are the teeth that are preserved with intense veneration in various places. Hiouen-Thsang saw more than a dozen of them in different parts of India; and the great monarch Ciladitya was on the eve of making war on the king of Cashmere for the possession of one, which, although by no means the largest, was yet an inch and a half long. The tooth of the Buddha preserved in Ceylon, a piece of ivory about the size of the little-finger, is exhibited very rarely, and then only with permission of the English government—so great is the concourse and so intense the excitement. See *CEYLON*.

There appears at first sight to be an inconsistency between this seeming worship of the Buddha, and the theory by which he is considered as no longer existing. Yet the two things are really not irreconcileable; not more so, at least, than theory and practice often are. With all their admiration of the Buddha, his followers have never made a god of him. Gautama is only the last Buddha—the Buddha of the present cycle. He had predecessors in the cycles that are past (twenty-four Buddhas of the past are enumerated, and Gautama could even tell their names); and when, at the end of the present cycle, all things shall be reduced to their elements, and the knowledge of the way of salvation shall perish with all things else; then, in the new world that shall spring up, another Buddha will appear, again to reveal to the renascent beings the way to Nirvana. Gautama foretold that Mitraya, one of his earliest adherents, should be the next Buddha\* (the Buddha of the future), and he gratified several of his followers with a like prospect in after-cycles. The Buddha was thus no greater than any mortal may aspire to become. The prodigious and supernatural powers which the legends represent him as possessing, are quite in accordance with Indian ideas; for even the Brahmins believe that by virtue, austerities, and science, a man may acquire power to make the gods tremble on their thrones.

The Buddha, then, is not a god; he is the ideal of what any man may become; and the great object of Buddhist worship is to keep this ideal vividly in the minds of the believers. In the presence of the statue, the tooth, or the footprint, the devout believer vividly recalls the example of him who trod the path that leads to deliverance. This veneration of the memory of Buddha is perhaps hardly distinguishable, among the ignorant, from worship of him as a present god; but in theory, the ritual is strictly commemorative, and does not necessarily involve idolatry, any more than the garlands laid on the tomb of a parent by a pious child. See *TOPE*.

The prayers addressed to the Buddha are more difficult to reconcile with the belief in his having ceased to exist. It is improbable, indeed, that the original scheme of Buddhism contemplated either the adoration of the statues of the Buddha, or the offering of prayers to him after his death. These are an after-growth—accretions upon the simple scheme of Gautama, and in a manner forced upon it during its struggle with other religions. For, a

offered on one occasion 6,490,320 flowers at the shrine of the tooth. At one temple it was provided that there should be offered "every day 100,000 flowers, and each day a different flower."

\* One who is on the way to become a supreme Buddha, and has arrived at that stage when he has only one more birth to undergo, is styled a *Bodhisattva* (having the essence of knowledge); a mere candidate for Nirvana is an *arhat* (venerable).

\* The quantity of flowers used as offerings is prodigious. A royal devotee in Ceylon, in the 15th c.,  
408

system of belief that seeks to supplant other systems, finds itself enticed to present something to rival and outdo them, if possible, in every point. Even the Christian church, in the middle ages, adopted with this view many of the rites and legends of paganism that were quite inconsistent with its own character; merely casting over them a slight disguise, and giving them Christian names. Prayer, too, is natural to man—an irrepressible instinct, as it were, and had to be gratified. And then the inconsistency in uttering prayers when there is no one to hear or answer, glaring as it appears to us, is by no means great to the Eastern mind. Prayers, like other sacred formulas, are conceived less as influencing the will of any superior being to grant the request, than as working in some magical way—producing their effects by a blind force inherent in themselves. They are, in short, mere incantations or charms. Even the prayers of a Brahman, who believes in the existence of gods, do not act so much by inclining the deity addressed to favour the petitioner, as by compelling him through their mysterious potency—through the operation of a law above the will of the highest gods. The Buddhist, then, may well believe that a formula of prayer in the name of ‘the Venerable of the world’ will be potent for his good in this way, without troubling himself to think whether any conscious being hears it or not.

The element in Buddhism which more than any other, perhaps, gave it an advantage over all surrounding religions, and led to its surprising extension, was the spirit of universal charity and sympathy that it breathed, as contrasted with the exclusiveness of caste. In this respect, it held much the same relation to Brahmanism that Christianity did to Judaism. It was, in fact, a reaction against the exclusiveness and formalism of Brahmanism—an attempt to render it more catholic, and to throw off its intolerable burden of ceremonies. Buddhism did not expressly abolish caste, but only declared that all followers of the Buddha who embraced the religious life were thereby released from its restrictions; in the bosom of a community who had all equally renounced the world, high and low, the twice-born Brahman and the outcast were brethren. This was the very way that Christianity dealt with the slavery of the ancient world. This opening of its ranks to all classes and to both sexes—for women were admitted to equal hopes and privileges with men, and one of Gautama’s early female disciples is to be the supreme Buddha of a future cycle—no doubt gave Buddhism one great advantage over Brahmanism. The Buddha, says M. Müller, ‘addressed himself to castes and outcasts. He promised salvation to all; and he commanded his disciples to preach his doctrine in all places and to all men. A sense of duty, extending from the narrow limits of the house, the village, and the country, to the widest circle of mankind, a feeling of sympathy and brotherhood towards all men, the idea, in fact, of humanity, were first pronounced by Buddha.’ This led to that remarkable missionary movement, already adverted to, which, beginning 300 B.C., sent forth a succession of devoted men, who spent their lives in spreading the faith of Buddha over all parts of Asia.

In the characteristic above mentioned, and in many other respects, the reader cannot fail to remark the striking resemblance that Buddhism presents to Christianity, and this in spite of the perverse theory on which it is founded. So numerous and surprising are the analogies and coincidences, that Mrs Speir, in her book on *Life in Ancient India*, ‘could almost imagine that before

God planted Christianity upon earth, he took a branch from the luxuriant tree, and threw it down to India.’

It would be superfluous to attempt here any formal refutation of the religion of the Buddha. To the readers of this work, the fundamental errors of the theory will be apparent enough. By giving prominence to the extravagances and almost inconceivable puerilities and absurdities with which the system has been overloaded, it would have been easy to make it look sufficiently ridiculous. But this is not to depict, it is to caricature. It is only too common for Christian writers to treat of heathen religions in such fashion. The only fair—the only true account of any religion, is that which enables the reader to conceive how human beings may have come to believe it and live by it. It is this object that has been chiefly kept in view in the preceding meagre sketch of a vast subject. Those who wish to pursue it further are referred to Spence Hardy’s *Manual of Buddhism*, and his *Eastern Monachism*, consisting chiefly of translations from the sacred books used in Ceylon; to J. Barthélémy Saint-Hilaire, *Le Bouddha et sa Religion*; and especially to a complete and elaborate digest by C. F. Koeppen of Berlin, in two vols.—*Religion of the Buddha*, and *Lamaist Hierarchy of Tibet*.

**BUDDING**, sometimes called INOCULATION, is an operation analogous to GRAFTING (q. v.), or indeed may be regarded as merely a particular mode of grafting, in which a leaf-bud is used as a graft instead of a young shoot. It is generally preferred for trees which are apt to throw out much gum when wounded, as the plum, cherry, peach, apricot, and stone-fruits in general, also for roses and many other flowering shrubs. The time for it is when the

bud is perfectly formed, about or a little after midsummer. The subjoined cut represents the various parts in budding: *a* is the bud cut out, with a shield of bark attached to it; *b*, the stem, with a slit in the bark to receive the shield attached to the bud; *c*, the bud inserted and the leaf cut away. The bud to be employed is taken, by means of a sharp knife, from the branch on which it has grown—generally a branch of the former year—a small portion of the bark and young wood being taken with it, extending to about half an inch above and three-quarters of an inch below the bud. The woody part is then separated from the bark and bud; but care is to be taken that the bud itself is not injured, which, however, is always the case when the operation is attempted before the bud is sufficiently matured, and is indicated by a hollow left at the bud when the wood has been removed. A longitudinal and a transverse cut are made in the bark of the stock intended to receive the bud, in the form of the letter T; the bark is raised on both sides, for which purpose the handle of the budding-knife generally terminates in a thin ivory blade, and the bud is inserted, the bark attached to the bud being cut across so as to join exactly to the transverse cut in that of the stock, that the bud may be nourished by the descending sap. The leaf in

## BUDDLEA—BURNOS AYRES.

the axil of which the bud grew is cut off. The newly inserted bud is for a time preserved in its place, and prevented from too much access of air by strands of bass-matting. The process just described is distinctively called *shield-budding*, and is the most common method of budding. Other methods are occasionally employed, as *reversed shield-budding*, in which the incisions are in the form of the letter T reversed, which is sometimes practised with trees of the orange family and others in which there is a very great flow of descending sap; and *scallop-budding*, in which a thin slip of bark is removed from the stock, and a similar slip bearing the bud is placed upon it, the upper edge and one of the lateral edges being made to fit exactly. Scallop-budding may be performed in spring, and if it fails, the ordinary method may be resorted to in summer. Budding is also sometimes performed by taking a tube of bark with one or more buds from a small branch, and placing it upon a branch of similar thickness in the stock, from which the bark has been removed.

**BUDDLE'A**, a genus of shrubs of the natural order *Scrophulariaceæ*, of which many species are known, all natives of the warmer parts of the world, and some of them much admired for their beautiful flowers. *B. Neemda* has received the praise of being one of the most beautiful plants of India. *B. globosa*, a native of Chili, with downy branches, lanceolate leaves, and globose heads of orange-coloured flowers, is hardy enough to endure the climate of most parts of England, and has become a very common ornament of gardens, but in Scotland it needs the protection of the greenhouse or frame.

**BUDE BURNER** and **BUDE LIGHT**. The Bude Burner, so called from the name of the residence of the inventor, Mr Gurney, consists of two, three, or more concentric argand burners, each inner one rising a little above the outer. On the same principle, a powerful light is produced by a number of flat flames disposed in concentric circles like the petals of a rose.—The Bude Light, also the invention of Mr Gurney, depends upon introducing oxygen into the centre of the flame instead of air, as in the common argand. A light of the most dazzling brilliancy is thus produced. The House of Commons is lighted by this means, the brilliancy being softened by the intervention of a ceiling of ground-glass.

**BUD'GET**, from the same source as the French *bouguette*, means a small bag, and has been used metaphorically to express a compact collection of things, as a budget of news, a budget of inventions, and the like. Water-budgets or buckets were a very honourable blazon on a coat-armorial, as being generally conferred in honour of some valiant feat for supplying an army with water. Guillim, in his *Display of Heraldry*, thinks the three mighty men in David's army who broke into the host of the Philistines, and drew water from the well of Bethlehem, 'deserved to have been remunerated with such armorial marks on their coat-armours for their valour.'

The term, 'The Budget,' is in Britain, from long usage, applied to that miscellaneous collection of matters which aggregate into the annual financial statement made to parliament by the Chancellor of the Exchequer. It contains two leading elements—a statement how the nation's account of charge and discharge stands in relation to the past, and an explanation of the probable expenditure of the ensuing year, with a scheme of the method in which it is to be met, whether by the existing or new taxes, or by loan. The statement of the budget

is always an important, sometimes a very exciting occasion; as, for instance, Sir Robert Peel's adoption of an income-tax in 1842, and his legislation for free trade in 1846. Another instance is Mr Gladstone's reduction of the wine-duties and treaty with France in 1860.

**BUDOS HEGY**, a mountain belonging to the Carpathians, on the eastern border of Transylvania, in lat.  $46^{\circ} 12' N.$ , and long.  $25^{\circ} 40' E.$  It is quite isolated, steep, and of conical shape, densely wooded on the lower slopes, and has an elevation of 7340 feet. It has numerous caverns, that emit sulphurous exhalations, and from its base issue strong sulphur springs.

**BU'DWEIS**, a town of Bohemia, situated on the Moldau, about 77 miles south of Prague. B. is well built, is partially fortified, and has an old cathedral, manufactures of woollens, stoneware, machines, lead-pencils, saltpetre, &c. Its position on the Moldau, and its connection with the Danube at Linz, by means of a horse-railway, the first constructed in Germany, give B. a considerable transit trade. Pop. (1869) 17,413. In the neighbourhood is an old feudal fortress, the *Schloss Frauenberg*, one of the seats of Prince Schwarzenberg, and a fine new Gothic castle also belonging to the same nobleman. Here he keeps herds of wild swine, and in grand hunting-matches, as many as 300 are killed in a day.

**BUEN AY'RÉ**, in Spanish, or **BON AIR** in French, an island in that subdivision of the West Indies which runs parallel with the coast of Venezuela. It is in lat.  $12^{\circ} 20' N.$ , and long.  $68^{\circ} 27' W.$ , being 30 miles to the east of Curaçao, which, like itself, belongs to the Dutch. B. A. produces cattle and salt. It measures 20 miles by 4, and contains about 2500 inhabitants. It has a tolerable harbour on its leeward or south-west side.

**BUEÑOS AYRÉS**, a city of South America, on the right bank of the Plate, which here, at a distance of 150 miles from the open sea, is 36 miles across. It stands in lat.  $34^{\circ} 36' S.$ , and long.  $58^{\circ} 24' W.$  Its disadvantages as a maritime town are great; the flood-tides of the ocean, when backed by easterly winds, being apt to make the estuary overflow its banks; and again, when westerly winds prevail, the estuary loses both width and depth. Monte Video, on the opposite shore, possesses a better harbour, and is nearer to the Atlantic, nor can it be doubted that, but for the greater facilities of B. A. in carrying on an inland trade, the former town would have proved a dangerous rival. Steam is rapidly placing both upon more equal terms. Of the trade, however, with Chili by Mendoza and the Andes—a trade which must always be carried on by land—B. A. must still command the monopoly. So familiar had B. A. become with land-carriage on an extensive scale, that its merchants, when blockaded in front during a war with Brazil, established, as it were, a new port of entry in the mouth of the Salado or Saladillo, at a distance of at least 150 miles. As a city, B. A. labours under some peculiar disadvantages. Its supplies of fresh water are received from the Plate in rudely constructed carts. Its immediate territory, purely alluvial, is almost as destitute of timber as of stones—the latter being brought either as ballast from Europe, or as freight from Martin Garcia, an island on the opposite side of the estuary; and the former from the province of Entre Ríos, and from the islets of its bordering rivers, the Uruguay and the Paraná. Fuel, too, is almost as scarce as building materials—peach-trees and the withered thistles of the prairies yielding the only indigenous supplies. B. A., which appears to deserve its name of *good air*, or rather *good air*,

## BUENOS AYRES—BUFFALO.

contains (1869) 177,787 inhabitants—about a fourth of whom are of European birth or descent. Among those of European birth, the vast majority are natives of France, of Italy, and of Great Britain. B. A. publishes newspapers both in French and in English as successfully as those in the vernacular tongue. The city, which measures 2 miles by 1½, is partitioned into blocks of about 150 yards square, by granite-paved streets. New houses are everywhere springing up; tramways traverse it in every direction; and the value of property has (1875) enormously increased. The principal buildings are the cathedral and its dependent churches, Episcopalian and Presbyterian chapels, a foundling hospital, an orphan asylum, the university, a military college, several public schools, and the government offices; there are also printing establishments, and manufactories of cigars, carpets, furniture, and boots and shoes. The exports consist of precious metals, hides, beef, wool, skins, tallow, and horse-hair; and the imports of cottons, linens, woollens, jewellery, perfumery, and deals. The custom-house dues, which in 1860 were 3 million dollars, in 1870 had increased to 13 millions. B. A. was founded in 1535; but having subsequently been twice destroyed by the Indians, it ought, in reality, to date only from 1580. In the beginning of the present century, it achieved, with very little aid from home, two triumphs over England. In 1806, one British force, which had just captured the city, was obliged to surrender; and in 1807, another, which attempted to recover the place, was repulsed with heavy loss; and these successes over so formidable a foe emboldened the colonists, three years afterwards, to throw off the yoke of Spain.

**BUENOS AYRES**, a province of the Argentine Confederation in South America, of which the city B. A. is capital, extends itself along the Atlantic, from the mouth of the Plata to that of the Rio Negro on the 41st parallel; on the N.E., it is washed by the Plata and the Paraná as far as the Arroyo del Medio; on the N. and the adjacent section of the W., it touches the province of Santa Fé. Elsewhere, its borders cannot be defined, constantly advancing, by slow and perilous steps, into the domain of the aborigines, for here the contest is not with the wilderness itself, which is a boundless prairie, but with its tenants, who, having an unlimited supply of horses for all purposes, are secured, in their every foray, alike against famine and fatigue. Its area is estimated at 63,000 square miles, with a pop. of (1869) 495,107. Besides the existing province of the name, it at one time comprised Uruguay or Banda Oriental, Paraguay, Bolivia, and the Argentine Confederation, being originally an appendage of Peru, under the immediate command of a captain-general, and becoming, in 1775, a separate vice-royalty of itself. Though the first three of these four divisions broke off chiefly in connection with the revolutionary struggle, yet the fourth continued, down to 1853, to recognise the city of B. A. as its head; and the inland states endeavoured both by war and diplomacy to re-annex the maritime province to the republic, till, in June 1860, their object was obtained, and B. A. became once more a province in the Argentine Confederation.

The country approaches so nearly to a plain, that most of the rain which falls is either absorbed or evaporated, or lost in salt-lakes, comparatively little drainage entering the Paraná or the Plata. The climate, though on the whole healthy and agreeable, is yet by no means steady or uniform. Every wind, in general, has, to a remarkable degree, its own weather—sultriness coming from the north, freshness from the south, moisture from the east,

and storm from the west; and besides the periodical heats of every summer, successive years of more than ordinary drought occur. Agriculture, properly so called, is followed chiefly in the more temperate and humid districts of the eastern coast; while the interior presents almost uninterrupted pasture to countless herds of horses and cattle. Under these circumstances, the business of grazing and hunting combined occupies or interests the great bulk of the population—a business that renders the province, whether as to the disposal of its productions or as to the supply of its wants, peculiarly dependent on that external commerce, which, throughout the whole of Spanish America, has naturally been identified with political freedom. Let it be added, that the Indians are intractable, and that the Africans, few in number at best, are principally menials; and it is seen at once why, in spite of national jealousies and sectarian prejudices, immigration from Europe has been not only tolerated by public opinion, but also encouraged by legislative enactment. Moreover, a comparatively congenial climate, as a recommendation to foreigners, has powerfully seconded the efforts of liberality and patriotism. It is perhaps mainly owing to this cause, which is common alike to Chili and to B. A.; that these two districts, notwithstanding their full share of wars and troubles, have so decidedly outstripped the other fragments of the same colonial empire in all the elements of liberty and civilisation. Hence their higher importance in the eyes of Europeans in general, and of Englishmen in particular. B. A. is the largest, most populous, and most flourishing of the provinces which comprise the Argentine Confederation. Numerous railways traverse it, emanating from the city of B. A., and extending into other parts of the republic. The annual immigration into B. A. is about 8000.

**BUFFALO** (*Bos Bubalus*), an animal of the ox tribe, very important and useful to man. It is a native of the East Indies, where it has been long domesticated, and from which it was carried to Egypt and to the south of Europe. It was introduced into Italy about the close of the 6th c. A. D., and is now very generally used as a beast of draught and of burden in that country, as it is also in India.

The B. is larger than the ox, and its limbs are stouter. Its form is more angular and clumsy; the head is larger in proportion to the size of the body; and the forehead is rather convex, and higher than broad; the dorsal line rises into a considerable elevation above the shoulders; the dewlap and the tail resemble those of the ox; the horns are large, slightly compressed, recline towards the neck, and have their points turned up. It is characteristic of the B., when walking or running, to carry the head with the muzzle projecting straight forward, and the horns laid back on the shoulders. The hair is irregular and bristly, often very thin, so that the smooth brown hide ‘shines with an unpleasant polish in the sunlight.’ In this as in other respects, the animal is adapted for marshy situations, which it naturally affects; preferring for its food the rank coarse herbage which they afford, delighting to immerse itself in water till only its head appears above the surface, in which condition it will remain for hours, and often enveloping itself in mud as a protection against insects. On account of these propensities, the buffaloes used as beasts of burden in India are seldom laden with any goods liable to be spoiled by water, as the animal is always ready to take an opportunity of lying down with his load in any river or pond which presents itself. In Italy, the B. seems nowhere more at home than in the Pontine Marshes and the pestilential Maremma.

The very regions where malaria is most prevalent seem to be those most adapted to its constitution.

The B. is a very powerful animal, much more powerful than the ox, and capable of dragging or carrying a far heavier load. The female yields a much greater quantity of milk than a cow, and of excellent quality. It is from B. milk that the *ghee* or semi-fluid butter of India is made. The hide is greatly valued for its strength and durability, but the flesh is very inferior to that of the ox.

The B. exhibits a considerable amount of intelligence. In a state of domestication, it is capable of becoming very docile. In the south of Europe, it is generally managed by a ring passed through the cartilage of the nose, but in India by a mere rope. The Indian driver rides upon a B.; but these animals keep so closely together as they are driven along, that, if necessary, he walks from the back of one to that of another perfectly at his ease. In a wild state, the B. is savage and dangerous, and even in domestication it is apt to resent injury. The native princes of India make buffaloes and tigers fight in their public shows; and the B. is more than a match for the tiger, even in single combat. The appearance of a tiger excites a herd of buffaloes, much as we see oxen excited by the approach of a dog; and if his safety is not secured by flight, they kill him, tossing him from one to another with their horns, and trampling him with their feet.

The B. is used in some parts of the east in the shooting of waterfowl, being trained to the sport, and sold at a considerable price. The sportsman conceals himself behind the B., which, being a familiar sight, is not alarming to the birds.

The CAPE B. (*Bos Caffer*) is generally regarded as a distinct species. It seems never to have been reduced to the service of man, although there is reason to believe it to be very capable of domestication. The horns are very large; they spread horizontally over the top of the head, and are then bent down laterally, and turned upwards at the point. The head is carried, as by the common B., with projecting muzzle and reclining horns, but the bases of the horns nearly meet on the forehead, where they are from eight to ten inches broad. The length of a full-grown Cape B. is about 8 feet from

the root of the horns to the tail, and the height 5*1*/<sub>2</sub> feet. This animal is regarded as more formidable than any other in South Africa; and the hunter will more readily risk an encounter with a lion than offer any provocation to a B. without great advantages for the combat, or great facilities for

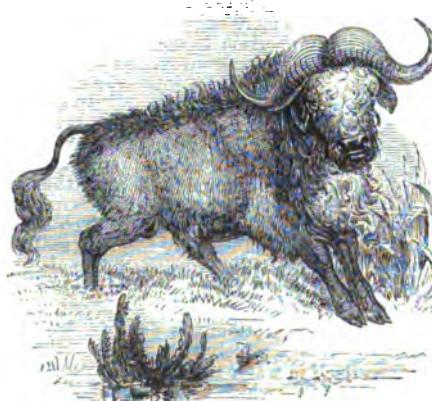

escape. The B. is still found in large herds in the interior of South Africa, but in Cape Colony, where it was once plentiful, it has now become comparatively rare. The hide is so thick and tough that the Caffres make shields of it, impenetrable to musket-shot; and the balls used by the hunters in shooting the animal are mixed with tin, and yet are often flattened by the resistance. The Cape B. grazes chiefly in the evening, and lies in woods and thickets during the day.

An attempt has been made to establish a genus, *Bubalus*, having the common B. for its type; but the characters lack precision, and the limits are uncertain.—The *Buffalo* of the Anglo-Americans is the American Bison. See BISON.

BUFFALO, a city of the state of New York, standing at the mouth of Buffalo Creek, which enters Lake Erie within 2 miles of its outlet, the Niagara river. Its progress has been perhaps more marvellous than that of any of its rivals. In 1801, when B. was founded, the basin of its fresh-water sea contained certainly fewer than 50,000 inhabitants, and seemed cut off from commercial communication by the Niagara falls on the east, and the currents of the Detroit and St Clair on the west. But these, and other natural disadvantages, have been made to vanish. A pier of 500 yards in length, by narrowing and accelerating the stream, has in a great measure removed the bar, so as to give a depth of 12 or 14 feet for a mile upwards. Steam has brought Lakes Huron, Michigan, and Superior within easy reach; but B. is no longer the grand terminus of the lake trade, since railroad competition and other causes have diverted much of her commerce to other ports. British improvements along the Niagara and the St Lawrence, available as they are for sea-going ships, have rendered B. a maritime emporium. The Erie Canal, 364 miles long, has connected B. as its terminus with the tide-waters of the Hudson; while three other enterprises of the kind, commencing respectively at Erie, Cleveland, and Toledo, have linked Lake Erie at three or rather four points with the Ohio, and through it with the Mississippi. At one time, the annual amount of exports and imports was 100 millions of dollars; and though this has decreased during the last six or eight years, its trade is still very great. The rise of B. has been remarkably rapid: in 1843, the port duties yielded but 436 dollars; in 1849, 46,939; in 1852, 69,732; and in 1869 the internal tax and customs revenue amounted to 3,591,000 dollars. The population has increased in a similar ratio. In 1810, there were 1508 inhabitants; 1830, 8653; 1840, 18,213; 1850, 42,261; 1860, 85,500; and in 1870 the number had swollen to 117,714. To shew the decrease in trade within the last few years, we notice that in 1869 B. imported 37,014,628 bushels of grain, a decline of 12,947,865 bushels from the imports of 1866. In 1814 the British burned B., and in 1825 the Erie Canal between it and Albany was opened.

B. is situated in lat. 42° 53' N., and long. 78° 53' W. It is regularly built. Its streets are straight and broad—Main Street, in particular, being 2 miles long and 120 feet wide; and its squares, which are three in number, are shaded by rows of trees. Besides the ordinary establishments of a populous and wealthy town, B. has a court-house, a lyceum, and a university. It is largely engaged in ship-building, and possesses iron-foundries, wool-factories, and saw-mills. It is divided into five wards, and is governed by a mayor and council annually elected.

BUFFALO'RA, a small town of Lombardy, about 25 miles north-north-west of Pavia, on the Ticino, here crossed by a bridge. The Austrians commenced

Cape Buffalo.

the root of the horns to the tail, and the height 5*1*/<sub>2</sub> feet. This animal is regarded as more formidable than any other in South Africa; and the hunter will more readily risk an encounter with a lion than offer any provocation to a B. without great advantages for the combat, or great facilities for

the Italian campaign of 1859 by entering Piedmont at this point. The bridge was partially blown up by Austrian engineers. Pop. 1250.

**BUFFET**, an article of furniture formerly serving the same purpose as a sideboard, which has now superseded it. B. is also a name given to foot-stools.

**BUFF LEATHER** is usually made out of salted and dried South American light ox and cow hides. After being limed in the usual way, they are unhaired and rounded, so that only the best part of the hide is made into buff leather. The grain and flesh being then scraped or cut off, the true cuticle, which is of a flexible fibrous nature, alone remains. The hide is next sprinkled over with cod-oil, and placed in the stocks, where it is worked for about 15 minutes. Having been taken out and partially dried, it is again submitted to a similar process of oiling and stocking; and during the first day, these operations may be repeated six times, decreasing daily for about a week, when one oiling and stocking in a day is sufficient. The hides are then placed in a stove, and subjected to a process called 'heating off,' after which they are scoured and rendered free from oiliness by being soaked in a strong lye of carbonate of potash. They are next worked well in the stocks, hot water being poured copiously upon them until the water runs off pure. Having been dried, they are subjected to a process called *grounding*—i.e., they are rubbed with a round knife, and also with pumice-stone and sand, until a smooth surface is produced. The leather, which is very pliant, and not liable to crack or rot, is now ready for the market, and is generally used for soldiers' belts and other army purposes.

During the early part of this century, the principal seat of the B. L. manufacture was in the neighbourhood of Edinburgh, one manufacturer turning out, previous to the battle of Waterloo, about 1300 hides per week. In peaceable times, the demand for B. L. is comparatively small, and the manufacture is now almost confined to London and the neighbourhood, where the raw material is most readily procured, and the demand for the manufactured article is greatest. The natural colour of the leather is light-yellow, but for some purposes it is bleached white. The precise chemical operation of the oil in the process of the manufacture is rather obscure, but as no glue can be got from hide that has been made into buff, the gelatine of the hide must have entered into combination with some of the constituents of the oil, and had its nature completely changed.

**BUFFON, GEORGE LOUIS LECLERC, COMTE DE**, one of the most famous naturalists and writers of the 18th c., was born at Montbard, in Burgundy, September 7, 1707. He studied law at the college of Jesuits at Dijon, but shewed so marked a predilection for astronomy and mathematics, that his father allowed him to follow his own inclinations. At Dijon, he became acquainted with Lord Kingston, whose tutor, a man of learning and taste, directed the mind of B. to the study of the sciences. With Lord Kingston and his tutor, B. travelled through France and Italy, and came to England, where, to improve his knowledge of our language, he translated Newton's *Fluctions* and Hales's *Vegetable Statica*. In 1733, he wrote several original essays, which gained notice in the Academy, of which he had been made a member. His general love of science received a definite impulse toward zoology by his appointment, in 1739, as intendant of the royal garden and museum. Hitherto zoology, consisting of a series of unconnected observations and fruitless attempts at classification, had been commonly regarded by educated readers as a dry

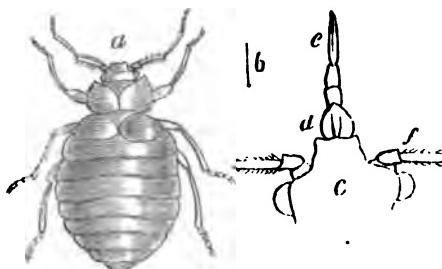

study, and by savans as play-work. B. first conceived the idea of making it attractive to the first of these classes, and of securing for it, at the same time, the respect of the second. His plan was assuredly comprehensive enough, since he aimed at nothing less than a collection of all the separate known facts of physical investigation, and a systematic arrangement of these, to assist the author in forming a theory of nature; but B. possessed neither the science nor the patience necessary for such a task. Endowed, however, with a brilliantly rhetorical imagination, and always inclined to deliver himself from doubts and ignorance by sparkling hypotheses, the elaboration of which cost him little trouble, he contrived to produce a work which, if not severely scientific in its method, at least shone with what many then conceived to be the brightest literary lustre. However, it is not to be denied that many of his views are very ingenious, although later researches have completely exploded them. The *Natural History* of B. made an epoch in the study of the natural sciences, though it has now little or no scientific value. His attempted explanations of natural phenomena were opposed by Condillac, who, with Helvetius, Diderot, D'Alembert, and others, also ridiculed, with a certain degree of justice, the excessive pomp of style used by Buffon. The most insignificant part of B.'s treatise is the mineralogy, for which he was quite unqualified by the deficiencies of his chemical, mathematical, and physical knowledge. The systematic and anatomical arrangement of the mammalia was executed by Daubenton, the colleague of Buffon. B.'s works passed through numerous editions, and several were translated into most of the languages of Europe. The best complete edition is the *Histoire Naturelle Générale et Particulière*, in 36 volumes (Par. 1749—1788). After receiving several high honours, being elevated to the rank of Comte de B. by Louis XV., and treated with great distinction by Louis XVI., B. died in Paris, April 16, 1788. In person and carriage, B. was noble; as a Parisian academician, and a self-complacent, theoretical naturalist, dressed in courtly style, pursuing his pleasant studies in the *allées* of the Royal Garden, and largely participating in the vices of his time, B. was quite a model of a French philosopher of the 18th century. His son, Henri Leclerc, Comte de B., born 1764, was attached, at the outbreak of the revolution, to the party of the Duke of Orleans, and fell under the guillotine. His last words were: 'Citoyens, je me nomme Buffon.'

**BUFFOO'N** (Fr. *bouffon*), a low jester. The Italian *buffo* (from *buffa*, a farce) is the name given to a comic singer in an opera. In the corrupt Latinity of the middle age, *buffa* meant a slap on the cheek; and in the Italian, *buffare* signifies the puffing of wind through the mouth. It is probably from the favourite trick played by clowns in farces—one swelling out his cheeks with wind, the other slapping them, so as to make a ludicrous explosion—that the terms *buffones* in Latin, *buffoni* in Italian, *buffons* in French, and in English *buffoon*, were derived. In Italy, the *buffo cantante* is distinct from the *buffo comico*; the former having greater musical talent, and sustaining a more important part, the latter having greater licence in jocoseness. The voice of a *buffo cantante* is generally a bass, but sometimes a tenor *buffo* is introduced.

**BUG, or BOG.** There are two rivers of this name in Russian Poland. The Western B., the largest tributary of the Vistula, rises in Austrian Galicia, and after a course of about 450 English miles, and receiving numerous tributaries, it joins the Vistula at the fortress of Modlin, near Warsaw. 413

It is navigable for a considerable distance. The Eastern B., the Hypanis of the ancients, rises in Podolia, and flows south into the estuary of the Dnieper. Its length is more than 400 miles. It is navigable for small-craft as far as Wosnessenak. At the junction of the Ingul with the B., stands the city of Niolaiew (q. v.).

**BUG**, a name applied to a large family of insects, *Cimicidae*, of the order *Hemiptera* (q. v.), sub-order *Heteroptera*, and often still further extended in its signification so as to include the whole of that sub-order, the insects of the section *Geocorissae* being designated land-bugs, and those of the section *Hydrocorissae*, water-bugs, the latter including water-scorpions, boat-flies, &c. All these insects, and particularly the land-bugs, although some of them are radiant in beautiful colours, have a strong resemblance in form and structure to the annoying and disgusting *Houan* B. or *Bird* B. (*Oimex lectularius*). The statement that this insect was introduced into England with timber brought from America to rebuild London after the great fire of 1666, must be rejected as erroneous; for although it appears to have been comparatively rare in England, it was well known in some parts of Europe long before that time, and is mentioned by Dioscorides. The Bed B. is destitute of wings—an anomalous peculiarity, as the insects of its order, and even of the same family, are generally furnished with them.

Bed Bug:

a, the insect, magnified; b, its natural length; c, the head, upper side; d, labrum; e, proboscis extended; f, base of antenna—very highly magnified.

The body is very flat, of a somewhat oval form; the whole insect is of a dirty rust colour, emits an offensive odour, and is about three-sixteenths of an inch in length; the legs are moderately long, and capable of being employed for pretty rapid motion; the antennae are thread-like and very slender, about half the length of the body; the mouth is formed for suction alone, and is furnished with a sort of proboscis, which is three-jointed, forms a sheath for the true sucker, and when not in use is recurred under the head and thorax. The B. lurks during the day in crevices of walls, of bedsteads, and of other furniture, but is sufficiently active during the night; and when it finds opportunity, sucks blood until it distends itself. It seems, however, to be capable of subsisting long without food. Young bugs resemble their parents in most things, except size and the want of elytra, insects of this order not undergoing such marvellous transformations as those of some other orders. The best preventive of bugs in a house is scrupulous attention to cleanliness; but where the nuisance exists, it is not easily removed, and various means are employed for this purpose, of which one of the best and safest is thorough washing with spirit of turpentine, although recourse is even had to washing with a solution of corrosive sub-limate.—Other species of B. (*Oimex*) suck the blood

of some of the inferior vertebrate animals, as pigeons, swallows, bats, &c.; but the greater number of insects of the B. family live by sucking the juices of vegetables. A small species (*Tingis pyri*), which sucks the leaves of the pear-tree, is very destructive in some parts of Europe, where it is popularly called the tiger. Some of these winged wood-bugs or field-bugs are capable of inflicting very painful wounds. Flying-bugs, enormous and fetid, are among the pests of India. Night is the time of their activity. Warm countries generally have winged bugs of great size and beauty; but if touched or irritated, they 'exhale an odour that, once perceived, is never after forgotten.' A winged B., as large as a cockchafer, lodges in the thatch and roofing of houses in Chili, and sallies forth at night, like the Bed B., to suck blood, of which it takes as much as a common leech.—It is worthy of notice that a species of field-B. (*Acanthosoma grisea*), a native of Britain, is one of the few insects that have yet been observed to shew affection and attention to their young. De Geer observed the female of this species, which inhabits the birch-tree, conducting a family of thirty or forty young ones as a hen does her chickens, shewing great uneasiness when they seemed to be threatened with danger, and waiting by them instead of trying to make her own escape.

**BUGEAUD, MARSHAL**, was born at Limoges, in France, October 15, 1784. In his 20th year he entered the army as a private. His conspicuous bravery in the Prussian, Polish, and Spanish campaigns gained him rapid promotion. Shortly before the fall of Napoleon, B. was made a colonel, and in 1815 commanded the advance-guard of the army corps of the Alpa. He afterwards retired to his estate, but was called into public life by the July revolution of 1830. He was elected deputy for Perigueux, and gained the esteem of Louis-Philippe, who created him a marshal. In 1836, he voted against electoral reforms and universal suffrage, denounced 'the tyranny of the press,' and soon contrived to make himself very unpopular. In December 1840, he was appointed governor-general of Algiers. He immediately set about organising the celebrated irregular force known as the Zouaves, and in a few years the French arms were everywhere triumphant over the Arab tribes. The cruelty of some of B.'s proceedings excited strong feelings of reprobation at the time, as well in France as in Europe generally. In 1844, he gained a victory over the Emperor of Morocco's forces at Ily, for which he was created Duc d'Ily. In the revolution of February 1848, Marshal B. had the command of the army in Paris, and would have dissuaded the king from signing the act of abdication; but panic made such counsel useless. Among all the friends of Louis-Philippe, Marshal B. seems to have been the only man who preserved firmness and presence of mind. When Louis Napoleon became president, he intrusted the chief command of the army of the Alps to B., who died of cholera in Paris, June 9, 1849.

**BUGENHAGEN, JOHANN**, surnamed *Pomeranus*, or Dr Pommer, one of Luther's chief helpers in the Reformation, was born at Wollin, near Stettin, in Pomerania, 1485; studied at Greifswald, and as early as 1508 became rector of the Treptow Academy. There he lived quietly, fulfilling the duties of his office until 1520, when his religious views were changed by reading Luther's little book, *De Captivitate Babylonica*. He was now seized, as it were, by the zealous spirit of the Reformation, and, to avoid the persecutions of the Catholic party, he betook himself to Wittenberg, where his talents procured for him in succession

several high positions. B.'s remarkable philological and exegetical powers were of great service to Luther in his translation of the Bible. In 1525, he opened the controversy between Luther and Zwingli by a treatise against the latter, to which Zwingli ably replied. He possessed a superior talent for organisation, establishing churches in Brunswick, Hamburg, Lubeck, and Pomerania. In 1537, he was called to Denmark by Christian III., to reform the ecclesiastical establishments of that country. He accomplished this so admirably, that the Danes to this day consider him their Reformer. In 1542, he returned to Wittenberg, and continued his energetic efforts to extend the new theology throughout his native land. He died 20th April 1558. His best work is his *Interpretatio in Librum Psalmorum* (Nurnberg, 1523).

BU'GLE (*Ajuga*), a genus of plants of the natural order *Labiatae*, having an irregular corolla, with very short upper lip and trifid lower lip, the stamens protruding. The species are mostly natives of the colder parts of the Old World, and several are British. The Common B. (*A. reptans*) is abundant in moist pastures and woods. Its flowers are generally blue, but varieties occur with white and purplish flowers, which are often introduced into flower-borders. The Alpine B. (*A. alpina*) is one of the beautiful flowers of the Swiss Alpa.

BU'GLOSS, a name popularly applied to many plants of the natural order *Boraginaceæ* (q. v.), as to the species of *Anchusa* or Alkanet (q. v.), &c. In some botanical works it is confined to the genus *Lycopsis*, a genus differing from *Anchusa* in little but the curiously curved tube of the corolla, and of which one species, *L. arvensis*, is a common weed in cornfields in Britain. The beautiful genus *Echium* bears the English name of VIPER'S BUGLOSS.

BUHL-WORK, or BOOL-WORK, is the name applied to a sort of inlaying of brass scrolls and other ornamental patterns in wood. The name is derived from its inventor, Boule, an Italian cabinet-maker, who settled in France in the reign of Louis XIV. He employed veneers of dark-coloured tortoise-shell, inlaid with brass. Cabinets of his manufacture are highly prized, as are also those of his contemporary Reismer, a German, who used a ground of tulip-wood, inlaid with flowers, &c., in darker woods, and varied with margins and bands of light wood, with the grain crossed for contrast. This modification of B. W. is correctly called Reismer work. For details of the methods of working, see INLAYING and MOSAIC.

BU'HRSTONE, a variety of quartz (q. v.), containing many small empty cells, which give it a peculiar roughness of surface, particularly adapting it for millstones. The name is given without reference to geological relations, but it is *not* quartz, rather than true quartz rock, which ordinarily assumes the character of buhrstone. There are different varieties of B., some of which are more compact, or have smaller cells than others; and those in which the cells are small and very regularly distributed, about equal in diameter to the spaces between them, the stone being also as hard as rock-crystal, are most esteemed. Good B. is found at Conway in Wales, and at several places in Scotland; but the finest millstones are obtained from the quarries of La Ferté-sous-Jouarre, in the department of Seine-et-Marne, near Paris. A single millstone in one piece of 6 feet diameter, sells for about £50, and one formed of several pieces for about £33. It is not unusual to form millstones of pieces of B. cut into parallelopipeds, like great wedges of soap, and bound together by iron hoops.

The stone is found in beds or in detached masses, and the mode of quarrying is peculiar. When the mass is large, it is cut out into the form of a huge cylinder; around this, grooves are cut, at distances of about 18 inches, the intended thickness of the millstones; into these grooves, wooden wedges are driven, and water is thrown upon the wedges, which, causing the wood to swell, splits the cylinder into the slices required.—Millstones are not always made of B., but sometimes of silicious gritstones, of sandstone, and even of granite. B. millstones are extremely durable.

BUILDING, the art of erecting or building houses and other edifices, in which several distinct professions are usually and more immediately concerned. At the head of the building-trade is the architect, who is employed to draw plans and make out specifications of the work to be performed. The builder acts ministerially; his duty consists in carrying out the plans put into his hands, according to certain stipulated terms. The profession of the architect demands not only much imaginative power, but great artistic skill, along with a practical knowledge of details. Endeavouring to realise the wishes of his employer, the architect devises what shall be the external effect and interior accommodation of a building, and portrays the whole on paper with rigorous accuracy. Besides general designs to give an idea of the structure and its interior arrangements, he furnishes the working plans or drawings, which are to guide the different mechanics—masons, joiners, &c.—in their several operations. These services of the architect, of course, involve much thought and labour, and he is therefore under the necessity of employing a staff of assistants, by whom the plans are executed under his orders. The making out of the specifications is a matter of careful study. To perform this part of his duty properly, the architect needs to be acquainted with the qualities of different kinds of materials; such as stone, lime, sand, bricks, wood, iron, &c. A knowledge of the strength of timber is particularly desirable. When the specifications are made out, they and the contract are subscribed by the builder. To insure as far as possible a faithful adherence to the specifications, the architect appoints a 'clerk of works' to keep watch over the whole operations, and who is authorised to check any seeming fault. During the whole proceedings, the architect is paramount. For the due execution of his plans, he feels that his professional reputation is at stake; and, accordingly, having involved his responsibility, the employer cannot with propriety interfere to make alterations while the work is in progress. Such is the etiquette of the profession. Should alterations be desirable, they become matter for a fresh agreement among the parties. When the works are finished, the builder hands his account to the architect to be examined and checked. If satisfied of its correctness, he grants a certificate of the fact, and this is the warrant for payment by the employer. The builder having been settled with, the employer now pays the architect's fee, which closes the transaction. This fee may be one, two, or more per cent. on the entire cost of the B., according to local usage or terms agreed on; whatever it is, it covers all charges for advice, plans, and other professional trouble.

Builders undertake work by 'contract,' or by 'schedule of prices.' If by contract, they engage to execute the whole works for a stipulated sum. If by schedule of prices, they agree to abide by the measurements of valiators appointed by the architect. These valiators go over the works when finished, and, taking an exact account of everything,

## BUILDING ACT FOR LONDON—BUILDING LEASES.

compare it with the account rendered by the builder; the architect being the ultimate referee. It is exceedingly important, for the sake of an amicable adjustment of accounts, that the builder should adhere scrupulously to the letter of the specifications—i.e., the covenant under which he has become bound. He can justify no departure from the specifications, on the plea that something as good has been given or done, or that he was not checked at the time by the clerk of works. Being explicitly a person employed to do a certain piece of work, in a certain way, he is in no respect entitled to substitute his own notions for those of his employers.

It may happen that a proprietor acts as his own architect, and employs a builder to execute his designs, on the understanding that he is to pay for everything according to a schedule of prices. In many instances, the builder is proprietor as well as architect, and merely carries out his own plans. Such is generally the case in the neighbourhood of London, where builders speculate in leasing land and erecting rows of dwellings for sale. This plan is greatly facilitated by the opportunity of buying every article required in house-building ready for use; such as bricks, door-steps, hearthstones, joists, flooring, doors, windows, marble mantel-pieces, slates, &c. In fact, house-building in the metropolis district is very much reduced to a system of purchasing and putting together certain articles from manufactures and depôts. For this kind of business, there may be said to be establishments for the sale of doors and windows, as there are shops for the sale of nails, locks, and hinges.

The application of a comprehensive manufacturing system in the preparation of various parts of a building is observable most particularly in certain establishments of great magnitude. The test is this—whether the builder conducts so gigantic a trade as to warrant him in setting up a steam-engine of great power, and in providing highly wrought machines for cutting and otherwise treating wood, stone, &c. When once this degree of magnitude is reached, the operations are conducted under very great advantage. The Crystal Palace in Hyde Park could never have been built at the stipulated cost, nor in the required space of time, but by the application of steam-power to work the machines which shaped and grooved the *two hundred miles* of saah-bars; by the resources of the largest English establishment in the glass-trade, in making one million square feet of sheet-glass; and by the skill and capital of our great iron manufacturers, in rapidly producing three thousand iron columns, and more than that number of iron girders. When the late Mr Thomas Cubitt was engaged in the vast building operations at Belgravia (a district in the west of London owned by the Marquis of Westminster), his factory on the banks of the Thames was the most complete ever known in the trade. It exemplified both the principles adverted to above—the manufacture of various articles by steam-worked machinery; and the collecting of large stores of other articles made in a similar way by other firms. There was a store of drawing-room and parlour doors, a store of window-sashes, a store of street-doors, and stores of mantel-pieces, stone and marble steps, balusters, slates, knockers, bells, and all the materials for house-building from the coarsest to the finest. There was also observed that systematic gradation of kinds and dimensions which is so much attended to in the higher kinds of machinery, and which so much expedites all operations; seeing that one particular piece would not only fit into or against another, but into or against any one of a whole class to which that other belonged. A house

built in this systematic way partakes a good deal in the nature of a large machine, in which all the parts fit together with very great accuracy. There can be little doubt that if skill and capital be judiciously applied in this way, a house ought to be better built and to cost less than if built in the ordinary un-systematic manner. It may also be mentioned here, that Mr Cubitt was the owner of a very large brick-making establishment on the banks of the Medway, between Rochester and Maidstone, where steam-power was employed in all the operations of making bricks. Some of the great railway contractors, who have become millionaires, were originally house-builders, alive to the grand results producible by the combination of steam-worked machinery with the labour of well-organised bodies of men.

As an art, B. is of vast antiquity, and has assumed different forms, according to the necessities of mankind and the materials readily at their disposal. In ancient Egypt, Greece, and Italy, B. in stone rose to a high state of perfection, and till the present day it may be said that the greatest progress in the art is made only where stone of a manageable kind is conveniently at command. Rome, and other Italian cities; Paris, Lyon, Bordeaux, and most cities in France; Brussels, Berlin, Leipsic, Munich, Geneva, Vienna, Edinburgh, and Glasgow are noble specimens of what may be achieved in stone workable with the chisel. On the other hand, London, the greatest city within the bounds of civilisation, is built of brick; so likewise are Manchester and Liverpool; also Amsterdam, Rotterdam, and other towns in Holland; and, as a general fact, it would appear that wherever brick has to be resorted to, there the allied arts of architecture and building, as regards domestic accommodation and elegance of style, are on a poor scale. B. with stone of a superior kind is now becoming common in New York, Philadelphia, and some other American cities. It is not necessary to trace in this article the various processes embraced in the comprehensive term BUILDING; seeing that all the materials used, and all the operations conducted, are noticed under the proper headings in the Encyclopædia.

### BUILDING ACT FOR LONDON AND ITS NEIGHBOURHOOD. See METROPOLIS LOCAL MANAGEMENT ACT.

**BUILDING LEASES.** In the law of England, a building lease is a demise of land for a long term of years, the lessee covenanting to erect certain houses or edifices thereon, according to specification. By the 19 and 20 Vict. c. 120, amended by the 21 and 22 Vict. c. 77, and which acts also apply to Ireland, the Court of Chancery is empowered to authorise leases of settled estates and B. L., which shall take effect in possession within one year next after the making of the same; the term for such building lease being ninety-nine years; or where the court shall be satisfied that it is the usual custom of the district, and beneficial to the inheritance to grant B. L. for longer terms, then for such term as the court shall direct. By a subsequent enactment, it is declared that the term building lease shall include a repairing lease, but such repairing lease to be for a term not exceeding sixty years.

By the 5 and 6 Vict. c. 108—passed to enable ecclesiastical persons to grant long leases for building, repairs, or other improvements—it is enacted that any ecclesiastical corporations, aggregate or sole, excepting as mentioned in the act, may, with consent of the *Ecclesiastical Commissioners for England* (q. v.)—to which, where the lessor is incumbent of a benefice, the consent of the patron also must

## BUILDING SOCIETIES—BULB.

be added—desire by deed the corporate lands or houses for any term not exceeding ninety-nine years, to take effect in possession and not in reversion, to any person willing to improve or repair the same; provided, that on the grant of such leases, a small rent may be reserved during the six first years, with an increased rent afterwards; but no such lease is to comprise the usual house of residence, its out-buildings or pleasure-grounds. The act contains other regulations, and it declares generally that it is made without prejudice to any right that ecclesiastical persons have under the former law to grant or lease, whether by renewal or otherwise.

In the Scotch law, the term building lease is applied to the case of proprietors of entailed estates, who, in order to encourage the building of villages and houses upon property so settled, are to have it in their power to grant leases of land for the purpose of building, for any number of years not exceeding ninety-nine years. See this matter regulated by the 10 Geo. III. c. 51. By the 3 and 4 Vict. c. 48, proprietors of entailed estates in Scotland may feu or lease on long leases ground for the building of churches and schools, and for the dwelling-houses and gardens for the ministers and masters of the same, and also for burying-ground and play-ground attached to such churches and schools. See LEASE and LEASEHOLD.

**BUILDING SOCIETIES.** See BENEFIT SOCIETIES.

**BUILDING STONE.** The chemical composition of B. S. varies. The majority of kinds are more or less silicious, and are designated sandstones. These consist of particles of sand, united together by the force of cohesion, and by a small proportion of a natural cement; in some cases, ferruginous, consisting of a compound of iron; and in other instances, calcareous, composed of carbonate of lime. Igneous rocks furnish very durable B. S., though in general the hardness of the materials renders them so difficult to work, that they are seldom resorted to where softer stones can be procured. Thus, granite is largely employed in the construction of the houses in Aberdeen, in the erection of bridges, in the paving of streets, and wherever great durability is required. Greenstone and basalt are also occasionally used. The B. S. employed in the new Houses of Parliament is a magnesian limestone, or a double carbonate of lime and magnesia, which is very close and compact in texture, is soft enough to be easily cut with the chisel, but durable enough to resist weathering, and retain the sharp outline of the carving. The other forms of carbonate of lime exhibit considerable durability. In the vicinity of Bath, as also in the Isle of Portland, an oolitic limestone is quarried, which is easily cut, and stands well.

A very convenient and accurate way of determining the durability of a B. S.—in other words, its power of resisting the effects of frost and other atmospheric agencies—is to place a small block in a cold saturated solution of sulphate of soda; raise to the boiling-point, so as to expel air from cavities in the stone, which then become filled with the solution; then allow to cool, and suspend the block of B. S. in air. Every now and then, it is dipped into the solution, and subsequently air-dried. The result is, that the sulphate of soda crystallises on the outside, and partially in the interior of the block, and in this respect acts as water does when it is frozen during winter; and if the B. S. be porous, and liable to decay by natural agencies, it gradually breaks up, and particles scale off. The amount of this corrosion can be determined by weighing the detached portions. Some building stones contain iron pyrites in little nodules diffused

here and there throughout the mass, and such become discoloured from the pyrites being decomposed by atmospheric influence, and the brownish-red oxide of iron (rust) is left as a stain on the surface of the block. The liability to decay or to discoloration in a B. S. may be arrested to a great extent by coating the outer surface with boiled linseed-oil, which communicates a dark appearance to the stone, but prevents oxygen or moisture from gaining access to the block. Ordinary oil-paint is employed for the same purpose. For the preservation of B. S. from decay by means of various solutions, see STONE, PRESERVATION OF.

**BUJALA'NCÉ,** a city of Andalusia, Spain, about 20 miles east of Cordova. It is surrounded by a moat and a wall flanked with old towers, has an old Arab castle, and manufactures of woollens, glass, and pottery, exports of agricultural produce, and an important annual cattle-fair. Pop. about 9000.

**BUKKUM WOOD.** See BRAZIL WOOD and SAFFAN WOOD.

**BUKKUR,** a fortified island of the Indus, in Sind, in lat. 27° 30' N., and long. 68° 56' E. It is 400 yards from Roree on the left bank, and 100 from Sukkur on the right. In the ordinary state of low water, the western and eastern arms of the river are respectively 15 feet and 30 feet deep. In particularly dry seasons, however, the former has been known to disappear altogether, and even the latter is said to have occasionally been fordable. In 1839, a British force, on its march to Afghanistan, made a stepping-stone, as it were, of B. in crossing the Indus, having joined it to either mainland by a bridge of boats. B. is no longer of any military value against a civilised assailant, commanded, as it is, on both sides by higher grounds. It is composed of limestone, being 800 yards long, and 300 broad, and rising 30 feet from the average level of the stream.

**BUKOWI'NA,** formerly the south-eastern division of Galicia, now a distinct crown-land of the Austrian empire, on the Russian frontier, occupies an area of 3981 square miles, with a population in 1869 of 513,404. It is traversed by offsets of the Carpathians, gives rise to many rivers, and abounds in wood, along with considerable mineral riches. Wood-cutting and mining afford occupation for a great number of the inhabitants. Large numbers of cattle are reared, and also excellent horses. B. till the end of the 15th c. belonged to Transylvania, when it came under the dominion of the Turks, by whom it was ceded to Austria in 1777. Czernowitz is the chief town.

**BULACA'N,** a town of Luzon, Philippines, at the head of the Bay of Manila, about twenty miles north-west of the city of that name. B. is chiefly composed of wooden houses, but has spacious streets, manufactures of silken mats and other fabrics, and large sugar-boiling establishments. Pop. between 9000 and 10,000.

**BULB,** in Botany, a subterranean bud covered with imbricated scales, having at their base a flattened disc, which represents the proper stem of the plant, and from which the roots proceed downwards, whilst from the midst of the scales an annual herbageous stem and leaves are sent up. The scales are regarded as modified leaves, and sometimes are all fleshy, as in the lily; sometimes the outer ones are membranous, as in the onion, in which case the B. is said to be *tunicated*. The B. is popularly but erroneously regarded as the root or part of the root of the plant, and plants in which it is found are very generally described as *bulbous-rooted*. New buds are formed in the axils of its scales, which grow at the expense of the parent B., and gradually

destroy it. In some plants, as the tiger-lily and some species of allium, leaf-buds (*bulbis* or *bulblet*) are developed on the stem above ground, which spontaneously separate and serve for the propagation of the plant, and which are entirely of the nature of bulbs, being formed of thickened scales, sometimes so closely united as to form a solid mass. The CORM (q. v.) was formerly regarded as a kind of B., and described as a solid B., but its structure is essentially different, although both it and the TUBER (q. v.) may be included in the description which Linneus has given of the B. with reference to the purpose which it serves as 'the winter-quarters of the plant.' Many bulbs, if removed from the ground during the period when the vegetation of the plant is most dormant, may be kept in a dry place without injury for a considerable time, even for years. Bulbs serve also for the preservation of plants in periods of drought, and are particularly frequent in those which delight in sandy soils. The abundance of 'bulbous-rooted' plants is a remarkable characteristic of the flora of the Cape of Good Hope. 'Bulbous-rooted' plants are very often distinguished by the beauty of their flowers, and many of them are among the most esteemed ornaments of gardens, green-houses, and stoves. The bulbs of tulips, hyacinths, and other favourite flowers are important articles of trade. Some bulbs, as that of the onion, are valuable as articles of food; others, as that of the squill, upon account of medicinal properties.

BULBUL, an Armenian name for the nightingale, which has found its way into English poetry chiefly through the patronage of Lord Byron. But the same name is given in India to a very different bird, *Pycnonotus haemorrhous*, belonging to the great tribe of *Dentirostres*, and formerly ranked among the thrushes, to which it is pretty nearly allied. It is a little bird of brilliant plumage, and the male has a crest or tuft on its head. It is remarkable for its pugnacity; the Singhalese consider it the most *game* of all birds, and the training of it to fight was one of the duties intrusted by the king of Kandy to the Kooroowa or Bird Headman. When pitted against an antagonist, such is the obstinate courage of this little creature, that it will sink from exhaustion rather than release its hold.—*Sir J. E. Tennent's Ceylon.*

BULGARIA, an extensive province of European Turkey, in lat.  $42^{\circ} 8'-45^{\circ} 20' N.$ , and long.  $22^{\circ} 15'-23^{\circ} 35' E.$  The Danube flows along the whole of its northern boundary; on the E. it has the Black Sea; and on the S. the Balkan range divides it from Rumelia and Macedonia. It has an area of about 38,000 square miles, with a population of 2,047,000, of whom 1,350,000 belong to the Greek Catholic Church. The country slopes terrace-like from south to north, and from the west to the east, acquiring a plain-like character before reaching the Black Sea. The rivers are rapid and tributary to the Danube. The soil in some parts is very fertile, producing great abundance of corn; in others, it does not yield sufficient for the consumption. There is excellent pasture-land, and the lower terraces are richly wooded. The exports include horned cattle, sheep, corn, wine, iron, wood, honey, wax; and otto of roses is an important article. The government is in the hands of the Mohammedan Beglerbeg of Rumelia; and since 1864 it has been divided into seven sanjaks—Rustchuk, Widdin, Nissa, Sophia, Tirnova, Varna, and Tultcha. In a military point of view, B. holds a position of great importance, and has been, in consequence, often an arena of warfare, from the time of the Roman and Byzantine to that of the Turko-Russian campaign of 1854.

418

The earliest known inhabitants of B. were the Moesians, who contended long against the Romans, and allied themselves with Gothic and Slavonic tribes against the Greek empire. Anastasius, the Greek emperor, in 507, built an extensive wall to defend his territories from Moesian invaders. In the 7th c., the Bulgarians, a people of Finnish origin, whose original seat was the banks of the Volga, conquered the Moesians, and established the kingdom of Bulgaria; they soon lost their own language and customs, and became assimilated to the other Slavonic inhabitants. After being tributary to the Greek emperors, and contending for some time against Hungary, B. became subject to the Porte in 1392; but the frightful oppression of despotic and sanguinary pashas has not, even to the present day, robbed the inhabitants of a distinctively national life and love of freedom. Since 866, the Bulgarians have chiefly belonged to the Greek Catholic Church.

The BULGARIAN LANGUAGE is divided into two dialects—Old Bulgarian and New Bulgarian; the former, the richest and best of the Slavonic dialects; the latter, very inferior, and chiefly remarkable for its store of popular songs.

BULGARIN, THADDEUS, one of the best known Russian authors, was born in Lithuania, 1789; received a military education in St Petersburg; and, in 1805, served in the campaign against France. Later, however, he forsook the Russian army for the French, and after sundry reverses was, in 1814, appointed by Napoleon to the command of a division of volunteers. After Napoleon's fall, B. went to Warsaw, where he contributed several poetical and humorous works to Polish literature. But, ultimately, he settled in St Petersburg, and devoting himself to the study of Russ, soon became a popular author. In 1825, together with his friend Gretsch, he began the *Northern Bee*, and subsequently he composed several romances—of which *Demetrius* and *Mazeppa* are the best—and published different periodicals. B. was humorous and graphic as a writer, judicious as an editor, as a critic severe, and by no means dispassionate. His large work, *Russia in its Historical, Statistical, Geographical, and Literary Aspect*, has been with his sanction translated into German, and published at Riga, 1839—1841. He died in 1859.

BULGEWAYS are timbers so placed as to facilitate the launching of a ship; for which, see LAUNCHING.

BULKHEADS, in a ship, are the partitions between the several portions of the interior; whether to separate it into rooms, or as a safeguard in case of wreck. In ships of war, the B. or partitions between the several cabins and storerooms are chiefly of wood; and most or many of these are removed when preparing for action, in order to obtain clear space for working the guns. In emigrant ships, the B. between the cabins are frequently mere lattice-work.

Water-tight B. are among the improvements in modern ship-building; they are iron walls running athwart the hold, as a means of dividing it into several portions; the interior is thus cut off into cells, each water-tight in reference to its neighbours. When such a ship is leaking in any one of the compartments, there is thus a chance that the others may be kept dry until the damage is repaired. Most of the large passenger-steamers are to some extent provided with these bulkheads. The *Great Eastern* has no less than ten of them, extending nearly up to the level of the upper deck. The presence of these B. greatly lessened the amount of injury occasioned by the explosion on board that

ship, on the 9th of September 1859; seeing that the disruption was thereby wholly confined to the compartment in which it occurred.

**BULL** (Lat. *bulla*, primarily, anything round or swelling) was originally the name of the capsule of the seal appended to letters from emperors or from the pope. Afterwards, the word was applied to the seal, and next to the document itself, as in the case of the celebrated Golden Bull of the Emperor Charles IV., which was so named from the golden capsule appended to imperial letters and other important documents by the Byzantine and Frank emperors as early as the 9th century. They are issued by the apostolic chancellor, and are dated 'from the day of incarnation,' whereas briefs are always dated 'from the day of the nativity.' The name is now applied exclusively to letters or documents issued in the name of the pope. In cases of granting favours, &c., the seal is appended to the open letter by a yellow or red band of silk; but in the administration of justice, a gray hempen band is used. All bulls, excepting those addressed to the United Greek Christians, are written in Latin with Gothic letters, and on the rough side of the parchment. See *BRIEF*. All bear the name and title of the pope—for example, *Gregorius Episcopus Servus Servorum Dei*, &c., is prefixed; then follows a general introduction, of which the initial words are used to give a distinct name to the B., as in the examples: the B. *Ezurge Domine*, issued by Pope Leo X. against Luther in 1520; the B. *In Oena Domini*, the celebrated B. against heretics, often re-issued since 1536; the famous *Unigenitus*, or B. against Queenel's writings, 1713; the *Dominus ac Redemptor Noster*, or B. for the abolition of the order of Jesuits; the *Ecclesia Christi*, or the B. which completed the *concordat* with France in 1801; the *De Salute Animarum*, or the B. for the regulation of the Catholic Church in Prussia. To every B., the leaden seal of the Church is appended, bearing on the obverse the arms of the pope, and on the reverse his name. Bulls issued during the interim between the election and consecration of a pope have no armorial bearings on the seal. A *bullarium* is a collection of papal bulls, as the *Bullarium Magnum Romanum a Leone Magno ad Benedictum XI. I.* (19 vols., Luxembourg, 1727—1758), the *B. Romanum* (28 vols., Rome, 1737—1744), and the *B. Benedicti XI. V.* (Mechlin, 1826—1827), and more recently, the continuation of the *Bullarium Romanum Magnum* by Barberini (Vienna, 1835).—From the same medieval Latin word *bulla* is derived the word *bulletin* (Italian, *bulletino*), commonly applied to dispatches from generals, reports of the health of royal personages, and on the continent, at least, to other brief authenticated documents, such as those of scientific societies, the best known of which are the bulletins of the St Petersburg and Belgic academies. It is, moreover, used as a title for periodicals, and, in France, also designates the slips of paper on which electors write their votes.

**BULL**, OLE BORNEMANN, a famous violinist, was born 5th February 1810, at Bergen, in Norway. No very authentic account of him is obtainable. His father, it is said, attempted to coerce him into the study of theology, and would not permit a musical instrument about the house. This foolish treatment only gave a more decisive character to the peculiar genius of the boy. Having gone to the university of Christiania in 1828, he found an opportunity to play at a concert, where his skill excited such enthusiasm, that he shortly after was offered the situation of music-director in the city. He accepted it, but in the following year went to Cassel, in

Germany, to study under Spohr. After several vicissitudes, he came to Paris in 1831, and afterwards travelled through Switzerland and Italy. During this period, he developed his peculiar style of playing, which was essentially that of the school of Paganini. B., however, wished to excel his model in originality, and in triumphing over the most extraordinary difficulties; but it was impossible for him to follow the flight of the great Italian, in whose brain some capricious musical demon seemed to lurk. Nevertheless, he was received in Italy with prodigious enthusiasm—Malibran herself embracing him on the stage at Naples. In 1836, he visited England, Scotland, and Ireland, and subsequently travelled in a professional capacity through Belgium, Holland, Russia, and Germany. After a long repose, he sailed for America, whence he returned in 1850; but he again went out, and was so successful, that he thought of retiring from public life. He purchased in Pennsylvania 125,000 acres of excellent ground, and founded a colony of Scandinavians. This turned out a complete failure, and B. was again compelled to resume his violin. He has once more visited Europe, whence he returned to the United States in 1869, with a fortune. He married a German lady in Wisconsin in 1870.

**BULL**, GEORGE, D.D., a learned prelate and theological writer, born at Wells, Gloucestershire, England, March 25, 1634; studied at Oxford, whence he retired in 1649, having refused to take the commonwealth oath imposed by the parliament. Receiving holy orders, his first charge was the parish of St George's, Bristol. In 1658, he obtained the rectory of Suddington St Mary's, near that city; and in 1662, was presented to the vicarage of Suddington St Peter's. In 1669, he published his *Harmonia Apostolica*, the object of which was to reconcile the apostles Paul and James on the subject of justification. This work occasioned considerable controversy among divines, and in answer, B. published his *Examen Centurie*, and *Apologetia pro Harmonia*. In 1678, he was presented to a prebend in Gloucester Cathedral, and made Rector of Aveming, Gloucestershire. In 1679, he was installed Archdeacon of Llandaff, and received the degree of D.D. from Oxford University. In 1685, he published his *Defensio Fidei Nicene*, against the Arians and Socinians, Tritheists and Sabellians; and in 1694, his *Judicium Ecclesia Catholica*, for which the thanks of the whole French clergy were sent to him through the celebrated Bossuet. His last work was his *Primitive and Apostolical Tradition*, &c. He was consecrated Bishop of St Davids in 1705, and died February 17, 1709.

**BULLA**, a genus of Mollusca, which in the older systems, founded upon characters taken from the shell alone, contained a heterogeneous assemblage of species essentially very different. Some of those having been removed to other orders, according to their organisation, the genus *Bulla*, and the family *Bullida*, of which it is the type, are placed in the order *Tectibranchiata* of Cuvier, an order of the class *Gasteropoda* (q. v.), and of that section of it called *Monocelia*, having the male and female organs of sex combined in the same individual. The *Bullidae* have a convoluted and generally thin shell, which serves as a covering and protection for the gills, and which in some of them is large enough to form a retreat for the entire animal, in others, is itself enveloped in the mantle. This shell forms a sort of transition link between the flat calcareous plate enclosed in the mantles of the *Aplysiae*.

or Sea-hares—to which B. is nearly allied—and the spiral shell of snails and other such conchiferous mollusks. The mouth of the shell is large, extending the whole length of the shell, widening towards one end, the lip acute. The gizzard of the *Bullides* is very muscular; and among its thick coats, in many species, are found calcareous bony plates, which being moved against each other by its muscles, serve to grind down the food. All the species are marine, some are found on the British coast. Some, from their form and fragility, are popularly called BUBBLE SHELLS, as the British *Bulla Hydatia*.

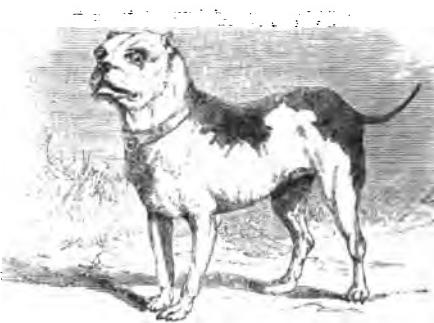

**BULLACE** (*Prunus insititia*), a shrub or small tree, larger and much less spiny than the aloe, but very closely allied to it, as it is also to the plum, so that many botanists regard them all as one species, an opinion much confirmed by the circumstance that the varieties pass into each other by imperceptible gradations. The B. may be regarded as a form intermediate between the plum and the sloe. Its leaves, however, are generally broader in proportion to their length than those of either of these, and its fruit-stalks more frequently in pairs; it differs also from both of them in its downy fruit-stalks, and in having the under side of its leaves permanently downy. The flowers are rather larger than even those of the plum; the fruit is larger than the aloe, generally globose, and, although it partakes in some degree both of the acidity and the roughness of the aloe, it is not unpleasant, especially after having been mellowed by frosts, and makes excellent pies or tarts. ‘A bullace-pie is a standing dish at the harvest-home supper in the south of England, only it requires rather more sugar than the housewife is always willing to allow.’ The B. is common in hedges, coppices, and banks in England, and in many parts of Europe. It is rare in Scotland.

**BU'LL-BAITING**, a barbarous sport, once very popular in England, and in which all classes of society equally delighted, but now, through the progress of civilisation, almost entirely confined to the lowest, and rare even among them. It consists in causing a bull to be attacked by dogs; and in order that the bull might be made as furious as possible, his nose was sometimes blown full of beaten pepper before he was turned loose. Another form of this sport was to fasten the bull to a stake, by a rope of some yards long, and to send bull-dogs against him, one at a time, which were trained to seize him by the nose, and when this was accomplished, it was called pinning the bull. But no small part of the enjoyment of the spectators was derived from the success with which the attacks of the dogs were met by the bull lowering his head to the ground, and receiving them on his horns, often tossing them to a great distance. In some places, B. took place regularly as a sort of annual festival, and funds were sometimes left to provide for it. King James I. of England greatly delighted in this sport. When the late Emperor Nicholas of Russia visited England, before his accession to the empire, he was present at a boxing-match and a B., which were got up to shew him English tastes.

An equally barbarous sport, termed *Bull-running*, was formerly practised at Stamford and Tutbury, where men and women took the place of dogs, maddened the bull with hideous noise, and then pursued it with ‘bull-clubs,’ till the unfortunate animal expired beneath the blows of its brutal assailants.

**BU'LL-DOG**, a kind of dog which is regarded as peculiarly English, but concerning which it is doubted whether it has existed as a distinct race, at least from the Roman era, or has more recently

sprung up, as a variety of the mastiff, or a cross between the mastiff and some other breed. Buffon, indeed, represents the B. as the parent race, and the mastiff as derived from it, but this opinion is generally rejected as erroneous. The B. has been regarded as a distinct species by some naturalists, and named *Canis Anglicus*, *C. lanarius*, &c. It is much smaller than the mastiff, but is very strong

Bull-dog.

and muscular. The breadth of muzzle is greater than in the mastiff, and the head is very large, almost appearing as of disproportionate size to the body. ‘The forehead sinks between the eyes, and the line of the nose rises again at a considerable angle; the lower jaw projects beyond the upper, often shewing the teeth, which altogether, with the frequent redness about the eyelids, produces a most forbidding aspect; the ears are partially drooping, unless the terrier blood is crossed in the animal, and the tail is carried high.’ The hair is short, and the tail taper, and not bushy. The present breed is commonly ochre or reddish buff, with the nose and chaps alone black; but a brindled breed formerly prevailed, which was often exported to the continent for strengthening the packs of wolf and boar hounds. The B. is seldom to be seen except in the company of persons who delight in dog-fighting and other barbarous sports. It was formerly much employed in bull-baiting, from which it derives its name. It is chiefly remarkable for its savage ferocity, and the pertinacity with which it retains its hold, as if its jaws were locked, and it could not let go. It will hang to the jaw or nose of a bull, although lifted from the ground. Colonel Hamilton Smith says he has seen one ‘pinning an American bison, and holding his nose down, till the animal gradually brought forward its hind feet, and, crushing the dog to death, tore his muzzle out of the fangs, most dreadfully mangled.’ The B. is also bold enough to attack any animal, however superior in size and strength.

The **BULL-TERRIER** is probably a mere variety of the B., or a cross between the B. and the terrier. It is smaller than the B., more lively, ‘and, if possible, still more ferocious.’ The ears are always pointed; the colour is very commonly white, with some black about the head. It is unrivalled in rat-catching.

**BULLER, CHARLES**, born in Calcutta in 1806, was a gentleman whose name fails to be recorded more on account of the hopes which his death in 1848 disappointed, than for the performances of his life. He was educated at Harrow and Cambridge, at both of which he distinguished himself, and for a time studied in Edinburgh, where he had Mr Thomas Carlyle for one of his tutors. He was called to the English bar in 1830, and entering

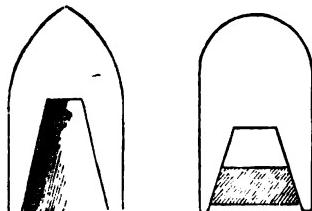

## BULLET—BULL-FIGHT.

parliament before the Reform Bill, continued a member of the Lower House till his death. He was still but a rising man when he died. In politics, a philosophical radical, he occupied successively the posts of Judge-advocate-general and President of the Poor-law Commission under Whig governments. The interest taken in his career, and his popularity, were, it would seem, largely owing to his amiability and accomplishments for society.

**BULLET** is the leaden projectile discharged from a musket, fowling-piece, pistol, or similar weapon. When the smooth-bore muskets alone were used by British infantry, the bullets were made by casting. Molten lead was poured into moulds; and the moulds were dipped in cold water, to hasten the solidification of the lead. The moulds were cooled after every few times of using; and the lead was heated only just to the degree for maintaining fluidity. At present, however, bullets are made more expeditiously, and more truly spherical in form, by a compressing machine, invented by Mr George Napier. The lead is first fashioned into a rod about a yard long by five or six eighths of an inch thick; this rod is passed between rollers to condense it; then between other rollers to press it into a row of nearly globular pieces; then a spherical die gives the proper form to each of these pieces; and, lastly, a treadle-worked punch separates them into bullets. With one of these machines, and two dies, nine boys can make 40,000 bullets in a day.

Spherical bullets for the old muskets, carbines, and pistols varied from 14 to 20 to the pound, and from 0·60 to 0·68 of an inch in diameter. There is a particular ratio, depending on the specific gravity of lead, by which the number to the pound will give the diameter, or *vice versa*.

Such bullets are, however, becoming every year less and less used in the army, being superseded by other forms better suited for rifles. These forms are singularly numerous. Robins's B. was egg-shaped, with the centre of gravity at the larger end;

Minié and Enfield Bullets.

Beaufoy's was ovoid, with a hemispherical cavity at one end; Manton's was a spherical ball put into a wooden cup, with projections on the exterior; Greener's was oval, with a plug of mixed metal driven into a hole barely large enough for it; Norton's, Delvigne's, Minié's, and others, are, or were, of various elongated shapes, mostly with some kind of plug, which, driven into the lead by the force of the explosion, causes it to fill up the grooves in the rifling of the barrel. This expanding or dilating action has been claimed by many inventors; but the government, in 1857, awarded Mr Greener £1000, as the person who had practically solved the difficulty as far back as 1836. The bullets for the Enfield rifles are now made with extraordinary speed, by machinery of beautiful construction. The machine draws in a coil of leaden rod, unwinds it, cuts it to the required length, stamps out the

bullets with steel dies, drops them into boxes, and conveys them away. Each machine, with its four dies, makes 7000 bullets per hour; and four such machines, in an easy day's work, turn out 300,000 bullets. So nearly are the machines automatic, that one man can attend them all. Other machines, attended by children, produce an equal number of little boxwood plugs for filling the cavity at the hinder end of the bullet. To what degree the Minié, Enfield, and other bullets differ, will be briefly noticed in the article on RIFLED ARMS. See also BREECH-LOADING ARMS in SUPP., Vol. X.

**BULLET-TREE**, or **BULLY-TREE**, a tree found in Guiana, and valued for its wood, which is solid, heavy, close-grained, and durable, and also for its fruit, which is a drupe about the size of a cherry, and very delicious. It is supposed to belong to the genus *Mimusops* (natural order Sapotaceæ, q. v.).

**BU'LLETIN.** See **BULL**.

**BU'LL-FIGHT.** Combats of men with bulls, for the entertainment of the public, were common in Greece, particularly in Thessaly, and in Rome under the emperors, though in later times they were forbidden both by emperors and popes. They are still a favourite pastime in Spain and Mexico. In Spain, they were abolished by Charles IV.; but Joseph, Napoleon's brother, re-established them, out of policy, the mass of the Spanish population being passionately fond of the sport. The most magnificent bull-fights were at one time instituted by the monarchs themselves; at present, both in the capital and in the larger towns of Spain, they are held either as private speculations, or for the benefit of public institutions. In Madrid, the bull-fighting season commences in April, and lasts until November. During that time, there is at least one afternoon in every week devoted to the sport. The proceeds go to the funds of the General Hospital. The fights take place in a kind of circus, called the *Plaza de Toros*, round which the seats rise one above another, like the steps of a stair, with a tier of boxes over them. The *Plaza* is capable of containing from 10,000 to 12,000 people, who pay a high price of admission, considering the rate of wages in Spain; and all go attired in their best to the spectacle. The best Andalusian bulls are bred at Utrera, the best Castilian ones on the Jarama, near Aranjuez. The latter are the breed usually chosen for fight in Madrid. They are fiercer and more active, but inferior in strength to British animals. The horses engaged in the conflicts are worthless brutes, fit only for the knacker. The men employed in the fight are generally those who have been bred to it as a profession, but occasionally amateurs may take part in it. The B. has been described as a tragedy in three acts. The principal performers in the first are the *picadores*; in the second, the *chulos* are the only actors; the third and last act devolves solely on the *matador*. The *picadores* are all mounted, dressed like Spanish knights of the olden time, and armed with a lance; they take up their position in the middle of the circus, opposite the bull-stalls. The *chulos*, who are on foot, are gay with ribbons, and wear very bright-coloured cloaks; they distribute themselves in the space between the barriers. The *matador*, or chief combatant, is also on foot. He is handsomely dressed, and holds in the right hand a naked sword, in the left the *muleta*, a small stick, with a piece of scarlet-coloured silk attached. On a sign given by the chief magistrate, a bull is let out from the stalls; the *picadores* stand ready in the arena waiting his charge. With a brave bull, they find all their skill requisite in acting on the defensive; with a cowardly one, they act on the offensive;

## BULL-FINCH—BULLHEAD.

and should their stabs be ineffectual in rousing the animal to the requisite fury, the poor beast is hooted by the crowd, and ultimately stabbed ingloriously in the spine. Whenever a horse is wounded, the rider betakes himself to flight; and when either the above casualty happens, or a *picador* is thrown, the *chulos* rush in, and attract the bull by their cloaks, saving themselves, if need be, by leaping over the palisade which encloses the circus. At the same time, another *picador* calls off the bull's attention to himself by shouting. When the bull begins to flag, the *picadores* are succeeded by the *chulos*, who bring with them the *banderillas*—i. e., barbed darts about two feet long, ornamented with coloured paper-flags, which they stick into the neck of the animal. Sometimes these darts have crackers attached to them, the explosion of which makes the bull furious. The *matador* now enters alone to complete the tragic business. As soon as the bull's eye catches the *muleta*, he generally rushes blindly at it; and then the *matador*, if he is well skilled, dexterously plunges the sword 'between the left shoulder and the blade,' and the animal drops dead at his feet. The victorious *matador* is greeted with acclamations, and not less so the bull, should he wound or even kill the *matador*, in which case another *matador* steps forth into the arena; but human life is rarely sacrificed. Eight or ten bulls are often despatched in a single day; twenty minutes being about the time usually taken to slay one.

In Madrid, in June 1833, 99 bulls were killed in the course of a single week. Bull-fighters are regarded as the lowest class in Spain. They are very ignorant and superstitious; and those who are killed on the spot, and die without confession, are denied burial rites.

**BULL-FINCH** (*Pyrrhula vulgaris*), a bird of the great family of *Fringillidae* (q. v.), a little larger than the common linnet, and of a genus closely allied to the Grosbeaks and Crossbills. The genus is particularly characterised by the short, thick, rounded bill, of which the sides are inflated and bulging, and the tip of the upper mandible overhangs that of the lower one. The B. is a bird of very soft and dense

unfrequent in England, Ireland, and the south of Scotland; and is found in most parts of Europe, from the south of Norway to the Mediterranean, extending eastward throughout Asia, even to Japan. It frequents woods and gardens, builds its nest in trees or bushes a few feet from the ground, feeds chiefly on seeds and berries in winter, and in spring is excessively destructive to the buds of fruit-trees in those localities in which it is abundant, selecting the flower-buds, and apparently finding them the most palatable of all food. Selby says: 'I have known a pair of these birds to strip a considerable sized plum-tree of every bud in the space of two days.' On this account, gardeners are sometimes compelled to wage war against the bull-finches.

The song of this bird, in a wild state, is very simple, and has no particular quality to recommend it; but it is remarkably susceptible of improvement by education; and trained bull-finches of superior acquirements are sold at a very considerable price. Some of these birds learn to whistle an air very accurately, and with a power and variety of intonation far exceeding their natural song. The ability to whistle several airs well, is rare. The training of these birds is a work both of time and trouble: it is chiefly carried on in Germany. Not less than nine months of training are requisite: it begins when the bird is a mere nestling, and must be carefully continued till after the first moulting; for it is a curious circumstance, that all which has been previously acquired is very apt to be lost at that time, or is afterwards so imperfectly remembered that the bird is of little value. The B. is capable of very strong attachment to those who feed and caress it, and often becomes so thoroughly domesticated as to exhibit no desire for liberty.—Curious variations of plumage are sometimes observed in it.—Other species of the genus *Pyrrhula* are known, natives of different parts of the world; and in this genus some ornithologists include *Corythas* of Cuvier, of which one species, the Pine-finches (q. v.), or Pine Grosbeak, is a native of Britain.

**BULL-FROG** (*Rana pipiens*), a species of frog (q. v.) found in most parts of the United States and Canada, but chiefly abundant in the southern states. It is of a large size, eight to twelve inches long, of an olive-green colour, clouded with black. It received its name from the remarkable loudness of its voice, which has been compared to the bellowing of a distant bull, and comes in as a hollow bass in the frog concerts which take place in the evening and all night long in marshy places in America. Its voice can be distinctly heard at a distance of forty or fifty yards. It sits for hours during the day, basking in the sun, near the margin of a stream, into which it plunges with a great leap on the least appearance of danger. It does not confine itself to insect and mollusca food, like smaller frogs, but is said to be partial to young ducks, and to swallow them entire. Audubon says 'its flesh is tender, white, and affords excellent eating,' the hind legs, however, being the only part used for food. He adds that these parts make excellent bait for the larger cat-fish, and that he has generally used the gun for procuring them, loading with very small shot.

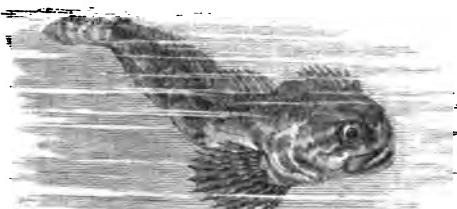

**BULLHEAD, RIVER BULLHEAD, or MILLER'S THUMB** (*Cottus Gobio*), a small fish, abundant in clear rivers and streams, in some parts of the British Islands, throughout the greater part of Europe, and in the north of Asia. It seldom exceeds four or five inches in length; is of a dark brown colour on the upper parts, and white beneath; has rather large fins, with rays slightly produced into spines and prettily spotted; and in

Bull-finches.

plumage, of a delicate bluish-gray colour above, the under parts of a bright tile-red, the crown of the head and the beak jet black, which colour also appears in the greater wing and tail coverts, in the quills, and in the tail-feathers; the wings are crossed by a conspicuous white bar. The colours of the female are less bright than those of the male. The tail of the B. is almost even. This bird is not

general appearance is not unlike the gurnards (q. v.). It is, however, generally regarded as a disagreeable object to the sight, on account of the great size and depressed form of its head, from which it derives its English names; the name, Miller's Thumb, alluding to the broad rounded form which the last joint of

Ballhead.

the thumb of a miller used to acquire in times when machinery was ruder than now, by its continual employment in testing the quality of the flour produced, and in turning it over on the fingers for inspection, that it might be known if the mill was doing its work well. The appearance of the B. is rendered still more unattractive by the entire absence of scales, a characteristic of the genus to which it belongs, the whole body and head being covered with a soft skin. Yet it is said to be of a very delicate flavour, and in some countries is much sought after as an article of food. Its flesh, when boiled, is reddish, like that of the salmon. Izaak Walton speaks of angling for the B., and in his pleasant quaint style describes the habits of the fish: 'He does usually dwell and hide himself in holes, or amongst stones in clear water, and in very hot days will lie a long time very still, and sun himself, and will be easy to be seen upon any flat stone, or any gravel, at which time he will suffer an angler to put hook baited with a small worm very near into his mouth, and he never refuses to bite, nor indeed to be caught, with the worst of anglers.'—The other British species of the genus *Cottus* (q. v.) are marine. The name B. is not usually given to any of them. A sea-fish of a nearly allied genus (*Apidophorus*) is sometimes called the ARMED BULLHEAD; it is also known as the POGG (q. v.).—The River B. differs from the marine species of the same genus, in having only one short spine on each side of the head, on the *preoperculum*.

**BULLINGER**, HENRY, the friend of Zwingli, and one of the chief reformers in Switzerland, was born at Bremgarten, in the canton of Aargau, July 18, 1504. He studied at Cologne, where he became acquainted with the writings of Luther; and during the year 1527, he attended the theological expositions of Zwingli, and went along with the latter to the religious conference held at Bern in 1528, the result of which was the reformation of the canton. In 1529, he married Anna Adlischwyl, formerly a nun, who bore him eleven children. By a powerful sermon which he preached at Bremgarten, on Whit-sunday 1529, B. induced his whole congregation to make a profession of Protestantism. In 1531, he was compelled by the Catholic party to flee from the canton, and went to Zurich, where, in the following year, he was appointed pastor of the principal church. In the controversy on the eucharist and the affairs of the Anabaptists, B. distinguished himself by his integrity and moderation; and in his house at Zurich several German theologians, compelled to leave their country, were hospitably sheltered. He took part in drawing up the first Helvetic Confession at Basel, in 1536, and in establishing a close relation between the Swiss and Anglican Churches. He died September 17, 1575.

His writings are numerous. The most important is a *History of the Reformation*, which was first published at Zurich, 1838. His sermons (translated) have also been recently published at Cambridge by the Parker Society.

**BU'LLION** usually means uncoined gold and silver, in bars or other masses; but in discussions on the currency, the term is frequently employed to signify the precious metals coined and uncoined. The origin of the word B. in its present sense, as well as that of the French *Billon* (q. v.), and the corresponding Spanish *vellon*, seems to be as follows: B. originally meant the mint, where the alloy for the coinage was prepared, and the coin stamped (either from the Lat. *bulla*, a round boss or stud, or stamp; or from the verb *bullare*, to boil or bubble); and hence it came in England to signify the standard metal of which the coins are made. In France, where the kings debased the currency much more than ever took place in England, *billon*, the mint, came to signify the base mixture issued therefrom.

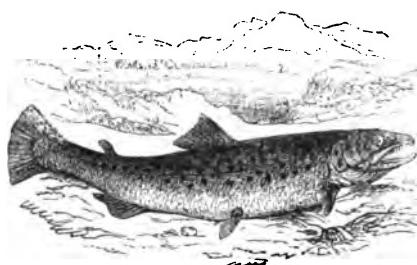

It is a question not yet satisfactorily settled, how far any great increase in the supply of B. has that effect in lessening the value of money, and consequently raising prices, which has always been very naturally attributed to it. It may indeed be maintained with some plausibility, that if B. were capable of being produced to such an extent beyond the actual demand for it as to glut the market, it would cease to be that general standard of money value which it has become, just because it is of all others the article which is steadiest in requiring a certain outlay of labour to produce it. Rises in prices have accompanied large supplies of gold, but they have also accompanied large supplies of other commodities indicative of a great increase in riches. It is certain that great increases in the supply of B. do not, as in the case of other goods, glut the market. For some years past, the supply of gold, owing to the new fields opened in America and Australia, has been quadrupled, with certainly no more influence on prices than what a general increase in prosperity might cause. There is, it will be observed, this great difference between gold and other commodities, that besides what may be within the crust of the earth, there is a great mass which has been accumulating for thousands of years in the possession of mankind, which comes forth as it is wanted. A few millions of tons of iron, or bales of cotton, beyond the usual annual average, would perhaps add a hundred per cent. to the available quantity for consumption; but a few millions of pounds worth of gold, having to be counted with all the gold in existence in the world, makes a scarcely perceptible addition to the stock.

The term B. is in this country associated with the memorable **BULLION REPORT** of 1810. In the year 1797, by what was called the Restriction Act (see **BANK**), the Bank of England was restrained from paying its notes in gold. There thus came to be two separate and independent currencies in the country—one of B., the other of paper. They came to differ in value from each other so much that in the year 1813, gold, of which the mint price was £3, 17s. 10d. per ounce, was actually worth, in bank paper, £5, 10s., or, in other words, the one-pound bank-note was worth 14s. 2d. There were various opinions on the cause of this difference. Some people simply said, that gold was dear, taking paper as the standard of value; others said, it was owing to our exports not balancing our imports; others, to too great facilities in discounting, by which money was advanced on bad security; and in general, it was held, that there could be no over-issue of paper-money, if it was backed by good security, and

employed only for genuine transactions, and not in fictitious credits. In the meantime, the select committee on the high price of gold B., had been wishing to get, not through theories or speculations but through actual facts, at the truth. The work of the committee was chiefly conducted by Mr Horner, aided by Sir Robert Peel, then a young man; and both of them entered on the task without any prepossession, and the desire to find the truth. They established the conclusion, among other important truths, that paper-money is always liable to be over-issued, and consequently depreciated, unless it be at all times immediately convertible into gold, and the monetary policy of the empire was subsequently established on this principle. A full analysis of the B. report will be found in Macleod's *Dictionary of Political Economy*.

BULL'S EYE, among the rigging of a ship, is a sort of small pulley in the form of a ring, with a rope spliced round the outer edge, and another sliding through a hole in the centre.—B. E., in rifle practice, is the small black centre within the circle on the target.

BULL TROUT (*Salmo Erios* or *S. griseus*), a fish nearly allied to the salmon, and like it, migratory in its habits, ascending rivers, in which it deposits its spawn, but living chiefly in the sea. It occurs in many of the rivers of Britain, but is 'probably better known in the Tweed than elsewhere,' being 'there as abundant as the salmon' (Yarrell). It is often called the GRAY TROUT,

Bull Trout.

sometimes simply the GRAY, and is the SEWEN of the Welsh rivers. It sometimes attains the weight of 20 lbs., although it is more commonly under 15 lbs. weight. It is less elegant in form than the salmon; the head and nape of the neck are thicker in proportion; and the tail, beyond the adipose fin, is more bulky and muscular; the tail fin is square at the end in young fish (in some places called *whillings*), and in older ones, becomes convex by the elongation of the central rays, whence the name *roundtail* sometimes given to this species. The scales are rather smaller than those of a salmon of equal size, and the colour is less bright; the males in the spawning season being reddish brown, the females blackish gray; at other times the general colour is like that of the salmon trout. The B. T. agrees with the salmon in having only a few teeth on the most anterior part of the *vomer* (the bone which runs down the centre of the palate); while the salmon trout, the common trout, and the great lake-trout, have a long line of teeth there: the teeth are larger and stronger than those of the salmon; there are differences also in the form of the gill-covers. To anglers, the B. T. is next to the salmon as a prize, and by many is mistaken for it. The flesh is paler in colour, coarser, with much less flavour, and is much less esteemed.—The name B. T. has been also given to the HUCHO (*Salmo*

*Hucho*), or salmon of the Danube, which sometimes attains the size of 30, or, it is said, even of 60 lbs.

BULOW, FRIED. WILH. VON, a famous Prussian general in the war of liberation, was born in 1755, entered the army young, and soon distinguished himself. When Prussia declared war with France in 1813, it was B. that commanded in the first successful encounter with the French at Möckern, April 5, and revived the self-confidence of the army after the adverse battle of Lützen. His victories over Oudinot and Ney at Grossbeeren and Dennewitz, saved Berlin, and inflicted severe loss on the enemy. He acted a conspicuous part in the battle of Leipzig, and by taking possession of Montmartre, finished the campaign of 1814. The king acknowledged his services by an estate worth £30,000, and the title of Count Dennewitz. In the campaign of 1815, he joined Blücher by forced marches, and headed the column that first came to the aid of Wellington at Waterloo. He died at Königberg, 11th January 1818.

BULRUSH, an English popular name for large rush-like or reed-like plants growing in marshes, not very strictly limited to any particular kind. Some authors employ it in a restricted sense as the designation of plants of the genus *Typha*, also known as Cat's-tail or Reed-mace. See TYPHA. It is perhaps more commonly restricted to large species of the genus *Scirpus* (q. v.), also called Club-rush, and particularly to *S. lacustris*, a common British plant, found also in all the northern parts of the world, growing about the muddy margins of lakes and ponds, with a creeping root and round stems varying from 2 to 8 feet in height, which are almost leafless, and bear their flowers in compound umbels of small brown spikelets on their side. The root is astringent and diuretic, and was formerly employed in medicine; but the stems are the most useful part of the plant, being much employed for making chair-bottoms, mats, &c.; also by coopers for filling up spaces between the seams of casks, to which purpose their spongy nature particularly adapts them, and not unfrequently for thatching cottages.

Bulrush (*Scirpus lacustris*):  
a, top of stem and flowers;  
b, a single floret.

BU'LTI, or LITTLE TIBET, a territory lying on the Upper Indus beyond the Himalaya, and forming a sort of debatable land between India and Tatary. It is immediately to the north of the Valley of Cashmere, with which it has been politically connected by conquest. It occupies about 8000 square miles, extending in N. lat. between 34° 30' and 36°, and in E. long. between 75° and 77°. With an average elevation of about 7000 feet above the sea, B. is surrounded by mountains of nearly the same height above its own level. Hence the temperature is such that only snow falls in what ought to be the rainy season, though in summer the thermometer ranges at noon from 70° to 90° F. European fruits are said to be plentiful. The inhabitants are of the Mongolian race, and chiefly

## BULWARK—BUNGALOW.

**Mohammedans.** Among the animals are the sha, the large-horned goat, the sheep, the musk-deer, and the ibis. The only town of consequence is the capital Iskardoh, which, in fact, sometimes gives its name to the whole province.

**BULWARK**, in military matters, was the old name for a rampart or bastion. In a ship, the bulwarks are the boarding above the level of the upper deck, nailed to the outside of the timber-heads and stanchions. In ordinary vessels they form a parapet, protecting the seamen from the waves, and prevent loose articles from being swept off the deck; in men-of-war they, in addition, serve to protect the men from an enemy's shot. In an inquiry made a few years ago concerning the availability of merchant-steamer as ships of war, it was found that the bulwarks would not afford sufficient protection to the men from musket-shot; but that if hammock-stanchions were fixed all round the bulwarks, and the men's hammocks placed in a netting upheld thereby, a very good protection might be obtained.

**BULWER LYTTON, SIR EDWARD.** See LYTTON.

**BULWER, SIR HENRY LYTTON, G.C.B.**, the Right Hon., diplomatist and author, an elder brother of the late Lord Lytton, was born in 1804, entered the diplomatic service in 1827, and was attached successively to the British Embassy at Berlin, Brussels, and the Hague. In 1830, he entered parliament, and during the following seven years he represented, in order, the constituencies of Wilton, Coventry, and Marylebone. In 1837, he became Secretary of Embassy at Constantinople, where he negotiated and concluded a treaty which is the foundation of our present commercial system in the East. In 1843, he was made Minister Plenipotentiary to the court of Madrid, and concluded the peace between Spain and Morocco in the following year. Whilst in Spain, his firmness and candour proved a source of great inconvenience to Narvaez, the Spanish soldier-diplomatist of that day, and who, pretending to have discovered the complicity of the British plenipotentiary in certain plots against the Spanish government, ordered him to leave Madrid. Both parties in the House of Commons approved of the whole course of B.'s conduct while at the court of Madrid, and her Majesty awarded to him the highest decorations of the order of the Bath. He afterwards proceeded to Washington, where he evinced equal art in conciliating the temper of the people, and maintaining the interests of his own country. In 1852, he was sent to Tuscany as envoy extraordinary; and in 1856 was nominated by Lord Palmerston commissioner at Bucharest for investigating the state of the Danubian Principalities. As British commissioner, he called forth from every minister and from every government concerned the warmest expressions of approval, and all concurred in recommending him for the post of ambassador to the Ottoman Porte, on the return of Lord Stratford de Redcliffe, in the spring of 1858. Sir Henry Lytton became a peer in 1871, with the title of Lord Dalling and Bulwer. He died June 2, 1872. He published *An Autumn in Greece; France, Social and Literary; The Monarchy of the Middle Classes; and a Life of Byron.*

**BUMBOAT**, a boat employed to carry provisions and other articles from harbours and ports to vessels lying at some distance from the shore. Boats of this kind belong to a class of petty traders, who in England are, for the most part, women. The provisions commonly offered for sale are soft bread, butter, fruit, vegetables, fish, and fresh meat—the fish fried, and the meat roasted, if wanted. Among

the other articles are included shirts, drawers, stockings, gloves, pipes, needles, thread, and a variety of odds and ends. The less respectable of the B. traders try to smuggle spirits on board; but if this is discovered, it leads to instant punishment. In fitting out and also in paying off ships in H.M. navy, the B. people are allowed on board for a certain length of time daily; but when a ship is in active commission, they come alongside only at meal-hours. Among the class of B. people generally, there is no little acuteness and enterprise. They learn all particulars about ships going and coming, and will even write to far-distant ports to secure a vessel's patronage. In their dealings, they of course prefer ready money, but in certain cases they give credit, and it is understood lose little by their liberality; for any attempt at evasion of payment by any of the crew, meets the displeasure of commanding officers. From Hong-kong up to the Bogue Forts, and in other Chinese waters, bumboats frequently accompany vessels, and are apt to become troublesome. From Malta, and some other places in the Mediterranean, the bumboats also haunt vessels on short cruises, in the hope of doing a little trade.

**BU'MKIN, or BOO'MKIN** (diminutive of boom), on shipboard, is a short boom which projects over each bow of the ship, to aid in extending the lower edge or clew of the foresail to windward—in nautical phrase, 'to board the fore tack to.' In a boat, the B. is a small outrigger over the stern, used for extending the mizzen.

**BUMMALOTI** (*Saurus ophiodon*), a fish of the family *Scopelidae* or *Sauridae*, often regarded as a subdivision of the great family *Salmonidae*. It is a marine fish, a native of the coasts of India, particularly of the Bombay and Malabar coasts, from which it is exported in large quantities, salted and dried, to other parts of India, being highly esteemed for its rich flavour, and often used as a relish. In commerce, it is known not only by the name B., but by the singular appellation of *Bombay Duck*. It is a fish of elongated form, with large fins and a very large mouth, the gape of which extends far behind the eyes, and which is furnished with a great number of long, slender teeth, barbed at the points. It is extremely voracious.

**BUNDELCUND**, a territory of Hindustan, between Gwalior on the west, and the Jumna, which separates it from the Doab, on the north-east. It extends in N. lat. from 23° 52' to 26° 26', and in E. long. from 77° 53' to 81° 39', containing rather more than 18,000 square miles, and about 2,500,000 inhabitants. Studded, as B. is, with isolated rocks rising precipitously from its surface—each of them a nucleus, as it were, of independence—it has generally been very much subdivided. Besides four districts belonging to the North-west Provinces of British India, it embraces nine rajahships, and numerous principalities of inferior name, known as jaghirea. The country, notwithstanding that it is well watered, has a climate which renders irrigation indispensable; and it is accordingly interspersed, at the cost of great labour and considerable ingenuity, with artificial dams. B., though not destitute of woodlands, presents rather jungle and copse than heavy timber. It is said to possess inexhaustible deposits of iron-ore, and to have given indications also of coal. The principal towns are Calpee, Jhansi, Callinger, Banda, Jalun, and Chatpur. The first three will be noticed in their places, Callinger being famous for its cave-temples, and Jhansi and Calpee having acquired celebrity in the mutiny of 1857—1858.

**BUNGALOW**, a species of rural villa or house,

so called in India. Bungalows which form the residence of Europeans, are of all sizes and styles, according to the taste and wealth of the owner. Some are of two stories, but more usually they consist of only a ground-floor, and are invariably surrounded with a verandah, the roof of which affords a shelter from the sun. In the chief cities of Calcutta, Madras, and Bombay some of the bungalows are really palatial residences, while in the mofussil they are of more moderate pretensions. In general, they are provided with exterior offices, to accommodate the large retinue of domestics common in Indian life. Besides these private bungalows, there are military bungalows on a large scale for accommodating soldiers in cantonments; likewise public bungalows, maintained by government for the accommodation of travellers, and in which seem to be blended the characters of an English road-side inn and an eastern caravanserai. These bungalows, though they vary greatly in actual comfort, are all on the same plan. They are quadrangular in shape, one story high, with high-peaked roofs, thatched or tiled, projecting so as to form porticos and verandahs. The B. is divided into 'suits' of two, three, or four rooms, provided with bedsteads, tables, and chairs; windows of glass, and framed glass-doors. Off each room is a bath-room and earthen jars of cool water. Travellers are expected to carry their servants, cooking-apparatus, wine, beer, bedding, &c., with them; but the khitnutgar of the better class of bungalows supplies table-ware, condiments, and even sometimes food and liquors, and he is usually skilled in cooking. Government charges one rupee, or two shillings a day, to each traveller for the use of the bungalow. A book is kept, in which travellers enter their names, the time of their arrival and departure, with the amount paid, and any remarks regarding the state of the B. and its attendance he may think proper. Natives seldom stop in these public bungalows, for though legally open to all, they are almost exclusively resorted to by Europeans; and natives even of good condition are faint to seek 'the squalid desolation of a tottering caravanserai,' or village 'dhurrumsala.' At every traveller's B. is stationed a government peon, who acts as watchman, and is bound to assist travellers' servants in procuring supplies of fuel and food in the nearest village. The distance between each B. on

Bungalow.

a trunk-road is generally about 12 or 15 miles—an Indian day's journey. The annexed cut represents a B. in the jungle. The introduction of railways will very soon put an end to the present system of travelling in India—a fact greatly to be desired, as the annoyance experienced moving slowly on with

baggage and servants, at the rate of a stage a day is almost inconceivable.

**BUNIAS**, a genus of plants of the natural order Crucifera, distinguished by ~~incumbent~~ linear spirally twisted cotyledons (q. v.), and a nut-like silicule (or round pod) with 2—4 cells. Only a few species are known, natives of the Levant. One of these, *B. Orientalis*, is cultivated in some countries—particularly in France—as a field-crop, for the sake of its leaves, which are used for feeding cattle. It was introduced into Britain more than 100 years since, but its cultivation has never become general, the amount of herbage which it yields being comparatively small. It is sometimes called HILL MUSTARD.

**BUTNION** is a painful condition met with in the joints of the feet, most commonly at the junction of the great toe with its metatarsal bone. It is caused by a gradual displacement of the bones, the toe itself turning outwards, and leaving the head or further extremity of the metatarsal bone projecting inwards. Over the latter, the skin is generally thin, and occasionally a bursa (q. v.) is present between the skin and bone. The pressure of a boot causes this bursa to inflame, and this may go on to suppuration or painful ulceration. Rest, poulticing, and such remedies are generally sufficient to subdue any inflammatory attack, and wearing a shoe so constructed as to save the B. from pressure, will probably prevent a recurrence of painful symptoms; but amputation and excision of the ends of the bones have been resorted to for the cure of the troublesome distortion.

**BUNKER'S HILL.** See CHARLESTOWN.

**BUNKUM**, a phrase used in the United States to signify an oratorical display in favour of a sham proposal, in order to catch popular applause. A member of the legislature, for example, desirous of standing well with his constituents, makes a flaming speech in favour of a measure in which they are interested; but with the knowledge that the measure is impracticable, and will not be carried. In fact, the speaker does not want to carry it; his sole object is to impose on his supporters, and acquire the character of a meritorious public leader. Such is speaking for bunkum. In some instances, the state legislatures enact laws brought forward on these dishonest grounds—the whole members, or at least a large majority of them, having no other object than bunkum. The consequence is, that many laws, agitated for by popular factions, remain a dead-letter, unless they happen to be enforced by clubs organised for the purpose. The word B. is said to be a corruption of Buncombe, the name of a county in N. Carolina, the representative of which informed Congress on one occasion that he was merely speaking 'for Buncombe.'

**BUNSEN**, CHRISTIAN KARL JOSIAS, BARON, one of the most distinguished statesmen and scholars of Germany, was born, 25th August 1791, at Korbach, in the principality of Waldeck, and studied philology at Göttingen (1809—1813) under Heyne. He had been appointed teacher in the Gymnasium of Göttingen in 1811, but quitted the position in 1813; and in pursuance of a course of study of Old and Middle High German, begun in company with Lachmann, and to extend his knowledge of the Germanic tongues, went to Holland, and afterwards to Copenhagen, where he learned Icelandic from Finn Magnussen. The historical works of Niebuhr and his character as a politician had filled B. with enthusiasm, and he spent some months of 1815 in Berlin, in order to become personally acquainted with the historian. In 1816, he went to Paris, and studied Persian and Arabic under Sylvestre de Sacy, and in the same year to Rome, where he married.

Niebuhr, then Prussian ambassador, took the greatest interest in the scientific pursuits of B., and procured (1818) his appointment as secretary to the embassy. The residence of the king of Prussia, Friedrich Wilhelm III., in Rome in 1822, had a decided influence on his subsequent career. In the course of a conversation in which B. had disagreed with the king, the latter asked his views on the Prussian ritual (*Agende*) and hymn-book question, then much agitated. Though these views were very different from what the king had been accustomed to hear, he took them in good part, and with expression of his personal regard, requested B. to continue in the state service. On Niebuhr's departure from Rome (1824), B. conducted the embassy provisionally for a time, and was then appointed resident minister (1827). Living in intimate intercourse with Niebuhr, B. had employed the time in deepening his investigation into the philosophy of language and religion; and had made, on the one hand, the philosophy of Plato and the constitutions of antiquity; on the other, biblical inquiries, church history, and liturgies—objects of special attention. Though not within the scope of the great plan of his life, he contributed largely to the *Beschreibung der Stadt Rom* (Description of Rome), 3 vols. (Stutt. 1830—1843); the greater part of the topographical communications on ancient Rome, and all the investigations into the early history of Christian Rome, are by him.—The first visit of Champollion to Rome formed an epoch in B.'s antiquarian studies. He was a zealous hearer of Champollion himself, and also encouraged Lepsius (q. v.) to the study of hieroglyphics. The Archeological Institute, established in 1829, found in B. its most active supporter. When he founded the Protestant hospital on the Tarpeian Rock (1835), he also built, adjoining his own house, a place of meeting for the Institute; and laboured earnestly for the cause of Protestantism. The king of Prussia had often asked his advice in the matter of the ritual, but had not adopted it. B. then, along with the chaplain, introduced (1825) into the chapel of the embassy at Rome a liturgy modelled after his own views, and sent a report (1828) to the king of the result. The king had this liturgy printed, and wrote the preface with his own hand. This work never came into the hands of the trade; but the most part of it was embodied in the *Allgemeine evang. Gesang- und Gebetbuch*, printed (1846) without the author's name, in the Rauhe Haus, Hamburg, which may be considered as the second edition of the *Versuch eines allgemeinen evang. Gesang- und Gebetbuchs* (Attempt at a General Evangelical Hymn and Prayer Book), Hamb. 1833.

In 1841, he was sent on a special mission to London, to negotiate the erection of an Anglo-Prussian bishopric in Jerusalem, and was shortly afterwards appointed ambassador at the English court. It is understood that, on occasion of a visit to Berlin in 1844, he was asked to write down his views on the question of granting a constitution to Prussia; and that in consequence he presented a series of memorials representing the urgency for a deliberative assembly, and also made a complete plan of a constitution closely resembling the English. In the Schleswig-Holstein question, B. strongly advocated the German view, in opposition to Denmark, and protested against the London Protocol of 1850. But in the midst of all his political duties, B. continued unabated his literary and philosophical pursuits, the results of which have from time to time appeared. His views regarding the part that Prussia should act in the Eastern question not being, it is understood, in accordance with those of his court, he ceased, in 1854, to represent Prussia at the

court of England, and retired to Heidelberg. In the estimation of Englishmen, B. must ever hold a high place. No foreigner has ever shewn a deeper appreciation of their national characteristics, or a heartier love of their social and political liberty. It must also be acknowledged that he has done service to the cause of enlightened Christianity, for, while in England, he was regarded by those who knew him both as the most philosophical and most reverent of lay-theologians. His chief works are: *Die Jure Atheniensium Hereditario* (Gött. 1813); *Die Kirche der Zukunft* (The Church of the Future—translated into English, and published by Longman), Hamb. 1845; *Ignatius von Antiochien und seine Zeit* (Ignatius of Antioch and his Time), Hamb. 1847; *Die drei echten und die vier unechten Briefe des Ignatius von Antiochien* (The Three Genuine and the Four Spurious Epistles of Ignatius of Antioch), Hamb. 1847; *Egyptens Stelle in der Weltgeschichte* (Egypt's Place in the World's History—translated into English by Cottrell), Hamb. 1845—1857; *Die Basiliken des Christlichen Roma* (The Basilicas of Christian Rome), Mun. 1843; *Hippolytus und seine Zeit* (Hippolytus and his Time), Lond. 1851; *Christianity and Mankind*, Jena, 1854; *Gott in der Geschichte* (God in History), Leip. 1857; and the *Bibelwerk*, which B. hoped to make his chief work, of which only a part appeared before his death, which took place in Nov. 1860.

**BUNSEN, ROBERT WILHELM**, a distinguished German chemist, was born at Göttingen, where his father was a professor, on March 31, 1811. He entered the university of his native town in 1828, where he devoted himself to the study of the natural sciences, especially to zoology and chemistry. He afterwards prosecuted his favourite studies at Paris, Berlin, and Vienna. After having held the post of professor at Cassel, Marburg, and Breslau successively, B. was, in 1852, appointed to the chair of chemistry at Heidelberg, where he has since remained. He has published numerous papers on physics and geology, as well as on chemistry. The charcoal pile, which bears his name, is in extensive use. That the hydrate of oxide of iron is an antidote to arsenic, is an important fact which was made known by him, along with his friend Berthold, in 1837. B. was the first to produce magnesium in large quantities; and, in 1860, he invented the magnesium light, which has proved so important to photography. But the greatest discovery with which his name is associated, is that of the spectrum analysis—made in conjunction with his friend Kirchhoff—which has been the means of working so many wonders in chemistry, and revealing so much to astronomers. Its first result was the discovery of two new metals. B. is not only a prolific discoverer in chemistry, but he has proved himself also one of its most successful teachers. His manner of demonstration is very happy. We have from his pen: *Descriptio Hydrometrorum* (Göttingen, 1830); *Eisenoxyhydrat, das Gegengift, &c.* (Hydrate of Oxide of Iron, an Antidote to Arsenic), &c. (Ibid., 2d edit. 1837). The government of Baden made him a privy-councillor in 1863.

**BUNT**, a disease of wheat and other grains, or the parasitic fungus which causes that disease. The name B. is supposed to be a corruption of *bunt*, or at least derived from the same root, a derivation perhaps suggested by the analogy of *Brand* (q. v.). B. is also called *Pepper Bunt*, and sometimes *Smut Ball*. It is one of the most common and injurious diseases of wheat, often affecting great part of a crop, although its prevalence has been greatly diminished by care on the part of farmers, and particularly by the selection of clean seed, and the dressing of the seed, before sowing, with some

## BUNTER SANDSTEIN—BUNTING.

substance, which, without injuring its vitality, destroys that of the spores or granules of the fungus. Even washing with water has a good effect, but greater benefit is derived from dressing with salt, quicklime, chloride of lime, Glauber's salt (sulphate of soda), and quicklime, or blue vitriol (sulphate of copper). Even arsenic and corrosive sublimate are used for this purpose. B. is now believed to be propagated by any contact of sound with unsound grain; by thrashing, which causes the B. dust to fly about; or by manure, in which the straw of infected grain has been mixed. Upon this knowledge, the means now adopted for its prevention are founded. A considerable mixture of B. is not supposed to render flour absolutely unwholesome, at least when made into fermented bread, but the bread is of a peculiar flavour, and a very dark colour. It is said that such flour is used to no small extent in the manufacture of gingerbread, the treacle disguising both the colour and the flavour.

**BUNTER SANDSTEIN**, or 'variegated sand-stone,' is the lowest member of the Triassic Period. As the triass is more perfectly developed in Germany than in Britain, the German beds are considered the typical group of this period. The B. S. consists of various coloured sandstones, interstratified with red marls and thin beds of limestone, which occasionally, as in the Harz, are oolitic, but in other places dolomitic. They attain a maximum thickness of 1500 feet. The English representatives of the B. S. are chiefly developed in Lancashire and Cheshire, and consist of red and mottled sandstones with beds of marl, and thick rather irregular bands of partially consolidated conglomerate called 'pebble beds.' Thirty species of fossil plants have been found in the B. S. near Strasburg, consisting chiefly of ferns, cycads, and conifers. But the most remarkable fossils in this formation are the remains of huge batrachians. Originally, the footprints which had been left by the animals on the moist sand were alone observed. From their resemblance to the impressions made by a human hand, the animal producing them was provisionally named *Cheirotherium* (q. v.). The subsequent discovery and examination of the remains of teeth and bones in the same beds, have afforded sufficient materials to enable Owen to reconstruct an animal named by him *Labyrinthodon* (q. v.), which undoubtedly produced the footprints. These remains have been detected in Lancashire and Cheshire, as well as in Germany.

**BUNTING**, or **BUNTING**, is a thin woollen material, of which the flags and signals of ships are usually made.

**BUNTING** (*Emberiza*), a genus of birds closely allied to finches and sparrows, and included with them by some ornithologists in the great family *Fringillidae* (q. v.), but by others made the type of a distinct family, *Emberizidae*, of which the most marked characteristics are a short, straight, conical bill; a curved form of the gape, produced by a narrowing of the sides of the upper mandible, and a corresponding enlargement of the under one, and a hard rounded knob on the palate or inner surface of the upper mandible. This knob probably aids in crushing the seeds, which are a principal part of the food of these birds. The species of the B. family are numerous, and are arranged in several genera. The true buntings (forming the restricted genus *Emberiza*) have the hind claw moderately short, curved, and strong, and the palatal knob large and bony. The **COMMON B.** or **CORN B.** (*E. miliaria*)—a bird considerably larger than a house-sparrow, brown, with darker streaks on the upper parts, whitish brown, with spots and lines of dark

brown on the under parts, and with a slightly forked tail—is frequent, particularly in low cultivated

Common Bunting (*Emberiza miliaria*).

grounds in Britain, and in most parts of Europe, extending also into Asia, living in pairs during spring and summer, but in flocks in winter, and often visiting barn-yards at that season, along with chaffinches and sparrows. It is the largest of the British buntings. It is supposed that the winter flocks in Britain are much increased by migration from more northerly regions. This B. often passes the night on the ground in stubble-fields, and is taken in the nets employed for catching larks, and brought with them to market. It usually builds its nest on or very near the ground. Its notes are harsh and unmusical.—The **RED B.**, or **BLACK-HEADED B.** (*E. Schoeniclus*), is a species common in marshy situations, both in Britain and on the continent of Europe; a very pretty little bird, with black head and throat, strikingly contrasted with the white nape and sides of the neck.—The **CIRL B.** (*E. Cirlus*), of which the head is olive-green, with black streaks, and with patches of bright lemon-yellow on the cheeks and over the eyes, is a rare British bird, and belongs chiefly to the south of Europe and the north of Africa. To this genus belong also the **OETOLAN** (q. v.) and the **YELLOW-HAMMER** (q. v.).—The **SNOW B.** (q. v.), or **SNOWFLAKE** (*E. nivalis* of many authors), has been placed in the new genus *Plectrophanes*. The name B. has been often very vaguely used, and many species have been almost indiscriminately called buntings or finches. The palatal knob affords the best distinctive character. North America has a number of species of bunting.—The **BLACK-THROATED B.** (*E. Americana*) is extremely plentiful on the prairies of Texas and other south-western parts of the United States; extending, however, as far as to Ohio, and even to Massachusetts. In the middle and northern states, it occurs only as a summer bird of passage. In its habits, it closely resembles the Common B. of Europe; but the palatal knob is less hard.

**BUNTING**, JABEZ, an eminent Wesleyan minister, was born at Manchester in 1779. At the age of 20, he devoted himself to ministerial work, in which he was very successful. He was elected president of the annual conference in 1820, and again in 1828, 1836, 1844. In 1834, he was chosen president of the theological institution belonging to the Wesleyan Methodist body, and he acted as one of the secretaries to the Missionary Society in connection with his denomination, for a period of more than twenty years. He was the chief authority in all matters relating to the government

## BUNYAN—BUOY.

and polity of Wesleyan Methodism. On his retirement from official life in 1857, his friends presented him with an annuity of £200, in consideration of the great services he had rendered to Methodism. He did not live, however, to profit by their kindness and forethought, having died in June 1858.

**BUNYAN, JOHN**, one of the most popular religious writers of any age, was born at Elstow, near Bedford, in 1628. He was brought up to his father's trade of tinker, and spent his youth in the practice of that humble craft, of which his name alone now serves to lessen somewhat the disrepute. It has generally been taken for granted that his early life was very loose and profligate, on the sole ground of his terrible self-accusations in after-years, when, from the height of religious fervour and Puritan strictness, he looked back on dancing and bell-ringing as deadly sins. This point is satisfactorily disposed of by Macaulay (*Encycl. Britann.*, art. 'Bunyan'). In his 16th or 17th year, he enlisted in the Parliamentary army, and in 1645, was present at the siege of Leicester, where he escaped death by the substitution of a comrade in his place as sentry. Nothing further is known of his military career. After leaving the army, he married, and soon after began to be visited by those terrible compunctions of conscience, and fits of doubt, sometimes passing into despair, which, with some quieter intervals, made his life, for several years, a journey through that Valley of Humiliation of which he afterwards gave so vivid a picture. Hope and peace came at last, and in 1655, B. became a member of the Baptist congregation at Bedford. Soon after, he was chosen its pastor, and for five years ministered with extraordinary diligence and success, his preaching generally attracting great crowds. The act against conventicles, passed on the Restoration, put a stop to his labours; he was convicted, and sentenced to perpetual banishment. In the meantime, he was committed to Bedford Jail, where he spent the next 12 years of his life, supporting the wants of his wife and children by making tagged laces, and ministering to all posterity by writing the *Pilgrim's Progress*. His library consisted of a Bible and Fox's *Martyrs*. The kindly interposition of a High Church bishop, Dr Barlow of Lincoln, at length released him, and he at once resumed his work as a preacher, itinerating throughout the country. After the issuing of James II.'s declaration for liberty of conscience, he again settled at Bedford, and ministered to the Baptist congregation in Mill-lane till his death, at London, of fever, in 1688. B.'s whole works were published in 1736, in 2 vols. folio. The most popular of them, after the *Pilgrim's Progress*, are the *Holy War*—another allegory, much less successful—and *Grace Abounding to the Chief of Sinners*, an autobiographical narrative. It is supposed that no other book, except the Bible, has gone through so many editions, and attained to so wide a popularity, in all languages, as the *Pilgrim's Progress*.

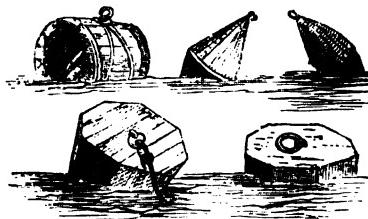

**BU'NZLAU**, a town of Prussia, in the province of Silesia, is situated on the Bober, about 25 miles west-north-west of Liegnitz. B. is surrounded by a ditch and a double line of walls, and has manufactures of woollens, linens, hosiery, and earthenware, the latter forming a considerable article of export. An obelisk to the Russian general, Kutusow, who died here in 1813, adorns the market-place. Pop. (1871) 8817.

**BU'NZLAU, JUNG**, a town of Bohemia, on the left bank of the Iser, about 32 miles north-east of Prague. B. is well built, has an old castle, and manufactures of cotton, woollen, soap, leather, &c.

It is said to owe its origin to King Boleslav, who founded it in the 10th century. Pop. (1869) 8695.

**BUOL-SCHAUENSTEIN, KARL FRED., COUNT**, Austrian statesman, was born 17th May 1797. After filling subordinate diplomatic posts, he became ambassador at Carlsruhe in 1828, afterwards at Stuttgart (1838) and at Turin (1844). Leaving Turin on the outbreak of the war in 1848, he went as ambassador to St Petersburg, and it fell to him to uphold the interest and dignity of his country, on occasion of the aid given by Russia in the Hungarian war. A not less difficult task was assigned him when, in 1851, he was sent to represent Austria in London; his address and conciliatory bearing contributed not a little to bring about a more friendly feeling between the two governments. On Schwarzenberg's death, B. was recalled to Vienna, and became foreign minister. In this position, he carried out the new politics of Austria no less firmly and successfully, though more moderately and quietly, than his predecessor. In the negotiations during and after the termination of the Crimean war, B. shewed himself a skilful and able statesman. After defending with zeal and ingenuity, in diplomatic notes and circulars, the position which Austria had taken up with reference to Sardinia, B. suddenly, on the actual commencement of the Italian campaign of 1859, resigned his place, which was immediately filled by Count Rechberg. Failing health was the cause officially assigned for the step, but the general belief was, that it indicated a triumph of the war-party in the council of Francis Joseph. He died Oct. 28, 1865.

**BUOY** is a floating body, intended as a mark for the guidance of mariners. It is made either of wood or metal, and is mostly hollow, to make it float better. Buoys are generally moored by chains to the bed of the river or channel. They are of various shapes and sizes, and are painted of various colours, partly to render them conspicuous, and partly to distinguish them one from another. Sometimes floating buoys mark out the best channel for entering a dock; sometimes they warn the mariner away from sands, spits, and shoals; sometimes they mark out a continuous double line, as at Spithead,

Various shapes of Buoys.

between which ships can alone with safety enter a harbour. The Trinity House has lately adopted a form of B., invented by Mr Herbert, in which, by due attention to the centre of flotation, and to the point where the mooring-chain is fixed, the tendency to pitch and roll is much lessened, and the B. kept nearly upright in all weathers. Messrs Brown and Lenox's bell-buoy, of recent invention, is an ingenious contrivance for rendering a B. audible, whether it is visible or not; so long as any stream of water, whether caused by a tide or a current, passes through the lower part of the B., it moves an undershot water-wheel, which rings a bell.

A buoy-rope, on shipboard, is the rope which connects the anchor with a B. floating above it. It is simply intended to point out the locality of

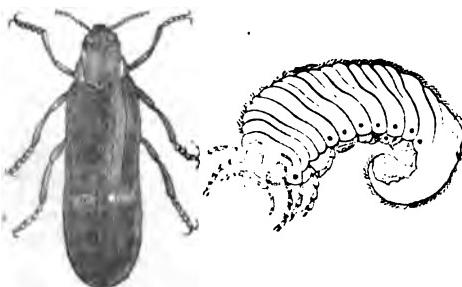

the anchor; but if it be strong, it is useful in assisting to raise the anchor, at times when the proper cable is cut or injured.

**BUOY'ANCY**, of ships, is the amount of weight which can be buoyed up by the hull. The B. of a vessel is proportionate to the weight of water displaced by its presence (see HYDROSTATICS), and is found in this way. The cubic feet of the part of a vessel to be immersed being known, multiply it by the weight of a cubic foot of water (62·5 lbs.), and the product will be the weight of water displaced. From this subtract the weight of the vessel, and the result will be the B. or the weight a vessel will carry without sinking lower than the given line. It is admitted, however, by naval architects, that all the old rules concerning B., displacement, and flotation, must undergo modification by the introduction of iron ships, paddle and screw propulsion, and the increased weight of broadside.

**BUOY-DUES.** Buoys are under very stringent regulations, on account of their importance to the safety of ships. The public buoys, for guiding into channels, and warning from shoals and rocks, are usually marked on the best charts relating to that particular water-way. The corporation of the Trinity House has a peculiar jurisdiction over the buoys and beacons in the Thames, and along the Essex and Suffolk coasts; as well as on other coasts in England and Wales. All ships which enter the ports within this jurisdiction pay a small sum as buoy-dues. The payment is sometimes a tonnage rate, varying from 0½d. to 2d. per ton; sometimes a rate per vessel, varying from 4d. to 3s.; sometimes a payment on entering only, at others on departure as well as on entering; while some kinds of coasting-vessels pay 5s. per annum, whatever may be the number of voyages. From the Thames buoys alone, the Trinity House receives £14,000 per annum as dues.

**BUPHAGA.** See BEE-EATER.

**BUPRESTIS**, a Linnean genus of Coleopterous (q. v.) insects, now divided into a number of genera, and forming a tribe or family, *Buprestidae*, of which some hundreds of species are known, most of them belonging to tropical countries, and remarkable for the splendour of their colours. The colours are generally metallic in their lustre, have frequently a burnished appearance, and are often beautifully iridescent. One of the largest species, *B. gigas*, is a native of Cayenne: it is about 2 inches long. The

Buprestis Bicolor.

Larva of Buprestis gigas.

English and other European species are all comparatively small. Most of the species spend the night on trees, shrubs, and other plants, flying about during the hottest part of the day. Some of them are popularly known as GOLDEN BEETLES. Plants are sometimes seen studded with them in the

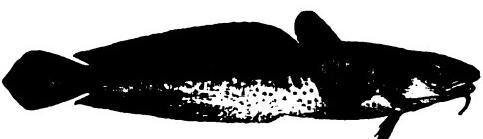

morning, as with gorgeous flowers. The golden elytra (wing-cases, see ELYTRA) of some species are used to enrich the embroidery of the Indian zenana; and the hæmous joints of the legs are strung on silken threads, and form necklaces and bracelets of singular brilliancy. The species of *Buprestidae* found in England are few; none have yet been found in Scotland. The larvae seem sometimes to be transported from one country to another in timber.

**BUR**, in an engraving, is a slight ridge of metal raised on the edges of a line by the graver or the dry point. As the bur produces an effect like a smear, it is usually regarded as a defect, and scraped off. Some etchers, however, take advantage of it to deepen their shadows, and Rembrandt made use of it in this way with telling effect.

**BURANHEM, or BURUNHEM.** See MONELLA BARK.

**BURA'NO**, an island and town of Northern Italy, in the Adriatic, about 5 miles north-east of Venice. The island supplies a large proportion of the vegetables consumed in Venice. B. has some lace-manufactures, boat-building, and an extensive ropework, but the inhabitants are chiefly employed in fishing. Pop. 8000.

**BUR'BOT** (*Lota vulgaris*), a fish of the same genus with the Ling (q. v.), and of the same family with the Cod, Haddock, &c., being the only British fresh-water species of that family, *Gadidae*. It is found in the Cam, the Trent, and other rivers of the eastern and midland counties of England, but is one of the most local of British fresh-water fishes. It is found also in various parts of the north of Europe, and at least as far south as Switzerland; in Siberia and other parts of Asia, even, it is said, in India. In English rivers, it often reaches 2 or 3 lbs. in weight, but has been taken of 8 lbs. weight, and in some parts of Europe, it is said to reach 10 or 12 lbs. weight. In appearance, the B. very

Burbot.

much resembles the ling, but is rather thicker at the neck, and tapers rather more rapidly, although still of a somewhat elongated form. It has two dorsal fins, the first short, the second very long, and a very long anal fin. It differs from the ling in the form of the tail-fin, which is oval and slightly pointed; but agrees with it in having a single barbule on the lower jaw. It is of a yellowish-brown colour, clouded and spotted with darker brown on the upper parts, the under parts lighter; the scales are small; and the whole body is covered with a mucous secretion. The flesh is white, firm, and of good flavour; 'and as the B. is in its nature extremely hardy, few difficulties present themselves in the way of their increase in quantity, while the value of the fish would amply repay the trouble or the cost of the experiment.'—*Yarrell*. The B. is capable of living for a long time out of water. It is commonly taken by trimmers and night-lines, as it feeds principally during the night. Its food consists of small fishes, worms, mollusca, &c. Its liver yields an oil similar to cod-liver oil.

**BURCKHARDT, JOHN LEWIS**, an enterprising African traveller, was born at Lausanne, in

## BURDEN—BURDETT.

Switzerland, November 24, 1784. In 1806, he came to London, and was introduced by Sir Joseph Banks to the African Association, which accepted his services to explore the route of Hornemann into the interior of Africa, and he embarked for Malta, February 14, 1809. He had previously qualified himself for the undertaking by a study of Arabic, and also by inuring himself to hunger, thirst, and exposure. From Malta he proceeded, under the disguise of an oriental dress and name, to Aleppo, where he studied about two years, at the end of which time he had become so proficient in the vulgar Arabic, that he could safely travel in the disguise of an oriental merchant. He visited Palmyra, Damascus, Lebanon, and other remarkable places, and then went to Cairo, his object being to proceed from thence to Fezzan, and then across the Sahara to Sudan. No opportunity offering itself at the time for that journey, he went into Nubia. No European traveller had before passed the Derr. In 1814, he travelled through the Nubian desert to the shore of the Red Sea and to Jeddah, whence he proceeded to Mecca, to study Islamism at its source. After staying four months in Mecca, he departed on a pilgrimage to Mount Arafat. So completely had he acquired the language and ideas of his fellow-pilgrims, that, when some doubt arose respecting his Mohammedan orthodoxy, he was thoroughly examined in the Koran, and was not only accepted as a true believer, but also highly commended as a great Moslem scholar. In 1815, he returned to Cairo, and in the following year ascended Mount Sinai. The Fezzan caravan, for which he had waited so long, was at last about to depart, and B. had made all his preparations for accompanying it, when he was seized with dysentery at Cairo, which terminated his life in a few days, October 15, 1817, at the early age of 33. As a holy sheik, he was interred with all funeral honours by the Turks in the Moslem burial-ground. His collection of oriental MSS., in 350 volumes, was left to the university of Cambridge. His journals of travel, remarkable alike for their interest and evident truthfulness, were published by the African Association. B. was a man born to be a traveller and discoverer; his inherent love of adventure was accompanied by an observant power of the highest order. His personal character recommended him to all with whom he came in contact, and his loss was greatly deplored, not only in England, but in Europe. His works are—*Travels in Nubia*, 1819; *Travels in Syria and the Holy Land*, 1822; *Travels in Arabia*, 1829; *Notes on the Bedouins and Wahabis*, 1830; and *Manners and Customs of the Modern Egyptians*, 1830.

**BURDEN**, a term of law in Scotland, used to signify any restriction, limitation, or encumbrance affecting either person or property. Burdens are said to be either personal or real. Where a party is taken bound by acceptance of a right to pay a certain sum to another, but where there is no clause charging the subject conveyed with the sum, the burden is said to be *personal*; that is, it will be binding upon the receiver and his representatives, but will constitute no real encumbrance on the lands, or other subject conveyed, nor amount, indeed, to anything more than a mere personal obligation on the grantor. But where the right is expressly granted under the burden of a specific sum, which is declared a burden or charge on the lands themselves, or where the right is declared null if the sum be not paid, the burden is said to be *real*.

By the 10 and 11 Vict. c. 48, real burdens need not be inserted in full in conveyances, if they have already been set forth in an instrument of title, in

which case, they may be referred to in the terms, or as nearly as may be in the terms, set forth in schedule C annexed to the act. A similar provision is made in regard to lands held in burbage tenure, by the 10 and 11 Vict. c. 49.

**BURDEN**, or **BURTHEN**, of a ship. See **TONNAGE**.

**BURDEN OF PROOF**, in legal procedure, signifies the obligation to establish by evidence certain disputed facts; and, as a general rule, this burden lies on the party asserting the affirmative of the issue to be tried or question in dispute, according to the maxim *ei incumbit probatio qui dicit non qui negat*—that is, proof is incumbent on him who asserts, not on him who denies. The principle of the law is, that the B. of P. is on the party who would fail if no evidence were adduced on either side. Accordingly, it almost always rests on the plaintiff in an action, or on the party asserting the facts on which the result of the litigation must depend. In one case tried before the late Baron Alderson, that learned judge laid down that the proper test was, *which party would be successful, if no evidence at all were given?* the B. of P., of course, falling on the party not in that position. This test has since been generally adopted and applied; but Mr Best, in his learned work on the *Principles of Evidence*, improves on it by the suggestion, that in strict accuracy the test ought to be, ‘which party would be successful, if no evidence at all, or *no more evidence*, as the case may be, were given?’ a consideration on which the discretion and judgment of counsel frequently depend. But although such, in general, is the position of the plaintiff, it sometimes happens that the B. of P. is imposed on the defendant, in consequence of his having the affirmative of the material issue to be tried.

It is this rule as to the B. of P. that demonstrates the real nature of the plea of *not guilty* in a criminal prosecution, and which divests that plea of the objections to it which are frequently heard expressed by over-scrupulous sentimentalists; for the meaning of that plea is not necessarily an assertion by the prisoner that he is absolutely guiltless or innocent, but that he wishes to be tried, and that as the B. of P. is on the prosecutor, while he has meanwhile the presumption of innocence in his favour.—Besides the work referred to, see on the subject of this article Starkie on the *Law of Evidence in England*, and Dickson on the same subject in Scotland.

**BURDENS, PUBLIC.** See **PUBLIC BURDENS**.

**BURDER**, REV. GEORGE, an active and influential minister of the Congregational body, was born in London, June 1762. After studying some time as an artist, he devoted himself to the ministry, and in 1778 was appointed pastor of an Independent Church at Lancaster. He afterwards removed to Coventry, and in 1803 to London. Here he became secretary to the London Missionary Society, and editor of the *Evangelical Magazine*, the duties of which offices he discharged with great zeal, until failing health compelled him to resign. B. took a prominent part in all the religious movements of his time. He died May 1832. His *Village Sermons* have been translated into several European languages; and he was the author of other series of sermons and publications which have had an immense circulation.

**BURDETT**, SIR FRANCIS, Bart., the most popular English politician of his time, born January 26, 1770. Educated at Westminster School and Oxford University, he spent some years on the continent, and was a witness to the progress of the first French Revolution. In 1793 he married Sophie, youngest daughter of Thomas Coutts,

## BURDOCK—BUREN.

Esq., the wealthy London banker, and in 1796 was elected M.P. for Boroughbridge, Yorkshire. In 1797, on the death of his grandfather, he succeeded to the baronetcy. In the House of Commons, he made himself conspicuous by his opposition to government and the war, and his advocacy of parliamentary reform, Catholic emancipation, and other liberal measures, most of which were afterwards carried. One of the most effective political speakers of that excited period, he for many years prominently occupied public attention, and was the idol of the London populace. Having succeeded in obtaining a parliamentary inquiry into the abuses of the metropolitan prisons, he became, in 1802, a candidate for Middlesex. He was first returned, then unseated, and after a second contest, defeated. At the general election of 1806, B. again became a candidate for Middlesex, but was defeated. In May 1807, he fought a duel with Mr James Paull, one of the candidates for Westminster the previous year. Soon after, he was returned, with Lord Cochrane, for Westminster, which he represented for nearly thirty years. B. having in 1810 published, in Cobbett's *Political Register*, a Letter to his Constituents, declaring the conduct of the House of Commons illegal in imprisoning John Gale Jones, the Speaker's warrant was issued for his apprehension, as being guilty of a breach of privilege. Refusing to surrender, he for two days barricaded his house; the populace supported him in his resistance, and in a street contest between them and the military some lives were lost; but on April 9, the sergeant-at-arms, aided by the police and military, obtained an entrance, and conveyed him to the Tower. The prorogation of parliament restored him to liberty. Prosecuted in 1819 for a libel contained in a Letter to his Constituents, strongly animadverting on the proceedings of the magistrates and yeomanry at the memorable Manchester meeting, he was sentenced to three months' imprisonment in the King's Bench, and to pay a fine of £1000. Some time after the appointment of the Melbourne ministry in 1835, he deserted the Liberal party, and joined the Conservatives. In July 1837, he was returned for Wiltshire. His death took place January 23, 1844.

**BURDOCK** (*Arcium*), a genus of plants of the great natural order *Composita* (q. v.), tribe *Cynaroccephala*. The heads of flowers are globose, or nearly so; and each of the scales of the involucrum runs out into a long rigid prickle, which is hooked at the point. By means of these hooks, the flower-head, popularly called a *bur*, readily lays hold of the clothes of a passer-by, the wool of a sheep, or the like, and thus the seeds are transported from one place to another, the short hairy pappus being insufficient to waft them far on the wind. The common B. (*A. Lappa*), of which varieties very slightly distinguished have sometimes been described as species (*A. Bardana*, &c.), is abundant in waste and bushy places, by waysides, &c., in Britain and throughout Europe, scarcely, however, growing except in rich land. Its root is biennial, large, and fleshy, somewhat carrot-shaped; the root-leaves large, stalked, heart-shaped; the stem stiff, upright, somewhat branched and leafy, three feet or more high. The whole aspect of the plant is coarse, and it is somewhat clammy to the touch. The root is sometimes used in medicine, being diaphoretic and diuretic, and acting upon the cutaneous system and the kidneys. It is capable of being made a substitute for sarsaparilla. When fresh, it has a disagreeable smell, but when dry, it is inodorous; it has a sweetish mucilaginous taste, becoming afterwards bitterish and rather acrid, and contains chiefly

inulin, bitter extractive, mucilage sugar, and a little tannin. In many countries, the roots, young shoots, and young leaves of B. are used in soups; and the

Burdock.

plant is cultivated for this use in Japan. The roots are said to resemble artichokes in taste. The leaves and their expressed juice are sometimes applied to burns and suppurations.

**BURDWAN**, a city in the district and province of the same name, in the presidency of Bengal, on the Grand Trunk Road from the Hoogly to the N.W. Provinces, in lat. 23° 12' N., and long. 87° 56' E., 74 miles from Calcutta, with which it is connected by railway. In point of architecture, it is a miserable place—an aggregate, as it were, of second-rate suburbs. Pop. (1871) 32,321.

**BURDWAN**, the district of the last-mentioned city, lying between Beerbboom on the north, and Hoogly on the south. It stretches in N. lat. from 22° 52' to 23° 40', and in E. long. from 87° 21' to 88° 23'. It has an area of 3523 square miles, with (1871) 2,034,745 inhabitants, or 577 to the square mile—proportion which certainly seems to justify a name that signifies productive. The district is largely engaged in the refining of sugar. It exports also iron and coal; chiefly, however, brought from the mines of Bancoorah, the district on the west. Next to the capital, Cutwa and Culna are the chief towns.—The province of B. has an area of 12,719 sq. m., and a pop. (1871) of 7,286,957.

**BUREAU**, a French word signifying a writing-table or desk; also an office for transacting business, a department of government, or the officials that carry it on. **BUREAUCRACY** is popularly applied to signify the kind of government exemplified in many continental states, where a host of government officials, regularly organised and subordinated, and responsible only to their chiefs, interfere with and control every detail of public and private life—the evil which the Germans call ‘mucht-government’ (*vielregieren*).

**BUREN**, MARTIN VAN, a president of the United States of America (1837–1841), was born at Kinderhook, in Columbia, New York, December 5, 1782. Educated for the bar, he was elected, in 1812, senator in the legislative assembly of New York, and in 1821 took his seat in Congress, where he supported democratic measures. In 1829 he was made Secretary of State, and in 1837 he succeeded General Jackson in the presidency, being elected by a majority of twenty-four votes over his rivals, Clay, Webster, and Harrison. On beginning the duties of his office, he found himself involved in such financial perplexities, that he immediately

summoned Congress to an extraordinary session, and proposed an entire separation of state-finance from the banks of the Union, a proposition which was decisively rejected, and B.'s popularity was greatly damaged. In 1840, he had to yield his place to General Harrison, the Whig candidate; and in 1844, when he again stood for the presidency, he was defeated by Polk. The result of this vote divided the Democrats into two parties, one of which, at a convention at Utica, unanimously declared for Van B. as president for 1848; but his election was prevented by the military renown of General Taylor, who left both Van B. and Cass with minorities. In 1856, he was again named for the presidency; but the majority of the Democratic party preferred Mr Buchanan. He died July 1862.

**BURG**, a town of Prussia, in the province of Saxony, situated on the Ihle, about 13 miles north-east of Magdeburg. It is walled, and has long been famous for its extensive woollen manufactures. It has also manufactures of linen, yarn, steel, pottery, and leather; dye-works, distilleries, foundries, &c., and a large trade in agricultural produce. Pop. (1871) 15,184.

**BURGAGE TENURE** is a species of holding in the law of real property which prevailed both in England and Scotland, although somewhat differently regarded in these two countries. In England, it is a species of free *socage* (q. v.) holding, and it prevails where the king or other person is lord of an ancient borough in which the tenements are held by a certain and determinate rent, and subject to a variety of customs, the principal and most remarkable of which is that called *Borough English* (q. v.). Among the other customs was a law that the wife shall be endowed with all her husband's tenements, and not with the third part only, as at common law.

In Scotland, by this tenure is meant a peculiar sort of military holding affecting property in royal burghs, the sovereign being superior or over-lord, and each individual proprietor or burgess holding direct of the crown, for the *reddendo* or service of *watching and warding* (q. v.). This service is otherwise termed 'service of burgh used and wont,' and is now merely nominal. Although the burgesses hold immediately of the crown, they do not receive their formal entry directly from the sovereign, but from the magistrates of the burgh, as the crown's commissioners. If the burgh, as such, ceases to exist, the crown does not thereby lose its rights over the proprietors, for they continue as crown vassals (q. v.). The statutes 31 and 32 Vict. c. 101, and 32 and 33 Vict. c. 116, abolished many useless forms in this tenure. See **TENURE OF LAND**.

**BURGA'S**, or **BURGHAZ'**, a town of European Turkey, in the province of Rumelia, on a promontory in the Black Sea, about 76 miles north-east of Adrianople. B., which is well built and clean, has manufactures of pottery of a superior kind, and a good trade in agricultural produce. Pop. about 6000. The Gulf of Burgas, at the head of which the town is situated, is about 14 miles in length, and has a depth varying from 5 to 12 fathoms.

**BURGEO ISLANDS**, belonging to England, and lying between Newfoundland and Cape Breton, in lat. 47° 33' N., and long. 57° 44' W. Besides being valuable as a fishing-station, they occupy a commanding position with respect to British North America in general, and the Gulf of St Lawrence in particular. The group has 700 inhabitants.

**BÜRGER**, GOTTFRIED AUGUST, one of the most popular German poets, was born, January 1, 1748, at Molmerswende, near Halberstadt, in Prussian Saxony. In his boyhood, he displayed no capacity

for hard study, and was particularly averse to Latin; but he at the same time shewed a relish for verse, though destitute of any other model than the Psalm-book. In 1764, he went to Halle, and applied himself to theology. In 1768, he abandoned this science for jurisprudence, which he studied at Göttingen. Here his conduct was careless and immoral, and he would probably have sunk into obscurity, if the intimacy which he happily formed with Voss, the two Stolbergs, and other young poets, had not stirred up his better nature, and inspired him with an earnest ambition to excel. He laboured hard at the classics of ancient and modern times, but the study of Shakespeare and Percy's *Reliques* had the greatest influence in deciding the style of poetry which he was to adopt. With regard to the intrinsic merits of his poems, which consist chiefly of ballads and songs, even German critics—such as Schiller, Gervinus, and Vilmar—differ widely in their opinions; but all agree in praising the popular style and fluent, spirited versification of his ballads, *Leonora*, *Lenardo and Blandine*, the *Parson's Daughter of Taubenhayn*, the *Wild Huntsman*, &c. B.'s life was spent in great poverty and misery, partly the result of misfortune, and partly induced by his own errors. He married thrice, in two instances very unhappily; lost his property by an unfortunate speculation; and, though the favourite poet of the German people, was left to earn his bread by translations and similar literary labours. He died June 8, 1794. Though a popular writer, B. was very careful as to style, and was one of the first who wrote good hexameter verse in German. His collected works were first published by Karl von Rheinhard, 1796—1798; latest edition, 1844.

**BÜRGERMEISTER**, the German title of the chief magistrate of a city or town, analogous to the French *maire*, the English *mayor*, and the Scotch *provost*.

**BU'RGESESS**, or **BURGHER**, from the same origin as borough, means, when taken in a general sense, much the same thing as the word citizen, but has a variety of special meanings, according to local institutions. In French literature, the word *bourgeoisie* is generally used to personify the excess of plebeian vulgarity; while, on the other hand, in England, the aristocratic member of parliament for a city is technically called a burgess. In almost all parts of Europe, when used in a technical sense, the word means a person who holds some peculiar privilege in a town or municipal corporation. The burgesses of the European towns, indeed, were, and still nominally are, an interesting relic of ancient Roman institutions, existing in contest and rivalry with the institutions of feudalism. The B., with a different name, is virtually the *civis* or citizen of the Roman municipality. It was a rank always of some moment, but especially valuable when the citizenship was of Rome, the metropolis. St Paul, when he was to be scourged, raised the alarm of the chief captain by stating that he was a Roman. Such an event might often have happened in the middle ages, when a B., brought before the court of a feudal lord, claimed the privilege of pleading in his own burgal court, or the king's tribunal. The European monarchs found it their interest to support the burgesses, as a check on the influence of the feudal aristocracy; and thus was nourished the great system of city communities, which have exercised so important an influence on the fate of the world. See **MUNICIPALITY**.

In the law of England, a B. is a member of the corporation of a corporate town, or he may be

BURGESS LIST—BURGH.

described as a freeman duly admitted as a member of the corporate body. This privilege was, and, to some extent, still is, acquired by birth or servitude—that is, by being born of a freeman, or by apprenticeship for seven years within the burgh to a freeman. It might also be obtained by gift or purchase; and the Municipal Corporation Act, the 5 and 6 Will. IV. c. 76—with the exception of abolishing the last-mentioned mode of admission by gift or purchase—expressly reserves the rights of such freemen and their families; and it also provides for the making up and preservation of a list of burgesses so admitted, to be called the *Freeman's Roll* (q. v.). In that act, a burgess is defined to be a male person, who, on the last day of August in any year, shall have occupied any house, warehouse, counting-house, or shop within the burgh, during that year and the whole of the two preceding years; and during such occupation shall also have been an inhabitant householder within the burgh, or within seven miles thereof. As the law now stands, every person of full age (and this includes females) who on the last day of July shall have occupied any house, warehouse, counting-house, shop, or other building within the burgh during the whole of the preceding twelve months, and also shall have resided within seven miles of the burgh, shall, if duly enrolled, be a burgess and member of the body corporate of the mayor, alderman, and burgesses of such burgh, provided he shall have paid his borough rates up to the preceding January, and shall not have been in receipt of parochial relief. The premises occupied need not be the same throughout the year if they are within the burgh, 35 and 36 Vict. c. 56. See TOWN-COUNCIL. The vote is by ballot.

In the Scotch law, the old definition of B. is still maintained. This is very similar to the old English one above mentioned, with the addition of admission to the privilege by election of the magistrates of the burgh—the burgesses taking, on the occasion of their admission, a quaint form of oath, in which they confess the religion of the country, loyalty to the Queen, to the provost and bailees of the burgh and their officers, and declaring, *inter alia*, that they will 'make concord where discord is, to the utmost of their power.' By the Scotch Municipal Reform Act, 3 and 4 Will. IV. c. 76, s. 14, it was enacted that councillors must be entered burgesses of the burgh before their induction—that is, wherever there is any body of burgesses in any such burgh; but now, any councillor is at once made a burgess by minute of council. One of the peculiar privileges of a B. in Scotland was, that his heir has a right to *herskip movables*; but that privilege was abolished by the statute 31 and 32 Vict. c. 101, s. 160, Titles to Land (Scotland) Act.

**BURGESS LIST AND BURGESS ROLL** are lists made under the provisions of the Municipal Corporation Act, 5 and 6 Will. IV. c. 76, amended by 20 and 21 Vict. c. 50, and 32 and 33 Vict. c. 55. The overseers of the poor of every parish wholly or in part within any burgh, are directed to make out an alphabetical list, called the *burgess list*, of all persons who may be entitled or qualified to be enrolled on the burgess roll of that year, such list to be open for perusal by any person, without the payment of any fee, at all reasonable hours, between the 1st (when the list must be signed and delivered) and 16th days of September in every year. This list is afterwards revised by the revising barrister, and the names of those persons allowed, on revision, to remain, are then transferred to the *Burgess Roll*, which is copied into a general alphabetical list in a book provided for that purpose by the town-clerk or clerk of the peace, and which book must be

completed on or before the 22d of October in every year; every such book being the burgess roll of the burgesses entitled to vote for councillors, assessors, and auditors of the burgh. Copies of such burgess roll, so completed, shall be made in writing, or printed, for delivery and sale to all persons applying for the same, on payment of a reasonable price for each copy. There are other regulations respecting these lists, and with respect to neglect and informality in making up the burgess roll. Every person of full age, who occupies a house, warehouse, counting-house, shop, or other building within the burgh for twelve months, and resident in or within seven miles, shall, if duly enrolled, be a burgess, 32 and 33 Vict. c. 56.

In regard to Scotland, it has been already explained (see BURGESS), that persons entitled to the privileges of burgesses must be admitted according to the old form, and councillors, before induction, may, by a minute of council, be made burgesses, 23 and 24 Vict. c. 47. But the list, which corresponds to the English burgess roll, is the list of municipal electors qualified according to the provisions of the 3 and 4 Will. IV. c. 76, 77; 31 and 32 Vict. c. 108; and 33 and 34 Vict. c. 92, relating to royal burghs in Scotland.

**BURGH** is a descriptive name of towns and cities in Scotland, corresponding to the English word *Borough* (q. v.). There were *burghs of barony*, *free burghs*, *burghs of regality*, and *royal burghs*. Since 1832, there have been what are called *parliamentary burghs*—that is, towns or burghs not being royal burghs, but sending or contributing to send representatives to parliament, under the Act 2 and 3 Will. IV. c. 65. By the General Police Act for Scotland, the word B. was declared to mean also any populous place, the boundaries of which are fixed by the act. Among parliamentary burghs are Paisley, Greenock, Leith, Kilmarnock, Falkirk, Hamilton, Peterhead, &c.; and by the 3 and 4 Will. IV. c. 77, 15 and 16 Vict. c. 32, 16 and 17 Vict. c. 26, 31 and 32 Vict. c. 108, 33 and 34 Vict. c. 92, 35 and 36 Vict. c. 33, a code is given for the election of their magistrates and councillors, and for the appointment of other officers; the election being with the persons qualified to vote for a member of parliament—to be concluded in Paisley, Greenock, Leith, and Kilmarnock, by open poll in one day, the polling-books to be summed up, and the result declared by the provost: in Falkirk, Hamilton, Musselburgh, Airdrie, Port-Glasgow, Peterhead, Portobello, Cromarty, and Oban, to be by signed lists: a third of the council to go out, and others to be elected every year; and the provost and magistrates to be chosen by the council from their own number.

The police of burghs, and everything regarding their draining, cleaning, lighting, &c., are regulated by the Police (Scotland) Act, 20 and 21 Vict. c. 72, and the Public Health (Scotland) Act, 30 and 31 Vict. c. 101.

**BURGS OR BARONY** are corporations consisting of the inhabitants of determinate tracts of ground within the *Barony* (q. v.), and municipally governed by magistrates, whose election is either dependent on the baron or lord of the district, or vested in the inhabitants themselves. Sometimes their charter of incorporation gave them power to create subordinate corporations and crafts, as in royal burghs; but all exclusive privileges of trading in burghs are abolished by the 9 and 10 Vict. c. 17. In other respects, the general corporate law of the country applies to burghs of barony, as to which see below.

**BURGERS, ROYAL** They have power to administer their common good, to elect their burgh-officers, to make bye-laws, and their burgesses are entitled to

## BURGH—BURGH ACRES.

challenge the sale or other disposition of the burgh's property.

**BURGS, FREE**, were burghs of barony enfranchised by crown charter with rights of trade, both home and foreign, but subjected, at the same time, to the same class of public burdens and taxation which royal burghs had to bear as the price of their peculiar privileges. Since the gradual decay and ultimate suppression of commercial monopoly, this class of burghs has become extinct, or rather all burghs may now be said to be *free*.

**BURGS OF REGALITY** were burghs of baronies, spiritual or temporal, enfranchised by crown charter, with regal or exclusive criminal jurisdiction within their own territories, and thence called *regalities* (q. v.). Some of these burghs of regality, especially those which were dependent on the greater bishops and abbots, were of high antiquity, and possessed jurisdiction and privilege of trade only distinguishable from those of royal burghs, by being more circumscribed in their limits. Since the abolition of hereditary jurisdictions, by the Act 20 Geo. II. c. 43, the distinction between burghs of regality and burghs of barony has ceased to be of any practical importance.

**BURGS, ROYAL.** A royal burgh is a corporate body deriving its existence, constitution, and rights, from a royal charter—such charter being either actual and express, or presumed to have existed, and by the accident of war and time, to have perished. By a Scotch act passed in 1469, a constitution was given to royal burghs, by which the right of appointing their successors belonged to the old councils, the act also containing the singular provision, that when the new council was chosen, the members of it, along with those of the old council, should choose all the office-bearers of the burgh, each craft or trade corporation being represented at the election by one of themselves. But this simple plan was not universally adopted, and the election gradually lost its former free and popular form—a close and exclusive proceeding being ultimately established in its place. This 'close system,' as it has been called, notwithstanding its repugnancy to the spirit of the times, and modern ideas of public administration, continued in force until the year 1833, when an act of parliament was passed, the 3 and 4 Will. IV. c. 76, amended by the 4 and 5 Will. IV. c. 87, and the 16 Vict. c. 26, by which it was abolished, and an entirely new constitution given to royal burghs, with the exception of nine of them, which, on account of the smallness of their population, are excepted from the provisions of the act, the election in these being conducted as it was before the act was passed. These nine burghs are: *Dornock, New Galloway, Culross, Lochmaben, Berwick, Wester Australter, Kilrenny, Kinghorn, and Kistore*. Of the other royal burghs, being those to which the reforming acts apply, the principal are—*EDINBURGH, Glasgow, Aberdeen, Dundee, Perth, Dunfermline, Dumfries, and Inverness*. The leading provisions of these acts are as follow: All persons within the burgh qualified under the Parliamentary Reform Act, 2 and 3 Will. IV. c. 66, in respect of property or occupancy of premises, and who have resided for six months next previous to the last day of June, within the royalty, or within seven miles of it, are entitled to vote in the election of councillors. In such burghs as do not now send members to parliament, property of the same value is required for the qualification, and claims for this privilege must be lodged with the town-clerk on or before the 21st of July, in a particular form. The councillors are chosen from among the electors residing, or personally carrying on business, within the royalty; and where there is a body

of burgesses in the burgh, each councillor, before his induction, must be entered a burgess—a requisite clearly unnecessary for the purposes of the municipal administration contemplated by the act, and which, it is expected, will be done away. The number of councillors in each burgh is such as, by the sett or constitution existing at the passing of the act, formed the common council, or, where this was variable, the smallest number making a full council. The electors of Edinburgh, Glasgow, Aberdeen, Dundee, Perth, Dunfermline, Dumfries, and Inverness, are divided into wards or districts. At the election immediately succeeding the passing of the act, each ward elected six councillors; but as every year the third part of the council goes out of office, in the order prescribed by the act, two councillors are now annually chosen by each ward, there being no bar, however, to the re-election of an outgoing councillor. The electors in other burghs choose the whole council exactly as these wards do their proportion of it, and consequently elect each year a third part in place of that which has retired. Upon the third lawful day after the election succeeding the passing of the act, the councillors meet and choose, by a plurality of voices, a provost, bailies, treasurer, and other office-bearers, as existing in the council by the sett or usage of the burgh; and vacancies occurring among such office-bearers, in consequence of the annual retirement of the third part of the council, are directed to be supplied from the councillors in like manner, as soon as the election of the new third has taken place, the first attending magistrate having a casting vote in cases of equality. Vacancies taking place during the year by death or resignation are supplied, *ad interim*, by the remaining members of the council, and the persons so elected by the councillors retire at the succeeding election. The rights of the guildry, trades, &c., to elect their own dean of guild, &c., are still preserved; but they are now no longer recognised as official or constituent members of the council, their functions being performed by a member of the council, elected by a majority of the councillors. In Aberdeen, Dundee, and Perth, however, the dean of guild, and in Edinburgh and Glasgow, the convener of trades and the dean of guild are, *ex officio*, members of council; and the electors in all the above-named burghs choose such a number of councillors as, together with these officers, makes up the proper number. No magistrate or councillor can be town-clerk. The magistrates and council possess the same powers of administration and jurisdiction as were enjoyed by the magistrates and town-council before the passing of the act; and none of them is responsible for the debts of the burgh, or the acts of his predecessors, otherwise than as a citizen or burgess. The existing council in all burghs royal must every year make up, on or before the 15th of October, a state of their affairs, to be kept in the town-clerk's or treasurer's office. The act 16 and 17 Vict. c. 26 provides for the supplying of vacancies in town-councils of burgh, consequent on void and irregular elections.

The police of burghs and other populous places, and the paving, draining, cleansing, lighting, and improving the same, are regulated by the 13 and 14 Vict. c. 33; and the 16 and 17 Vict. c. 93, enables burghs to improve and maintain their harbours.

The exclusive privilege of trading in burghs is abolished by the 9 and 10 Vict. c. 17.

**BURGHERS**, a name popularly given to a religious denomination in Scotland. See UNITED PRESBYTERIAN CHURCH.

**BURGH ACRES** are acres or small patches of land lying in the neighbourhood of Royal Burghs

(q. v.), usually feued or leased out to burgesses or persons resident within the burgh. A Scotch act of parliament, passed in 1695, relating to the division or partition of lands lying runrig, excepts burgh acrea, or, as the act calls them, 'burrow and incorporate acres,' from its provisions; but this is to be understood only of royal burghs, and not of burghs of barony or others.

**BURGHS, CONVENTION OF.** See CONVENTION OF ROYAL BURGHS.

**BURGKMAIR, HANS**, a noted old German painter and wood-engraver, was born at Augsburg, 1473. He was the father-in-law of the elder Holbein, and the friend of Albert Dürer, whose influence is manifest in B.'s works. Several excellent paintings by B. are preserved in the galleries of Munich, Berlin, Augsburg, and Vienna. But he is best known as a wood-engraver; his cuts amounting in all to nearly 700. Among the most celebrated of these is his 'Triumph of the Emperor Maximilian,' in 135 cuts, with a description by the emperor himself. Another fine series of 237 cuts, called 'The Wise King,' represents the deeds of Maximilian. B. is supposed to have died about the year 1559.

**BURGLARY** (through the old Fr. from Lat. *burgi latro*, a robber of a burg or enclosure), in the criminal law of England, is defined to be a breaking and entering the mansion-house of another in the night, with intent to commit some felony within the same, whether such intent be executed or not. It is peculiar to this crime, that it can only be committed in the *night-time*, which, by the 7 Will. IV., and 1 Vict. c. 86, s. 4, is considered as commencing at nine in the evening, and concluding at six in the morning of the next day. The next requisite of the crime, according to the definition we have given, relates to the *place* of its commission. It must be in a *mansion-house*, for such is the technical expression; but this is construed to mean any private dwelling, or any building temporarily or permanently used for that purpose. It cannot be committed in a distant barn, warehouse, or the like, unless there be a communication with the dwelling-house, nor in a house where no one resides. But if it is B. to break into a house which is used as an occasional residence, and which the owner is in the habit of leaving for a short period, with the intention of returning, even although no one be in the house at the time of the offence. A chamber in a college, or an inn of court, is also within the meaning of a *mansion-house*; so likewise is a room or lodging in any private house, if the owner and the lodger enter by different outer doors; but if they both enter by one outer door, then the offence can only be committed against the owner. For the same reason, a building belonging to a corporation, and separately inhabited by the officers of the body corporate, is the *mansion-house* of the corporation, and not of the officers. Again, a shop which is part of another man's house, and hired merely for the purpose of work or trade, is not a dwelling-house, and B. cannot be committed in it, neither as against the shopkeeper, nor against the person who occupies the other portion of the house. This offence cannot be committed in a tent or booth erected in a market or fair, though the owner may lodge therein, for his doing so makes it no more B. to break open such an erection, than it would be to uncover a tilted waggon under the same circumstances. But it may be committed by breaking open a church, which, according to Sir Edward Coke, is *domus mansionalis Dei*, the *mansion-house* of God.

As to the *manner* of committing B., it is laid down by Blackstone that there must be both a

486

breaking and an entry to complete it. There must, in general, be an actual breaking, a substantial and forcible irruption—as, at least, by breaking, or taking out the glass of, or otherwise opening a window; picking a lock, or opening it with a key; by lifting up the latch of a door, or unloosening any other fastening. But if a person leaves his doors or windows open, it is his own folly and negligence, and if a man enters therein, it is no B.; yet if he afterwards unlocks an inner or chamber door, it is so. To come down a chimney is held a burglarious entry, for that is as much closed as the nature of things will admit; so also to knock at a door, and upon its being opened, to rush in with a felonious intent; or, under pretence of taking lodgings, to fall upon the landlord, and rob him. If the servant conspires with a robber, and lets him into the house by night, this is B. in both.

The *intent* must also appear, otherwise the offence will amount only to a trespass; and it must be an intent to commit felony, which may be inferred from the conduct of the offender while in the house.

The punishment for this crime is now regulated by the act 7 Will. IV. and 1 Vict. c. 86, amended by the 16 and 17 Vict. c. 99, and the 20 and 21 Vict. c. 3. The provisions are to the effect, that any one convicted of B. shall be liable to penal servitude for life, or any term not less than ten years, or to be imprisoned for any term not more than three years; and in the case of imprisonment, hard labour and solitary confinement may be superadded. It is further enacted, that whosoever shall burglariously break and enter into any dwelling-house, and shall assault with intent to murder any person being therein; or shall stab, cut, wound, beat, or strike any such person, shall be guilty of felony, and suffer death. By another statute, the 14 and 15 Vict. c. 19, also amended by the 16 and 17 Vict. c. 99, and the 20 and 21 Vict. c. 3, it is enacted that any person found by night, armed with any dangerous or offensive weapon or instrument, or with housebreaking implements, or with face blackened or disguised, with intent to enter any buildings, and to commit felony therein; or if he be found by night in any building with intent to commit a felony therein—is guilty of a misdemeanour, punishable with imprisonment, not exceeding three years; and in case of a second conviction, is liable either to such imprisonment, or to penal servitude for not less than three, and not exceeding ten years.

Blackstone observes, that this offence was anciently called *Hameecken*, as, he adds, it is in Scotland to this day. But the Scotch law on this subject has some points of difference—*hameecken*, or *hame-sucken*, as it is spelled in the Scotch books, not being quite identical with B.: thus, the former is an offence exclusively against the *person*, and it may be committed in the daytime as well as at night; and there are other points of dissimilarity. The Scotch law relating to *housebreaking* and *stouthief* affords analogies. See *HAIMSUCKEN*, *HOUSEBREAKING*, *STOUTHIEF*, *LARCENY*, *ROBBERY*, *ASSAULT*.

**BÜRGLEN**, a village of Switzerland, in the canton of Uri, about two miles from Altorf. It is celebrated as the birthplace of William Tell. The supposed site of the patriot's house is now occupied by a chapel, upon the walls of which are represented certain well known scenes from his history.

**BURGOMASTER.** See *GULL*.

**BURGOS**, a city of Spain, capital of the new province of the same name, and of the former kingdom of Old Castile, is situated in a fertile valley at the foot of the Sierra d'Oca, and on the right bank

## BURGOYNE—BURGUNDY.

of the river Arlanzon, in lat.  $42^{\circ} 20' N.$ , and long.  $3^{\circ} 45' W.$  Pop. 25,700. B. is a very ancient place, having been founded in 844. Many of the gloomy old houses of its early history still remain. In the castle of B., Edward I. of England was married to Eleanor of Castile. The cathedral of B., founded in 1221, is one of the noblest specimens of Gothic architecture in Spain. Its various chapels are rich in fine sculpture and tombs. It was the birthplace of the Cid (q. v.). B. has manufactures of woollens, linens, and hats, but it depends chiefly on the traffic which its position on the great road from France and the northern Spanish provinces to Madrid secures it. B. has several charitable and educational institutions. It formerly had a much larger population—as many as 50,000—but on the removal of the court to Madrid in the 16th c. B. began to decline in population and importance. It was further greatly injured in November 1808 by the French, who sacked it. In 1812, the castle was four times unsuccessfully besieged by Wellington, who, however, took it in the following year, when the French blew it up, as well as the fortifications.—The province of B. has an area of 7082 square miles, and a population, in 1870, of 353,560. The surface is elevated, the soil fertile, yielding grain and fruits. The hills afford rich pasture; and the minerals gold, silver, iron, lead, and copper are found.

BURGOYNE, JOHN, a British general and dramatist, natural son of Lord Bingley, early entered the army, and in August 1759 was appointed lieutenant-colonel commandant of the 16th Light Dragoons. In 1761 he served at Belle Isle, and in 1762 commanded a force sent into Portugal for the defence of that kingdom against the Spaniards, when he surprised and captured Alcantara. In 1776 he served in North America, and in the summer of 1777 he was appointed to the command of a large force ordered to penetrate from Canada into the rebellious districts. The early part of the expedition was marked by his capture of Ticonderoga; but neglecting to preserve his communications with Canada, he encountered the greatest difficulties, and was at last obliged to surrender with his army to General Gates, at Saratoga. Soon after his return to England, having been denied an audience of the king, and refused a court-martial, he went over to the opposition party, and voluntarily resigned all his appointments. On a change of ministry, at the close of the American war, he was appointed commander-in-chief in Ireland. This office he resigned two years after, and subsequently seems to have devoted his time to light literature. He was the author of some pamphlets in defence of his conduct, and of *The Maid of the Oaks* (1780), *The Heiress* (1786), *The Lord of the Manor*, and other stock dramatic pieces. B. was one of the managers for conducting the impeachment of Warren Hastings. He died June 4, 1792.

BURGOYNE, SIR JOHN FOX, Bart., an eminent engineer-officer, born in 1782, entered the Royal Engineers in 1798. From 1800 to 1807, he served in the Mediterranean and the Levant; proceeded with Sir John Moore's force to Sweden, and subsequently to Portugal, and was at Corunna in 1809. The same year, he became attached to the Third Division of the army under Sir Arthur Wellesley in the Peninsula, and till the conclusion of the war in 1814, was present at all its sieges, distinguishing himself in those of San Sebastian and Burgos, and was twice wounded. He became Lieutenant-colonel April 27, 1812; in 1814, was commanding engineer of the expedition to New Orleans, and in 1826, of

that sent to Portugal. In 1830 he was appointed chairman of the Board of Public Works in Ireland; and in 1845, Inspector-general of Fortifications in England. In 1851 he obtained the rank of Lieutenant-general, and in 1854 was made D.C.L. of Oxford University. During the same year he was sent to Turkey, to devise measures against the advance of the Russians; and in the Crimean war he was chief of the engineering department of the British army till recalled in 1855. For his services at Sebastopol, he received from the Sultan the order of the Medjidie, and from the French emperor that of grand officer of the Legion of Honour. He was made general in 1855, and created a baronet in 1856. He died 7th October 1871.

BURGUNDY (Fr. *Bourgogne*), an ancient province of France, now forming the departments Côte d'Or, Saône-et-Loire, Ain, and part of Yonne. Dijon was the capital of Burgundy. The ancient Burgundians (*Burgundi* or *Burgundiones*), originally a German tribe, were at first settled on the banks of the Oder and the Vistula, and afterwards extended themselves to the Rhine and the Neckar, and, in 407, penetrated into Roman Gaul. Their conversion to Christianity took place in the course of eight days! They adopted a brief Arian confession of faith, and were baptized. From 407 to 534, the kingdom of B. was several times divided; and in 451, Gundicar, king of B., with 10,000 men, confronted Attila, but was defeated and slain. The tradition of this overthrow of the old Burgundians is preserved in a confused form in the *Nibelungen Lied*.

In 534, B. passed under the rule of the Franks; but the weak government of the later Carlovingian kings allowed it to become once more independent, and it was named the kingdom of Arles, from the residence of its first king, Bozo, who died in 887. He was succeeded by his son Louis; and after a time of contention and division of the French territories, Duke Rudolf, nephew of King Hugo of France, made himself ruler of Upper B., and was followed by Rudolf II. (912), who was crowned king of Italy in 921, and united Lower B., or Arles, to his own kingdom in 928. Conrad the Peaceable succeeded, and after him, Rudolf III., who, dying without male issue in 1032, bequeathed his kingdom to the Emperor Conrad II. of Germany, whose son, Henry III., made it a duchy of the German empire.

With Philip the Bold, the founder of the new ducal dynasty of B., a new and splendid era was commenced, in 1363, and was continued to the death of Charles the Bold (q. v.), in 1477, who left no male issue. B. was then incorporated with France.

BURGUNDY, LOUIS, DUKE OF, the grandson of Louis XIV. of France, and Dauphin of France after the death of his father, was born at Versailles in 1682. Even in childhood he was ungovernable, and became excessively violent and haughty, and abandoned to all gross and sensual passions. Although educated under the care of the Abbé Fénelon, he used, when 30 years of age, to divert himself with drowning flies in oil, and blowing up living frogs with gunpowder. He had the misfortune to be deformed; his deportment and manners were undignified, and his mind was imbued with bigotry. When only about 15 years of age, he was married to the Princess Adelaide of Savoy, and spent his time wholly in amusements in the company of his spouse and of the ladies of the court. Nevertheless, in 1701, he was nominally appointed generalissimo of the army, really under the command of the Duke de Vendôme, and is said to have shewn some spirit in a cavalry-fight at Nimeguen; but he quarrelled with Vendôme, chiefly because he had once been compelled to establish his head-quarters

## BURGUNDY PITCH—BURIAL.

in a nunnery. He lost the respect of the army, and was exposed to many humiliations, partly proceeding from intrigues set on foot against him out of envy by his father. He returned to the court more eccentric, gloomy, and unsociable than before. But when he became, on his father's death, the second person in the kingdom, all his defects vanished from the sight of the courtiers, and flattery bestowed on him the title of the Great Dauphin. He died suddenly in the year 1712. A few days previously, his wife and her son, the Duke of Bretagne, had died, and the same bears carried father, mother, and child to St Denis. The Duke of Orleans, subsequently regent, and his daughter, the Duchess of Berri, were accused, but without reason, of having caused them to be poisoned.

**BURGUNDY PITCH**, a resinous substance prepared from common frankincense (q. v.), the spontaneous exudation of the Norway spruce-fir (*Abies excelsa*; see FIR) by melting it in hot water, by which means it is freed from a considerable part of the volatile oil which it contains. By straining it through a coarse cloth, impurities are also removed. B. P. is of a yellowish-white colour, hard and brittle when cold, but softening by the heat of the hand, and readily adhering to the skin. It has a not unpleasant resinous odour, and a slightly bitter taste. It is used in medicine as an external application only, and generally acts as a mild irritant. A very common application of it is as a plaster in complaints of the chest, and in rheumatic complaints. It enters also as an ingredient with resin, oils, &c., into a compound plaster of similar use. The B. P. of commerce is now principally brought from Hamburg; but the greater part of what is sold under that name is really manufactured of common resin and palm-oil, or from American turpentine. It has a fuller yellow colour than the genuine B. P., and a less agreeable odour.

**BURGUNDY WINES** are chiefly the produce of vineyards cultivated on the hilly lands forming the Côte d'Or, between Dijon and Chalons. These hills average about from 800 to 1000 feet in height; the vineyards ascend up the slopes in terraces, and spread along the table-land on the summit. 'In richness of flavour and in perfume, and all the more delicate qualities of the juice of the grape, the wines grown here unquestionably rank as the finest in the world.' The most celebrated of the red wines of Burgundy are the Closvougeot (near Beaune), Nuits, Chambertin (the favourite wine of Louis XIV. as well as of Napoleon), the Romané-Conti, Richebourg, Volnay, and Pommard. Of other red wines of Burgundy not grown on the Côte d'Or, those of Pitoy, Perrière, Preaux, and Auxerne, are held in most repute. The white wines of Burgundy are also the finest in France, but being produced in less quantity, they have less celebrity. The quantity of wine annually produced in Burgundy averages 3,500,000 hectolitres (77,000,000 gallons), of which only about a fifth is consumed in the district.

**BURIAL**, a word of Teut. origin (Ang.-Sax. *biryan*, to conceal), is applied to the prevalent method among civilised nations of disposing of the dead, by hiding them in the earth. As there is almost nothing else so deeply interesting to the living as the disposal of those whom they have loved and lost, so there is perhaps nothing else so distinctive of the condition and character of a people as the method in which they treat their dead. Hence, funeral customs associate themselves with a wide variety of sentiments, from gentle and rational sorrow, up to deification of the departed, accompanied sometimes with cruelty

and ferocity towards the living. People of a low and barbarous type carelessly permit the remains of the dead to lie in the way of the living, and there are a few instances in which the object of artificial arrangements has been to preserve a decorated portion of the body—as, for instance, a gilded skull—among survivors. The general tendency of mankind, however, has always been to bury the dead out of sight of the living; and various as the methods of accomplishing this end have been, they have resolved themselves into three great classifications: 1. The simple closing up of the body in earth or stone; 2. The burning of the body, and the entombing of the cinders; and, 3. The embalming of the body. The first of these seems to be the earliest form of which we have any record, and it is the form most amply sanctioned by the existing practice of the civilised world. It is the method referred to in the earliest Scriptures; and all are familiar with the touching scene in which Abraham buries Sarah in the cave in the land of Canaan which belonged to Ephron, but was, after a solemn and courteous negotiation, secured to Abraham for a possession to bury his dead in (Gen. c. 23). The horrible fate of being left unburied, either from scorn or neglect, is powerfully told in the prophecy of Jeremiah against Jehoiakim: 'He shall be buried with the burial of an ass, drawn and cast forth beyond the gates of Jerusalem.' There is frequent allusion in the later Scriptures, and especially in the New Testament, to the embalming of the body in antiseptics and fragrant substances; and the burning of the bodies of Saul and his sons is accounted for by commentators on the supposition that they were too far decayed to be embalmed. The Israelites may have learned the practice of embalming from the Egyptians, among whom it was an art so greatly cultivated and extensively practised, that Egyptian corpses, as inoffensive as any article of wood or stone, are scattered over Europe in museums, and are even to be found as curiosities in private houses. The soil and climate of Upper Egypt seem to have afforded facilities for embalming unmatched in any other part of the world; and in other places the vestiges of the practice are comparatively rare, though it is usual even yet to embalm royal corpses, and in some places to preserve a series of mummies, as in the vault of the monastery of Kreuzberg, at Bonn, where the monks have been successively preserved in their costume for centuries. The practice of incremation, or of the burning of the body, and the entombing of the ashes, deserves more inquiry than it has yet obtained. In Greece, in Etruria—both before and after it came under the Romans—and in the north of Europe, the simple burial of the body, and its prior reduction to ashes, were both practised, and sometimes contemporaneously. The tombs of Etruria are rich in art, much of it going to the adornment of the urns of baked clay in which the ashes of the dead are kept. Vessels of terra-cotta, or cooked earth, containing human remains, have been found, often so large that they appear to have served as coffins for containing the whole body. Vessels of this kind were found in the valley of the Scamander by some British officers while spending their leisure time after the siege of Sebastopol, upon the ground supposed to have been occupied by the besiegers of Troy. Smaller cinerary urns have been found over so extensive a portion of the world, that it is difficult to define the limits to which they belong. The Danish antiquaries say, that in their stone period, when the use of metals was unknown, the dead were all buried unburned in stone chambers, and that the burning of the bodies and the preservation of the ashes in urns came in with the age of bronze. These antiquaries associate

with the older system those amorphous mounds of earth or stone called barrows or tumuli, which are to be found all over the north of Europe. Mr Bremner, in travelling among the steppes of the Ukraine, saw multitudes of these small mounds, which reminded him at once of what he had seen on the plain of Troy, at Upsala in Sweden, in Scotland, and in Ireland. The Irish tumulus of New Grange is perhaps the most remarkable of all, forming a connecting link between the simple barrow on the moor and the pyramids of Egypt, which are the perfection of the same kind of structure applied to the same purpose—the burial of the distinguished dead. These structures open up a large field of curious inquiry. The simple theory, that they were raised over the dead, has lately been disturbed by the discovery that many of them are not artificial, but relics of sheets of alluvial matter, the mass of which has been carried away; and even in these, human remains have been found, the natural mounds having been used as monuments. Even when human remains are connected with barrows, cromlechs, or the large shapeless pillars commonly called Druidical, it is often questionable whether the monument was made to receive such remains. It is certainly ascertained to have been a practice in ancient times to bury bodies in tombs which were themselves ancient when they received their inmates.

Some of the grandest buildings in the world have been tombs; such are the pyramids, the castle of St Angelo, the tomb of Cecilia Metella, and many temples scattered over Hindustan and other eastern countries. Thus, the respect paid by the living to the dead has preserved for the world many magnificent fruits of architectural genius and labour. A notion that the dead may require the things they have been fond of in life, has also preserved to the existing world many relics of the customs of past ages. The tombs of Egypt have supplied an immense quantity of them, which have taught the present age more of the manners of ancient nations than all the learned books that have been written. It is an awful remembrance, at the same time, that inanimate things were not all that the dead were expected to take with them. Herodotus tells us of favourite horses and slaves sacrificed at the holocaust of the dead chief. The same thing has been done in our own day in Ashantee. In many countries, the wives had the doom, or privilege, as it was thought, of departing with their husbands; and down to the present generation the practice has lived in full vigour in the Hindu suti. Among the Jews, the Greeks, the Romans, and many ancient nations, the dead were buried beyond the towns. The 'stop, traveller!' was a usual memorandum on Roman tombs. In Christian countries, if the remains of the saint to whom a church was dedicated could be obtained—or anything passing for the remains—they were buried near the altar in the choir. It became a prevalent desire to be buried near these saints, and the bodies of men eminent for their piety, or high in rank, came thus to be buried in churches. The extension of the practice was the origin of churchyards. These, in crowded towns, became offensive and unhealthy. It can scarcely be said that this practice, so detrimental to the public health, as the burial within churches, was checked in this country until the whole system of intramural interment, as it was called, was attacked, about the year 1844, by Mr Chadwick and other sanitary reformers. Measures were afterwards carried for shutting graveyards in crowded cities, and placing interments in open cemeteries under sanitary control. The first great measure was passed in 1850, when the Board of Health was made a Burial Board for the Metropolis, and power

was given to the Privy Council to close the city graveyards. The act was modified two years afterwards, by transferring the duties of managing cemeteries to local boards appointed by the vestries. It was in London that the danger was most urgent and the remedy immediate. It was extended to the English provinces in 1853, and to Scotland in 1855.

In England, burial in some part of the parish churchyard is a common law right, which may be enforced by mandamus—that is, every person may be buried in the parish where he dies. But the body of a parishioner cannot be interred in an iron coffin or vault, or even in any particular part of a churchyard, as, for instance, the family vault, without an additional fee. To acquire a right to be buried in a particular vault or place, a faculty must be obtained from the ordinary, as in the case of a pew in the church. But this right is at an end when the family cease to be parishioners. All such rights, by faculty or otherwise, are expressly saved by the **BURIAL ACTS** (q. v.).

By the canons of the Church of England, clergymen cannot refuse or delay to bury any corpse that is brought to the church or churchyard; on the other hand, a conspiracy to prevent a B. is an indictable offence, and so is the wilfully obstructing a clergyman in reading the B.-service in a parish church. It is a popular error, that a creditor can arrest or detain the body of a deceased debtor; and the doing such an act is indictable as a misdemeanour. It is also an error, that permitting a funeral procession to pass over private grounds creates a public right of way. By the 3 Geo. IV. c. 126, s. 32, the inhabitants of any parish, township, or place, when going to or returning from attending funerals of persons in England who have died and are to be buried there, are exempted from any toll within these limits. And by the 4 Geo. IV. c. 49, s. 36, the same regulation is extended to Scotland; the only difference being, that in the latter case the limitation of the district is described by the word *parish* alone. The 6 and 7 Will. IV. c. 86 regulated the registry of deaths. The 4 Geo. IV. c. 52 abolished the barbarous mode of burying persons found *solo de se*, and directs that their B. shall take place, without any marks of ignominy, privately in the parish churchyard, between the hours of nine and twelve at night, under the direction of the coroner. The B. of dead bodies cast on shore is enforced by 49 Geo. III. c. 75. See Wharton's *Law Lexicon*.

In Scotland, the right of B. in a churchyard is an incident of property in the parish; but it is a mere right of B., and there is not necessarily any corresponding ownership in the *soil* or ground of the churchyard. In Edinburgh, however, the right to special B.-places in churchyards is recognised.—For B. in cemeteries in England and Scotland, see CEMETERY.

**BURIAL ACTS.** These are the 15 and 16 Vict. c. 85, for London; the 16 and 17 Vict. c. 134, the 17 and 18 Vict. c. 87, and the 18 and 19 Vict. c. 79 and 128, for places in England beyond the limits of the metropolis—all as amended by the 20 and 21 Vict. c. 81, and the 22 Vict. c. 1, 23 and 24 Vict. c. 64, 25 and 26 Vict. c. 100, 34 and 35 Vict. c. 33. These acts were rendered necessary when it was resolved on sanitary grounds to put a stop to burials in populous places, which could only be effectually done by giving power to parishes to acquire other burial-grounds in rural places. These statutes have long been proverbial for their confusion (e.g. 20 and 21 Vict., which proposes in the preamble to amend 18 and 19 Vict. c. 78, really amends c. 79), and relate to the appointment of

burial-boards for parishes—the authorising new burial-places, proper sanitary regulations, the control by the government and by order in council, and many other details too numerous to specify here. Our readers must be content with our referring them to the acts themselves, or to their lawyers.

The corresponding acts for Scotland are the 18 and 19 Vict. c. 68, amended by the 20 and 21 Vict. c. 42, and 29 and 30 Vict. c. 50.

**BURIAL SOCIETIES** are friendly societies constituted in the usual manner, and with the express object of supplying a fund for paying the funeral expenses of the members on their death. See FRIENDLY SOCIETIES. It became customary to enter the names not only of adults, but of children, in such societies. The proceedings of the criminal courts have shewn that, in some instances, children on whose lives such an insurance was effected have been killed or allowed to die of neglect, and the alarm created by such instances, was enhanced by the discovery that children were frequently insured in more than one society. To obviate this calamitous use of a beneficial arrangement, it was provided that no insurance of a child under six years of age in a burial society should be legal. It was attested to the Select Committee of the Commons on Friendly Societies in 1849, that the practice of such insurances continued in uncertified societies; and at the same time it was stated on behalf of the friendly societies: ‘In our long experience with these societies in Liverpool, in which are nearly 100,000 members, approximating to nearly one-third of the population of this great town, we have not had one instance of death by violence for the sake of the burial money.’ In the Friendly Societies Act of 1850, and in subsequent enactments, stringent arrangements for certifying the cause of death have been adopted as a sufficient protection from this crime.

**BURIDAN, JEAN**, a scholastic metaphysician of the nominalist party, was born at Bethune, in Artois, in the 14th c., and studied at Paris under Occam, where he also became a teacher of philosophy. The events of his life, as well as the manner of his death, are very obscure. One account states, that he was thrown into the Seine, by command of Marguerite de Bourgogne, daughter-in-law of Philippe le Bel, whose infidelities he had rebuked. Another, later, but less mythical-looking account, states that B. was driven from France as a disciple of Occam, and fled to Austria, where he founded a school. His elucidations of Aristotle are among his most useful writings. In his *Logic*, his great endeavour was to facilitate the discovery of middle terms for all kinds of syllogisms. The celebrated sophism known to the schoolmen under the name of BURIDAN’s Ass, has been discussed at superfluous length, and with needless ingenuity, by Bayle. It is not at all likely that it was ever adduced by B., but more probably by his adversaries, who wished to ridicule his metaphysical doctrine of Determinism—viz., that in every mental and bodily action the will must be determined by something out of itself. The sophism referred to is, that if a hungry ass be placed exactly between two bundles of hay of equal size and attractiveness, it must starve, as there is nothing to determine the will of the animal towards either bundle. His chief works are—*Summa Dialectica* (Paris, 1487), *Compendium Logica* (Venice, 1489; Oxford, 1637), *In Aristoteles Metaphysica* (Paris, 1518).

**BU'RIN**, or GRAVER, the principal instrument used in copper-engraving, is made of tempered steel, and is of prismatic form, the graving end being ground off obliquely to a sharp point. The style of a

master is frequently described by the expressions *soft* B., *graphic* B., *brilliant* B., or whatever other character may belong to it.

**BURITI PALM** (*Mauritia vinifera*; see MAURITIA), a beautiful palm, which grows in great abundance in the swamps of some parts of the north of Brazil. It is one of the loftiest of palms. Its leaves are fan-shaped, and form a large globular head at the top of the stem. It produces a great number of nuts about the size of a small hen’s egg, covered with rhomboidal scales arranged in a spiral manner. Between these scales and the albuminous substance of the nut, there is an oily reddish pulp, which is boiled with sugar, and made into a sweet-meat. An emulsion is also prepared from it, which, when sweetened with sugar, is a very palatable beverage, but if much used, is said to tinge the skin of a yellow colour. The juice of the stem also makes a very agreeable drink; but to obtain it, the tree must be cut down, when several holes about 6 inches square, 3 inches deep, and 6 feet apart, are cut in the trunk with a small axe; and these in a short time are filled with a reddish-coloured liquid, having much the flavour of sweet wine.

**BURKE, EDMUND**, a philosopher and politician, distinguished over all the men of his times for eloquence and political foresight, was born in 1730, in Dublin, where his father had an extensive practice as an attorney. As a school-boy, he displayed those traits of character and the germs of those powers which ultimately gave him greatness. In 1744, B. entered the university of Dublin, of which he became a scholar. His undergraduate course was not unmarked by the ordinary distinctions of successful application; but it would appear that he mainly devoted himself to his favourite studies of poetry, oratory, history, and metaphysics. In February 1748, he graduated B.A., and in 1751 took his degree as Master of Arts. In the interval (1750), being destined for the English bar, he proceeded to London, to keep his terms at the Middle Temple. To legal studies, however, he never took kindly, and ultimately he abandoned the idea of becoming a barrister. During the years 1750–1756 he would appear to have occupied himself in travelling through England, enjoying the society of literary men, in study, and finally in writing for various periodicals.

B., when yet at the university, had achieved a local reputation for literary talent and eloquence. Among the compositions of his undergraduate life, the most noticeable perhaps is his translation of the conclusion of the second Georgic of Virgil, which shews poetic talent of no mean order. His first important publication, however, was the celebrated *Vindication of Natural Society*, written in imitation and ridicule of the style and reasoning of Lord Bolingbroke, in which, with well-concealed irony, he confutes his lordship’s views of society by a *reductio ad absurdum*. This work, published anonymously in 1756, at the age of 26, attracted considerable attention. Soon after, in the same year, appeared his well-known essay, *A Philosophical Inquiry into the Origin of our Ideas of the Sublime and Beautiful*—a work containing a comprehensive induction of the various sources of the ideas referred to, but which must be pronounced a failure, so far as it pretends to analyse into their primary elements the emotions of the sublime and beautiful.

The essay on the *Sublime and Beautiful* attained a rapid popularity, and its author soon found himself courted by all the eminent men of his time. Garrick was already one of his friends; among them he soon could count Reynolds, Soame Jenyns, Lord Lyttelton, Warburton, Hume, and Dr

Johnson. Notwithstanding this popularity, however, his progress continued slow; for three years yet, he had to occupy himself with periodical writing, devoting his leisure principally to political subjects. What is considered a joint work of B. and his cousin, William Bourke, appeared in 1757—viz., *An Account of the European Settlements in America*—and shews how carefully at this date he had studied the condition of the colonies. In 1761, Mr W. G. Hamilton ('Single-speech Hamilton'), then Secretary for Ireland, having appointed him his private secretary, he returned to Dublin, where, during two years' service, he demonstrated his aptitude for political business, receiving in 1763, in reward of his services, a pension on the Irish establishment of £300, which, however, he did not long enjoy.

Returning to London, B. in 1764, along with Reynolds, founded the Literary Club, the history of which is associated with almost every considerable name in the literature of the period. But literary society did not call off his attention from the chances of a political career. He became private secretary to the Marquis of Rockingham, on his becoming premier, and at the same time entered parliament as member for Wendover. Here his eloquence at once made him the reputation of being 'the first man in the Commons.' The Rockingham administration, however, lived only a few months, and with it terminated this his second political employment. To trace his subsequent career in parliament is more than the limits of this article will allow; it must suffice to state briefly that his parliamentary life extended from 1766 to 1794 without intermission; that he was successively member for Wendover, Bristol, and Malton; twice held the post of Paymaster of the Forces, once under Rockingham, and again under Lord North, with the standing of a privy councillor; that after a career in parliament remarkable for the laboriousness, earnestness, and brilliancy with which every duty was discharged, and extending over nearly 30 years, he retired at last, receiving the thanks of the Commons for his numerous public services, and rewarded by government, on the express request of his sovereign, with pensions amounting in all to £3700. It would be wrong, however, to omit that as Paymaster of the Forces he, with a scrupulous regard to public economy, sacrificed all the perquisites of his office, exhibiting a severe integrity unexampled among public men; and that in his relation with the constituency of Bristol, which was alienated from him by his advocacy of the claims of the Roman Catholics and of the opening up of the trade of Ireland, he was the first to maintain the doctrine of the independence of parliamentary representatives—that they are not machines to vote for measures approved by their constituencies simply for that reason, but men and thinkers chosen by them to calmly consider and legislate for the good of the commonwealth. It must also be mentioned, that during his career he rendered more important service to the cause of humanity than any man of his time: he prepared the way for the abolition of the slave-trade, a measure which was destined to ripen in the hands of Wilberforce; he advocated the cause of humanity in India against the voracious greed of stockholders, who regarded its millions simply as materials for plunder, and largely contributed to improve the government of that country. Towards America he advocated a policy of justice and conciliation, which, had it been adopted, would have averted the horrors of the War of Independence, and retained the colonies in amity with the mother-country. And to the advocacy of every cause which he espoused, he brought a capacity

for patient research that was unlimited, and an eloquence that has never been transcended.

Before proceeding to remark on the character and powers of B., a very brief notice must be taken of his leading literary efforts connected with his political labours. Little more than a catalogue can here be given of them. Omitting a variety of valuable letters—several on the condition of Ireland—notice must be taken of his *Observations on a Pamphlet on the Present State of the Nation*, being his first political pamphlet, published in 1769, in answer to one variously ascribed to Fox or Grenville. In 1770, he published a pamphlet, *On the Cause of the Present Discontents*. On the 18th February 1788, he commenced his celebrated speech opening the trial of Warren Hastings (q. v.), the most remarkable trial, perhaps, in the history of the world. This speech lasted over four days, and has been characterised as 'a tempest of invective and eloquence.' No idea can be conveyed of the effect which it produced. The trial lasted seven years, and closed with another great and splendid oration from B., lasting over nine days. Hastings, it is well known, was acquitted. While this trial was advancing, B. found time to take part in all the current business. In 1790 appeared his *Reflections on the Revolution of France*, which sold in tens of thousands, and is said to have produced an effect never produced before nor since by any political essay. Hereafter, the world showered honours on B., of which space forbids even the enumeration. Having, in 1791, withdrawn from the Whigs on the French question, he offered for the consideration of government, *Thoughts on French Affairs*, which, however, was not published till after his death. *Heads for Consideration on the Present State of Affairs*, and *Reply to a Noble Lord*, next followed, the latter being relative to himself personally. His last work, *Thoughts on a Regicide Peace*, shewed that he retained to the end of his life his whole powers unimpaired.

Few men have been the subjects of higher panegyric than B., and, on the whole, few have better deserved praise. He was noble-minded, pure in his life, and a purist in politics. Intellectually, he was most richly endowed; with much imagination, rare powers of observation, and indefatigable industry, there was no subject which he could not master, and none which, having mastered, he could not expound with unparalleled richness of language. But with these virtues and powers were conjoined defects, which, without bating their greatness, largely neutralised their influence. He was, it may be said, too literary to be a philosopher, and too philosophic to be a politician. His career would seem to illustrate this position. His oratory astounded by its brilliancy rather than persuaded by its tone and argument; and in the long-run, the eloquence which failed to command the reason, ceased to captivate the ear. The man who at first evoked the enthusiasm of the House by the brilliancy and power of his eloquence, did actually at last empty it by persistence in the monotonous splendours of his speeches. Passionate, and in a great degree untractable, he was unsuited for party politics, and drifted from all his connections, breaking up slowly all party ties, and even the ties of friendship, till he reached at last a state of almost political isolation. At the same time, it must not be forgotten how great an influence he, half philosopher half politician, exercised on the counsels of the state; many of his views on politics and public economy were anticipations of science, as many of his previsions of the course of events were prophecies.

B. died on the 7th July 1797, in his 68th year.

A collected edition of his works in quarto was published in 1827. His life has been written by Dr Croly. More recently (1842), his works have been collected by Dr Henry Rogers, who has prefaced the collection by an able biographical and critical sketch.

**BURKING.** See ANATOMY (in Law).

**BURLEIGH, WILLIAM CECIL, LORD.** See CECIL.

**BURLE'SQUE** (from Ital. *burla*, jest, mockery), denoting a style of speaking, acting, writing, drawing, is a low and rude grade of the comic. The legitimate comic brings together contrasts with a final view to harmonising and reconciling them; the B. distorts and caricatures, and brings the incongruities into stronger relief. The farce is the B. of comedy. Deformities and monstrosities that excite disgust do not belong to the burlesque. The lofty and the abject, the great and the little are conjoined, with the sole view of exciting a laugh. Nor does the true B. turn real greatness and nobility into laughter, but only sham greatness—false pathos, and all hollow pretension and affectation. The B. style appears to have been unknown to the ancients; it originated among the Italians, more particularly with the poet Berni (q. v.). The genuinely national *buffone* of the Italian personages the burlesque. Carlo Gozzi, in his tragic-comedies, is perhaps the greatest in the B. vein. Scarron among the French, and *Hudibras* in English, are examples. Parody or travesty (q. v.) is a species of burlesque.

**BURLETTA,** a comic operetta or musical farce.

**BURLINGTON,** the name of two cities of some note in the United States.—1. A port of entry in New Jersey, on the Delaware, about twenty miles above Philadelphia, with which, as well as with New York, it is connected by the Camden and Amboy Railway. Here is an Episcopalian college, founded in 1846, which, in 1863, numbered 72 students, with a library of 2000 vols. B. is in lat. 40° 5' N., and long. 75° 10' W., and has (1870) 5817 inhabitants, with about 13,000 tons of shipping.—2. The most populous city in Vermont, containing more than twice as many inhabitants as Montpelier, the capital of the state. It is in lat. 44° 27' N., and long. 73° 10' W.; and is beautifully situated on the east shore of Lake Champlain, the ground gradually rising as it recedes from the lake. It communicates with the St Lawrence by means of the Richelieu River—the outlet of the lake—and its artificial substitute the Champlain Canal; while through the Champlain Canal it has access to the Hudson. It is connected also by railway with Montreal, Boston, and New York. The Vermont University crowns the slope on which the city stands, and commands an extensive view of the opposite coast of New York. Pop. (1870) 14,387.

**BURLINGTON.** See BRIDLINGTON.

**BURMAH, EMPIRE OF,** called also the EMPIRE OF AVA, an important kingdom of the Indo-Chinese peninsula, formerly of great extent; but by two contests with the British power in India, it lost several provinces, and is now, in its widest sense and including tributary states, comprehended between 19° 29' and 28° N. lat., and 93° and 100° E. long., having an area of about 188,000 square miles, and a scanty population estimated at from 3,000,000 to 4,000,000. It is bounded on the N. by mountains, separating it from Assam and Tibet; on the E., by China; on the S., by the British province of Pegu; and on the W., by Munnipore and mountain-ranges dividing it from Tipperah, Chittagong, and Aracan. The Burman empire, as it now exists, has three

422

well-marked divisions: 1. Northern B., inhabited chiefly by Singphoo, Shans, and other tribes; 2. B. proper; 3. The Eastern Shan tributary states. The area of B. proper, from lat. 24° N. to the frontier of Pegu, is 44,450 square miles, with a population of about 1,200,000.

**Physical features.**—From the eastern extremity of the great transverse mountain-barrier of Northern India, longitudinal ranges strike away southwards, and between two of these the Burman territories are situated. The country slopes from the highland regions of the north towards the coast, and has been fitly described as ‘a varied surface of rolling upland, interspersed with alluvial basins and sudden ridges of hill.’

The principal river, the Irrawaddy (q. v.), having its source amid the snowy mountains from which descends the Brahmaputra, is the great commercial highway of the country, through the heart of which it takes its course. Passing Amarapura, Ava, and other towns, it enters Pegu, and, 90 miles below Prome, divides into an eastern and western branch, the former flowing past Rangoon, the latter forming the Bassein river. The Kyen-dwein is its principal tributary. To the east of the Irrawaddy, the Salween, after an almost parallel course, enters the British territories in nearly the same latitude.

**Climate.**—On the coast, only two seasons are known—the dry and the rainy, which are regulated by the north-east and the south-west monsoons; but in B. proper, less rain falls, and there are three seasons—the cold, the hot, and the rainy. Some showers fall in May or June, but the great rains last from the middle of August to the end of October. The cool season is from the middle of October till the beginning of April, and from this month till the great rains is the hot part of the year, the thermometer ranging from 85° to 100°. The climate is, on the whole, healthy, but the jungles are very pestiferous.

**Minerals.**—B. has vast fields of mineral wealth, but little enterprise and capital are brought to bear upon them. There are gold mines at Bamo, near the Chinese frontier. Auriferous sand is found in many of the streams. Silver is obtained at Bao-dwein, likewise on the confines of China, and also in the Shan country, from whence comes the chief supply of lead. Iron is quarried at Poukpa, a lofty mountain a few miles east of Pagan. The celebrated ruby mines of B. are situated 60 or 70 miles north-east from the capital, and are jealously guarded. Sapphires of great size are found in the same stratum, but are more rare. The annual value of the gems is estimated at from £12,000 to £15,000 sterling, and they are the property of the king. Wells of the mineral oil, petroleum, are worked at Ye-nan-gyoung, on the Irrawaddy, above Prome. Marble, noble serpentine, and amber are likewise found in large quantities.

**Vegetable productions.**—A few only of the most striking of these can be noticed. Of the graceful palm-tribe (*Palmaceæ*), the cocoa-nut, the betel, the palmyra, and the nipa, or water-palm, are the most prized. The useful bamboo is widely diffused. The teak, of which B. possesses inexhaustible forests, and the hopes, are amongst the most valuable of the timber-trees. Forests of pine grow to the eastward of Amarapura. The wood-oil tree is found on the higher Salween, one trunk of which will produce from 30 to 40 gallons of oil every season. The staple fruit of the country is the plantain or banana. The jack is prized by the natives. The mango reaches the height of 100 feet, and produces a delicious fruit. Rice, wheat, tobacco, indigo, and cotton are cultivated.

**Animals.**—The *Felidae*, or cat family, abound,

tigers, leopards, and tiger-cats being met with in every part of the country. Of the *Pachydermata*, the elephant and rhinoceros are the most noteworthy. The elephant, buffalo, and Indian ox have been domesticated.

*Ethnology.*—The Burmans belong to that branch of the Mongoloids characterised by a monosyllabic language; they are short-headed, broad-skulled, and flat-faced. The hair is black, and the skin of a deep brown colour. Their dress is simple, but peculiar. The *in-gie*, a white linen jacket, is common to both sexes. Wrapped round the lower part of the body, the men wear the *put-so*, which is several yards in length; the women, the *te-mine*, a scant garment of cotton or silk. Silks, muslins, and valuable gold ornaments are worn on especial occasions. Betel-nut chewing and cigar-smoking are greatly practised by both men and women. The Burmans are, generally speaking, fine, well-made men, and excel in wrestling, boxing, rowing, football, and other athletic exercises; they are clever as carpenters and smiths. Burman houses are made of a framework of bamboo, thatched with the leaf of the water-palm, and are invariably raised on posts several feet from the ground. The women are more industrious than the men; they buy, sell, weave, and attend to the domestic concerns. Both sexes delight in merry-making, feasting, buffoonery, and sight-seeing. A *pooay*, or theatrical representation, is a very favourite amusement, and a buffalo-fight attracts crowds of spectators. The Burman has little patriotism, but is attached to his home. Without individual cruelty, he is indifferent to the shedding of blood by his rulers. Though temperate and hardy, he dislikes discipline and continued employment; and when in power, is too often arrogant, arbitrary, and corrupt.

Besides the true Burman, a great variety of races inhabit the Burman territories. The *Telaings*, or *Moans*, descendants of the ancient Peguans, are pretty well amalgamated with the Burmans. The *Shans*, or *Tai*, perhaps the most numerous and widely diffused of the Indo-Chinese peoples, are scattered over the peninsula, from Munnipore to Bangkok. Of the eastern Shan states, some are tributary to B., others to Siam, while those west of the Irrawaddy are wholly under Burman rule. The *Singphos* cluster round the mountains of the north, and along the western mountain-boundary of Burmah, wild *Kyungs*, and many tribes under different names, live in varying degrees of civilisation. The *Karens* are met with chiefly in Southern Burmah.

*Religion.*—Buddhism (q.v.) is the prevailing religion of B., where it has been preserved in great purity. Its monuments—temples, shrines, and monasteries—are innumerable; its festivals are carefully observed, and its monastic system is fully established in every part of the kingdom. While directing the reader to the special article on BUDDHISM for an account of its doctrines, history, &c., we may here glance at its development, institutions, and edifices among the Burmans.

The members of the monastic fraternity are known in B. as *pon-gyees*, meaning 'great glory'; but the Pali word is *rakan*, or holy man. The *pon-gyees* are not priests, in the usual acceptation of the term, but rather monks. Their religious ministrations are confined to sermons, and they do not interfere with the worship of the people. They are a very numerous class, living in monasteries, or *kyungs*, and may at once be known by their yellow robes (the colour of mourning), shaved heads, and bare feet. They subsist wholly by the charity of the people, which, however, they well repay by instructing the boys of the country. The

*kyungs* are thus converted into national schools. The vows of a *pon-gye* include celibacy, poverty, and the renunciation of the world; but from these he may at any time be released, and return to a secular life. Hence, nearly every youth assumes the yellow robe for a time, as a meritorious act, or for the purpose of study, and the ceremony of making a *pon-gye* is one of great importance. The ostensible object of the brotherhood is the more perfect observance of the laws of Buddha. The order is composed of five classes—viz., young men who wear the yellow robe and live in the *kyungs*, but are not professed members; those on whom the title and character of *pon-gyees* have been solemnly conferred with the usual ceremonies; the heads or governors of the several communities; provincials, whose jurisdiction extends over their respective provinces; and, lastly, a superior general, or great master, who directs the affairs of the order throughout the empire.

No provision is made for religion by the government, but it meets with liberal support from the people. A *pon-gye* is held in profound veneration; his person is sacred, and he is addressed by the lordly title of *pya* or *pyra*; nor does this reverence terminate with his death. On the decease of a distinguished member, his body is embalmed, while the limbs are swathed in linen, varnished, and even gilded. The mummy is then placed on a highly decorated casket, and preserved, sometimes for months, until the grand day of funeral. The Burman rites of cremation are very remarkable, but we cannot here enlarge upon them. On the whole, a favourable opinion may be passed on the monastic fraternity of B.; although abuses have crept in, discipline is more lax than formerly, and many doubtless assume the yellow robe from unworthy motives.

In B., the last Buddha is worshipped under the name of Gautama. His images crowd the temples, and many are of a gigantic size. The days of worship are at the new and full moon, and seven days after each; but the whole time, from the full moon of July to the full moon of October, is devoted by the Burmans to a stricter observance of the ceremonies of their religion. During the latter month, several religious festivals take place, which are so many social gatherings and occasions for grand displays of dress, dancing, music, and feasting. At such times, barges full of gaily-dressed people, the women dancing to the monotonous dissonance of a Burman band, may be seen gliding along the rivers to some shrine of peculiar sanctity. The worship on these occasions has been described by an eye-witness, in 1857, as follows: 'Arrived at the shrines and temples, the people suddenly turn from pleasure to devotion. Men bearing ornamental paper-umbrellas, fruits, flowers, and other offerings, crowd the image-houses, present their gifts to the favourite idol, make their *shek-ho*, and say their prayers with all dispatch. Others are gluing more gold-leaf on the face of the image, or saluting him with crackers, the explosion of which in nowise interfered with the serenity of the worshippers. The women for the most part remain outside, kneeling on the sward, just at the entrance of the temple, where a view can be obtained of the image within.' On another occasion, we read: 'The principal temple being under repair, was much crowded by bamboo scaffolding, and new pillars were being put up, each bearing an inscription with the name of the donor. . . . The umbrellas brought as offerings were so numerous, that one could with difficulty thread a passage through them. Some were pure white, others white and gold, while many boasted all the colours of the

rainbow. They were made of paper, beautifully cut into various patterns. There were numerous altars and images, and numberless little Gautamas; but a deep niche or cave, at the far end of which was a fat idol, with a yellow cloth wrapped round him, seemed a place of peculiar sanctity. This recess would have been quite dark, had it not been for the numberless tapers of yellow wax that were burning before the image. The closeness of the place, the smoke from the candles, and the fumes from the quantity of crackers constantly being let off, rendered respiration almost impossible. An old pon-gyee, however, the only one I ever saw in a temple, seemed quite in his element; his shaven bristly head and coarse features looking ugly enough to serve for some favourite idol, and he seemed a fitting embodiment of so senseless and degrading a worship. Offerings of flowers, paper-ornaments, flags, and candles were scattered about in profusion. The beating a bell with a deer's horn, the explosion of crackers, and the rapid muttering of prayers, made up a din of sounds, the suitable accompaniment of so misdirected a devotion.'

The rosary is in general use, and the Pali words *Aniciya! doka! anatta!* expressing the transitory nature of all sublunary things, are very often repeated. The Burman is singularly free from fanaticism in the exercise of his religion, and his most sacred temples may be freely entered by the stranger without offence; indeed, the impartial observer will hardly fail to admit that Buddhism, in the absence of a purer creed, possesses considerable influence for good in the country under consideration. 'It teaches man to combat, control, and master the passions of his heart, to make reason predominate over sense, mind over matter, and to practise the virtues required for the attainment of these objects.'

The sacred edifices are of three kinds : 1. The *tope*, *dagoba*, or *shrine* (*Zadee* or *Taa-dee*), a monument erected to the last Buddha, is a solid, bell-shaped mass of plastered brickwork, tapering to the summit, which is crowned by the *tee*, or umbrella, of open ironwork. 2. The *temple*, in which are

many images of Gautama. The most remarkable specimen of Burman temple-architecture is the *Ananda* of Pagan. The ground-plan takes the form of a perfect Greek cross; and a tapering spire, with a gilded tee at the height of 168 feet from the foundation, crowns the whole. 3. The *kyoung* or monastery (*vihara*) is generally constructed with a roof of several diminishing stages, and is often elaborately adorned. Burman architecture 'differs essentially from that of India in the frequent use of the pointed arch, not only for doors and windows, but also in the vaulted coverings of passages.'

*Cities.—Amarapura*, the present capital of B., and seat of royalty, is built on a peninsula of the Irrawaddy, a few miles above Ava. It is laid out four-square, and bounded by a defensive wall of brick; the palace occupies the centre. Ava, for a long time the capital of the empire, has been for years almost a desert. Pagan represents the past of B., and is remarkable for its magnificent ruins of temple-architecture, extending over a space of 8 square miles; the prevailing type is the cruciform vaulted temple.

*Government.*—The government of B. is a pure despotism, life and property being at the mercy of the reigning sovereign. Many instances of the cruel abuse of arbitrary power, by even recent kings, might be given. The present monarch is, however, mild, approachable, and apparently desires the welfare and happiness of his subjects. The *Lot-dau*, or High Court of Council, is composed of the four *woon-gyees*, or principal ministers of state. The *atwen-woones*, or household ministers, are likewise four in number. They receive the royal commands, and are in close attendance upon the king. The *woon-douks* are a third order of ministers, and act as assistants to the *woon-gyees*. The decisions of the *lot-dau*, when sanctioned by the king, become law. The *Dam-a-shat*, a Burman translation of the *Institutes of Menu*, is also in force. White umbrellas and white elephants are regarded as insignia of royalty. The ‘Lord White Elephant,’ indeed, is looked on as an estate of the realm, a mark of universal sovereignty, and a sacred being. It has a palace, a minister, and numerous attendants.—The

62

### Specimen of Burmese Writing.

*military power* of the country is not great, and of musketeers it is probable that the king could not command more than 18,000.

The civilization of B., if not retrograde—which the ruins of Pagan would almost seem to indicate—is stationary and stereotyped, like that of China. All the wealth of the country is lavished on the sacred edifices, £10,000 sterling being sometimes

expended on the gilding and beautifying of a single shrine or temple, whilst roads, bridges, and works of public utility are neglected.

The vernacular tongue of B. belongs to the mono-syllabic class of languages, and is without inflection; the character is formed of circles and segments of circles. It is engraved on prepared strips of palm-leaf, and a number of these form a book. Printing

## BURMAH—BURNET.

is unknown except where introduced by the missionaries. *Pali* is the language of the religious literature.

**Commerce.**—Exports and imports, by way of Pegu, pay a duty of 10 per cent at the British frontier custom-house, established at Thayet-myo. The principal exports (from B. Proper) consist of Sesamum oil, teak-timber, petroleum, sweet-oil, tobacco, Jackered boxes, gold-leaf, silver, lead, copper, stick-lac, indigo, cocoa-nuts, &c.; ponies, wheat, pulse, and cotton, pass Thayet-myo duty free. The imports (into the Burman empire) are *ngapee* (a paste of rank pickled fish, which is eaten with rice, the staple food of the Burman), paddy, rice, dried fish, salt—all these being imported by thousands of tons annually. Cotton piece-goods, silk do., and woollens, pass free. B. carries on likewise an overland traffic with China, the cotton of Ava being exchanged for the silk of the Celestial Empire.

The standard currency of B., called *yowet-ni* (red-leaf), is silver, but there is no coinage. This metal is used, however, of varying degrees of purity, which complicates mercantile transactions, and assayers are employed to find the value of the metal.

**History.**—Of the early and mythical history of B., nothing need here be said. The kingdoms of Ava and Pegu long contended for mastery. The latter was in its zenith about 1580 A.D. Passing on to 1752, it appears that the Peguans, after a period of subjection, obtained the advantage. At this time, however, Alompra, or *Aloung Pra*, the most celebrated warrior-king in Burman history, rose to power, founded the present dynasty, subdued the Peguans, and incorporated their country, as well as many neighbouring states, with his own. The Burman empire attained its greatest expansion in 1822. The wars of 1822—1824 and 1852 with the British, have reduced the kingdom to its present contracted limits. See *Narrative of the Mission from the Governor-general of India to the Court of Ava*, 1855, by Captain Yule (Lond. 1858); Gouger's *Personal Narrative of Two Years' Imprisonment in Burmah* (Lond. 1862); Mason's *Natural Productions of B.*; Winter's *Six Months in B.* (Lond. 1858); Malcom's *Travels in the Burman Empire*; Missions of Symes, Cox, Canning, Crawfurd, and Burney to the Court of Ava, and personal observation.

**BURMAH, BRITISH**, includes the three maritime provinces of India beyond the Ganges, which were united under one local administration in 1862. It extends along the eastern side of the Bay of Bengal, from 20° 50' to 10° 50' N. lat. It has a coast-line of fully 900 English miles, and a total area of 93,664 sq. m., distributed as follows: Aracan, 18,530; Pegu, 28,404; Tenasserim, 46,730.

The whole of this territory was taken from the king of Burmah in the two wars provoked by him.

Akyab, Rangoon, and Maulmain are the principal seaports of Aracan, Pegu, and Tenasserim respectively. Pegu is the most prosperous of these three divisions, and has made the most progress within recent times. Pop. of B. (1872) 2,562,323. The Burmans (including Aracanese and Talcins, or Peguens) number about two millions. Of the other races—Karens, Shans, Chinese, and Hindus—the Karens are the most numerous and interesting.—Report by Lieutenant-colonel A. P. Phayre, &c.

**BURMANN, PETER**, the most important member of a Dutch family celebrated for learning, was born at Utrecht 1668, studied law at the university of that city and of Leyden, and, after taking his degree in 1688, travelled through Germany and Switzerland. After practising as an advocate for some years, he was appointed professor of history and rhetoric in the university of Utrecht; which

office he subsequently exchanged for the professorship of Greek. In 1715, after the death of Perizonius, he removed to the university of Leyden, where he died 31st March 1741.

His literary career was very active, and his hot temper and intolerant spirit involved him in many controversies. Among his most distinguished adversaries were Le Clerc and Bentley. His chief works are editions of the Latin classics—Petronius, Velleius Paterculus, Quintilian, Valerius Flaccus, Phaedrus, Ovid, the Poëtae Minores, Suetonius, Lucan. The first of these appeared in 1709, and the last in 1740. They are characterised less by taste and critical acumen than by learning, fulness of matter, and beauty of type.

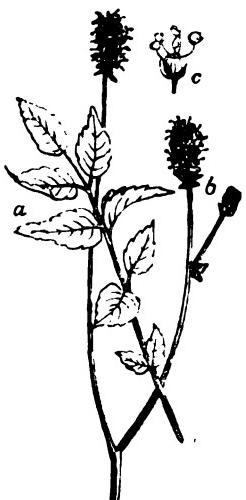

**BURN, RICHARD**, was born in 1720 at the village of Winton, in Westmoreland. After being educated at Queen's College, Oxford, he received the living of Orton, in his native county, which he continued to hold until his death in 1785. He is widely known as the compiler of two very useful law-books, the *Justice of the Peace* and *Ecclesiastical Law*, which have each passed through many editions. He also published a *History of the Poor-laws*, an edition of Blackstone's *Commentaries*, and several sermons and works of a religious nature.

**BURNES, SIR ALEXANDER**, a distinguished traveller in Central Asia, was born at Montrose, in Scotland, 1805, where his father, who was a cousin of Robert Burns the poet, was an active magistrate. He early entered the Indian army, and his knowledge of Oriental languages gained him rapid promotion. After performing some important missions for the Indian government, he was, at his own suggestion, sent on an expedition into Central Asia. Starting from Lahore on the 11th February 1832, B., having adopted the dress and usage of the Afghans for greater safety, passed through Peahawur and Cabul, and crossing the Indian Caucasus, reached Balkh on the 9th June. Thence he passed on to Bokhara, Astrabad, and Teheran, and journeying through Ispahan and Shiraz, reached Bushire on the Persian Gulf, from whence he embarked for India. He received the special thanks of the governor-general for his travels; and on his return to England in 1833, he received a warm welcome from the India House and Board of Control, and was highly honoured by the Royal Geographical and other societies. In September 1839, having previously, for his important services, been knighted and promoted to the rank of lieutenant-colonel, he was appointed political resident at Cabul, where he was murdered on the breaking out of the insurrection in that city in November 1841. B. was the author of several papers in the *Journal of the Geographical Society*, also of *Travels into Bokhara*, and of *Cabul*, being a narrative of a journey to and residence in that city, which was published after his death.

**BURNET**, the English name of two genera of plants, *Sanguisorba* and *Poterium*, belonging to the natural order *Sanguisorboe* (q. v.)—very generally regarded as a sub-order of Rosaceæ—which have much resemblance to one another, and receive a common name also in other languages. *Sanguisorba* has hermaphrodite flowers with four stamens; in *Poterium*, the flowers are polygamous, and the stamens indefinite in number. In both, the calyx is 4-fid, and the corolla wanting.—**GREAT B.** (*Sanguisorba officinalis*) is common in meadows in all parts of Europe, and not unfrequent in some parts of England, particularly where the soil is calcareous. It has a stem 1—2 feet high, pinnate leaves, with about four pair of ovate serrated leaflets and an odd one; the flowers are crowded in dark red spikes.

## BURNET.

It is cultivated in Germany for feeding cattle, and is much esteemed for this use, as it grows well even

Great Burnet (*Sanguisorba officinalis*):  
a, a leaf; b, spikes of flowers; c, a flower.

on very poor soils, and the produce is abundant. Cattle are very fond of it. The root is astringent, and was formerly used in medicine.—COMMON B. (*Poterium Sanguisorba*) grows in sunny places on hills in the middle and south of Europe, and is

Common Burnet (*Poterium Sanguisorba*):

common in England, especially in the chalk districts. In habit and foliage, it much resembles the Great B., but the leaflets are smaller, and the flowers are in heads of a dull purplish colour. It has been much cultivated in some parts of England as a substitute for clover on chalky soils, and is relished by cattle. It forms great part of the natural pasture of the South Downs, and of the excellent sheep-walks of Salisbury Plain. It is regarded as a plant particularly suitable for poor soils. It is sometimes cultivated in gardens, and its leaves, which are slightly astringent, are used in salads or soups. They are said to form one

of the ingredients of the famous cool *tawhard*, and the name *Poterium* is from a Greek word signifying a drinking vessel.—Both this and the preceding are perennial plants.—There are several other species both of *Sanguisorba* and *Poterium*, some of the latter shrubby, natives chiefly of the warmer temperate parts of the world.

BURNET, GILBERT, Bishop of Salisbury, was born at Edinburgh on the 18th September 1643. He was educated at home, and afterwards at Marischal College, Aberdeen, where he pursued his studies so diligently, that he took his degree of M.A. before he was fourteen. In the course of a year he made up his mind to enter the church, and read so hard at theology, that in less than three years he had mastered the chief systems of divinity, besides having gone over the Old and New Testaments in the original, with all the Commentaries of note in his time. In 1663, he visited Cambridge, Oxford, and London, where he met with many of the leading divines of England. Next year, he passed over into Holland, and perfected his knowledge of Hebrew under a learned rabbin of Amsterdam. In 1665, he was presented to the parish of Saltoun, where he remained five years. In 1669, he was appointed Professor of Divinity in the university of Glasgow, but having mixed himself up in the politico-ecclesiastical affairs of the time, he brought upon himself the enmity of Lauderdale, and found it prudent to resign his chair in 1674. He now removed to London, and was made preacher at the Rolls' Chapel by Sir Harbottle Grimston, and afterwards lecturer at St Clement's. In 1676, he published his *Memoirs of the Dukes of Hamilton*, and in 1679, the first volume of his *History of the Reformation*, which procured him a vote of thanks from both Houses of Parliament. Next year appeared *Some Passages in the Life and Death of the Earl of Rochester*, in which B. records the religious interviews which he had with that profligate nobleman during his last illness, and which led to the latter's conviction of the truth of Christianity. In 1681, he published the second volume of his *History of the Reformation*, and in 1682, his *Life of Sir Matthew Hale*. The efforts which had previously been made, were now repeated, to induce him to break with the liberal and moderate party, and to attach himself to the king. He was offered the bishopric of Chichester, but refused it. In 1683, he narrowly escaped being brought into trouble in regard to the Ryehouse plot. He conducted the defence, attended the execution, and vindicated the memory of his friend Lord William Russell. The king exhibited his unkindly spite by depriving B. of his St Clement's lectureship. On the accession of James II., he went to the continent, and travelled through France, Italy, Switzerland, and Germany. In 1684, he was introduced to the Prince of Orange, with whom he became a great favourite, and by whom he was frequently consulted in reference to the great scheme for the deliverance of England. When William came over, B. accompanied him in the capacity of royal chaplain, and shortly after, was appointed Bishop of Salisbury. He entered on the duties of his diocese with great ardour; but his first pastoral letter, in which he founded the right of William to the throne on conquest, gave so much offence to both Houses of Parliament, that they ordered it to be burned by the hands of the common hangman. William, however, who knew the excellent qualities of the bishop, was not greatly impressed by this solemn performance, and continued to trust B. to the end of his life. In 1698, B. was appointed preceptor to the Duke of Gloucester; in 1699, he published his celebrated exposition of the 39 Articles, which was condemned as heterodox by that not

very competent assembly, the House of Lords. In 1714, appeared the third volume of his *History of the Reformation*. In the spring of 1715, he was attacked by a pleuritic fever, and carried off on the 17th of March, in the 72d year of his age. B. was thrice married: his first wife was remarkable for her beauty; the second, for her fortune; and the third, for her piety.

Soon after B.'s death, appeared *Bishop B.'s History of his Own Time, from the Restoration of King Charles II. to the Conclusion of the Treaty of Peace at Utrecht, in the Reign of Queen Anne*. It was sarcastically but foolishly abused by the Tory writers of the day—Swift, Pope, Arbuthnot, and others. B. was a man of strict, almost of puritanic virtue; yet his charity, geniality, and moderation of sentiment might be imitated with advantage even in our own day. His style is neither elegant nor correct, and his judgment is not always reliable, yet the honesty, earnestness, simplicity, and vigour of his writings, as well as their fulness of details, make his works very valuable to the student of history.

**BURNET, JOHN**, a painter, engraver, and author, was born at Fisherrow, near Edinburgh, March 1784. He was first brought under the notice of the public through his engravings of Wilkie's works, which he executed in a most admirable manner. Of his own paintings, the best known engraving is that of 'Greenwich Pensioners receiving News of the Battle of Trafalgar.' He has written several works on art, illustrated by drawings and engravings of his own, the most important of which is a *Practical Treatise on Painting*. He is also the author of *Rembrandt and his Works*, 4to, 1849; and in conjunction with Mr Peter Cunningham, of the *Life and Works of J. M. W. Turner*, 4to, 1852.

**BURNET, THOMAS**, best known from his *Theory of the Earth*, was born in Yorkshire, 1635, and studied at Cambridge. After acting as travelling-tutor to several noblemen, he was elected Master of the Charter-house (1685), and later, succeeded Archbishop Tillotson as clerk of the closet to William III. But having (1692) published a work, *Archæologia Philosophica, sive Doctrina Antiqua de Rerum Originibus* (also in English), displaying great learning, but treating the Mosaic account of the Fall as an allegory, he was obliged to retire from the clerksip, and lived in the Charter-house till his death, in 1715. His *Telluris Theoria Sacra* (first part, 1680; second, 1689) was written in Latin, but translated, or rather recomposed in English, by the author. It is an ingenious speculation, written in ignorance of the facts of the earth's structure, and is therefore a mere system of cosmogony, and not geology. But it abounds in sublime and poetical conceptions and descriptions, conveyed in language of extraordinary eloquence, and called forth the highest applause at the time.

**BURNETT PRIZES, THE**, are two theological premiums, founded by Mr Burnett of Dens, Aberdeenshire. This gentleman (born 1729—died 1784) was a general merchant in Aberdeen, and for many years during his lifetime spent £300 annually on the poor. On his death, he bequeathed the fortune he had made to found the above prizes, as well as for the establishment of funds to relieve poor persons and pauper lunatics, and to support a jail-chaplain, in Aberdeen. He directed the prize-fund to be accumulated for 40 years at a time, and the prizes (not less than £1200 and £400) to be awarded to the authors of the two best treatises on 'The evidence that there is a Being all-powerful, wise, and good, by whom everything exists; and particularly to obviate difficulties

regarding the wisdom and goodness of the Deity; and this independent of written revelation, and of the revelation of the Lord Jesus; and from the whole to point out the inferences most necessary and useful to mankind.' The competition is open to the whole world, and the prizes are adjudicated by three persons appointed by the trustees of the testator, together with the ministers of the Established Church of Aberdeen, and the principals and professors of King's and Marischal Colleges, Aberdeen. On the first competition in 1815, 50 essays were given in; and the judges awarded the first prize, £1200, to Dr William Lawrence Brown, Principal of Marischal College and University of Aberdeen, for an essay entitled *The Existence of a Supreme Creator*; and the second prize, £400, to the Rev. John Bird Sumner, afterwards Archbishop of Canterbury, for an essay entitled *Records of Creation*. On the second competition, in 1855, 208 essays were given in; and the judges, Rev. Baden Powell, Mr Henry Rogers, and Mr Isaac Taylor, awarded the first prize, £1800, to the Rev. Robert Anchor Thompson, Lincolnshire, for an essay entitled *Christian Theism*; and the second prize, £600, to the Rev. Dr John Tulloch, Principal of St Mary's College, St Andrews, for an essay on *Theism*. The above four essays have been published in accordance with Mr Burnett's deed.

**BURNETT'S DISINFECTING LIQUID AND ANTISEPTIC FLUID** is a liquid introduced by Sir W. Burnett for the purpose of deodorising the bilge-water of ships, sewerage-water, &c. It is a strong solution (sp. gr. 2) of chloride of zinc, accompanied by a small amount of chloride of iron; and when intended to be used, it is mixed with water in the proportion of one pint to five gallons of water. The liquid acts only as a *deodoriser* and *antiseptic* (see *ANTIMICROBIALS*), and does not yield any vapour which can exhibit the properties of a disinfectant (q. v.). It is of service in preserving dead animal tissues, as in the dissecting-room, and in jars containing anatomical specimens. It has little action on knives or steel instruments. When added to bilge or sewerage-water, the chloride of zinc ( $ZnCl$ ) mainly acts by decomposing the offensive sulphide of ammonium ( $NH_3S$ ), which it does by forming the sulphide of zinc ( $ZnS$ ) and chloride of ammonium ( $NH_4Cl$ ), both of which are odourless. The strong solution of chloride of zinc has also been applied to the preservation of timber, and the process of so treating wood is called, after its inventor, *Burnettising*. *Creve's* disinfectant liquid is chemically the same as the above.

**BURNLEY, DR CHARLES**, a musical composer, celebrated as the author of the *General History of Music*, was born at Shrewsbury, 1726. Having studied music in his native city, in Chester, and under Dr Arne in London, he commenced giving lessons in music himself. After composing three pieces—*Robin Hood*, *Alfred*, and *Queen Mab*—for Drury Lane, B. left London, and settled at Lynn, in Norfolk, where he designed his work on the *History of Music*. In 1770—1772, he travelled in France, Italy, the Netherlands, and Germany, collecting materials for his proposed work, and published an essay on the *Present State of Music in France and Italy*, &c. (2 vols., Lond. 1772). This was followed by his *General History of Music from the earliest Ages to the present Period* (4 vols., Lond. 1776—1789). Beside other minor works, B. wrote a *Life of Handel*, and nearly all the musical articles in *Ross's Cyclopædia*. He was appointed organist to the Hospital at Chelsea in 1789. He died in 1815. He was intimately acquainted with many of the most eminent men of the day, including Edmund

## BURNING GLASSES AND MIRRORS—BURNS.

Burke and Dr Johnson.—His second daughter, FRANCISCA B. (afterwards Madame D'Arblay), became distinguished as authoress of *Evelina*, *Cecilia*, *Georgina*, and *Camilla*—novels formerly very popular, and still retaining some interest.

**BURNING GLASSES AND MIRRORS.** See LENS, and MIRROR.

**BURNLEY**, a thriving town and parliamentary borough in Lancashire, situated in a narrow vale on the banks of the Brun, a mile and a half above its junction with the North Calder, and 24 miles north of Manchester. Pop. (1871) of p. b., 44,320. It has manufactures of cottons and woollens, calico-printing works, iron and brass foundries, machine-making works, breweries, tanneries, and rope-works. There are collieries in the vicinity, and traffic is facilitated by railways and canals, which unite it with the principal centres of trade in Lancashire and Yorkshire. B returns one member to parliament.

A Roman vicinal way passed through the town, part of which is still known and used as the 'Long Causeway.' Roman coins, pottery, urns, &c., have been found near the town, and an extensive series of beacons, encampments, dikes, &c., occupy the slopes of the hills in the neighbourhood for a linear distance of more than 10 miles. From the name of the river, *Brun*, and other circumstances, these slopes are supposed to furnish a very probable site for the battle of Brunnenburgh, so celebrated in Saxon history.

**BURNOUF, EUGENE**, one of the most distinguished orientalists of modern times, was born at Paris, April 1, 1801, and after entering on the study of law, betook himself to the oriental languages, especially those of India and Persia. In conjunction with Professor Lassen of Bonn, he published, in 1826, *Essai sur le Pali*, which was followed, in 1827, by *Observations Grammaticales sur quelques Passages de l'Essai sur le Pali*. His great aim, however, at this time, was to obtain a complete knowledge of the remains of the religious literature in the Zend, or old Persic language, which had been neglected since the time of Anquetil du Perron, or, at least, not philologically and critically examined. B. undertook to decipher those curious MSS. which Anquetil du Perron had brought home with him, and which lay unregarded in the *Bibliothèque Impériale*. He commenced by causing the *chef-d'œuvre* of old Persic literature, the *Vendidad-Sadé* (one of the books of Zoroaster), to be lithographed with great care, and published from time to time in the *Journal Asiatique* the brilliant results of his laborious studies, which drew upon him the regard of the learned world. In 1834, he published the first volume of his *Commentaires sur le Yagna l'un des Livres Liturgiques des Perses*, a work which, for the first time, rendered possible a knowledge not only of the dogmas, but also of the language of Zoroaster. It is a master-piece of conscientious industry, united with copious lingual and antiquarian lore. His studies in the Zend language induced him to make an attempt to decipher the cuneiform inscriptions of Persepolis, in his *Mémoire sur deux Inscriptions Cunéiformes* (Par. 1836). In 1840, he published the text along with a translation of the *Bhāgavat-Purāna*, a system of Indian mythology and tradition. As the fruit of his study of the Sanscrit books of the Buddhists, appeared in 1845 the *Introduction à l'Histoire du Bouddhisme*. See BUDDHISM. This great work absorbed for six years the whole energies of B., who was now recognised as the worthy successor of Silvestre de Sacy. It is to be regretted that death did not permit this illustrious orientalist to continue his labours further. He died May 28, 1852.

448

**BURNS, ROBERT**, the great lyric poet of Scotland, was born 25th January 1759, in a small cottage near Ayr. His father, then a nursery-gardener, and afterwards the occupant of a small farm, had to struggle all his life with poverty and misfortune, but made every exertion to give his children a good education; and the young poet enjoyed an amount of instruction and miscellaneous reading which, to those unacquainted with the habits of the Scottish peasantry, would seem incompatible with the straitened circumstances and early toil which were his lot. About his sixteenth year, he began composing verses in the Scottish dialect, which attracted notice in the vicinity, and extended the circle of his acquaintance; and thus he became exposed to temptations which, acting on an extremely sociable and passionate disposition, broke in upon the previous sobriety and correctness of his life. A small farm, on which he had entered with his brother in 1781, proved far from a prosperous undertaking; and being harassed and imbibited by other misfortunes—the results of imprudence—he resolved to leave his native land, and go to Jamaica. Partly to procure the means of paying his passage, he published a collection of his poems at Kilmarnock in 1786. The reception these met with was highly favourable, and his genius was recognised in quarters where he had not looked for notice. While preparing to embark, he received a letter encouraging him to go to Edinburgh, and issue a new edition. This was the turning-point of his life. During his stay in the Scottish metropolis, he associated with all that was eminent in letters, rank, and fashion, and his conversational powers excited little less admiration than his poetry. The profits of the publication were considerable, and enabled him to take the farm of Ellisland, near Dumfries, where he settled in 1788, having publicly ratified his marriage with Jean Armour. With his farm he conjoined the office of an exciseman; but after three or four years, he was obliged to give up farming, and from that time lived in Dumfries, dependent on his salary from the Excise, which, at first, only £50, never rose above £70. The striking contrasts in the lot of the rich and the poor with which his residence in Edinburgh had impressed him, made him hail the French Revolution with enthusiasm; and some imprudent expressions of his having been reported to the authorities, destroyed his prospects of promotion in the service, and only the interference of an influential friend prevented him from losing his office. Such was then the terror of innovation, and the hatred of everything like liberal opinions, that many of the better classes, who had feted the poet, now shunned the 'Jacobin,' as they stigmatised him. Imbittered by what he felt to be injustice, he recklessly allowed those habits of dissipation to grow upon him which made the more respectable of all classes look coldly on him; and the remorse thus occasioned in his calmer moments aggravated that tendency to melancholy which the gloom and toil of his early years had probably implanted in his constitution. Broken in health, he died 21st July 1796.

The poetry of B. is purely the outpouring of the moment—the response of the feelings to the immediate circumstances of life. Its charm and power lie in the justness of the feelings expressed, and in the truthfulness and freshness which it derives direct from life. Seldom have such manliness, tenderness, and passion been united as in the songs of Burns. They formed the first awakening of the spirit of true poetry in Britain after a long slumber. The popularity that B. instantly acquired has continued unabated, not only in his native Scotland, but wherever English is spoken; his poems

have also been translated into almost every European tongue. Dr Currie, of Liverpool, published the first collected edition of his poems and letters, with a life (4 vols. Lond. 1800), for the benefit of the poet's widow and family. Several more complete collections have appeared since, of which that by Allan Cunningham, in 8 vols. (Lond. 1834), may be mentioned. A life of B., by Lockhart, appeared,

Edin. 1828. In *The Life and Works of Burns* (Edin. 1851–2), by R. Chambers, the poems are incorporated in the narrative in chronological order.

In 1859, the centenary of B.'s birth was celebrated with unparalleled enthusiasm, not only in every city and almost in every village of Scotland, but in the chief cities of England, and throughout America, the British colonies, and India.

Autograph of Burns.

**BURNS AND SCALDS** are injuries to the surface of the living body arising from excessive heat—a scald implying that the heat proceeded from a fluid medium, as boiling water; a burn, from a solid. The injury is much the same in both cases; therefore the directions for the treatment of burns will be applicable also to scalds. These injuries may be divided into three classes: 1. Burns resulting in simple redness of the skin; 2. Burns resulting in vesication or blistering; 3. Burns resulting in sloughing, or death of the part. The first object, after the accident has occurred, is to relieve the suffering; and cold applied either in the form of ice or water seems in most cases to have almost a specific power in allaying pain and checking the advance of inflammation. In other cases, moderate warmth is found more efficacious, and we must be guided mainly by the sensations of the sufferer as to which of these remedies we make use of. In very severe cases, opium or chloroform may be employed. But if the injury the body has received be very serious, the patient complains less of pain than of cold; he shivers, is much depressed, and must be well supplied with stimulants, to prevent his dying from the shock.

The best local application is the Carron-oil, which derives its name from the famous ironworks, where it has been used for many years. It consists of equal parts of olive-oil and lime-water, and should be applied on linen rags or cotton-wool. Blisters may be pricked, and the contained serum allowed to trickle away, but on no account is the raised skin to be removed. The dressings should not be changed oftener than cleanliness requires; and as each portion of the old dressing is removed, it must at once be replaced with fresh, so that as little exposure as possible of the burnt surface may take place. The main principle of treatment is exclusion of the air from the injured part; and so long as this is effected, it matters but little what remedial agent is employed. Great care must be taken in the treatment of a sore resulting from a burn, that the contraction of the scar does not cause distortion of the neighbouring parts.

When the clothes catch fire, the person should lie down on the floor, and roll herself, or be rolled, in the rug, table-cover, or anything sufficiently voluminous to stifle the flames; and afterwards the clothes, especially stockings, should be removed with great care, lest the cuticle should separate with them, which would materially increase the sufferings of the patient.

Extensive scalds or burns are very fatal to young children; and it must be remembered that their skin is more susceptible to external impressions, and will suffer from a degree of heat innocuous to an adult. Infants have frequently been scalded to death in too hot baths, or by too hot fomentations. The principles of treatment for burns produced by the contact of chemical agents to the skin, are the same as those for burns by fire.

#### BURNT OFFERING. See SACRIFICE.

**BURNT SIÉNNNA**, a fine orange-red pigment, transparent and permanent, used both in oil and water colour painting. It is obtained by simply burning the ferruginous ochreous earth known as Terra di Sienna. Excellent greens are produced by mixing it with Prussian blue. It mixes well with other pigments generally, and dries quickly.

**BURNT STONES**, antique carnelians found in ruins, and seeming to have been acted upon by fire, having a dull appearance externally, but exhibiting a beautiful red colour when held up to the light. They are sold at a very high price, particularly if to the natural beauty of the stone is added the merit of fine workmanship. They were once, however, more esteemed than now, and an imitation of them, by burning the upper surface of carnelians with a hot iron, was very fashionable.

**BURNT UMBER**, a pigment of a russet-brown colour, is semi-transparent, mixes well with other pigments, and dries quickly. It is obtained by burning umber, an ochreous earth containing manganese, and deriving its name from the place where it was first discovered—Umbria in Italy.

**BURNTISLAND**, a seaport town of Fifehire, on the north shore of the Firth of Forth, about 8 miles north-north-west of Edinburgh. It consists of one long street, clean and well kept, with a back street running parallel, and some diverging lanes. B. is a station on the Edinburgh, Perth, and Dundee Railway, a steam-boat ferry connecting it with Granton, the station on the opposite side of the Forth. It has a commodious harbour on the west. Its trade consists principally of distilling, herring-curing, and the shipping of coal and iron; and in the summer season it is now considerably resorted to as a convenient watering-place. It unites with Kinghorn, Dysart, and Kirkcaldy to send one member to parliament. Pop. (1871) 3422.

**BURRIANA**, a town of Spain, in the province

of Castellon-de-la-Plana, about 8 miles south from the town of that name, is situated on the left bank of the Rio Seco, about 1 mile from its mouth in the Mediterranean. It has a population of 6200, who are chiefly engaged in agriculture and fishing; and exports wine, oil, and fruit.

**BURRITT,** ELIJAH, a distinguished advocate of the doctrines of the Peace Society, and widely known as 'the learned blacksmith,' was born at New Britain in Connecticut, United States, in 1811. He was brought up to the trade of a blacksmith; but devoted all his leisure to study, especially to mathematics and languages. In the latter field of study, his range has been very wide, embracing more or less Latin, Greek, Hebrew, Arabic, and other oriental tongues, and almost all modern European and Slavonic languages. He is, however, much better known to the world as an earnest apostle of peace than as a scholar. To preach the doctrine of 'universal brotherhood,' he has travelled through Europe and the United States. His chief works are, *Sparks from the Anvil*, *A Voice from the Forge*, *Peace Papers*, and *Lectures and Speeches*. He has taken a prominent part in the Peace Congresses of Brussels, Paris, Frankfort, London, and Edinburgh; and in advocating an ocean penny-postage. For many years he resided in England, part of the time as U. S. Consul at Birmingham. He has lately delivered a series of temperance lectures in America.

**BURSARY** (Fr. *bourse*, Lat. *bursa*, a purse), the annual proceed of a sum permanently invested for the maintenance of a student at a university. A number of small bursaries were till lately the only equivalents at the Scotch universities for the scholarships of the English. Their large number, and the small amount of each was, in course of time, found to have a prejudicial effect, more particularly at Aberdeen, which possessed the largest number, and where a practice had obtained of multiplying bursars on the foundation, at the discretion of the senatus or patrona. Both the University Commissioners of 1831 and those of 1863 expressed their opinion that it was less provision for encouraging learning in its earlier stages than adequate inducements to persons who have passed the preliminary class to make learning the business of their lives, that was wanted in Scotland. The general effect of the ordinances issued by the Commissioners of 1863, in carrying out the directions of Act 21 and 22 Vict. c. 83, was to consolidate some of the smallest bursaries into others of greater value, and in some instances to remove restrictions that had proved injurious, while a large number was thrown open to competition. There are, however, still a large proportion of purely presentation bursaries, and in some there is a preference given to a particular name, or to natives of a particular district. At Aberdeen, the commissioners founded eight scholarships of £65 annual value; at St Andrews they so modified the Ramsay foundation as to found two scholarships of £60; and in Edinburgh they acquired funds sufficient to establish the Pitt and Mackenzie scholarships of £60 and £120 annual value. Since 1863, a large number of scholarships, tenable by graduates and fellowships, have been founded by private individuals on a more liberal scale than the old bursaries, particularly in Edinburgh and Glasgow. At Edinburgh there are at present about 140 bursaries, of which 100 are in arts, and 30 in theology; they vary in amount from £2, 15s. 6d. to £100. Among the most considerable of them are two of £90, founded in 1809 by Dr Donald Grant, for students of his own surname; one founded by Sir John Macpherson in 1821, worth £88, for Highland students; the Jardine competition

bursary of £40, four Lennie bursaries of £48, four Bruce bursaries of £30, and three of £40; two competition bursaries of £100 and £50 respectively, founded in 1860 by Mr Patrick of Roughwood, for young men educated at Ayr; two bursaries founded in 1865 by Miss Scott of Horseliehill, and one by Miss Harrison in 1867, for £40 each; and two founded by the Rev. John Spence in 1867, for £30. The scholarships for graduates are about thirty, varying in amount from £60 to £120; and there are about eight fellowships, varying from £100 to £160. Of 114 bursaries at Glasgow, many of them small, the most considerable are six founded by Lord Dundonald in 1672, four in philosophy, and two in divinity, of £40; two by Mr Patrick, of £100 and £50 respectively; and the Brisbane medical bursary of £50, founded in 1777. Glasgow has also ten exhibitions to Balliol College, Oxford, on the Snell foundation (q. v.), and 17 scholarships of from £50 to £225, the highest being the four founded by George A. Clark, in 1872. At St Andrews there are 76 bursaries belonging to the United College, varying in amount from £5 to £30; 20 belonging to St Mary's, varying from £6 to £50; and 20 of the same value transferable from the United College, when the bursars proceed to the study of divinity; two Ramsay scholarships of £50; four scholarships tenable for four years, founded by Mr Guthrie of Craigie, worth £100 the first year, and afterwards £50; and two scholarships of £50, founded by Mrs Tyndal Bruce. At Aberdeen the number of bursaries is about 213, varying from £5 to £50; and there are eight scholarships of £55, tenable for four years, as also some valuable exhibitions to Cambridge.

**BURSLEM**, a town of Staffordshire, on the Trent and Mersey Canal, in the centre of the pottery district, 20 miles north of Stafford. It forms a portion of the parliamentary borough of Stoke-upon-Trent. Pop. (1871) 25,562. The abundance of coal and the variety of clays have made B., since the 17th c., one of the chief seats of the fickle manufacture. Porcelain and pottery of all kinds—Parian, iron and stone ware, &c.—are produced on a large scale, as well as encaustic tiles. There is also a glass manufactory here. The affairs of the town are managed by a 'local Board of Health.' At Birches Head, a mile and a half from B., stands a large service reservoir of the Staffordshire Water-works Company, from which the town and neighbourhood are supplied with excellent water. A fine new town-hall was erected in 1865, which, besides the usual municipal offices, contains lecture rooms and news rooms. B. was the native place of Josiah Wedgwood, who in the middle of the 18th c. greatly improved the manufacture of pottery. A Wedgwood memorial institute has recently been erected, to serve as a school of art, a free library, and a museum. An appropriate character is given to it by introducing into the ornamentation of the façade terra cotta mouldings, Wedgwood's jasper ware, &c.

**BURTON, JOHN HILL**, advocate (member of the Scottish Bar), has achieved for himself a place in the world of letters by a variety of works, all remarkable for ability, and several for original thought. B. was born at Aberdeen on the 22d of August 1809; his father was an officer in the army, and his mother the daughter of an Aberdeenshire laird. Having graduated at Marischal College, Aberdeen, he became an apprentice to the profession of law in his native city; which, however, he afterwards abandoned for the higher sphere of the Edinburgh bar. Here, with time on his hands, he devoted himself to study and letters. For a long series of years, from 1833 downwards, he was a contributor to the *Westminster Review* of articles on

## BURTON—BURY ST EDMUND'S.

law, history, and political economy; and for several years he has contributed to *Blackwood's Magazine* literary sketches, among which may be mentioned the series entitled *The Scot Abroad*. Among his original works may be mentioned, *The Life and Correspondence of David Hume*, 2 vols. 8vo (Edin. 1846); *Lives of Simon Lord Lovat and Duncan Forbes of Culloden*, 8vo (Lond. 1847), both excellent biographies; *Political and Social Economy*, 16mo (Edin. 1849), a work in which he has shewn high capacity for economical and social speculation, and which is indeed a valuable, condensed, and lucid contribution to the literature of social science; *Narratives from Criminal Trials in Scotland*; *A Manual of Scottish Law*; *A Treatise on the Law (Scottish) of Bankruptcy*; *The History of Scotland from the Revolution to the Extinction of the Last Jacobite Insurrection*, 2 vols. 8vo. (Lond. 1853); and *The History of Scotland from Agricola's Invasion to the Revolution of 1688*, 7 vols. (1867—1870). The high merits of B.'s historical works have been universally admitted. Among his other labours he has edited the works of Jeremy Bentham (nominally in conjunction with the late Sir John Bowring), with an able introduction; and in addition to this, he has the merit of having conferred a benefit at once on the public and the memory of his author by a volume of *Benthamiana*, being a collection of choice and characteristic passages from Bentham's works. As a reward for his indefatigable labours in the fields of law, history, and politics, B. was, in 1854, appointed Secretary to the Prison Board of Scotland; and since the abolition of that Board in 1860, has remained as Manager and Secretary in connection with the Home Office. He holds the old office of Historiographer Royal for Scotland, and is an LL.D. of Edinburgh University.

**BURTON, ROBERT**, author of the *Anatomy of Melancholy*, was born at Lindley, in Leicestershire, in 1676, and studied at Brasenose and Christ Church, Oxford. In 1616, he was appointed to the vicarage of St Thomas, and in 1628, to the rectory of Seagrave in his native county. He appears, however, to have continued all his life at Christ Church, where he died in 1640, leaving legacies of £100 each to the Bodleian and Christ Church libraries, and as many of his books as they did not already possess. A monument was erected to his memory in Christ Church Cathedral. B. is described by Anthony Wood as a good mathematician, a dabbler in nativities, a well-read scholar, and a thorough-paced philologist. 'As he was by many accounted a severe student, and a melancholy and humorous person, so by others who knew him well, a person of great honesty, plain-dealing, and charity. I have heard some of the ancients of Christ Church often say that his company was very merry, facetie, and juvenile.' His *Anatomy of Melancholy*, in which he appears under the title of Democritus Junior, is one of the most curious *melanges* of heterogeneous elements ever put together. It consists mainly of an extraordinary mass of quotations from old and obscure writers, strung on a thread of rambling reflection; often tiresomely pedantic, but relieved by quaint touches of humour and feeling. In his own lifetime, it was highly popular, and went through five editions; after that, it fell into comparative oblivion, but is now again popular among lovers of quaint literature. Dr Johnson said it was the only book that ever took him out of bed two hours before his usual time.

**BURTON-ON-TRENT**, a market-town in Staffordshire, on the river Trent and the Midland Railway. The Grand Trunk Canal also passes the

town, and enters the Trent below. A bridge of 36 arches, built before the Norman Conquest, here crossed the river, but was replaced in 1864 by a new one of 32 arches. The population of B. has been nearly trebled within the last 20 years, being, in 1871, 20,378. This is owing to the rapid extension of the brewing of ale, which is the staple product of the place. There are upwards of a score of breweries in B., some of them on a scale of unparalleled magnitude. The two establishments of Bass and Allsopp cover together more than 100 acres of ground, and can produce yearly upwards of a million barrels of ale. There are, of course, extensive cooperages, and also iron-foundries. The public edifices are not particularly noticeable.

**BURTSCHIED**, or **BORCETTE**, a town of Rhenish Prussia, about half a mile distant from Aix-la-Chapelle, with which it is connected by an avenue of trees. It has manufactures of woollen cloths and cassimeres, and celebrated sulphur springs and baths, with a temperature of 106° to 155° F. Pop. (1871) 10,079.

**BURWHA**, or, as Dr Barth spells it, **BA'RUA**, a town of Bornu, Central Africa, situated on the west bank of Lake Tchad, about 80 miles north-north-west of Kuka. The town, which consists of closely packed huts, is surrounded by high clay-walls, which, however, 'owing to the high mounds of rubbish imbedding them on all sides,' afford no protection whatever from the attacks of the Tawarek, to whom the inhabitants have to pay tribute. Fish in great quantities are caught in the adjoining lake, and form the chief food of the inhabitants, as well as their only article of commerce. Pop. about 6000.

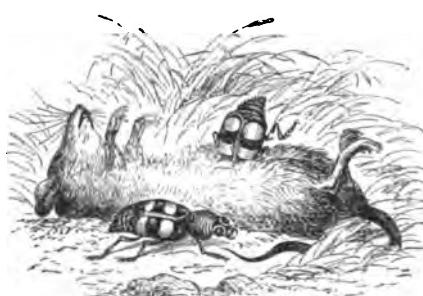

**BURY**, a flourishing manufacturing town in the south-east of Lancashire, on a rising ground backed by hills on the north and east, between the Irwell and the Roche, 9 miles north-west of Manchester. It was early a seat of the woollen manufactures, carried on by Flemings, but these, though still considerable, now yield in importance to those of cotton. Besides spinning and weaving factories, there are important print, bleach, paper, and dye works, and some large foundries and engine manufactories. In the vicinity are excellent freestone quarries, and abundant coal-mines. The town has recently been much improved in drainage, and an ample supply of water has been secured from hills at a distance. Pop. (1871) 41,344. B. returns one member to parliament. Some improvements in the cotton manufacture arose here—notably, the invention by John Kay of the fly-shuttle. The late Sir Robert Peel was born in B., where his father established his great print-works. A bronze statue of Sir Robert has been erected in the old market-place.

**BURY ST EDMUND'S**, or **ST EDMUND'S BURY**, an ancient borough in Suffolkshire, on the Upper Larke, 26 miles north-west of Ipswich. It is well built, and delightfully situated. Pop. (1871) 14,923. It returns two members to parliament. It has a trade in wool, butter, corn, and cheese, but no manufactures. A very complete system of drainage has been carried out, the sewage being conveyed to a distance, and, by means of pumps, applied to irrigation. A new Corn Exchange was erected in 1862; in 1864, the Suffolk General Hospital was rebuilt. B. received its name from Edmund, the Saxon king and martyr, who was crowned here on Christmas Day, 886; taken prisoner, and put to death by the Danes. On the site of his tomb, six priests founded a monastery; and here Canute raised a Benedictine abbey, which in time became the richest and most important

## BURYING BEETLE—BUSCHING.

in England, save that of Glastonbury. From 1020 to its dissolution by Henry VIII, it was ruled over by a line of 33 abbots. The abbot was a spiritual baron of parliament, had judicial authority in all causes within the liberty of B., had the power of inflicting capital punishment, and the privilege of coining. At the dissolution, the annual income was equivalent to £50,000 of our money. Of this magnificent establishment, little now remains but the western gate, erected in 1327, a noble relic of the decorated Gothic style; and the 'Church-gate,' a quadrangular tower of massive simplicity, 86 feet high. The churchyard, to which this tower formed the portal, includes, besides the abbey ruins and some other buildings, the fine old churches of St Mary and St James. The celebrated grammar-school of B. was founded by King Edward VI. in 1550, and is free to sons of the inhabitants of the town. It has two annual exhibitions to the universities, and has produced many eminent scholars. Among the many religious and charitable institutions connected with the abbey, of which portions still exist, is St Saviour's Hospital, founded by that notable abbot, Samson, whose life and actions, as recorded by Jocelyn of Brakelond, Mr Carlyle has so vividly recalled in his *Past and Present*. The poet Lydgate was a monk in this abbey; and Sir Nicholas Bacon was born here. At B., King John first met his indomitable barons before he signed Magna Charta. Parliaments were held here in 1272, 1296, and 1446, the last of which ordered the arrest of Humphrey, the good Duke of Gloucester, who was found dead in his bed the morning after his arrest; and sovereigns, as late as Elizabeth's time, were often nobly entertained at St Edmund's town. Three miles south-west of B., the Marquis of Bristol has a splendid seat, Ickworth Park, a circular pile 90 feet in diameter, and 140 feet high.

**BURYING BEETLE** (*Necrophorus*), a genus of Coleopterous (q. v.) insects, of the tribe or family *Silphidae*, with short club-shaped antennæ, remarkable for their habit of burying the bodies of mice,

Burying Beetle.

moles, and other small animals, in order to deposit their eggs in them, and to provide a supply of food for their larvæ. Some of the species are natives of Britain, among which is *N. Vespillo*, the species of which the habits were first observed, which is, however, more common in some parts of continental Europe. It is a black beetle, about an inch long, with two bright orange bands across its back, and having an excessively fetid smell, which long adheres to whatever it touches. Its sense of smell would seem to be extremely acute, and a dead animal soon attracts it, a pair generally arriving together, male and female, to feed upon the body, and the male to proceed to its interment, if sufficiently small, previous to which, however, they

have sometimes to drag it to some distance to a place suitable for their purpose. The head of the insect is the only tool employed in the operation, and is held sloping outwards, and employed in a manner which exhibits great muscular power. A furrow is first made around the body, then another within the first, and so on till the earth is so excavated from beneath, that the body begins to sink, when the insects, by great efforts, drag it down into the hole, and when it is fairly in, the excavated earth is thrown back over it. The female then lays her eggs in it; and when this is accomplished, and the cravings of appetite are satisfied, it is left for the larvæ, which are of a lengthened form, with six feet, whitish, and a brown head.—The known species of B. B. are mostly natives of Europe and of North America.

**BUSACHINO**, or **BUSAQUINO**, a town of Sicily, in the province of Palermo, about 29 miles south-south-west of the city of that name. It has manufactures of linen, and a population of 8100.

**BUSA'CO**, a ridge or serra on the north side of the river Mondego, in the province of Beira, Portugal, about 20 miles north-north-east of Coimbra. Here Wellington, with about 40,000 British and Portuguese troops, repulsed the attack of Massena with 65,000 French, 27th September 1810. Unable to force the position, Massena turned it by a pass over an adjoining ridge, and Wellington retired behind the lines of Torres Vedras, which indeed it was his intention to do, even if there had been no battle.

**BUSBY, RICHARD**, the most famous of English schoolmasters, was born at Lutton, Northamptonshire, September 22, 1606. Educated at Westminster School, and Oxford, he was, in 1640, appointed head-master of Westminster School, the duties of which office he continued to discharge until his death in 1695. He is the type of pedagogues alike for learning, assiduity, and the application of the birch. He was a most successful teacher, and at one time could point to no less than sixteen occupants of the bench of bishops who had been educated in his school; and altogether, he has the reputation of having 'bred up the greatest number of learned scholars that ever adorned any age or nation.' He published several works, but they were chiefly for school use.

**BU'SCA**, a town of Piedmont, situated on the left bank of the river Maira, an affluent of the Po, about 9 miles north-west of Coni. Excellent wine is produced in the vicinity. Pop. 9375.

**BÜSCHING, ANT. FRIEDR.**, a celebrated geographer, was born 27th September 1724, at Stadt-hagen, in the principality of Schaumburg-Lippe, Germany. He studied theology at Halle, where he enjoyed the friendship of Baumgarten. In 1754, he was appointed extraordinary professor of philosophy in Göttingen, but soon incurred the displeasure of the Hanoverian government by his religious heterodoxy. Göttingen thus becoming an unpleasant residence to him, he accepted an invitation, in 1761, to St Petersburg as preacher to a Protestant congregation there. In 1765 he returned to Germany, and in 1766 was called to Berlin as Upper Consistorial Councillor and Director of a *gymnasium* in Berlin, where he died, 28th May 1793. Until the appearance of B.'s *Erdbeschreibung*, the first volume of which was published at Hamburg in 1754, neither Germany nor any other nation possessed a geographical work which made any pretension to scientific treatment or completeness of execution. The changes in the political arrangements of the world have, however, deprived the work of its original value, but it has been corrected and edited

## BUSEMBAUM—BUST.

by subsequent writers. Of his other numerous publications, the most important is the *Magazin für Historie und Geographie* (25 vols. Hamburg, 1767—1793).

**BUSEMBAUM, HERMANN**, a theologian of the order of the Jesuits, was born in 1600 at Nottelen, in Westphalia. About 1640, he taught ethical philosophy at Cologne, and later, was appointed rector of the College of Jesuits at Münster. He died 31st January 1668. His work entitled *Medulla Theologica Moralis* (1645), was celebrated as a standard authority in the seminaries of the Jesuits, though several of its propositions were condemned by the pope. It has gone through more than fifty editions. It was enlarged by the Jesuit Lacroix (1707), and re-edited, with improvements and additions, by the Jesuit Montauzan in 1729, and again by Alfonso de Ligorio in 1757. As it was found that the work contained doctrine in favour of regicide, it was burned, by order of the parliament of Toulouse, on the occasion of an attempt made on the life of Louis XV. by Damiens in 1757. Subsequently, the Jesuits Zacharia and Franzoja of Padua wrote in defence of B.'s work.

**BUSH ANTELOPE, BUSH BUCK, and BUSH GOAT**, names common to a number of species of Antelope (q. v.), natives chiefly of the southern and western parts of Africa, forming a section of the genus *Antelope*, which some naturalists have attempted to erect into a distinct genus (*Philantomba* or *Cephalopus*). They are animals of more compact form, shorter limbs, and greater strength, but much less agility, than the true or typical antelopes. They are remarkable for the arched form of the back. They have short, straight, or slightly curved horns, situated far back, and generally peculiar to the male sex, with usually a long tuft of hair between them. They have no tear-pits, but instead of them, a naked glandular line, formed of two series of pores, on each cheek. They frequent jungles, thick forests, and beds of reeds, and when pursued, seek to escape by diving into a thicket. The common or white-backed B. A. of Sierra Leone (*Antelope sylvicola*) is about three feet high at the shoulder: it is a dull, heavy, awkward-looking animal; keeps concealed in the thickets during the day, living singly or in pairs, and feeds in the open spaces in the early mornings only. To shoot it, sportsmen place themselves on the margin of the woods, and watch their opportunity as it comes out to graze. Its flesh is more esteemed than that of the more agile antelopes. Nearly twenty other species are usually ranked in this section of antelopes, among which is the *Kleene Boc* (*Antelope pygmaea*) of South Africa, a species abundant in many parts of Cape Colony, of very small size, not more than one foot in height at the shoulder, and with horns only about  $1\frac{1}{4}$  inch in length. It is a timid, gentle animal, easily domesticated. It differs from the typical Bush Antelopes in the great activity which it displays.

**BUSHEAB**, a low flat island in the Persian Gulf, about 11 miles from the Persian coast, in lat.  $28^{\circ} 50'$  N., long.  $53^{\circ} 12'$  E. It is about 18 miles long, narrow, and well peopled, with a town and harbour at its western extremity. Its proper name is *Khoshaub*, signifying 'good water.'

**BUSHEL** [Fr. *boisseau*, allied to *bois*(*s*)*e*, box, butt; Lat. *bulla*, a measure in general], a dry measure used in Britain for grain, fruit, &c. The quarter contains 8 bushels, and the bushel 8 gallons, the gallon measuring 277.274 cubic inches, and holding 10 lbs. avoirdupois of distilled water. Hence the imperial bushel contains 80 lbs. of water, and measures 2218.2 cubic inches. The old Winchester

bushel measured 2150 cubic inches; hence 33 Winchester bushels = 32 imperial bushels nearly.

**BUSHIRE**. See ABURRIEHR.

**BU'SHMAN'S RIVER**, or BO'SJESMAN'S RIVER, in the east part of the Cape Colony, South Africa, is about 200 miles long, and forms on its lower course the west boundary of Albany, whose capital is Graham's Town. Its general direction is from north to south, its mouth being about lat.  $33^{\circ} 4'$  S., and about long.  $26^{\circ} 4'$  E.

**BU'SKIN**, a kind of half-boot, lacing tight to the leg. The ancient tragedians wore buskins (*coturni*), often with thick soles, to add to their stature. Hence the B. is often put for Tragedy, as the sock (*soccus*, a flat-soled shoe) for Comedy. In ancient sculpture, Diana, and hunters in general, as well as men of rank and authority, are represented in buskins often highly ornamented.

**BUSS** is the name of a small vessel, usually from 50 to 60 tons' burden, much used in the herring-fishery, especially by the Dutch. The B. has two small sheds or cabins—one at the prow, to serve as a kitchen, and the other at the stern. The remaining space is a receptacle for fish.

**BUSSU PALM** (*Manicaria saccifera*), a South American palm, growing in the tidal swamps of the Amazon, the only known species of its genus. The stem is only 10—15 feet high, curved or crooked, and deeply ringed. The leaves are simple or undivided, and are the largest of the kind produced by

Bussu Palm.

any known palm, being often 30 feet long, and 4 or 5 feet wide. They are simply branched, drooping, and the fruit is of an olive colour, large, hard, and three-seeded. The leaves make excellent and durable thatch, being split down the midrib, and laid obliquely on the rafters, so that the furrows formed by the veins lie in a nearly vertical direction, and serve as so many little gutters to carry off the water. The spathe, taken off entire, is used by the Indians as a bag, or the larger ones are stretched out to make caps.

**BUST** (Ital. *busto*; Fr. *buste*), in plastic art, the

## BUST—BUSTARD.

name given to a sculptural representation of the head and upper part of the human body. The earliest busts formed by the ancients were probably those heads of Mercury which, when elevated on tall square blocks of stone, received the name of *Hermes* (q. v.). These hermes were afterwards frequently surmounted by representations of other divinities, such as Minerva; and as they gradually assumed more and more of the human form, they passed

Bust of Aristotle.

into busts, which were made of marble, bronze, &c. But it was not till very late in the history of art that busts, in the sense of portraits of individuals, came to be used, either in Greece or Rome; and it is remarkable that neither Greeks nor Romans designated them by any special name, for the Latin word *bustum* had a quite different meaning. It was not till Alexander's time that busts were used for purposes of portraiture in Greece; and most of the Roman busts which we possess belong to the period of the emperors. During the learned period of Greece, which commenced with Aristotle, portraits of men of letters formed an important department of art; and it became an object with the founders of museums and libraries to procure complete sets of them. The artists of this period exhibited remarkable ability in expressing the characters of the individuals whom they represented. In this way, we have well authenticated busts of Socrates, Plato, Zeno the Stoic, and other philosophers; of poets and orators, such as Isocrates and Demosthenes; of Athenian statesmen and distinguished women. In Rome, representations of the kings, and persons of distinction belonging to the earlier period, were probably made from the *imagines majorum* which every patrician preserved in his atrium, and which were commonly made of wax. These, no doubt, were often merely fanciful representations, partly taken, it may be, from the more prominent features which belonged to the existing members of the family. The earliest well authenticated Roman B. which we possess, is probably that of Scipio Africanus the Elder. During the empire, busts for the most part were accurate portraits, and still furnish us with the means of becoming acquainted with the features, not only of the emperors themselves, but of most other persons of distinction. Busts of poets and men of letters are far less frequently met with amongst the Romans than amongst the Greeks. The chief marks of the authenticity in these busts are the names which very frequently are inscribed on them, and, where these are not found, the comparison which we are enabled to make between them and coins. Private

collectors of busts were not unknown in antiquity, as, for example, M. Terentius Varro and Pomponius Atticus. In our own time, King Louis of Bavaria made, in his celebrated Valhalla, the most remarkable collection of busts which perhaps anywhere exists. The first complete collection of engravings from antique busts was made by Fulvius Urmarius in his *Illustrum Imagines* (Rome, 1569, and Antwerp, 1606). Recently, we have been indebted to Visconti's *Iconographic Grecque* (Paris, 1811) and *Iconographic Romaine* (Paris, 1817) for a similar collection.

**BUSTARD** (*Otis*), a genus of birds, sometimes made the type of a family, *Otidæ*, usually ranked in the order *Gruallæ* (q. v.). The general structure seems to agree best with that of the *Gruallæ*; but there are points of strong resemblance to gallinaceous birds, both in the appearance and habits of the bustards; while their power of running, and the use which they make of their wings to aid in running, are indicative of a relation to the *Struthionidae*, or ostrich tribe. They differ, however, from these birds in possessing wings quite capable of flight, although even when pressed by danger they often seek to escape by running, and the great B. of Europe has been pursued and taken by greyhounds.—Bustards are birds of bulky form, with long neck and long naked legs; the toes, three in number, all directed forward, short, united at the base, and edged with membrane; the wings rather rounded; the bill of moderate length, straight, or nearly so. They are mostly inhabitants of open plains, to which all their habits are adapted.—The **Great B.** (*Otis tarda*) was at one time plentiful in some parts of England, and was also an inhabitant of the south-east of Scotland; but extending cultivation, and the

Great Bustard.

persecution to which it has been subjected, have now rendered it a very rare British bird. It is common in the south and east of Europe, and abounds in the wide steppes of Tatar. It is the largest of European birds, the male sometimes weighing nearly 30 lbs. The female is much smaller than the male. The plumage is of a pale chestnut colour on the upper parts, beautifully variegated with black—much white and black on the wings, the tail tipped with white. The tail is short, spreading, and rounded. A tuft or plume about seven inches long, springing from the chin, passes backwards and downwards on each side, in the summer dress of the

## BUTCHER BIRD—BUTEA.

male, partly concealing a long stripe of bare skin on each side of the neck. The anatomy of the male exhibits a remarkable peculiarity in a large bag or pouch, capable of holding several pints, the entrance to which is between the under-side of the tongue and the lower mandible. The use of this bag is unknown; but it has been conjectured to be for conveying water to the females and young, in wide arid plains. The Great B. feeds indiscriminately on animal and vegetable food, swallows frogs, mice, worms, &c., and is very fond of turnip-tops. Its flesh is highly esteemed for its flavour. It is polygamous. No difficulty is found in taming it, but all attempts to reduce it to a state of true domestication have hitherto failed, from its not breeding in the poultry-yard.—The LITTLE B. (*O. tetraz*), frequent in the south of Europe and north of Africa, is only an accidental visitant in Britain. It is not half the size of the Great Bustard.—The BLACK-HEADED B. (*O. nigriceps*) is found in large flocks in the open plains of the Mahratta country. Its flesh is esteemed one of the greatest delicacies which India produces.—The KORI B. (*O. Kori*) of South Africa, a magnificent bird, standing upwards of five feet in height, has a similar reputation as one of the best kinds of game.—Australia possesses a B. (*O. Australasicus*) somewhat exceeding the Great B. of Europe in stature. It is called Wild Turkey by the colonists of New South Wales. Its plumage is finely freckled or spotted; the prevailing colour is brown. It has become comparatively rare in the more settled districts, its flesh being particularly delicate and well flavoured, but may be seen stalking majestically in the grassy plains, wherever human footsteps are still rare.

**BU'TCHER BIRD.** See SHRIKE.

**BUTCHERS' BROOM** (*Ruscus*), a genus of plants of the natural order *Liliaceæ*, with male and female flowers on separate plants, a perianth of six leaves, filaments united, one style, and the fruit a berry. The common B. B. (*R. aculeatus*) is a shrubby, or almost shrubby evergreen plant, with a biennial

Butchers' Broom :  
a, branch, with flowers ; b, a berry ; c, a seed ;  
d, a female flower.

stem, 1—3 feet high, sending out many short branches and ovate alternate sharp-pointed false leaves of the same substance as the branches, the flowers minute and arising from the disk of the false leaves, solitary; the berries red, almost as large as wild-cherries, and of a sweetish taste. It is common in many parts of the south of Europe,

and in the south of England in woods and hedges. The English name is derived from the use made of the plant by butchers, to sweep their blocks. It grows well under trees or shrubs, and can often be advantageously introduced for ornamental purposes. The root was formerly much used in medicine. It is aperient and diuretic.—*R. hypophyllum*, a native of Italy, had once a considerable reputation as a stimulant of the uterus.

**BUTE**, an island in the Firth of Clyde, Scotland, separated from the coast of Argyle by a narrow winding strait, called the Kyles of Bute, mostly under a mile wide, about 6 miles distant from the west coast of Ayrshire, and 8 miles north of Arran. It is about 16 miles long, of irregular breadth, and with an area of 60 square miles. The surface to the north is high, rugged, and barren; in the centre and south it is low and undulating, and comparatively fertile. The highest point rises 875 feet. The coast is rocky, and has some bays. The island has several small lakes. The climate is milder than in any other part of Scotland, and though moist, less so than on the west coast generally; hence, it is much resorted to by invalids. In the south, the soil is sandy; towards the north, clay predominates. Most of the arable land is under tillage, and agriculture is in a good state. The chief crops are oats and wheat. Pop. (1871) 10,064. The principal town is Rothesay. Most of the island belongs to the Marquis of Bute, whose beautiful seat, Mount Stuart, is about 4 miles south from Rothesay. Among the antiquities of B. are Rothesay Castle, Kames Castle, Kilmorie Castle, St Blaine's Chapel, Dungly, a remarkable vitrified fort on a high crag on the south-west coast, and the Devil's Caldron, a circular erection, the original purpose of which is not well known. B. and the neighbouring isles were for many centuries subject to the Norwegians.

**BUTCHERSHIRE**, a county in the south-west of Scotland, comprising the isles of Bute (q. v.) and Arran (q. v.), and the Cumbraes, Holy Isle, Pladda, Inchmarnoch, and other smaller islands. The area of the whole, according to the Ordnance Survey, is 225 square miles, or 143,977 statute acres. The population, in 1871, was 16,977. B. returns one member to parliament. The county town is Rothesay, in the island of Bute.

**BUTE, JOHN STUART**, third EARL OF, was born in 1718, and died in 1792. About 1737, he attracted the favourable notice of Frederick Prince of Wales, who made him one of his Lords of the Bedchamber. After the death of the prince, he became Groom of the Stole to his son, afterwards George III., over whose mind he obtained a strong influence. In March 1761, he was appointed one of the principal Secretaries of State; and from the 29th May 1762 to the 8th April 1763, he was Prime Minister. His government is memorable only as one of the most unpopular that ever held office in Britain, its fundamental principle being the supremacy of the royal prerogative, of which the executive government were merely the humble servants. Lord Bute was given to scientific pursuits, especially botany, and shewed himself a liberal patron of literature and art. He married the only daughter of Lady Mary Wortley Montagu.

**BUTTEA**, a genus of plants of the natural order *Leguminosæ*, sub-order *Papilionaceæ*, remarkable for the great length of the standard of the flower, and having a compressed one-seeded pod, membranaceous at the apex. The best known species are *B. frondosa* and *B. superba*, natives of India; and the former very widely diffused throughout that country, generally appearing as a sort of shrub in

## BUTLER.

the neighbourhood of villages, but in the jungles growing into a small tree. These trees present a gorgeous sight when covered with racemes of large deep scarlet flowers. They have trifoliate leaves, with roundish leaflets, velvety beneath. They yield a resinous exudation, which occurs in the form of lurid red tears, often covering the twigs, and is one of the kinds of Lac (q. v.) brought to the market in India. The juice of the tree is not red, and the lac is supposed to be elaborated by insects, but of what species is unknown.—*B. frondosa* is called the *Dhak* Tree in India. The bark and roots are very fibrous, and the fibre is used for calking boats. The flowers, called *Tessoo* or *Kessoo*, yield 'a beautiful dye, which is likely to come into extensive use' (*Royale*).

BUTLER, JOSEPH, one of the most eminent of English divines, was born in 1692 at Wantage, in Berkshire, where his father kept a shop. With a view to the ministry of the Presbyterian Church, he attended a dissenting academy at Tewkesbury, in Gloucestershire. At the age of 22, he gave proof of high metaphysical ability in a letter to Dr Samuel Clarke, usually appended to that celebrated writer's *a-priori* demonstration, to which it offers some objections. About this time, he made up his mind to join the Church of England, and in March 1714 entered Oriel College, Oxford. Soon after, he took orders. In 1718, he was appointed preacher at the Rolls Chapel, where he preached those remarkable sermons which he published in 1726. The first three, *On Human Nature*, constitute one of the most important contributions ever made to moral science. The scope of the reasoning is briefly, that virtue is consonant with, and vice a violation of, man's nature. In 1725, B. was presented to the rich benefice of Stanhope, in the county of Durham, to which he removed in the following year. Here he resided in great retirement till 1733. His friend Secker, the archbishop, desired to see him promoted to some more important position, and mentioned his name once to Queen Caroline. The queen thought he had been dead, and asked Archbishop Blackburne if it were not so. 'No, madam,' said the archbishop; 'but he is buried.' In 1733, B. became chaplain to his friend Lord Chancellor Talbot, and at the same time a prebendary of Rochester. In 1736, he published the great work of which the germs were contained in his three sermons, and which has entitled him, in the eyes of his eloquent disciple Chalmers, to be called 'the Bacon of theology.' The leading aim of the *Analogy* is to shew, that all the objections to revealed religion are equally applicable to the whole constitution of nature, and that the general analogy between the principles of divine government, as revealed in the Scriptures, and those manifested in the course of nature, warrants the conclusion that they have one Author. Soon after the publication of this work, B. was appointed clerk of the closet to the queen, who greatly prized his conversation. In 1738, he was made Bishop of Bristol; in 1740, Dean of St Paul's; and in 1750, he was translated to the see of Durham. He lived only to make one visitation of his diocese. His 'charge' on the occasion, in which he pointed out, with characteristic depth of insight, the importance of a due maintenance of the externals of religion, as a means of keeping alive the thought of it in the minds of the people, subjected him to much censure as betraying a tendency to Roman Catholicism—a charge unworthy now of serious notice. B.'s private character was such as became a Christian prelate: grave and judicious, he was at the same time meek and generous. His intercourse with his clergy and people was frank and humane; his episcopal treasures were wisely

and munificently distributed, as not his own; and no anxious legatee looked with hope to his death. That event took place at Bath, June 16, 1752, and the good bishop's remains were buried in Bristol Cathedral. His works, notwithstanding a dry and uninteresting style, have gone through numerous editions. The best is that edited with a life, &c., by Fitzgerald.

BUTLER, SAMUEL, poet, was born at Strensham, Worcestershire, in 1612. His father was a farmer in that place, and said to be a person of some education. Young B., after acquiring the rudiments of his education at home, was placed at the college school at Worcester. His progress there was rapid, and on leaving it, he proceeded to one of the universities. After finishing his education, he was appointed clerk to T. Jeffreys, Esq., justice of the peace, and in his leisure hours devoted himself to the study of music and poetry. He afterwards entered the household of the Countess of Kent, which he left, and went to live with Sir Samuel Luke, who resided in the same county. After the king's restoration, he was made secretary to the Earl of Carberry, which office he held till 1661. About this time, B. married a Mrs Herbert, a lady of good family and some property, which, however, was afterwards lost by being invested in bad securities. He published the first part of *Hudibras* in 1663, and its reception at court was immediate and triumphant. It received all the favour Charles could spare from his spaniels and his mistresses, and he deigned even to garnish his royal conversation with its wit. The courtiers took up the fashion, the coffee-houses and taverns followed suit, and finally the mob went into raptures, in imitation of its betters. *Hudibras* was pirated within four weeks of its publication. The king had wit enough to see the merit of the work, but he lacked generosity to relieve the necessities of the writer. There seems to be no good reason to believe that B.'s palm ever tingled to the touch of royal pension or gratuity. Poverty is almost the only thing in B.'s life that one is certain of. In 1664, he published the second part of his book, and a third part appeared in 1678. He died in Rose Street, Covent Garden, in 1680; and while some say that he starved from pride, all agree that at his death he was very poor.

*Hudibras* is a kind of metrical *Don Quixote*; and if the work of Cervantes stands at the head of its class in the literature of Spain, *Hudibras* occupies the same place in the literature of England. The Puritans are the subjects of B.'s derision, and King Charles must have felt that the poet avenged for him the battle of Worcester. The weight, compression, and plenteousness of the wit is wonderful. *Hudibras* is like a mass of crystals, every point flashes. It is beyond any other book, of wit 'all compact.' B. thinks in witty couplets, he argues in them, he spears his foes with a jest, he routs and chases them into oblivion with unextinguishable laughter. His best things have become proverbs. His mass of wit has been grated down into common speech, and particles of it may be found any day glittering in the talk of English ploughmen and artisans.

BUTLER, WILLIAM ARCHER, a religious and philosophical writer of singularly high promise, was born in 1814, at Annerville, near Clonmel, Ireland. He was originally a Roman Catholic, but subsequently became a Protestant, and studied at Trinity College, Dublin, where he was appointed Professor of Moral Philosophy in 1837. He died in 1848. The principal work on which his reputation is based, is the *Lectures on the History of Ancient Philosophy*,

## BUTLERAGE OF WINE—BUTTER.

edited with notes by W. Hepworth Thomson (Cambridge, 1856, 2 vols.). These lectures are remarkable for their great learning, eloquence, and depth of judgment. Besides his lectures, there have appeared, *Sermons*, with a memoir by the Rev. Thomas Woodward (Dublin, 1849); *Letters on the Development of Christian Doctrine* (Dublin, 1850); *Letters on Romanism* (Lond. 1854).

**BUTLERAGE OF WINE**, as described by Blackstone and Stephen, is a very ancient hereditary duty belonging to the crown, and is otherwise called the *priseage* of wine. This duty is taken notice of in the Great Roll of the Exchequer, 8 Richard I., still extant. Under the right to levy it, the crown could take two tuns of wine from every ship (English or foreign) importing into England twenty tuns or more, one before, and one behind the mast; which, by charter of Edward I., was exchanged into a duty of two shillings for every tun imported by merchant strangers, and called butlerage, because paid to the king's butler.

**BUTOMUS**, a genus of aquatic plants, of which one species, *B. umbellatus*, is frequent in ditches and ponds in England, Ireland, and many parts of Europe, but is very rare in Scotland. It is popularly called Flowering Rush, and is one of the plants to which the praise has been assigned of being the

Scythians, Thracians, and Phrygians, whilst the Romans obtained it from Germany. In Southern Europe, at the present time, B. is very sparingly used; and in Italy, Spain, Portugal, and Southern France, it is sold by apothecaries as a medicinal agent for external application. The amount of B. in cows' milk (q. v.) is about 4 per cent, though the kind of pasture, quantity of milk, and general condition, influence the relative quantity of the several ingredients of milk. In the extraction of B., the milk is allowed to cool, and the cream which rises to the surface is skimmed off, and put into a large, deep, earthenware vessel, where it lies for several days till enough has been collected for a *churning*. Any difference in the exact mode of treatment of the milk yields a B. with some peculiarity or other. Thus, the B. and cream of Devonshire, which are famed for their superior richness, owe this in greater part to the mode of manipulating the milk, and not to the special character of that fluid, or to the richness of the pastures in those districts. The milk in Devonshire is not allowed to cool slowly, as elsewhere, but is at once placed in large deep pans, and carefully heated. A scum quickly rises, which is pushed to the side; and whenever the bubbles of steam appear, the milk is removed, and allowed to cool in the ordinary way, when a good deal of the milk thickens to the consistence of B., and is skimmed off as the celebrated *Devonshire clouted cream*. In England, the B. of Epping and Cambridge is highly esteemed, and in every part of Great Britain, the Dutch B., in a salted form, is very largely consumed; indeed, three-fourths of all the foreign B. consumed in Great Britain is imported from Holland.

In order to separate the B. from milk, recourse is always had to the process of agitation in CHURNS (q. v.). The principle involved in each and all of the forms of this apparatus is the thorough agitation of the contents, so as to cause the rupture of the minute fat globules present in the milk, and the incorporation or kneading of these ruptured fat globules into larger or smaller masses of butter. The cream is strained through cloth into the churn, to remove any foreign matter; and the agitators being set in motion, the friction of the movement, combined with the admission of air, and the chemical changes it induces, raises the temperature of the whole contents. At one time, it was thought that one great object of the agitation was the admission of the oxygen of the air, which becoming thoroughly incorporated with constituents of the milk, combined therewith, and, as a consequence, led to the separation of the butter. It is found, however, that B. can be obtained from milk by mere agitation, without the admission of the oxygen of the air. At the same time, in the ordinary way of churning, oxygen does play a subordinate part by combining with the sugar of the milk, and forming lactic acid, which in its turn sours the milk, and separates therefrom the caseine (q. v.)—cheese-matter—in minute clots or flakes, yielding what is commonly called *sour* or *butter milk*. The process of churning must be conducted at a medium rate. If too quickly performed, the B. is soft and frothy, and is said to be *burst*; whilst when too slowly made, it is highly tenacious, strong tasting, and badly flavoured. When all the B. has come, which is known by the particles agglutinating into irregular masses, the B. is made by taking the lumps, and well washing and kneading them on a wooden board in a tub of pure spring-water till all the butter-milk has been expressed; it is then divided into the requisite size of lumps, fashioned into rolls, or moulded into forms, and usually stamped with some device. In

*Butomus umbellatus.*

most beautiful in the British flora. The leaves are all radical, 2–3 feet long, linear, triangular, their sharp edges sometimes cutting the mouths of cattle, whence the generic name (Gr. *ox-cutting*). The scape, or flowering stem, is longer than the leaves, terminating in a large umbel of rose-coloured flowers, readily distinguished from those of all other British plants by having nine stamens, six in an outer, and three in an inner row.

**BUTTER** (Ger. *butter*; Fr. *beurre*; Lat. *butterum*) is the fatty substance present in the milk of the mammalia, and capable of being extracted from it. In ancient times, the Hebrews seem to have made copious use of butter as food; but the Greeks and the Romans used it only as an ointment in their baths, and it is probable that the Greeks obtained their knowledge of the substance from

## BUTTER—BUTTERFLY.

the making up of the B., the hands of the operator must be scrupulously clean, and be free from the slightest taint of soap. Persons who are subject to moist hands should never knead B., as it is very liable to be contaminated by the slightest foreign matter, especially animal secretions; and it is better always for the operator to wash the hands with water containing some oatmeal before commencing. So important is this source of contamination regarded in America, that every endeavour is made to get quit of manual labour in working the B., and a wooden butter-worker has been invented, and is largely used there. When newly prepared, the B. is called *fresh* or *sweet* B., and is of a yellow colour, which is well known to be deeper as the pasture on which the cows have been fed is richer, and hence the poorer kinds of B. are often artificially coloured with a little annatto (q. v.), and rarely with the juice of carrots.

A large quantity of the B. sent into market has more or less common salt added, for the purpose of preserving it. For use within a week or two, the proportion of common salt employed is about half an ounce to two pounds of B., though, where it has to be kept for some time, as much as one ounce of salt to one pound of B. is used. The incorporation requires to be carefully and dexterously done, so that the resulting material may be uniform; and the better plan is to add only a portion of the salt at a time, and to knead and re-knead the B. till the whole is thoroughly mixed. When the less amount of salt has been employed, the result is *powdered* B., and the larger quantity yields *salt* butter. Much of the latter is closely packed in small wooden firkins or *kits*, and occasionally in stoneware, and sent into market. Great care must be taken to have these kits, and indeed to have every vessel used in the preparation, as clean or *sweet* as possible. Constant rinsings with cold water, and scaldings with boiling water, are resorted to. Attention must likewise be paid to the atmosphere of the apartments in which the milk is first placed, and in which the subsequent operations go on, as a tainted atmosphere always tends to injure the quality of the marketable commodity.

The adulterations liable to be present in B. are an undue proportion of salt and water, and these run up occasionally to upwards of 33 per cent., or one-third of the total weight. Another adulteration is the presence of lactate of zinc, derived from the milk being placed in zinc pails and basins, from the impression that by some imaginary electrical influence an increase in the amount of cream will be the result; but though this is not attained, yet the milk tending to form lactic acid, the latter attacks the zinc vessel, and forms lactate of zinc, which dissolves in the milk, and thereby contaminates it, imparting an unpleasant taste, and, when present in larger quantity, leading to violent spasmodic vomiting. When B. is allowed to get old, it becomes rancid, and tastes and smells disagreeably. To some extent, an acid is formed, called Butyric Acid (q. v.). The use of B. in diet will be considered under FOOD and NUTRITION.

**BUTTER**, in Chemistry, is often applied generically to any substance of the consistence of B., and is therefore used to designate palm, cocoanut, shea, and nutmeg oils. It is also applied to certain metallic substances which have an oily aspect and consistence resembling melted B.; thus we have B. of antimony, bismuth, zinc, and tin.—**BUTTER** of Antimony is a thick, dense, oily compound, produced by acting upon the native sulphuret of antimony ( $Sb_2S_3$ ) by concentrated hydrochloric acid ( $HCl$ ) and heat, when the oily chloride of antimony ( $SbCl_3$ ) is formed. See ANTIMONY.

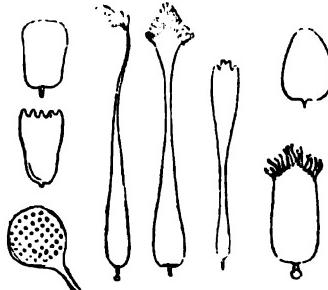

**BUTTER, Rock**, a mineral which may be regarded as a variety of Alum (q. v.)—an iron alum, appearing as a pasty exudation from rocks that contain alum or its constituents, particularly alum-slate and other schistose rocks. It occurs at Hurst alum-work, near Paisley, Scotland, and in a number of places on the continent of Europe. It is not unlike butter in colour, varying from yellowish white to sulphur yellow. It is rather greasy to the touch, and is easily broken in pieces.

**BUTTER TREE**, a name given to several tropical trees, of different natural orders, the fruits of which yield concrete fixed oils, having the appearance and used for the purposes of butter. The B. trees of India and Africa belong to the genus *Basseia* (q. v.), of the natural order Sapotaceæ; the B. trees of Guiana and Brazil to the genus *Caryocar* (q. v.), of the natural order *Rhambolaceæ*. The Oil-palms (q. v.), and the *Cocos butyracea* (see COCOA NUT), may also be regarded as B. trees, although not generally receiving that name.

**BUTTERCUP**. See RANUNCULUS.

**BUTTERFISH**. See GUNNEL.

**BUTTERFLY**, the common English name of all the diurnal Lepidopterous (q. v.) insects, corresponding with the genus *Papilio*, as originally defined by Linnaeus, but forming many genera in the most recent entomological systems. Butterflies exhibit a great similarity in almost all respects to other lepidopterous insects, the common characters of which will be found in the article on that order; but are distinguished even more than the rest of them generally, by brilliancy of colouring, which in butterflies also belongs to the under as well as the upper side of the wings, whilst the beauty of moths and hawk-moths appears chiefly on the upper side. Accordant with this circumstance, is the further peculiarity, that almost all butterflies, when at rest, usually hold their wings erect, the under side being thus chiefly exhibited; whilst the other lepidopterous insects, when at rest, hold their wings in a horizontal or somewhat inclined position, and some have them wrapped round the body. Butterflies are also the only lepidopterous insects which have no spines, bristles, or hooks on the margins of their wings, by which the second wing on each side can be attached to the first, but both when flying and

Various forms of Scales (highly magnified) from the Wings of Butterflies.

at rest, have all their wings quite separate. The manner in which the scales of the wings are imbricated, gives those of butterflies a smoother appearance than those of moths and hawk-moths. The antennæ of butterflies are generally simple, slender, and elongated, and terminated by a little club. Their caterpillars have always sixteen feet (see CATERPILLAR). The pupa or chrysalis is angular; is seldom enveloped in a cocoon; is generally

## BUTTERFLY.

suspended by the tail, by means of a silky substance, often to a leaf or twig, but is sometimes supported by bands around the middle; and generally exhibits more or less of that golden colouring from which both the names *aurela* (Lat. *aurum*) and *chrysalis* (Gr. *chrysos*) are derived.

Butterflies are found in all parts of the world; they are to be seen during the sunshine of the brief summer extracting nectar from the flowers even of Greenland and Spitzbergen, but they are most numerous in the warmest regions; where, however, many of them live chiefly in the shade of moist foliage, in woods and jungles. Dr Hooker, describing the scenery on the banks of the Great Runjeet in the Sikkim Himalaya, says, that 'by far the most striking feature consisted in the amazing quantity of superb butterflies, large tropical swallow-tails, black, with scarlet or yellow eyes on their wings. They were seen everywhere, sailing majestically through the still hot air, or fluttering from one scorching rock to another, and especially loving to settle on the damp sand of the river edge, where they sat by thousands, with erect wings, balancing themselves with a rocking motion, as their heavy sails inclined them to one side or the other, resembling a crowded fleet of yachts on a calm day.'

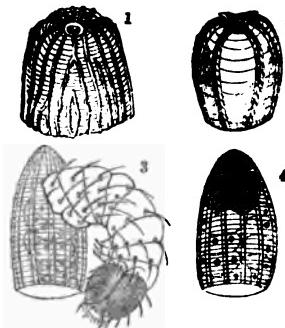

Butterflies possess no small power of wing; some of them, indeed, of which the wings are comparatively thin and delicate, are inferior in this respect, and have a sort of zigzag flight; but others soar in the air with a steady and continuous motion. Short-lived as they are all generally believed to be, some of the tropical species perform wonderful migrations; concerning which, however, nothing but the fact is yet well known. 'Frequently,' says Sir James Emerson Tennent in his work on *Ceylon*, 'the extraordinary sight presents itself of flights of these delicate creatures, generally of a white or pale yellow hue, apparently miles in breadth, and of such prodigious extension as to occupy hours and even days uninterruptedly in their passage, whence coming no one knows, whither going no one can tell.'

The number of species of *B.* is very great, and the arrangement of them has been found difficult, chiefly upon account of the great similarity in all important respects which prevails among them all. They are divided, however, into two well-marked sections, of which the first is characterised by having only a single pair of spurs or spines on the *tibia* (or fourth joints of the legs), placed at their lower extremity; whilst in the other section, the *tibiae* of the hinder legs have two pair of spurs, one pair at each extremity. This distinction, seemingly unimportant in itself, is accompanied by other differences. The second section of butterflies may be regarded as forming a sort of connecting link between butterflies and hawk-moths. A few British species belong to it, but the species are generally tropical, and some of them, found in tropical America, are remarkable for their rapidity and power of flight, and for the migrations which they perform, besides being amongst 'the most splendid insects in creation,' a resplendent green, imitable by art, relieving the velvet black of their wings, and varying with every change of light. The beautiful iridescence of the wings of these and many other butterflies is owing to the peculiar position of the scales.

Some groups of butterflies are remarkable for the imperfect development of the first pair of legs, so that they are generally described as having four legs instead of six.

The eggs of butterflies are deposited on the plants, the leaves of which are to supply the food of the caterpillars. In cold and temperate climates, the eggs deposited in autumn are not hatched till the following spring; but it is believed that many

species produce several broods in a year, as the eggs in summer may be hatched in a few days. The

Eggs of Butterflies, highly magnified:

1. Egg of Queen of Spain Fritillary (*Argynnis Lathonia*);
2. Egg of Peacock Butterfly (*Venessa Io*);
3. Larva of Large Garden White Butterfly (*Pieris Brassica*), in the act of bursting from the egg;
4. Egg of same insect, ready to hatch, shewing the head and curved body of enclosed caterpillar through the transparent envelope.—For these illustrations we are indebted to Westwood's excellent treatise on British Butterflies.

caterpillars of each species are generally confined to some particular kind of plant, the leaves of which they devour; their ravages are well known, but the excessive increase of their numbers is in part restrained by many enemies, and by none more than by the ichneumons (q. v.) and other insects which deposit their eggs in them, and the larvae of which feed on them. The annexed cut represents a common species of *B.*, with its larva and pupa; an account of *B.* transformations will be given under INSECT TRANSFORMATIONS.

Large Garden White Butterfly (*Pieris Brassica*), reduced:

*a.* caterpillar; *b.* chrysalis; *c.* perfect insect.

Butterflies vary in size from less than an inch to almost a foot across the expanded wings. The largest species are tropical. Some of the species are very widely distributed: *Cynthia cardui*, of which the caterpillar feeds on the leaves of thistles, is found not only throughout Europe, but in Egypt, Barbary, Senegal, Cape Colony, Madagascar, China, Java, Australia, Brazil, and North America, being, in fact, one of the most widely distributed of all insects. The geographical limits of other species appear to be very restricted. The diversity of colouring is almost endless, but a prevalence of certain hues, or of certain modes of the disposal of them, is observable throughout large groups. The

## BUTTERFLY FISH—BUTTON.

caterpillars of many species are variously furnished with spines, those of others—none of them British—have long fleshy prominences, horny at the tip, probably intended as means of defence. The hinder wings of many butterflies are curiously prolonged into tail-like appendages, one or more on each wing, which vary in form, being sometimes long and linear, sometimes broad and widening towards the extremity. These are, however, little seen in British species.

Butterflies are chiefly known to us as objects of admiration and of pleasing contemplation, enhancing the charms of the most delightful weather, and always associated with the most lovely scenes, or—it must be added—as a cause of annoyance and vexation by the ravages of their caterpillar young in our fields and gardens. There is, however, one small species (*Papilio humata*) which affords a supply of food to some of the wretched aborigines of Australia. Butterflies of this species congregate in such vast numbers on the masses of granite in the mountains, that they are collected by simply making smothered fires under the rocks, in the smoke of which they are suffocated. Bushels of them are thus procured, and they are baked by placing them on the heated ground, the down and wings removed, and the bodies made into cakes which resemble lumps of fat. The months of November, December, and January are quite a season of festivity from the abundance of this food.

Brief notices of a few of the principal kinds of B. will be found in other parts of this work. See CABBAGE BUTTERFLY, CAMBERWELL BEAUTY, PURPLE EMPEROR, &c.

**BUTTERFLY FISH.** See BLENNY.

**BUTTERFLY WEED, or PLEURISY ROOT** (*Asclepias tuberosa*, see ASCLEPIAS), a plant found in all parts of the United States, and which has obtained a considerable reputation for the medicinal virtues of its root. The root is large, formed of irregular tubers or spindle-shaped branches, externally yellowish brown, internally white, with a somewhat acrid nauseous taste when recent, merely bitter when dried. It yields its properties to boiling water, and is usually administered in the form of a decoction, sometimes in that of a powder. It is diaphoretic and expectorant, and has been found useful in the commencement of pulmonary affections, in rheumatism, and in dysentery.—The stem of the plant is erect and hairy, with spreading branches; the leaves oblongo-lanceolate, alternate, hairy, and somewhat crowded; the flowers orange-yellow, forming numerous umbels.

**BUTTERMILK** is the form of milk from which the butter or oily matter has been abstracted. See BUTTER. Buttermilk contains the caseine, sugar, and salts of ordinary milk, and is only deficient in oily matters. It is therefore nutritious, and is largely used in Ireland and Scotland as an article of food, being very generally partaken of with porridge and with potatoes. It may be drunk *ad libitum*, is a very agreeable cooling beverage, and is therefore useful in certain febrile and inflammatory conditions.

**BUTTERWORT** (*Pinguicula*), a genus of plants of the natural order *Lentibulariaceæ* (q. v.), distinguished by a two-lipped calyx, the upper lip trifid, the lower bifid; a spurred corolla, two-lipped and gaping, the upper lip arched; and a globose germin. The species are small plants with only radical leaves, found in the bogs and marshes of different quarters of the world. Some of them possess much beauty when in flower, particularly *P. grandiflora*, a rare native of the south of France and of Ireland. The common B.

(*P. vulgaris*) is abundant in the northern parts of Britain and of Europe. It has the power of coagulating milk. The Laplanders pour reindeer milk,

Butterwort (*Pinguicula vulgaris*):  
a, the entire plant; b, a flower.

warm from the animal, upon the leaves of this plant, instantly strain it, and set it aside for two or three days, till it acquires the consistence of cream, and some degree of acidity, when it is with them a favourite article of food. A little of it in this state will produce the same effect on warm reindeer milk which was at first produced by the leaves of the plant. The origin of the English name B. is sometimes referred to the power of coagulating milk, sometimes to the peculiar sliminess of the leaves.

**BUTTISHOLZ**, a village of Switzerland, in the canton of Lucerne, and 11 miles north-west from the city of that name. Near to B. is a large mound called the English Barrow, because here are buried 3000 Englishmen, followers of De Coucy, son-in-law of Edward III. of England, who, while devastating the cantons, were defeated and killed by Swiss peasants in 1376.

**BUTTMANN, PHILIPP KARL**, one of the most distinguished philologists of modern times, was born at Frankfurt-on-the-Main in 1764, and studied at Göttingen under Heyne. He became, in 1789, assistant in the Royal Library in Berlin, and rose successively to be secretary and librarian (1811). He held at the same time (1800—1808) a professorship in the Joachimsthal Gymnasium in Berlin, which he afterwards exchanged for a professorship in the newly founded university of that city. He died 21st June 1829. B. is best known by his Greek grammars, the *Griech. Grammatik* (Berl. 1792; 21st ed. by his son, Alexander Buttmann, 1863), and an abridgment of it, *Griech. Schulgram.* (14th ed. 1862); both have been translated into English. His *Lexilogus* (translated by Fishlake) and *Aufführliche Griech. Sprachlehre*, or Larger Greek Grammar, which have gone through several editions, are designed for scholars. In his *Mythologue*, he has collected his essays on the myths of the ancients.

**BUTTON.** The term B. is applied to the well-known appendages to dress used for fastening or for ornament; and to a sort of oblong latch moving

upon a pivot in the middle, used by joiners and cabinet-makers for fastening the lids of boxes, doors of presses, &c. The mass of fused metal found at the bottom of a crucible or cupel, after fusing or assaying, is also technically called a button.

The history of button-making is in many ways a curious one. Dating no further back as a trade of any importance than the reign of Elizabeth, it has undergone several extraordinary changes, produced chiefly by the ever-varying fashions in dress, but also by some simple, though ingenious inventions, as well as by foreign competition. In Great Britain, Birmingham has always been the principal seat of the button-manufacture. What has been called the 'Augustan age' of button-making in that city included the latter portion of last and the early part of the present century, when even tradesmen wore coats 'loaded with innumerable gilt buttons,' and when employers on a moderate scale in this manufacture were making incomes of from £2000 to £3000 a year, and their workmen from £2 to £4 per week. Early in the present century, Mr R. Sanders introduced the cloth-covered button, which initiated the change from those made of metal, and by which he rapidly made a fortune. His son, in 1825, effected the apparently trivial but really ingenious improvement of making it with a canvas tuft instead of a metal shank, by which both the button-holes and the garment itself were less subject to injury. This kind of button had an enormous sale, and is still much used. A further alteration was made on it by Mr W. Elliott, who patented, in 1837, a mode of covering the button with silk, having a pattern in the centre, the demand for which was at one time so great, that sixty looms were employed in London in making the special material required for them. In 1841, the old Dorsetshire wire and thread button was replaced by the 'three-fold linen button,' still considered by housewives indispensable for underclothing, since neither washing nor mangling destroys it. It is said to be the invention of Mr H. Jeffries, of Birmingham, but was patented by Mr J. Aston, and continues to be made in vast numbers. A single English firm recently consumed in one year for this kind of button, 63,000 yards of cloth and 34 tons of metal, upon which 250 hands were employed.

Turning now to other materials which have had a great 'success' in their day, we find that buttons made of hoof, under the name of 'horn buttons,' as introduced nearly 40 years ago by Mons. E. Bassot of Paris, were for a good many years most extensively manufactured at Birmingham, and sent to all parts of the world. In hoof buttons the trade is now comparatively insignificant, and the French makers possess the market for what of it remains. Tweed clothing and fabrics in imitation of it have, through the necessity of matching their various colours, led to the buttons for them being made of a rather uncommon material, namely, vegetable ivory (q. v.). This substance, which is the fruit of a palm, somewhat resembles true ivory, but is rather softer. It can be readily turned in the lathe, and dyed of various colours. More than twenty tons of it, valued at from £25 to £30 per ton, are weekly consumed in Birmingham in making buttons, and it is also largely used for the same purpose in France and Germany.

What we have hitherto said refers principally to what manufacturers call the revolutions of the trade; but there are other important branches which have been less subject to change, chief among these being the so-called 'pearl buttons'—that is, buttons made of mother-of-pearl shells. This has long been a leading branch, and employs a greater number of hands than any other. Metal buttons, too, although not relatively so important

as formerly, have never ceased to form a prominent section of the trade. They are a numerous class, and include all sorts for uniforms, trouser buttons, fancy buttons which are gilt, stamped, chased, or enamelled, and many cheap varieties in iron and other metals for export. Numerous kinds of composite buttons are also partly composed of metal. Glass buttons form another interesting branch, carried on to a considerable extent in Birmingham, but more largely in Bohemia and Paris; so also do porcelain buttons, which, although an English invention, are now almost exclusively made in France. Vulcanite (q. v.) buttons have been extensively made in the United States. As to other materials, a Birmingham manufacturer says it were easy to write out a long list from which buttons have been made, but very difficult to name one from which they have not been made.

We shall now describe briefly some of the processes in button-making, beginning with metal buttons. Circular discs, called 'blanks,' are first cut out of sheet brass or other metal by means of fly-presses, usually worked by girls. The fly-press consists of a vertical iron screw with a triple thread, to which screw is attached a horizontal arm, bending downwards at the end to form a handle. A punch attached to the press rises and falls with the motion of this handle, and rapidly cuts out the blanks. When large quantities of one pattern are required, a self-feeding, self-acting machine is used, which cuts out the blanks in rows at one blow, turning them out at the rate of 2000 gross per day. After being annealed, the blanks are next made convex by a blow from a stamp. The shanks are formed of wire by a separate machine, which cuts off pieces, and bends them into loops of the required form. When these are soldered on, the buttons are dressed on a lathe. They are then gilded and burnished; some, however, are only lacquered; and some, though gilt, are finished in a dead or frosted style.—'Shell' buttons are those with a convex face, a flat or convex back, and hollow. These are made of two blanks, that forming the face being larger than the back to which the shank is attached. These blanks are pressed into the required shape by dies worked in the fly-press, and then, by another die, the edge of the larger blank is lapped over the smaller, and thus attached without soldering. Livery and other buttons having a device in strong relief are stamped by a die placed in a stamping-press. See STAMPING OF METALS.

In making covered buttons, a metal blank is punched, and its edge is turned up by a die in a fly-press; then a smaller metal blank is punched with a hole in the middle, and of such size, that, when flat, it shall fit into the upturned edge of the first: this perforated blank, or *collet*, is next pressed into a concave or dished shape. Two cloth blanks—the face one of silk, and the other for the tuft of thin canvas—are now punched, one considerably larger than the front metal blank, the other somewhat smaller; the larger cloth blank is laid upon the flat face of the metal blank, which is filled with a disc of mill-board or paper, and its edges turned over; these edges are covered by the smaller cloth, and then the collet laid upon them with its concavity towards the cloth. They are now all pressed together in a sort of die or mould, by which means the collet is flattened and spread out, while the upturned edge of the metal blank is turned forcibly over it, thus securing the collet, and with it the cloth which is strained tightly on the face, and its edges bound between the blank and the collet, so that the whole is firmly held together. The linen-covered button for underclothing, above referred to, is formed of a single brass ring with a groove or canal on one face.

## BUTTONWOOD—BUTYRIC ACID.

Into this the edges of the two round linen blanks are placed, so that when the edges of the groove are pressed firmly down, the button is entirely covered with linen.

Buttons with holes, technically called 'four-holes,' 'three-holes,' and 'two-holes,' when of pearl-shell, wood, bone, or ivory, are cut with a tubular saw, turned separately in a lathe, and drilled. When of metal, the blanks are punched, then stamped in dies to the required form; the holes are punched, and 'rymered,' to round the sharp edges that would otherwise cut the thread.—Glass buttons are most largely made by taking a rod of glass of any colour, softening the end by heat, and pressing it into a mould, each half of which is fixed to one limb of a pair of pincers. The shank is placed into a hole in the mould before the melted glass is inserted.

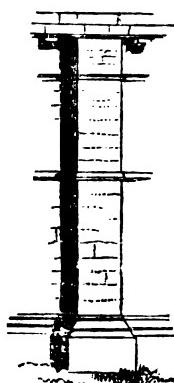

According to an estimate published a few years ago by Mr J. P. Turner of Birmingham, to whose paper we have been much indebted, the number of artisans employed in the button manufactures of that city was then as follows:

Making metal buttons of all kinds,	1200
" covered buttons, including linen,	1500
" pearl buttons,	2000
" vegetable ivory buttons,	700
" other kinds, as glass, horn, bone, wood, &c.,	600
Total,	6000

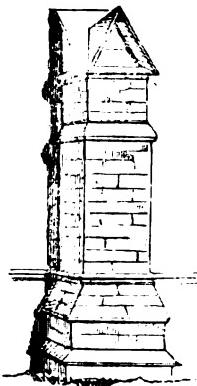

Probably about 1000 more are employed in London and elsewhere in Great Britain, and a large proportion of the whole are females. At that time, which was before the war with Germany, about 20,000 persons were employed in France, shewing how much more largely the button industry has been developed in that country. Germany is a still greater producer, the cheaper kinds of fancy buttons made in the Rhineish provinces of Prussia, the glass buttons of Bohemia, and the pearl buttons of Vienna being more extensively exported than those of any other country. Buttons of various kinds are made on a large scale in the United States, but that country still imports them largely from Europe.

## BUTTONWOOD. See PLANK.

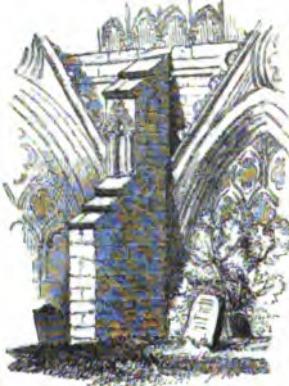

### VARIOUS FORMS OF BUTTRESSES.

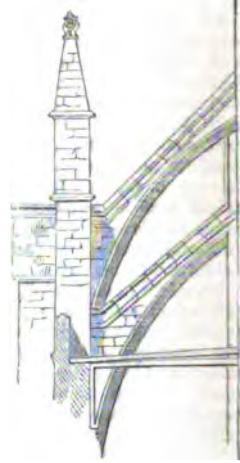

Fountains Abbey,  
c. 1170.

Dorchester, Oxfordshire.  
c. 1300.

Canterbury Cathedral.

Flying Buttress,  
Westminster Abbey.

**BUTTRESS** (Old Eng. *bottres*; Fr. *butte*), a projection for the purpose of giving additional support or strength to a wall. In the classical style, there were no buttresses, their place being, to a certain extent, supplied by pilasters, antae, &c. The different stages of Gothic architecture are marked by the form of buttresses employed, almost as distinctly as by the form of the arch. The Norman B. was broad, often semicircular, sometimes dieing into the wall at the top, and never projecting from it to any great extent. Early English buttresses project much more boldly, and are considerably narrower, than the Norman. They are frequently broken into stages, which diminish in size as they ascend. In the decorated style, this division into stages is almost invariable, the B. being often supplied with niches terminating in pinnacles, and very highly ornamented with carving, statues, &c. In the perpendicular style, they retain the forms which had been introduced during the decorated period, the ornamentation, of course, being varied to suit the character of the style. Flying buttresses—i. e., buttresses in the form of a sloping arch, connecting the upper and central portions of an arched structure with the vertical buttresses of the outer walls—were introduced into England

at the period of the Early English, though they existed on the continent previously, where they continued to be used to a greater extent. They were also very common in Scotland. In England, they are generally called arch-buttresses.

## BUTUÁ ROOT. See CICHAMPELOS.

**BUTYRIC ACID** may be best obtained by saponifying butter with potash, then adding dilute sulphuric acid till an acid reaction is attained, and distilling about one half of the mixture, adding a little water, and continuing the distillation till the residue is not acid. B. A. may also be obtained by allowing a small quantity of milk-curd to act upon a solution of sugar at a temperature of 77° to 86°, which excites a peculiar process of fermentation resulting in the formation of butyric acid. Some chalk is added to take up the B. A. whenever produced, and the better proportions to employ are 100 sugar, 8 to 10 fresh curd, and 50 chalk, with sufficient water to make a thin liquid. The butyrate of lime is left in the vessel, and on acting upon that by dilute hydrochloric or sulphuric acid, and redistilling, the free B. A. passes over in vapour, and is condensed. B. A. is a transparent, thin, oily liquid, with a most persistent

## BUTYRIC ETHER—BUXTORF.

rancid odour. It is mixable in all proportions in water, alcohol, ether, and oil of vitriol; has the specific gravity 973 (water being 1000), boils at 314°; though it volatilises at ordinary temperatures, as appears from the rancid odour of its vapour. Its chemical symbol is  $\text{HO.C}_4\text{H}_7\text{O}_2$ , and it combines with bases, such as lime, soda, &c., to form salts.

**BUTYRIC ETHER**, or **PINE-APPLE OIL**, is an exceedingly fragrant oil obtained by distilling butyric acid (or the butyrate of lime), alcohol, and sulphuric acid. The material which passes over is the B. E., and it is generally mixed with alcohol, and sold in commerce as *Artificial Pine-apple Oil*. It possesses the same very pleasant flavour which belongs to pine-apples, and there is little doubt that pine-apples owe their flavour to the presence of natural butyric ether. The artificial variety is now extensively used for flavouring confections, as pine-apple drops, for sophisticating bad rum, and for flavouring custards, ices, and creams, as also an acidulated drink or lemonade named Pine-apple Ale. B. E. alone cannot be used in perfumery for handkerchief use, as, when inhaled in even small quantity, it tends to cause irritation of the air-tubes of the lungs and intense headache, but it is employed as one material in the manufacture of compound perfumes. It is composed of ordinary ether ( $\text{C}_4\text{H}_8\text{O}$ ) and butyric acid ( $\text{C}_4\text{H}_7\text{O}_2 + \text{HO}$ ), and its strict chemical name and symbol is the butyrate of the oxide of ethyl ( $\text{C}_4\text{H}_8\text{O.C}_2\text{H}_5\text{O}_2$ ). It is remarkable that a substance possessing such a disagreeable odour as butyric acid (that of rancid butter) should be capable of forming, in part at least, a substance with such a pleasant flavour as artificial pine-apple oil.

**BUXA'R**, a town of Shahabad, in Behar, presidency of Bengal, situated on the right bank of the Ganges. It is chiefly remarkable as the scene of a victory gained in 1764 by Sir Hector Munro. At the head of 7072 men, of whom only 857 were Europeans, he defeated a native army of 40,000, and captured 133 guns. B. is 62 miles north-east of Benares, and 398 north-west of Calcutta. Pop. (1871) 13,446.

**BUXRAU'MIA**, a genus of Mosses, of which only one species is known, *B. aphylla*, a very rare British plant, remarkable for its apparent want of leaves; the whole plant above ground seeming to consist of a little conical bulb, with minute scales, which are, however, really its leaves.

**BUXTON**, a town in Derbyshire, 33 miles north-west of Derby. It lies 900 feet above the sea, in a deep valley, surrounded by hills and moors, which have been tastefully planted; the only approach being by a narrow ravine, by which the Wye flows into the Derwent. The new part of the town is much under the level of the old. Five miles to the east of B. is Chee Tor, a perpendicular limestone rock, rising to a height of between 300 and 400 feet from the Wye. B. has for 300 years been famous for its calcareous springs, tepid (82° F.), and cold (discharging 120 gallons of water per minute), and its chalybeate springs. It is visited annually, from June to October, by 12,000 to 14,000 persons, the waters being taken for indigestion, gout, rheumatism, and nervous and cutaneous diseases. Nearly 5000 strangers can be accommodated at one time. There is an institution, called the Devonshire Hospital, containing 100 beds, supported by subscription, where nearly 1000 patients are annually boarded and lodged free of charge. The baths and public walks are numerous. Much of the splendour of B. is due to the Dukes of Devonshire, one of whom, in the last century, at the cost of £120,000, erected an immense three-storied pile of buildings,

of gritstone, called the Crescent, a curve of 200 feet, with wings of 58 feet. It includes two hotels, a library, assembly rooms, &c. Near B. is the Diamond Hill, famous for its crystals; and Poole's Hole, a stalactitic cavern 560 yards long. The Romans had baths here. Mary Queen of Scots resided for some time at B., when in the custody of the Earl of Shrewsbury. B. is approached by railway both from north and south; and the baths, which were rebuilt some years ago, are considered among the finest in Europe. The town, which in 1871 had a population of 3717, is rapidly increasing. Two newspapers are published.

**BUXTON**, Sir THOMAS FOWELL, a man of singular earnestness and force of character, belonging to the class termed 'philanthropists,' was born in 1786 at Earl's Colne, Essex. The eldest son of a wealthy family, and early deprived of paternal guidance, his youth was distinguished chiefly by a strong development of animal energy, natural enough to a young Englishman whose full stature exceeded 6 feet 4 inches. At the university of Dublin, his mind at length asserted its claims, and the new consciousness of needing to raise the family fortunes animated him to extraordinary efforts. His preparatory education had been almost thrown away, but at 21 he left the university its most distinguished graduate. In that year he married a sister of the celebrated Mrs. Fry, and entered business as a brewer, with an energy which in due time was crowned with splendid prosperity. His warm religious and moral impulses soon brought him prominently forward as an advocate of philanthropic interests. Prison discipline formed one of the earliest subjects of his efforts. In 1818, he entered parliament as member for Weymouth, which he continued to represent for about 20 years, taking a prominent part in every debate on such questions as the amelioration of criminal law and of prison discipline, widow-burning and slave emancipation. The latter, in particular, engrossed a large share of his activity for many years, and no man on that side displayed more indomitable zeal and firmness in its advocacy. In 1837, he was rejected by his constituency, and refused ever after to stand for a borough. His philanthropic labours, however, terminated only with his life. In 1840, he received the well-merited distinction of a baronetcy. He died on the 19th February 1845.

**BUXTORF**, JOHANN, a celebrated orientalist, was born 25th December 1594, at Kamen, in Westphalia; studied at Marburg, Herborn, Basel, and Geneva. After travelling through Germany and Switzerland, he settled at Basel, where he became professor of Hebrew in 1611. He died of the plague, 13th September 1629. In a knowledge of rabbinical literature, he surpassed all his contemporaries. The two works which prove his extensive acquaintance with this recondite branch of theological study, are his *Biblia Hebraica Rabbinica* (Basel, 1618—1619), and his *Tiberias seu Commentarius Masorethicus* (Basel, 1620). The most useful of his grammatical works is the *Lexicon Hebreicum et Chaldaicum* (Basel, 1607).

**BUXTORF**, JOHANN, the son of the former, was born at Basel, 13th August 1598, and displayed at an early period a decided predilection for the same studies with his father. At five years of age—according to his rather credulous biographers—he could read German, Latin, and Hebrew. To perfect his knowledge of these tongues, he visited Holland, France, and Germany; and in 1630 was appointed to succeed his father in the chair of Hebrew at Basel, where he died 16th August 1664. Besides his *Lexicon Chaldaicum et Syriacum* (Basel, 1622),

and a work of Maimonides, entitled *More Nevochim* (Basel, 1629), which is an exposition of obscure passages of the Old Testament; he published from the MSS. of his father a *Lexicon Chaldaicum, Talmudicum, et Rabbinicium* (Basel, 1639), and *Concordantiae Bibliorum Hebraicorum* (Basel, 1632).

BU'XUS. See Box.

BUYING OF PLEAS by lawyers is prohibited by an old Scotch act passed in 1594. It is explained under the English term *champerty*, to which it is analogous.

BUYUKDEREH, a beautiful suburb of Constantinople, from which it is a few miles distant, situated on the Bosphorus, in the midst of the most charming scenery. It forms the summer residence of many of the Christian ambassadors, some of whom have splendid mansions here.

BU'ZZARD (*Buteo*), a genus of *Accipitres* (q. v.), or birds of prey, of the family *Falconidae*, having a rather small and weak bill, which bends from the base, and is not notched, as in falcons. The legs are short and strong, the tarsi covered with scales or with feathers, the toes short, and the claws strong. Buzzards may be regarded as an inferior kind of eagles; they do not possess courage equal to that of eagles and falcons, nor equal strength of bill or claws. They are large birds; the COMMON B.

Common Buzzard.

(*B. vulgaris*) measuring almost 4 feet from tip to tip of its outstretched wings. It is a bird still pretty common in Britain, although much less so than it formerly was. It is subject to variations of plumage; the prevailing colour is brown, with a considerable mixture of black on the upper parts, and of white or grayish-white on the under. It is sluggish and inactive, in comparison with many other birds of the same family; is usually slow in its flight, and often sits long on a tree, watching for prey, which, when it perceives, it glides silently into the air, and sweeping rapidly down, seizes it in its claws. This B. is plentiful in all the wooded parts of Europe; it is found also in the north of Africa, and is known to exist in the western parts of Asia; but it is doubtful how far it extends over that continent, a distinct although very similar species occurring in the Himalaya Mountains. The Common B. is, however, a North American bird. Tame female buzzards have been known in several instances to exhibit so strong a propensity for incubation, and the rearing

of young, at the proper season, that they have hatched hens' eggs and brought up the chickens, although if chickens not of their own hatching were brought within their reach, they devoured them. Meat given to the B. nurse was carefully divided among her nurplings, but they found out by their own instincts the use of grain and other vegetable food.—The ROUGH-LEGGED B. (*B. lagopus*) is very similar to the Common B., but is at once distinguished by having the tarsi feathered to the toes, whilst in the Common B. they are covered with scales. It is a rarer British bird, yet not of unfrequent occurrence; it is very widely diffused, being found in the Old World from Lapland to the Cape of Good Hope, and equally common in North America. It is most frequently to be seen in marshy districts, and often skimming over marshes, where it makes prey of frogs.—The RED-TAILED HAWK of North America is a species of B. (*Buteo borealis*). It is in very bad repute among American farmers and housewives for its frequent invasion of poultry-yards, from which it has acquired the name of *Hen-hawk*.—Several other species of B. appear to be limited to particular parts of the world, as *Buteo Jackal*—so called from the resemblance of its voice to that of the jackal—to South Africa, and *B. melanosternon* to Australia. The Australian species has the head, chest, and centre of the belly deep black.—The HONEY BUZZARDS (q. v.) belong to a different genus, although nearly allied to the true buzzards, as are also the HARRIERS (q. v.), of which the most common British species, the Marsh Harrier, is sometimes called the *Moor Buzzard*.—BALD B. is a name of the OSPREY (q. v.).

BYBLOS, an ancient city of Phoenicia, now called Jubell, situated at the base of the lower range of the Libanus, about half-way between Tripoli and Beyrouth. B. was famous as the birthplace of Adonis, or Thammuz, in whose honour a splendid temple was erected, which attracted many worshippers. The name given to the town by the Jews was Giblah, and its inhabitants the Giblites are noticed in the Scriptures as stone-squarers and calkers of ships. A wall belonging, apparently, to the era of the Crusades, surrounds the town, and the remains of a Roman theatre are still visible.—B. was also the name of a town in the Egyptian Delta, celebrated for its manufacture of papyrus from the byblus or papyrus plant.

BY-LAWS are the private regulations which are usually made by corporate bodies for the control and government of the corporation. They are binding, unless contrary to the laws of the land, or to the charter, or act of incorporation, or, as it has been decided in England, unless they are manifestly unreasonable. Blackstone tells us that the right of making B. was allowed by the law of the Twelve Tables at Rome; and Mr Stephen, in his *Commentaries*, states that in the law of England such a right is so much of course, as regards every corporation, that if the charter by which certain persons are incorporated give to a select body, out of their whole number, a power to make B. as to certain specified matters, the body at large is nevertheless at liberty to make them with regard to all matters not specified. Every corporation, too, can of course alter or repeal the B. which itself has made. By the Municipal Corporation Act, 5 and 6 Will. IV. c. 76, s. 90, borough councils have power to make B. for the government of the borough, and for the prevention and suppression of nuisances; such by-laws, however, not to be of force till the expiration of forty days after the same, or a copy, shall have been sent to one of the secretaries of state, during which period

Her Majesty, with the advice of her privy council, may either disallow the B., or a part, or enlarge the time within which they shall not come into force. Railway companies are required to lay before the Board of Trade, for the approbation of that authority, certified copies of the B. and regulations by which the railway is governed, which B. may be disallowed by the Board at its pleasure. See CANAL, CARRIER, RAILWAY.

BYNG, GEORGE, VISCOUNT TORRINGTON, a British admiral, born January 27, 1663, eldest son of John Byng, Esq., of Wrotham, Kent, entered the navy as a volunteer at the age of 15, and rapidly rose to the rank of lieutenant. In 1688, he recommended himself to the Prince of Orange by his activity and zeal in attacking the officers of the fleet to the cause of the Revolution, and was advanced to the rank of captain. In 1702 he took part in the capturing and burning of the Spanish fleet at Vigo, and in the following year was made rear-admiral of the red. The attack on Gibraltar was solely confided to his command, and for his gallant conduct at the battle of Malaga he was knighted by Queen Anne. In 1708 he became admiral of the blue, and commanded a squadron fitted out to oppose an intended invasion of Scotland from France, on the part of the Pretender. He pursued the French fleet to the Firth of Forth, took one ship, and forced the fleet back to Dunkirk, on which occasion he was presented with the freedom of the city of Edinburgh. On the breaking out of the rebellion of 1715, he was appointed to the command of a squadron in the Downs, and for important services against the French, was created a baronet. In 1718, he commanded the English fleet sent to Sicily for the protection of the neutrality of Italy, and gained a victory over the Spanish fleet off Messina. Soon after, he was appointed treasurer of the navy and rear-admiral of Great Britain. In January 1721, he was sworn one of the privy council, and in September following, created Baron Southill and Viscount Torrington. On the revival of the Order of the Bath, in 1725, he was installed one of the knights; and, on the accession of George II., was nominated First Lord of the Admiralty. He represented Plymouth in parliament from 1708 until 1721. Died January 17, 1733.

BYNG, JOHN, a brave but ill-fated British admiral, fourth son of the preceding, born in 1704, entered the navy early, served under his father, and, in 1727, became captain. In 1748, he had attained the rank of admiral of the red. In 1756, he was appointed to command a squadron of ten ships of the line in the Mediterranean, destined for the relief of Minorca, at that time blockaded by a French fleet under La Galissoniere. On the 20th May, B. made the signal to engage, which was obeyed by Rear-admiral West with such impetuosity that several of the enemy's ships were driven out of the line; but B. not advancing to his support, the French were allowed to escape, and Minorca was lost. The dissatisfaction in England, on the news arriving, was taken advantage of by the ministry to avert the public odium from their own inefficient measures. B. was tried by a court-martial, and condemned to death, for a breach of the 12th article of war, but recommended to mercy. Sacrificed to the general indignation, he was shot on board the *Monarch*, at Portsmouth, March 14, 1757, meeting his fate with firmness and resignation. In the fleet, he was not popular, being a strict disciplinarian.

BYNKERSHOEK, CORNELIUS VAN, a Dutch jurisconsult, was born at Middelburg, in Zealand, 29th May 1673. He studied at the university of

Franeker, took the degree of doctor in 1694, and immediately after commenced to practise as an advocate at the Hague. In 1703, he was elected by the states-general a member of the supreme court, and in the exercise of his functions, soon had occasion to observe how defective and vague was the common law of the country. In 1710, with a view to remedy this, he published the first part of his *Observationes Juris Roman*; in 1719, his *Opuscula Varii Argumenti*; and in 1724, he was elevated to the dignity of president of the supreme court. In 1733, appeared the rest of his *Observationes Juris Roman*. B. now began to devote himself earnestly to the study of Dutch and international law, acquiring, of the former in particular, a most extensive and solid knowledge. His great work on this subject is his *Quæstiones Juris Privati*, which he did not live to finish, and on the other, his *Quæstiones Juris Publici*. In addition to these, B. collected (from his notes) the decisions and proceedings of the supreme court in his time, under the title *Observationes Tumultuaria*, and besides (what is perhaps his most valuable work) made a digest under the title of *Corpus Juris Hollandici et Zelandici*, of all the laws of his own country, whether statutory, or existing in the decisions of courts, or in the practice of the bar, or in the customs of particular places. He died 16th April 1743. A complete edition of his works was published by Professor Vicat of Geneva, in 1761.

BYRGJUS, JUSTRUS, or, more properly, JOBST BÜRGJ, the inventor of various astronomical instruments, was born 28th February 1552, at Lichtensteig, in the canton of St Gall, Switzerland. In 1553, he went into the service of the learned Landgraf of Hesse, Wilhelm IV. His first work was a celestial globe, the surface of which was plated with silver, and in which the stars were placed according to his own observations. The landgraf sent it to the Emperor Rudolf II., who thought it so beautiful, that in 1604, he appointed B. his own mechanician. B. subsequently went to Austria, but returned to Cassel in 1622, where he died in 1633. Many of his reputed discoveries and inventions are questioned, such as those of logarithms and the proportional compasses; but he seems to have hit upon something like both, while it is certain that he was the inventor of a method of resolving spherical triangles.

BYRLAW, BIRLAW, or BURLAW, the name given to a sort of popular jurisprudence formerly in use in Scotland, in villages and among husbandmen. Sir John Skene, writing in 1597, when the system was in full force, defines B. as 'leges rusticorum, de re rustica late—laws made by husbandmen, concerning neighbourhood to be kept among themselves.'—*Reg. Majest. lib. iv. c. 39; De Verb. Signif. voce Bvrlaw.* As the B. was enacted by the common consent of the villagers or neighbours, so it was administered by judges chosen by them from their own ranks. These judges were commonly called 'byrlaw men,' a name which is still applied in some parts of Scotland to an arbiter, oddsmen, or umpire. The courts which they held were called 'byrlaw courts,' and took cognizance of disputes between neighbour and neighbour. B. is supposed to be derived from boor, or baur, a countryman.

BYRON, GEORGE GORDON, LORD, a great English poet, was born in Holles Street, London, on the 22d of January 1788. He was the only son of Captain John Byron, of the Guards, and Catherine Gordon of Gight, an heiress in Aberdeenshire. Captain Byron and his wife did not live happily. Domestic peace perished in the conflict of their ungovernable tempers.

The husband's habits were profligate in the highest degree, and the wife's fortune was soon squandered in the debauch and at the gambling-table. Separated from her husband, the lady retired to the city of Aberdeen with her little lame boy, whom she passionately loved, her sole income at this time being about £130 per annum. In his 11th year, B. succeeded his grand-uncle, William Lord Byron; and mother and son immediately left the north for Newstead Abbey, the ancient seat of the family, situated a few miles distant from Nottingham, in the romantic district which Sherwood Forest shadowed, and which was once familiar with the bugle of Robin Hood. On succeeding to the title, B. was placed in a private school at Dulwich, and thereafter sent to Harrow. The most remarkable thing about B.'s early year was his extraordinary attachments. Like almost every member of the poetic tribe, he 'had a passion for the name of Mary.' In his 8th year, in Aberdeenshire, he fell in love with Mary Duff. Margaret Parker, a cousin of his own, and who died early, was his next idol. His strongest passion was, however, for Mary Chaworth. This lady he first met when on a visit to Newstead in 1803, at which date he was in his 15th year. Miss Chaworth's father had been killed in a duel by Lord Byron, the grand-uncle of the poet, and marriage would have healed the family feud, and would have joined rich estates. But it was not to be. Miss Chaworth was B.'s senior by two years, and evidently felt little flattered by the worship of the lame Harrow boy. Next year came the parting interview described in *The Dream*, with which every Englishman is familiar now as with a personal experience. In 1805, B. removed to Trinity College, Cambridge; and two years thereafter his first volume of verse, entitled *Hours of Idleness*, was printed at Newark. The poems therein contained were not absolutely without merit, but they might have been written by any well-educated

Autograph of Byron.

lad, who, in addition to ordinary ability, possessed the slightest touch of poetic sensibility. The volume was fiercely assailed by Lord (then Mr) Brougham in the *Edinburgh Review*, and his sarcasms stung B. into a poet. The satire, *English Bards and Scotch Reviewers*, was written in reply to the article in the *Edinburgh*, and the town was taken by a play of wit and a mastery of versification unequalled since the days of Pope. In the babble of praise that immediately arose, B. withdrew from England, visited the shores of the Mediterranean, and sojourned in Turkey and Greece. On his return in 1812 he published the first two cantos of *Childe Harold*, with immense success, and was at once enrolled among the great poets of his country. During the next two years, he produced *The Giaour*, *The Bride of Abydos*, *The Corsair*, and *Lara*. While these brilliant pieces were flowing from his pen, he was indulging in all the revelries and excesses of the metropolis. What was noblest in the man revolted at this mode of life, and, in an effort to escape from it, he married Miss Milbanke, daughter of Sir Ralph Milbanke, a baronet in the county of Durham. This union proved singularly infelicitous. It lasted only a year, and during that brief period, money embarrassments, recriminations, and all the miseries incident to an ill-assorted marriage, were of frequent occurrence. After the birth of her child Ada, Lady Byron retired to her

father's house, and refused to return. This event, from the celebrity of one of the parties, caused considerable excitement in the fashionable world. B. became the subject of all uncharitable tongues. The most popular poet, he was for a space the most unpopular individual in the country. In one of his letters, written from Italy some years later, referring to the slanders current at the time, he thus expresses himself: 'I was accused of every monstrous vice by public rumour and private rancour. My name, which had been a knightly or a noble one since my fathers helped to conquer the kingdom for William the Norman, was tainted. I felt that if what was whispered, and muttered, and murmured was true, I was unfit for England; if false, England was unfit for me. I withdrew.' The separation from his wife, and the departure from England, mark a stage in B.'s genius. A new element of power had entered into his verse; the reader feels it quite distinctly in the magnificent burst of exultation that opens the third canto of the *Childe*—

Once more upon the waters, yet once more!

Misery and indignation stimulated him to remarkable activity. Six months' stay at Geneva produced the third canto of *Childe Harold* and *The Prisoner of Chillon*. *Manfred* and *The Lament of Tasso* were written in 1817. The next year, he was at Venice, and finished *Childe Harold* there; and, in the gay and witty *Beppo*, made an experiment in the new field which he was afterwards to work so successfully. During the next three years, he produced the first five cantos of *Don Juan*, and a number of dramas of various merit, *Cain* and *Werner* being opposite poles. In 1822, he removed to Pisa, and worked there at *Don Juan*, which poem, with the exception of *The Vision of Judgment*, occupied his pen almost up to the close of his life. Morally, his Italian life was unsatisfactory, and his genius was tainted by his indulgences. At the close of his career, he was visited by a new inspiration; the sun, so long obscured, shone out gloriously at its setting. In the summer of 1823, he sailed for Greece, to aid the struggle for independence with his influence and money. He arrived at Missolonghi on the 4th of January 1824. There he found nothing but confusion and contending chiefs; but in three months, he succeeded in evoking some kind of order from the turbulent patriotic chaos. His health, however, began to fail. On the 9th April, he was overtaken by a shower while on horseback, and fever and rheumatism followed. Medical aid was procured, and copious bleeding recommended; but this, B., with characteristic wilfulness, opposed. Before death, he sank into a state of lethargy, and those who were near heard him murmuring about his wife, his sister, and his child. After twenty-four hours' insensibility, he expired on the evening of the 19th April 1824. His body was conveyed to England; and, denied a resting-place in Westminster Abbey, it rests in the family vault in the village church of Hucknall, near Newstead.

Lord B. is a remarkable instance of the fluctuations of literary fashion. Elevated to the highest pinnacle of fame in the heyday of his early popularity, he was unduly depressed after his death, when the false romance which he threw around himself and his writings began to wear away; and it is only during the last ten or twelve years that the proper place has been found for him in the public estimation. He is high, but not the highest. The resources of his intellect were amazing. He gained his first reputation as a picturer of the gloomy and stormy passions. After he wrote *Beppo*, he was surprised to find that he was a humorist; when he reached Greece, he discovered

an ability for military organisation. When all the school-girls of England fancied their handsome idol with a scowling brow and a curled lip, he was laughing in Italy, and declaring himself to be the most unromantic being in the world. And he was right. Take away all his oriental wrappings, and you discover an honest Englishman, who, above all things, hates cant and humbug. In *Don Juan* and his *Letters* there is a wonderful fund of wit, sarcasm, humour, and knowledge of man. Few men had a clearer eye for fact and reality. His eloquence, pathos, and despair; his *Manfreds* and *Childe Harold's*, were only phases of his mind. Toward the close of his life, he was working toward his real strength, and that lay in wit and the direct representation of human life. If his years had been extended, he would in all likelihood have deserted poetry for prose, gaudy coloured fiction for sober fact; and the assertion may be hazarded, that the English novel would have boasted of another and a greater Fielding.

BYRON BAY lies on the north-east coast of Labrador in North America, its lat. and long. being respectively 54° 40' N., and 57° 30' W.

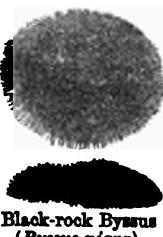

BYRON ISLAND is situated in the Mulgrave Archipelago of the Pacific Ocean, its lat. and long. being respectively 1° 18' S., and 177° 20' E.

BYSSUS, a name given from ancient Greek and Roman times to the bundle of silky filaments by which many lamellibranchiate mollusks—bivalve shells—attach themselves to rocks or other fixed substances. The B. springs from a cavity at the base of the solitary foot of the mollusk, and its filaments, which are capable of being reproduced if destroyed, are secreted by a glandular tissue which occupies a

Byssaceæ, and placed among Lichens. Some have regarded this group as entitled to the rank of a distinct order, 'comprehending the filamentous fungi found in cellars, and similar plants'; but others reject the genus as altogether spurious. Some of the species once included in it have now been satisfactorily shown to be Lichens, others to be *Conferaceæ*, whilst many appear to be really not distinct vegetable forms, but cryptogamic plants prevented by unfavourable circumstances from proper development. The green incrustations formerly regarded as species of B., have been found to be the primary germination of mosses, often species of *Polytrichum* and *Tortula*. It cannot be said, however, that the nature of all the vegetable forms which have been referred to the genus B., has yet been satisfactorily ascertained. Some of them are very phosphorescent, and are generally found where some higher form of vegetation is undergoing decay.

BYSTRÖM, JOH. NIKOLAUS, a celebrated sculptor, was born 18th December 1783, at Philippstadt, in the province of Wermeland, Sweden, and educated under Sergell of Stockholm. In 1809, he obtained the highest prize in the Swedish Academy of Arts, and in the following year went to Rome, where he executed his first independent work, a 'Drunken Bacchante,' and sent it home. It was received with great approbation, and B. had to repeat it thrice. In 1815, he returned to Stockholm, and surprised the newly elected crown-prince by exhibiting a colossal statue of himself, which he had finished all but the head in Rome, and had found means to complete quietly in Stockholm. The crown-prince was highly gratified, and commissioned B. to execute colossal statues of Charles X., XI., and XII. After 1833, he resided in Stockholm; but returned to Rome in 1844, and died there March 13, 1848. His chief works are: 'A Nymph going into the Bath,' 'A reclining Juno suckling the Young Hercules,' 'Hygieia,' 'A Pandora combing her Hair,' 'A Dancing-girl,' a statue of Linnaeus, and colossal statues of Charles XIII., Gustavus Adolphus, and Charles XIV. B. excels in the delineation of females and children, but his male figures want strength of character; his conceptions are always true to nature, his grouping skilful and pleasant, and his execution is clear and distinct.

BYTTNERIACEÆ, a natural order of exogenous plants, sometimes united with the order *Sterculiaceæ* (q. v.), and also closely allied to *Malvaceæ* (q. v.), from which it differs, especially in the stamens not being columnar—although more or less united, generally into a cup or tube—also in the anthers being turned inwards, and 2-celled. The species of this order are trees, shrubs, or half-shrubby plants, abounding chiefly in tropical climates, although some are natives of the temperate zones. About 400 have been described. The flowers of many are beautiful. The most important product of the order is Cacao (q. v.). The fruit of *Guazuma ulmifolia*, a native of Brazil, is eaten, being filled with a sweet and pleasant mucilage. The young bark of this tree yields, when macerated, a copious mucilage, and is therefore used in Martinique for clarifying sugar, as is that of *Kydia calycina* in the northern provinces of India. *Guazuma ulmifolia* was introduced into India, and at one time largely cultivated in the Madras presidency, under the name of Bastard Cedar, that its foliage and young shoots might be employed as fodder for cattle. Its straight,

Black-rock Byssus

Byssus of Common Mussel.

furrow running nearly to the extremity of the foot. They are united together at the base in a common mass, and are often considerably divergent. They are guided to their place by the foot, and expand into a sort of disc at the point of attachment, so as to have a firm hold. A few common mussels in an aquarium readily afford an opportunity of observing the B., particularly when the filaments are attached to the glass-sides of the vessel. In the *Pinna* (q. v.) of the Mediterranean, the B. is remarkably long and delicate, has a beautiful silky lustre, is very strong, and is capable of being woven into cloth, upon which a very high value is set; but the animal which produces it is now so rare, that it is almost exclusively an article of curiosity. This manufacture was known to the ancients.

BYSSUS (Gr., a fine flaxen or silky substance), a genus established by Linnaeus to include some of the lowest and most obscure forms of vegetation, and defined as having a substance like fine down or velvet, simple or feathered. Botanists sometimes ranked it among *Algae*, sometimes among *Fungi*; it has been made the type of a group

luxuriant young branches yield a strong fibre. The bark of other species of this order also affords a tough fibre, which is employed for making cordage, particularly that of *Microlema* (or *Schillera*) *spectabilis* in the regions on the southern base of the Himalaya, *Abroma augustum* in various parts of India, *Dombeya spectabilis* in Madagascar, and *D. umbellata* in the Isle of Bourbon. *Abroma augustum* has been especially recommended to attention and cultivation on account of its fibre, which is beautiful, white, fine, and strong, and is produced in great abundance. The plant grows to be a handsome small tree, having hairy lobed leaves and beautiful drooping purple flowers; but may be treated much as willows grown for basket-making, and in this way yields two, three, or even four crops of cuttings annually, which are peeled and the bark macerated in order to the separation of the fibre.

BY-TOWN, a town of Upper Canada, on the Ottawa, which took its name from Colonel By of the Royal Engineers. It is now *Ottawa* (q. v.), the capital of the Dominion of Canada.

BYZANTINE ART. From the time of Constantine the Great, the emperors of the East arrogated to their imperial city the pre-eminence which, for so long a period, ancient Rome had actually possessed; and, as a necessary consequence of this assumption, Constantinople, or Byzantium, as it still continued sometimes to be called, became the rival of the mother-city in the richness and variety of its artistic monuments. In Rome, and, indeed, in the whole of Western Europe, the first effect produced by the influx of the mighty stream of barbarian life, and the consequent dissolution of existing society, was the almost total suppression of artistic effort. It was then that the artists of the West, willing and eager to avail themselves of the invitation held out to them, poured into Constantinople, carrying with them what yet remained of the artistic life of the ancient world. Byzantium was the hearth on which, during the dark period of the middle ages, those feeble sparks of ancient art were kept alive, which served to kindle the new and independent artistic life of the modern world. Not only were the painters and sculptors of Italy indebted to the art of Byzantium for the tradition of that ideal mode of conception to which the term classical is peculiarly applied, but artists in every department derived thence the elements of that technical knowledge without which the embodiment of such conceptions is impossible. This practical acquaintance with the technical rudiments of their respective arts, which could scarcely have been derived from a mere examination of ancient works, was communicated to the fathers of Italian art by living Byzantines, some of them probably the descendants of those whom barbarian conquests had driven into the East, and whom the conquests of a still more barbarous race now restored to Western Europe. It is impossible to doubt that modern art was largely indebted to this circumstance for the marvellous stride which it took immediately after the taking of Constantinople by the Turks. But though its chief value may consist in its having thus transmitted to us the succession of antiquity, B. A. was by no means devoid of original and individual character; and it is only in so far as it possesses this, and not when regarded as a mere conservation of antique types and processes, that it takes rank as a school of art. The characteristic element in B. A. may be described as the earliest artistic recognition and representation to the senses of what was new and peculiar in Christian as opposed to heathen life. To the fullest extent to which it could claim a separate and individual existence, B. A. was Christian art; and

consequently in Germany, where the subject has received more attention than in this country, the two terms are frequently used as synonymous. The appearance of B. A. in this its only peculiar sense, dates from the age of Justinian, i. e., from the earlier half of the 6th c., and its productive period may be said to terminate with the conquest of the Eastern Empire by the Crusaders in 1204. But though its decline dates from this event, B. A. continued to exist in considerable vigour down to the final destruction of the Empire of the East in 1453; and even now may be seen as the inseparable handmaid of the Greek Church, both in Europe and in Asia. It is in this point of view, and more particularly as forming the basis of artistic life in Russia, that B. A. possesses its chief living interest in our day. What Rome was to the Western, Byzantium was to the Eastern European; and the relation of the latter to his mother-city, if it commenced at a somewhat later date, continued during the whole period of the middle ages.

Though the inhabitants of Eastern Europe thus derived their traditions of antiquity from a meaner source than the Romanic nations, they received them more unbroken; and, from first to last, were subjected to their influences during a much longer period. To them the living voice and hand continued to communicate what for nearly a thousand years Italians, Spaniards, and Franks had had to seek in the dead image and letter alone; and if anything still remains unrecorded of ancient thought, it doubtless dwells on Greek, and not on Roman or German tongues. Indolent, luxurious, and dissolute as their ancestors had been in classical times, the citizens of Constantinople were distinguished by an intellectual character, which, unfruitful and enfeebled though it was, was systematic, subtle, mystical, and pedantic. They were eminently an instructed people; but, like individuals whose glory is in the past, they were more conservative than original; and, however justly we may despise the chaff which they engendered, it is impossible to overestimate the value of the corns of gold which clung to their memories.

BYZANTINE ARCHITECTURE. The typical form of B. Architecture, at least as applied to ecclesiastical

Church of St Sophia at Constantinople:  
Specimen of Byzantine Architecture.

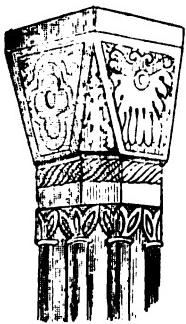

purposes, was fixed by the church of St Sophia, which still exists as the great mosque of Constantinople. It was built, or rather rebuilt, by the orders of Justinian, the architects being Anthemius of Tralles, and Isodorus, the Elder, of Miletus, and completed 537 A.D. Though the largest and most magnificent, the church of St Sophia was but one of twenty-five churches which were erected in the

capital, and of a vastly greater number of ecclesiastical structures with which the provinces were adorned by the pious emperor. The style thus introduced largely influenced the architecture even of Western Europe; and in St Mark's at Venice, the churches at Ravenna and elsewhere on the Adriatic, and even in the cathedral of Aix-la-Chapelle, we have examples of churches almost purely Byzantine. The fundamental principle in the construction of Byzantine churches was an endlessly varied application of the Roman arch—whilst its exhibition in the form of the cupola was their most characteristic feature. In the St Sophia, as was generally the case, the cupola covered the principal central portion of the church, and was supported by strong and lofty pillars, bound together by bold arches. To this central space were usually joined others of smaller size, which were covered by half-cupolas or arches of more ordinary construction. Though frequently in the form of a Greek

cross, with the great cupola rising in the centre, and smaller or semi-cupolas surmounting the four arms, neither this nor any other plan was consistently adhered to in Byzantine churches. The windows were always semioircular, similar to those in the Romanic churches of Germany, and in our own Saxon or early Norman churches; but the doors were frequently square-headed, after the classical model. Many of the details, such as the square capitals tapering downwards, and the bold projecting mouldings ornamented

with foliage, seem to have owed their origin entirely to the ingenuity of Byzantine architects. The earlier Byzantine churches were profusely ornamented with mosaics, which, after the admixture of the Gothic element, and the adoption of the pointed arch, gave place to fresco-paintings. The constant use of the Apse (q. v.) is, after the cupola, perhaps their most marked feature. The following division into periods, though, like most divisions of the kind, somewhat arbitrary, has the authority of M. Couchaud, an eminent French architect, in its favour, and is, apparently, adopted by Parker: 1. From the time of Constantine to the middle of the 6th c.; 2. From the beginning of Justinian's reign down to the 11th c., which comprises the greater part of the existing buildings of the pure Byzantine type; 3. From the 11th c. to the conquest of Greece by the Turks, when the influence of the Venetian conquests is apparent in the intermixture of Italian and Gothic details and characteristics.

**BYZANTINE SCULPTURE.** When contrasted with the ignoble, tasteless, and meaningless productions of the later plastic art of Rome, that of Constantinople claims both admiration and respect. The figures are not deficient in dignity either in form or in attitude, and a deeply Christian spirit is traceable both in their general conception, and in their rich and significant symbolical accompaniments. In sculpture, as in architecture, the peculiar Byzantine type first exhibits itself towards the beginning of the 6th century. Alongside of unmistakable reminiscences of the antique, it exhibits characteristics which are as unquestionably oriental. The figures are positively laden, not with drapery alone, but with costume, which obscures the nobler and freer lines in which the ancients

Byzantine Column.

delighted. The execution is careful, even painful. All this becomes more and more the case as we advance in the order of time, the earliest Christian works, and those immediately suggested by the antique, exhibiting such faults only to a limited extent. Down to the 12th c., the defects which we have described were the worst which could be laid to the charge of B. sculpture, and it is scarcely earlier than the 13th c. that it assumes that mummy-like aspect by which it is too generally known. The art of carving in ivory was practised with great success at Constantinople, and in the examples of it which remain, the gradual decline—the *benumbing process*, as it has been aptly called—may be traced with great distinctness. Of this species of work, in its earlier and better time, a fine specimen in alto-rilievo of the 'forty saints' may be seen in the museum at Berlin. The decorations of the churches, and of the sacred vessels used in the service of the altar, formed no insignificant objects of art in the better Byzantine period. Cups, plates, lamps, candlesticks, crosses, and the like, were either of gold or silver, and frequently adorned with jewels; whilst the altar itself, the chancel, and sometimes the whole interior of the church, were covered with precious metals, the panels being adorned with mosaics or frescoes.

**BYZANTINE PAINTING.** The same characteristics which we have ascribed to the sculpture belonged to the pictorial efforts of the artists of Byzantium, and of the neighbouring countries who were mostly their imitators. The execution was careful and anxious rather than skilful, and such skill as still remained was exhibited in the mechanical perfection with which the gilding of the backgrounds and other details were managed. Of B. pictures, the best existing specimens are to be found in Italy, and belong especially to the school of Sienna. The picture of the Virgin in the church of St Domenico at Sienna by Guido, bearing date 1221, deserves special mention. Much labour was expended on the illumination of MSS. of the Scriptures, and of these many beautiful examples, as fresh as when they were painted, may be seen in most of the larger public libraries of Europe. The chief interest attaching to B. painting consists in the parental relation in which it stood to the art of Italy. Cimabue may be regarded as its immediate heir; and in the works of Giotto, Leonardo da Vinci, Pietro Perugino, and even of Raphael in his earlier time, the traces of the inheritance are quite unmistakable. See PAINTING.

**BYZANTINE EMPIRE,** also styled the EAST ROMAN, EASTERN, or GREEK EMPIRE, was founded in 395 A.D., when Theodosius the Great, at his death, divided the Roman empire between his two sons, Arcadius and Honorius. The former, a weak and luxurious character, was made emperor of the eastern division, formerly included under the prefectures of the East and of Illyricum—namely, Syria, Asia Minor, and Pontus, stretching along the shores of the Black Sea in Asia; Egypt in Africa; and Thrace, Moesia (now Bulgaria), Macedonia, Greece, and Crete in Europe. Arcadius left the government of the empire in the hands of his minister, Rufinus, from whom it passed to the eunuch Eutropius, and afterwards to Gainas, the murderer of Rufinus. Gainas fell by his ambition in 401, and the shameless and avaricious Empress Eudoxia ruled until the time of her death, 404. See ARCADIUS. After Theodosius II., a minor, under the guidance of the prefect Praetorio Anthemius, had held the reins during six years, he resigned the government in favour of his sister Pulcheria (Augusta), who ruled powerfully while her brother was kept apart from all state

affairs. Western Illyria (comprehending Pannonia, Dalmatia, and Noricum) was ceded to the Eastern empire by the Roman emperor, Valentinian III.; and after several victories achieved by the Byzantine general, Ardaburias, over the Persians, a part of Armenia was also annexed. But, nevertheless, Thrace and Macedonia could only be secured from the destructive conquests of Attila by the payment of tribute. After the death of Theodosius II., Pulcheria married the senator Marcianus (450—457), whose firmness repelled the invasions of Attila. Marcianus was followed by Leo I., surnamed Macella (the Butcher), a Thracian of low birth, but elevated to the throne by the commander-in-chief, Aspar, who, being himself an Arian, would not venture to encounter the perils that sovereignty might have entailed on one of his religious views. Leo II., grandson of the former, succeeded, but died after a few months, in consequence of which the crown came into the possession of his father, Zeno (474—491), who was banished by Basiliscus (475), but who re-ascended the throne in 477. Though a weak and unpopular ruler, he contrived to retain his power in spite of several serious revolts. The internal distraction of the empire, to which, as at other times, religious strifes added considerably, increased greatly during the reign of Zeno, and the invasions of the Goths were prevented only by gifts and stratagems. Ariadne, widow of Zeno, by her second marriage, raised the courtier Silentarius to the throne under the title Anastasius I. (491—518). By the help of the Goths, this monarch overthrew, after a six years' contest, the robber tribes of Mount Taurus. A new enemy, however, now appeared on the Danube in the Bulgarians, against whose desolating raids Anastasius built the Long Wall, to protect the peninsula on which Constantinople lies. The war with the Persians also broke out anew during his reign, and religious tumults often purpled the streets of Constantinople itself. After his death, the army raised Justinus I. to the throne. He maintained his position mainly through the favour of the clergy, whom he had conciliated by his severe persecution of heretics.

His nephew, Justinian (q. v.), succeeded (527—565), and became celebrated by his code of laws, and by the victories of his great generals, Belisarius (q. v.) and Narses (q. v.). But the rapid decline of the empire after his death shewed that he had not been able to give it any internal consolidation or vitality. It was during the reign of Justinian that those pestilent contests of the Blues and Whites against the Greens and Reds (political factions so named from the colours respectively worn) first attained any consequence; and though the first disturbance was terribly chastised by Belisarius in 532, they continued to distract the capital periodically down to the 7th century. Justin II. (565—578), a weak man, governed by his wife, Sophia, yielded a part of Italy to the Longobards, was unsuccessful against the Persians, allowed the Avari to plunder the Danubian provinces, and ultimately became insane through vexation and anxiety. Tiberius, the captain of the guard, was then made regent, and after the death of Justin II., received the imperial dignity. He ruled with mildness and prudence (578—582), purchased a peace with the Avari, concluded the war with Persia, and left as his successor the commander-in-chief, Mauricius, who reigned from 582 to 602. Having replaced on the throne the Persian king, Kosees II., who had been banished by his subjects, he thus secured the peace of his eastern frontiers; but, on the other hand, the war against the Avari did not prosper. His niggardly treatment of the army caused a military insurrection, in which he was slain along with his son; and

Phocas, one of his generals, was elevated to the throne. Phocas proved a bad ruler. Through his monstrous vices, tyranny, and incapacity for government, the empire lapsed into still deeper anarchy. Suddenly, however, a deliverer appeared in the person of Heraclius (q. v.), son of the exarch or governor-general of Africa, who headed a conspiracy, marched to Constantinople, overthrew the tyrant, and ascended the throne, 610. But great as was the genius of Heraclius, he had to submit to twelve years of defeat before he could organise and discipline a victorious army. In 622, he opened those magnificent campaigns in which the power of Persia was crushed, and which in the opinion of Gibbon, were equal to those of Scipio or Hannibal. He lived, however, to see more formidable foes in the Arabs, who, inspired by fanatic zeal, and led by the Calif Omar, captured, during 635—641, the countries on the Euphrates, with Syria, Judea, and Egypt. The power of the Greeks, which was demanded to resist the Arabian invasions, was miserably divided and weakened by their unending religious quarrels, especially the controversy of the Orthodox against the Monothelites (q. v.). The empire was breaking asunder, and Heraclius, now worn out with the fatigues of war, had abandoned his enfeebled senses to pleasure, and his enfeebled intellect to theological discussions. He died in 641. Constantine III., who succeeded his father, Heraclius, also died soon after, and was followed by Heraclonias, who lost the crown, and was mutilated in an insurrection. The next ruler was Constans, son of Constantine III., who ruled from 642 to 668, made himself odious by cruelty, and perished in an insurrection. His son, Constantine IV., Pogonatus (668—685), enforced a treaty of peace on the invading Arabs (675) by his successful use of the Greek fire in warfare. On the other side, he was compelled to pay tribute in 680 to the Bulgarians, who had established themselves in ancient Moesia. Justinian II. (685—711), son and successor of Pogonatus, was victorious in war against the Monothelite Maronites; but was defeated by the Bulgarians (688), and by the Arabs (692). His cruelty caused an insurrection, at the head of which was Leontius, who, in 695, deposed him, cut off his nose (hence his surname Rhinotmetus), and banished him to the Tauric Chersonese; in 705, he was restored to the throne, but adversity had taught him no wisdom. A part of his subjects revolted, and the king, abandoned by his army and by the Bulgarians, was assassinated in 711. With him the dynasty of Heraclius expired.

Philippicus Bardanes (the leader of the last insurrection against Justinian II.) was next raised to the throne (711); but having made himself odious by favouring the metaphysical tenets of the Monothelites, he was deposed, and brutally deprived of eyesight (713). His successor, Anastasius II., prudently screened himself from a mutinous army by retiring into a monastery (718), and left the crown to Theodosius III., who abdicated in 717, when Leo, the Isaurian, and general of the army of the East, did not recognise him, and marched with hostile intent to Constantinople. Leo (q. v.) himself ascended the throne in 717, and drove back the Arabs from Constantinople, but unhappily gave occasion, in 726, for that contest concerning the worship of images, which rent the empire for more than a century. In 728, the exarchate of Ravenna was lost, and the eastern provinces became the prey of the Arabs, over whom, however, he won a great victory in Phrygia. He died in 741. Constantine V. (741—775), son of Leo III., on account of his zeal as an iconoclast, was hated by the monks, who gave him the surname 'Copronymos,' because

(according to their malicious and uncleanly statement) he had polluted the font at his baptism. He was a brave ruler, recovered from the Arabs parts of Syria and Armenia, and ultimately defeated the Bulgarians, against whom he had long been unsuccessful. His son, Leo IV. (775–780), was a mild ruler; but by the ability of his generals, he made the boundaries of the empire secure against the Arabs. After him, Constantine VI. ascended the throne under the guardianship of his ambitious mother, Irene (q. v.), who raised a powerful party in favour of image-worship. Constantine having made an attempt to liberate himself from the influence of his mother and her paramour, Stauratius, Irene barbarously caused her own son to be blinded (797). He died soon after this atrocity; and Irene, who had boldly conceived the design of marrying the Emperor Charlemagne, and thus uniting the east and west of Europe in one vast realm, excited the opposition which, in 802, placed her treasurer, Nicephorus, on the throne. Irene was banished to Lesbos, where she died in 803. Nicephorus, who fell in battle against the Bulgarians (811), was succeeded by his son, Stauratius, who soon yielded the throne to his brother-in-law, Michael I., from whom it was taken by the Armenian general, Leo V., a powerful ruler, who conquered the Bulgarians, but fell (820) in a conspiracy excited by his zeal against image-worship. Michael II., the Stammerer, was raised from a dungeon to the throne, and ruled until 829. In his reign, Crete and Sicily passed into the hands of the Arabs. Under the rule of his son, Theophilus, who is praised by the Byzantine historians for his love of justice (829–842), the general, Manuel, gained some indecisive victories over the Arabs. Theodora, widow of Theophilus, and guardian of Michael III. (842–867), brought the controversy about images to a close at the council of Nicaea (842), when the worship of these was fully sanctioned and re-introduced. During this reign, the government busied itself in the persecution of the Paulicians (q. v.), while the Arabs devastated the Asiatic provinces. Theodora, having been banished to a convent by her son, the government was for some time held by Bardas, uncle of Michael III., and after his assassination, by Basilus I., the Macedonian, who caused Michael to be put to death, and afterwards ruled ably from 867 to 886. But though on the whole successful against the Arabs, the latter contrived to make themselves masters of Syracuse. His dynasty (the Macedonian) maintained itself on the Byzantine throne, with some few interruptions, until 1056. The reign of his son, Leo VI., the Philosopher, (886–912), was not prosperous. The inroads of the Bulgarians and of the Arabs, who, in 904, plundered Thessalonica, continued to increase during the government of his son, Constantine VII., Porphyrogenitus, who ruled mildly but feebly (912–959). Under his son, the dissolute Romanus II. (959–963), Crete was retaken from the Arabs by the vigour of his general, Nicephorus Phocas, who, on the death of the emperor, married his widow, Theophanicia. She, however, caused him to be murdered in 969, as she wished to marry John Tzimiskes, who ruled till 976, and, like his predecessor, was victorious against the Arabs and Bulgarians, as also the Russians, who about this time began to emerge from obscurity as an enemy of the Byzantine power. His successor, Basilus II. (976–1025), the son of Romanus, conquered the Bulgarian kingdom, and attached it as a province to the empire, which it remained till 1186, when it again became independent. His brother, Constantine VIII. (1025–1028), did not resemble him. Romanus III. next ascended the throne, but was assassinated by his

wife, Zoe, a profligate but crafty princess, who raised successively to the imperial dignity Michael IV. (1034), Michael V. (1041), and Constantine IX. (1042). Meanwhile, Russians and Arabs devastated the realm. In Asia, the Seljuk Turks proved dangerous enemies; while in Lower Italy, the Normans narrowed the Byzantine power to the possession of Otranto. After Constantine's death in 1054, Theodora, sister of Zoe, was elected empress; and on her death in 1056, Michael VI., who was deposed by Isaac I., Comnenus.

With Isaac I., Comnenus, who came to the throne in 1057, the dynasty of the Comnenian emperors began. He retired to a monastery (1059), and was succeeded by Constantine X., whose widow, Eudocia, married Romanus IV., and raised him to the throne. Romanus was deposed in 1071 by Michael VII. (son of Constantine X.), who, in his turn, was dethroned by Nicephorus III. (1078), who reigned until 1081, when he was deposed by Alexius I., Comnenus (q. v.), (1081–1118). This last reign was marked by the commencement of the Crusades. The successors of Alexius—his son, Kalo-Joannes (1118–1143), and Manuel I. (1143–1180)—were able rulers, and victorious in their engagements with the Turks. Manuel's son, Alexius II., was murdered by his guardian, Andronicus (grandson of Alexius I.), who raised himself to the throne. He was the last prince of the Comnenian dynasty, and fell in an insurrection excited by his own cruelty, 1185.

After the first turbulent reign of Isaac II., who was blinded and deposed by his brother, Alexius III., who took the surname of Comnenus in 1195, the Crusaders restored Isaac to the throne (1203), and also crowned his son Alexius IV.; but the restless citizens of Constantinople elected Nicolas Kanabas, who took the title of Alexius V., and pursuing the usual bloody course, put his predecessor to death.

In 1204, the French and the Venetians (collectively named Latins) advanced on Constantinople, and captured the city, April 12, having made themselves masters of the European provinces. The whole was divided into four parts, of which the first, including the metropolis, fell to the lot of Baldwin, Count of Flanders, who was made emperor, and to whom the other participants in the expedition did fealty for their respective shares. The Venetians obtained the coasts of the Adriatic and Aegean seas, a part of the Morea, and several islands; Bonifacius, Count of Montferrat, Macedonia and part of Greece; several dukedoms, countships, &c., were also established at Athens, Philippopolis, and other places for French knights; while a number of Greek princes, both on the mainland and in the islands, maintained their independence. In the west of Asia Minor, Theodorus Lascaris, who had been elected emperor at Constantinople, formally transferred the seat of government to Nicaea; and finally, in the north-east of Asia Minor, the governor of the province of Colchis, Alexius Comnenus, ruled at Trebizond with absolute authority; while one of his successors, John Comnenus, even assumed the title of emperor. At Constantinople, neither Baldwin nor his successors could strengthen the sinking empire. Baldwin himself died (1206) a prisoner in the hands of the Bulgarians. After him came his brother Henry, who ruled bravely and wisely till 1216. For the next four years, the empire was actually without a ruler, and a prey to utter anarchy. In 1221, Robert, son of Peter, Count of Auxerre and Courtenay, came to the throne; and was succeeded by John of Brienne, titular king of Jerusalem (1228–1237); and the latter by Baldwin II. (1237–1261).

During these reigns, a great part of the empire was seized by John Vatatzes, successor of Theodorus Lascaris of Nicaea (1222—1255). This ruler was followed in Nicaea by Theodorus II. (1255—1259), whose son, Johannes, during his minority, was superseded by Michael VIII., Palaeologus, who, by the help of the Genoese, captured Constantinople (July 28, 1261), and thus put an end to the Latin dynasty; though some few Latin principalities maintained themselves till the fall of the Byzantine empire.

Michael, the first of the Palaeologi, a powerful prince, really endeavoured to strengthen the realm; but by his unhappy attempt to unite the Greek Church with the Latin, from which it had decisively separated (1054), he gave great offence to the clergy and the people. His son, Andronicus II., who came to the throne, 1282, re-established the Greek ritual. After the death of his son and co-regent, Michael IX. (1320), Andronicus II. was compelled to divide the throne with his grandson, Andronicus III., who became sole emperor, 1328. This monarch unsuccessfully opposed the Turks, who took Nicaea and Nicomedia in 1339, and wasted the European coasts. He died in 1341. Under his son, Johannes V., the Turks first gained a firm footing in the European provinces, and spread themselves from Gallipoli (which they captured in 1357) over other districts. Sultan Murad took Adrianople, 1361, and made it the seat of government. He and his follower, Bajazet, conquered all the Byzantine territories as far as Constantinople. Manuel II., son and successor of Johannes, was besieged in Constantinople by Bajazet, who defeated an army under Sigismund of Hungary, at Nicopolis, in 1396, and compelled the Byzantine monarch to cede to the Turks one of the main streets of the city, which was saved from capture only by Timur's incursions into the Turkish territories, 1402. By this diversion Manuel recovered some portion of the Byzantine provinces; but made so little use of the occasion, that, in 1422, the metropolis was again besieged by Murad II., who, after he had overthrown the force sent to aid the emperor by Ladislaus, king of Hungary, at the battle of Varna, made Constantinople, in 1444, the limit of the domains of Johannes VI., son of Manuel, and compelled him to pay tribute. Constantine XI., brother of Johannes, bravely but fruitlessly contended against the overwhelming Turkish forces, and fell heroically in the defence of Constantinople, which was captured by Mohammed II., May 29, 1453, when the B. E. was brought to a close. The petty Latin princes who existed here and there in Greece, and the despots, Demetrius and Thomas, who ruled in the Morea, were subdued by Mohammed in 1460; while David, a member of the Comnenian dynasty, the last emperor of Trebizond, submitted in 1461.

It is almost superfluous, after this painful and bloody record of dynastic crimes and tumults, continuing century after century for upwards of a thousand years, to affirm that the history of the world never witnessed so miserable and degraded a caricature of imperial government as the B. E. affords, or to express the conviction, that nature was sternly satisfied to behold it finally swept from the face of the earth, even by the hands of barbarous Turks.

The constitution of the B. E. was founded on the institutions of Diocletian and Constantine the Great, and was purely despotic. The emperors, who were consecrated by the Patriarchs of Constantinople, claimed, as the true descendants of the Caesars, a sovereignty over the West as well as the East, and styled themselves 'rulers of the

Romans,' even after Charlemagne had founded a new dynasty. Though great influence was at various times exercised by the clergy as well as by women, courtiers, and ministers, the emperors were pure autocrats, having supreme power in all departments of government, and being themselves superior to all laws. By pompous titles, by great splendour of costume, and by a strict observance of an elaborately minute court ceremonial, as well as by the cruel penalties inflicted for any insult offered to the imperial dignity, or to the dignity of the emperor's relatives, they kept themselves sacredly apart from the people. Gradually everything disappeared that might have been a check upon the utter despotism of the supreme power. As early as the 6th c., the consulate was absorbed into the mass of imperial honours, while the traces of the senate which Constantine had established at Byzantium, and which was composed of those on whom the emperor had bestowed the dignity of patriciate, as well as the chartered privileges of the towns, had entirely vanished in the 10th century. The privy council, to whom the conduct of the state was intrusted, was arbitrarily chosen by the emperor. The state-officials were very numerous, and their respective ranks carefully distinguished. They were raised far above the populace by titles and privileges, but were utterly dependent on the throne. Among these, the *Domestici* (including many eunuchs), claimed the highest rank as immediate attendants on the emperor. The rank of the *Curopalates*, who had charge of the four chief imperial palaces, became, in course of time, subordinate to that of the *Protopresarii*, who was invested with the highest dignity of all. The *Domestici* were made commanders-in-chief of the army. Among them, the *Domesticus* of the East (styled, *par excellence*, *Megadomesticus*) held the highest rank, and finally, under the Palaeologi, was considered the first civil and military officer of the realm. The provinces were ruled by governors bound to contribute certain sums to the royal revenue, which gave rise to oppressive exactions. No distinction was made between the state-revenue and the privy-purse. For military service, the land was divided into districts (*Themata*); and the army, down to the later times, consisted almost entirely of foreign mercenary troops, the imperial body-guard, or *Spatharii*, who were mainly Germans, holding the highest rank. The admiral of the fleet was styled *Megas Dux*. In the midst of constant internal and external disturbances, the administration of justice was grossly neglected and abused, though Justinian and other emperors earnestly endeavoured to establish just laws.

**BYZANTINE HISTORIANS** are those Greek writers who have handled the history of the Byzantine empire. They are divided into three classes—1. Those whose works refer exclusively to Byzantine history; 2. Those who professedly occupy themselves with universal history, but at the same time treat Byzantine history at disproportionate length; 3. Those who write on Byzantine customs, antiquities, architecture, &c. The B. H. are far from faultless, yet, as they are the only sources of information regarding the vast empire of the East, they are invaluable to us. The most interesting and instructive among them, however, are those who confine their attention to a limited number of years, and to the events which transpired under their own observation, or in which they took part. The principal B. H. were collected and published at Paris in 36 vols., with Latin translations under the editorship of P. Philippe Labbé, a Jesuit and his successors (1648—1711). This magnificent collection was reprinted, with additions, at Venice, 1727—1733. In 1828, Niebuhr, assisted by Bekker, the

two Dindorfis, Schopen, Meinecke, and Lachmann, began a new *Corpus Scriptorum Historia Byzantina*, of which many volumes have already appeared.

BYZA'NTINES, in Numismatics, is the term applied to coins of the Byzantine empire. Byzantine coins are of gold, silver, and bronze; bear impressions distinct from those of the earlier Roman coins; and were copied in several countries where the Byzantine standard was adopted. The commercial relations of the Eastern empire served to distribute its coinage over almost all the then known world. It was current in India, as well as in the north of Europe. Recently, an increased attention has been paid to the study of Byzantine coins as aids to history.—Saulcy, *Essai de Classification de Suites Monétaires Byzantines* (Metz, 1836).

BYZA'NTIUM, a city which stood on the Thracian Bosphorus, was first founded by emigrants from Megara in 667 B. C., and rapidly rose to importance as a seat of commerce. Its position was at once secure and enchanting; it commanded the shores of Europe and Asia, had magnificent facilities for trade, and was also encircled with rich, picturesque, and varied scenery. After a time of subjugation under Darius Hystaspes, B. was liberated from the Persian yoke by Pausanias. Along with other Grecian seaports, B. revolted from Athens in 440 B. C., but was captured by Alcibiades (408). Lysander recovered it for the Lacede-

monians in 405. Shortly afterwards, it renewed its alliance with Athens, and in 390, Thrasybulus altered its form of government from an oligarchy into a democracy. When Athens again acquired a dangerous importance as a naval power, B. in 356, leagued itself with Chios, Rhodes, and King Mausolus II. of Caria, and crippled the trade of the former city; with which, however, it again formed an alliance, through the influence of Demosthenes, in opposition to Philip of Macedon, who, in 341—340 B. C., vainly besieged Byzantium. Under Alexander the Great, B. retained a certain degree of independence. For some time, B. was tributary to the Gauls, who settled in Thrace, after the death of Brennus (280 B. C.). After the second Punic war, when the Romans began to interfere in the affairs of Grecian and Asiatic cities, B. attached itself to Rome, and, retaining almost entire its former liberties, maintained also its commercial importance. In the civil war between Septimius Severus and Pescennius Niger, B. sided with the latter. It was therefore besieged by Severus, and, after a brave defence of three years' duration, was captured in 196 A. D., and reduced to ruin. Severus, repenting of the desolation which he had made, rebuilt a part of the city under the name of *Augusta Antonina*, and ornamented it with baths, porticos, &c. Caracalla restored to the inhabitants their ancient privileges; and, in 330 A. D., under the name of New Rome or Constantinople, it was made the metropolis of the Roman empire. See CONSTANTINOPLE.

THE third letter in all the alphabets derived from the Roman. It corresponds in place to the Greek gamma ( $\Gamma$ ), and had originally the same sound—viz., that of *g* in *gun*; as is expressly recorded, and as is proved by very old inscriptions, on which we read *leaciones, lece*, for what were afterwards written *legiones, lego*. This medial or flat guttural sound of *c* was at an early period of Roman history lost in the sharp guttural or *k*-sound (see ALPHABET), and this continued to be the pronunciation of the letter *c* in Latin down at least to the 8th c. of the Christian era, not only in such words as *comes, clamo*, but also before the vowels *e* and *i*. Such Latin words as *Cicero, fecit*, are uniformly represented in Greek by *Kikero, phekit*; and in the times of the Empire, the Germans borrowed *Kaiser, keller*, from *Cæsar, cellarium*.

It seems difficult, at first sight, to account for the same letter having sounds so different as those heard in *call* and in *civil*. The beginning of the transition is to be found in the effect produced upon certain consonants by their standing before *i* followed by a vowel. Thus, in *nation*, *ti* has the effect of *sh*; and out of *diurnal* has sprung *jurnal*. In such combinations, *i* is originally a semivowel having the force of *y*, and it is easy to see that *tion, dyur*, pronounced in one syllable, cannot but slide into the sibilant or hissing sounds of *shon, jur*. A precisely similar effect is produced on the *k*-sound before *ia, ii, io*; in *Lucius, Porcia*, or rather *Lukyus, Porkya*, *ky* tends to slide into a hissing sound similar to that of *ty* and *dy*. This tendency shewed itself early in the Latin tongue; and in the vulgar Latin of later ages, and in the Românic tongues that sprang out of it, it fully developed itself, so that the Italian came to pronounce *Lucia* as if written *Lushzia*. Combinations like *co, ca*, are little different from *ci* and *ca*, and would naturally follow the same course; and the *s* sound being once associated with the letter *c* in these positions, was gradually extended to it in cases where the *e* or *i* was not followed by a vowel.

The Anglo-Saxon alphabet resembled the Roman, from which it sprang, in having no *k*, and in always using *c* with the sound of *k*; *king* and *keen* were spelled *cyning* and *cene*. It was also without *g*, for which *cu* was used—*quick* being spelled *cwic*. By a process analogous to that described above, such Anglo-Saxon words as *ceorl, ceasan* (pro. *kyorl, kyasan*), became transformed into the English *churl, choose*. And this suggests a natural explanation of the multitude of cases where the *c* of the Latin has been transformed into *ch* in French, and has passed in this form into English—e. g., Lat. *caput*, Fr. *chef*, Eng. *chief*; Lat. *caminus*, Eng. *chimney*; Lat. *carmen*, Eng. *charm*. For as the Anglo-Saxons turned the *karl* or *korl* of the other Gothic nations into *kyorl*, so doubtless the Romanised Gauls corrupted the pronunciation of the Latin *camera*, for example, into *kyamera* (compare

Eng. *cart*, pro. by some *kyard*), which would then readily slide into *chambre*.

In the other Germanic alphabets, which were derived partly from the Roman and partly from the Greek, the Greek *kappa* or *k* is used almost to the exclusion of *c*, which, in German, Swedish, &c., appears only in words borrowed from the Românic languages. See letter K.

In modern English, *c* is pronounced like *k* before the vowels *a, o, u*, and like *s* before *e, i*, and *y*; and where the sharp guttural sound has to be represented before *e, i*, and *y*, the Germanic *k* has superseded the Anglo-Saxon *c*, as in *king, keen*. In so far as mere sound is concerned, *c* is a superfluous letter in English; in every case its power could be represented either by *k* or by *s*. In the corresponding words of the several Aryan languages, we find various substitutions for *c*, thus: Lat. *calamus*, Eng. *alm* (stalk), Rus. *soloma*; Lat. *cord*, Eng. *heart*, Rus. *serdze*; Lat. *collum*, Ger. *hals* (neck); Lat. *acer* (sharp), Fr. *aire*, Eng. *anger*; Lat. *duc* (lead or draw), Ger. *zog*, Eng. *tug*, Gr. *pepo*, Lat. *coquo*, Eng. *cook*; Lat. *dixit*, Ital. *dito*. *C* sometimes disappears before *l* and *r*; thus: Gr. *kleo* (to sound one's fame, allied to *kleo*, to call or shout), Lat. *laudo*, to praise, Ger. *lau*, voice, Eng. *loud*, Old Ger. *hlud*, fame (hence *Hludwig* or *Clodowig*, Clovis, Louis).

*C*, in Music, is the name of one of the notes of the gamut. The scale of *C* major has neither flats nor sharps, and therefore is called the natural scale. The different octaves of the gamut, beginning with *C*, are called by the Germans the great, small, one-stroked, two-stroked, &c., beginning with

; thus, *C, c, - c, c, c*.

*C* is also the sound on which the system of music is founded, and from which the mathematical proportions of intervals are taken; that is, a string of a given length sounding *C*, when divided into certain proportions, is made to produce harmonically the intervals of the different fundamental chords.

*C MAJOR*, the first of the twelve major keys in modern music; being the natural scale, it has no signature.

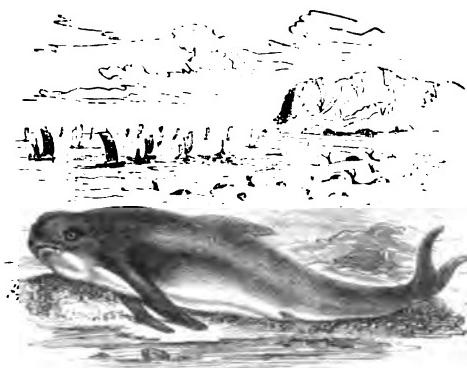

*C MINOR*, the tonic minor of *C* major, has three flats for its signature—viz., *B flat, E flat, and A flat*.

*CAABA*. See *KAABA*.

*CAA'TING WHALE* (*Globicephalus deductor*), an interesting cetaceous animal, which has been very generally included by naturalists in the genus *Delphinus* with dolphins (q. v.) and porpoises (q. v.), being named by some *Delphinus melas* (Gr. black), by others *D. globiceps*, from the round form of its head, but which has recently been separated from the true dolphins, either as a species of porpoise (*Phocaena*), or as the type of a distinct genus, *Globicephalus*, principally characterised by the rounded muzzle, and the convex and rounded top of the head. The general form of the animal is not unlike that of the

## CABAGAN—CABBAGE.

common porpoise, but it is much larger, being from 16 to 24 feet in length. The body is thick, its circumference at the origin of the dorsal fin, where it is greatest, being rather more than 10 feet, tapering towards the tail, which is deeply forked. The

Caaing Whale.

pectoral fins are remarkably long and narrow, fully 5 feet in length, differing very much in this respect from those of every other known cetaceous animal. The whole number of vertebrae is 55. The colour is black, with a white streak from the throat to the vent; and the skin is beautifully smooth, shining like oiled silk.

The C. W. feeds on cod, ling, and other large fishes, but also to a great extent on cephalopodous mollusca, the cuttle-fish, indeed, seeming to be its principal food. It is the most gregarious of all the Cetacea, great shoals or herds being usually seen together in the northern seas which it inhabits. These herds exhibit the same propensity with flocks of sheep, when pressed by any danger, to follow their leaders, so that when they are hemmed in by boats, if one break through to the open sea, all escape; but if one is driven ashore, the rest rush forward with such blind impetuosity as to strand themselves upon the beach, where they become an easy prey and rich prize to their pursuers. The appearance of a herd of caaing whales in a northern bay produces a scene of great excitement, and every boat is in requisition. From 50 to 100 whales are often captured, and it is recorded that 1110 were killed, in the winter of 1809—1810, at Hvalfjord, in Iceland. The word *caaing* is not the Scottish form of *calling*, as has been supposed, but is a totally different Scotch word, which signifies *driving*. C. W. appears to be originally an Orkney or Zetland name. The same animal is known to sailors as the Black Whale, the Howling Whale, the Social Whale, and the Pilot-fish.—Another species of the same genus, *G. Rissoneanus*, 9 or 10 feet long, the male of a bluish-white colour, the female brown, both sexes marked with irregular white lines and brown spots, is found in the Mediterranean.

**CABAGA'N**, a thriving town, situated at the northern extremity of the island of Luzon, one of the Philippines. Pop. upwards of 11,000.

**CABA'L**, a term employed to denote a small, intriguing, factious party in the state, and also a union of several such, which, for political or personal ends, agree to modify or sacrifice their principles. The word was used to describe an English ministry in the reign of Charles II., the initials of whose names composed CABAL—viz., Clifford, Ashley, Buckingham, Arlington, and Lauderdale. This was not the origin of the word, however, as

some have supposed; but merely the ingenious application of a word previously in use, and which appears to have been derived from the French *cabale*, possessing a similar signification.

**CABANIS, PIERRE JEAN GEORGES**, a French physician, philosophical writer, and partisan of Mirabeau in the Revolution, was born at Cognac, in the department of the Charente-Inférieure, 1757. When he had completed his studies in Paris (1773), he went to Warsaw, in the capacity of secretary to a Polish magnate. On his return to Paris, he was for some time engaged in literary pursuits, from which he turned his attention to an earnest study of medicine. At the outbreak of the Revolution, he attached himself to the liberal side, but detested the cruelties which followed. For Mirabeau, whose opinions he received, he wrote a work on national education, which was published after the death of that great orator (1791). C. was one of the Council of Five Hundred, afterwards member of the senate, and administrator of the hospitals of Paris. He died May 5, 1808. His chief work, *Rapport du Physique et du Moral de l'Homme*, completed in 1802, gained its author a considerable reputation as a writer and philosopher. The work displays no mean power of observation and analysis, but is characterised by a sensationalism so absolute, that it seems at first sight as if the author were burlesquing with grave irony the doctrines of his brother-materialists. He denies that the soul is an entity; it is only a faculty; and declares the brain to be merely a particular organ specially fitted to produce thought, as the stomach and the intestines perform the function of digestion. C. traces this grotesque analogy through all its niceties, and at last triumphantly concludes, 'that the brain digests impressions and organically secretes thought!'

**CABATUAN**, a city of the province of Iloilo, on the island of Panay, one of the Philippines. It is situated on the banks of the river Tiguin, which so abounds with crocodiles that fishing is unsafe. Navigation is very uncertain, the river being sometimes nearly dry, while at others it overflows its banks, and deluges the surrounding country. The city was founded in 1732, and possesses a population of 23,000, who are chiefly engaged in the production of rice, and of cocoa-nut oil.

**CABAZERA**, capital of the province of Cagayan, island of Luzon, Philippines. Pop. 15,000. Tobacco is grown very extensively in the province, and its manufacture affords employment to large numbers of people.

**CABEAGE** (*Brassica oleracea*; see **BRASSICA**), a plant in most general cultivation for culinary purposes in Europe and other countries, cultivated also to a considerable extent for feeding cattle. It is a native of the rocky shores of Britain and other parts of Europe, more plentiful on the shores of the Mediterranean than in more northern latitudes, and in its wild state is generally from a foot to two feet high. This plant has been cultivated in Europe from time immemorial; it has likewise been cultivated from an early period in gardens and about villages in India. Few plants shew so great a tendency to vary in their form through cultivation; and among the varieties of this one species are reckoned several of our most esteemed culinary vegetables, such as Kale (q. v.) or Greens, Borecole, Colewort (q. v.), Savoy (q. v.), Kohl Rabi (q. v.), Cauliflower (q. v.), and Broccoli (q. v.)—plants which differ much in their appearance and in the particular qualities for which they are valuable, both from each other and from the original wild plant.

The wild C. has smooth sea-green leaves, waved

## CABBAGE BARK—CABBALA.

and variously indented; the bolling of the leaves, or their forming close heads at a certain stage of the growth of the plant, so that the inner leaves are blanched, is peculiar to those cultivated varieties which commonly receive the name of cabbage.

The ordinary varieties of C. are often called by the general name of *White C.*, to distinguish them from the *Red C.*, which is of a deep brownish-red or purplish colour, and is chiefly used for pickling, for which purpose it is much esteemed. The *Tree C.*, or *Cow C.*, is a variety cultivated for cattle, especially in the Channel Islands and the north of France, of which the leaves do not close together into compact heads, but which is remarkable for its great height-reaching when it is in flower, ten feet on rich soils—and for its branching stem. The stems of this kind are sometimes used as stakes for pease, and even as cross-spar for thatched roofs. The *Portugal* or *Tronchuda C.*, also known as *Couve Tronchuda*, is a variety remarkable for its delicacy, and for the large midribs of its leaves, which are often used like sea-kale. It is an article of luxury like cauliflower, and requires a somewhat similar cultivation.—C.-seed is sown either in spring or autumn, and the seedlings transplanted in rows at distances of two feet or upwards, according to the size of the variety. They are often planted closer, and the alternate plants cut young for open greens, for which the sprouts that arise from the stem of some varieties after the head has been cut off are also used. Cabbages require a rich, well-manured soil, and the earth about the roots ought to be often stirred. By sowing and planting at different dates and of different varieties, a succession is secured in the garden; and when winter approaches, part of the principal crop may be taken up and laid in a sloping position, so that only the heads are above the earth, in which way they are generally preserved without injury. In some places, cabbages are completely buried in the earth, the plants not being allowed to touch each other; and this method succeeds well in peaty or sandy soils.

The C., considered as food, contains more than 90 per cent. of water, and therefore cannot be very nutritious: 100 parts of the ordinary C. consist of

Extractive,	2·34
Gummy matter,	2·89
Resin,	0·05
Vegetable albumen,	0·29
Green fecula,	0·63
Water and salts,	93·00

The digestibility of C. varies according as it is partaken of raw or boiled: thus, raw C. alone is digested in  $2\frac{1}{2}$  hours; raw C. with vinegar, in 2 hours; and boiled C. takes  $4\frac{1}{2}$  hours. Immense quantities of cabbages are used in Germany as *Sauer Kraut* (q. v.).

**CABBAGE BARK.** See ANDIRA.

**CABBAGE BUTTERFLY**, a name common to several species of butterfly, the larvae of which devour the leaves of cruciferous plants, especially of the cabbage tribe, and are popularly known as cabbage-worms or kale-worms. The **LARGE C. B.**, or Large White Garden Butterfly (*Pontia Brassica*, or *Pieris Brassica*), is one of the most common of British butterflies. It is white; the wings tipped and spotted with black. The wings, when expanded, measure from  $2\frac{1}{2}$  to 3 inches across. The antennae terminate in an ovoid club. The female lays her eggs, which are conical and bright yellow, in clusters of 20 or 30, on the leaves of the plants which are the destined food of the caterpillars. The caterpillars, when fully grown, are about 1 inch or  $1\frac{1}{2}$  inch long, and are excessively voracious, eating twice their own weight of cabbage-leaf in 24 hours. When full grown, they suspend themselves

476

by their tails, often under ledges of garden-walls, or similar projections, and are metamorphosed into shining pale-green chrysalids, spotted with black, from which the perfect insect emerges, either in the same season or after the lapse of a winter—no longer to devour cabbage-leaves, but to subsist delicately upon honey, which it sucks from flowers. See INSECTS.—The **SMALL C. B.**, or Small Garden White Butterfly, sometimes called the TURNIP BUTTERFLY (*Pontia* or *Pieris Rapæ*), very much resembles the Large C. B., but the expanse of the wings is only about 2 inches. The eggs are laid singly on the under side of the leaves of cabbages, turnips, &c., and the caterpillars, which are of a velvety appearance, pale green, with a yellow line along the back, and a yellow dotted line on each side, sometimes appear in great numbers, and prove very destructive. They bore into the hearts of cabbages, instead of merely stripping the leaves, like those of the last species, and thus are a greater pest, even when comparatively few. The chrysalis is of a pale reddish-brown colour, freckled with black.—A third species, also common in Britain, the GREEN-VEINED WHITE BUTTERFLY (*Pontia* or *Pieris Napi*), very nearly resembles the small cabbage butterfly.—The excessive multiplication of these insects is generally prevented by small birds, which devour them and their caterpillars, and by insects of the *Ichneumon* (q. v.) tribe, which lay their eggs in the caterpillars, that their own larvae may feed on them.

**CABBAGE FLY** (*Anthomyia Brassicae*), a fly of the same family with the house-fly, flesh-fly, &c., and of which the larvae or maggots often do great injury to the roots of cabbages, and sometimes to those of turnips. It is of the same genus with the fly generally known as the Turnip Fly (q. v.), and also with the Potato Fly (q. v.), Beet Fly (q. v.), &c. It is about one-fourth of an inch in length, and half an inch in expanse of wings; of an ash-gray colour; the male having a silvery gray face, and a long black streak on the forehead; the female, a silvery white face, without any black streak; the abdomen of the male is linear, that of the female terminates conically; the eyes of the male nearly meet on the crown, those of the female are distant, with a broad black stripe between them. The larva is very similar to that of the flesh-fly—yellowish white, tapering to the head, which has two black hooks. The pupa is rust-coloured and horny.

**CABBAGE MOTH** (*Mamestra* or *Noctua Brassicae*), a species of moth, the caterpillar of which feeds on cabbage and turnip leaves, and is sometimes very destructive. The caterpillar is greenish-black, and changes to a brown pupa in autumn. The perfect insect is of a rich mottled-brown colour, the upper wings clouded and waved with darker brown, and having pale and white spots, a yellowish line near the fringe, the fringe dotted with black and ochre, the under wings brownish and white.

**CABBAGE PALM**, or **CABBAGE TREE**, a name given in different countries to different species of Palm, the great terminal bud of which—the Palm Cabbage—is eaten like cabbage. The C. P. of the West Indies is *Arecia oleracea*. The Southern States of America have also their C. P. or Cabbage Tree, otherwise called the Palmetto (*Chamaerops Palmetto*). See ARECA, EUTERPE, PALM, and PALMETTO.

**CA'BBALA** (from Heb. *kibbel*, to receive), the received doctrine, by which is not to be understood the popularly accepted doctrine, but that inner or mystical interpretation of the Law which the Cabalists allege that Moses received from God in the mount, and subsequently taught to Joshua, who in his turn communicated it to the seventy elders, and

which has ever since been the treasure of the select Jews. Since the 12th c., the study of this secret lore has gradually resulted in a distinct school and literature, the elements of which, however, are already visible in the Macedonian epoch, and the real or historical source of which is to be found in the eastern doctrine of emanation. In Philo, in the Talmud, &c., we certainly find theologico-philosophical conceptions, which were at a later period taken up and modified; but the first book on cosmogony is *Jezirah*, a production of the 7th c., attributed to Akiba. After the second half of the 12th c., the Cabalistic doctrines, which had at first been confined to such high themes as God and creation, began to include exegesis, ethics, and philosophy, and so became a kind of mystical religious philosophy. The numerous cabalistic writings composed during the three subsequent centuries, professed to teach the secret or mystical sense of Holy Writ, and the principles on which it is grounded, the higher meaning of the Law, as well as the method of performing miracles, by the use of divine names and sacred incantations. The cabalists, moreover, prepared books, which they attributed to the oldest authorities—for instance, *Sohar*, a work written in Aramaic, during the 13th c., and fathered upon Simeon-ben-Joachai, a scholar of Akiba. This became the Bible of the Cabalistic neophytes. The chief opponents of the Cabalists were the philosophers, and in part the Talmudists. Towards the close of the 16th c., the Cabalistic wisdom, which by that time had degenerated into magic and word-juggling, received a new impulse from its teachers in Palestine and Italy. Since the time of Reuchlin, many Christian scholars have investigated the subject.

CABEIRI, divinities anciently worshipped in Egypt, Phenicia, Asia Minor, and Greece. The ancients have left us very obscure notices of the C., and learned men have been unable to reach any satisfactory conclusions with regard to them and their worship. It is certain that the worship had both its mysteries and its orgies, and it appears also that the C. were amongst the inferior divinities, and regarded as dwelling upon the earth, like the Curetes, Corybantes, and Dactyles, and were probably representatives of the powers of nature.

CABÉS, or KHABS, GULF OF (ancient *Syrtis Minor*), an inlet of the Mediterranean Sea, lying between the islands of Kerkenna and Jerba, on the north-east coast of Africa, in lat. about 34° N., and long. from 10° to 11° E. The town of Cabes (ancient Tacape) stands at the head of the gulf.

CABET, ÉTIENNE, a notable French communist, was born at Dijon, January 2, 1788, and educated for the bar, but turned his attention to literature and politics. Under the Restoration, he was one of the leaders of the Carbonari (q. v.), and in 1831 was elected deputy for the department of Côte d'Or. Soon afterwards, he published a *History of the July Revolution* (1832), started a Radical Sunday paper, *Le Populaire* (1833), and, on account of an article in this paper, was sentenced to two years' imprisonment, but escaped to London. Here he wrote brochures against the July government, and began his communistic studies. After the amnesty, 1839, he returned to Paris, and published a *History of the French Revolution* (4 vols., 1840), bestowing great praise on the old Jacobins. He attracted far more notice by his *Voyage en Icarie* (1840), a 'philosophical and social romance,' describing a communistic Utopia. The work obtained great popularity among the working-classes of Paris. C. next proceeded to turn his 'philosophical romance' into a reality, and published (1847) in his journal, *Le Populaire*,

the statutes for the formation of an 'Icarian colony' on the Red River in Texas; inviting his followers to emigrate. The first division sailed on the 2d February 1848, but a short experience convinced them that Texas was anything but a Utopia. Their complaints reached Europe, but did not deter C. from embarking at the head of a second band of colonists. On his arrival, he learned that the Mormons had just been expelled from Nauvoo, in Illinois, and that their city was left deserted. The Icarians established themselves there in May 1850. C. now returned to France, to repel the accusations against his probity which had been circulated during his absence, and to obtain a reversal of the judgment which had been formally pronounced against him, 30th September 1849. Having succeeded in this, he went back to Nauvoo, where he governed, as a sort of dictator, his petty colony, until 1856, when he was deprived of his office, and obliged to flee to St Louis, where he died 9th December of the same year. C. was a shallow thinker, a weak ruler, and a poor writer; but his success, such as it was, is a proof of what can be accomplished by what has been termed, with more vigour than elegance, 'pig-headed perseverance.'

CABEZA DEL BUEY, a town of the new province of Badajoz, Spain, about 86 miles east-south-east of the city of Badajoz. It is situated on the northern slope of the Sierra Pedregoso, has manufactures of woollens and linens, and a trade in cattle and agricultural produce. Pop. 5400.

CABEZON DE LA SAL, a town of Spain, in the province of Valladolid, about 7 miles north-north-east of the city of that name. It is situated on the Pisuerga, and is celebrated as the scene of one of the first battles of the Peninsular campaign, in which the Spaniards were signally defeated by the French. Pop. 2000.

CABIN is the general name for a room or apartment on shipboard. In ships of war, the living-rooms of the admirals and captains are called 'state' cabins, and are fitted up with much elegance, with a gallery or balcony projecting at the stern. The chief officers below the captain have their cabins on either side of the main-deck; while those of the subordinate commissioned officers are, in large ships, on either side of the lower or orlop deck. All the cabins of a ship of war are enclosed by light panelling, which is quickly removable when preparing for action.

CABINET (Ital. *gabinetto*), a small chamber set apart for some special purpose, such as the conservation of works of art, antiquities, specimens of natural objects, models, and the like. From signifying the chamber in which such collections are contained, the term C. has recently come to be employed by us, in imitation of the French, to signify the collections themselves, and this even when they fill many rooms or galleries. It often means simply a small room appended to a larger one, when it is also called an anteroom, a retiring-room, and the like. See CLOSET.—CABINET PICTURES, a picture suited for a cabinet or small room. C. pictures are generally small in size, highly finished, and thus suited for close inspection.

CABINET. See MINISTRY.

CABLE is either a large rope, or a chain of iron links, chiefly employed on shipboard to suspend and retain the anchors. Rope cables are made of the best hemp, twisted into a mass of great compactness and strength. The circumference varies from about 3 inches to 26. A certain number of yarns are twisted to form a lissum; three lissums are twisted in an opposite

## CABLE-MOULDING—CABOT.

direction to form a *strand*; and three strands are twisted (in the same direction as the yarns in a lissum) to form a *cable*. The number of yarns in a C. of given size is not always alike, because the yarns slightly vary in thickness; but the following is one among many tables which have been prepared relating to cables of 120 fathoms, and of the usual degrees of thickness:

Inches. Circumference.	Yarns.	Lbs.
3 . . . .	= 48 . . .	= 192
6 . . . .	= 174 . . .	= 606
9 . . . .	= 393 . . .	= 1572
12 . . . .	= 699 . . .	= 2796
15 . . . .	= 1083 . . .	= 4572
18 . . . .	= 1574 . . .	= 6596
20 . . . .	= 1943 . . .	= 7772

Some cables are made with four strands, but three is the common number. If a C. be twisted too much, it is stiff; if too little, it is weak. The strength of a C. of 18 inches' circumference is found to be about 60 tons; and for other dimensions, the strength varies according to the cube of the diameter. On shipboard, cables receive the names of *chief cables*, *bower cables*, &c., according to the anchor to which they are attached. During the last great European war, the largest ships in the British navy carried ten cables, most of which were about two feet, or a little more, in circumference. Although ships seldom anchor at a greater depth than 40 fathoms, it is not deemed safe to trust the anchor to a C. of 120 fathoms, lest the C. should be jerked by a high sea when too nearly perpendicular; two are spliced together at the ends, and the C. of 240 fathoms thus produced acts more like an elastic spring.

**CHAIN CABLES** are made of links, the length of each of which is generally about six diameters of the iron of which it is made, and the breadth about three and a half diameters. In government contracts, chain cables are required to be made in 12½ fathoms lengths, with one swivel in the

Thickness of Iron.	Weight of Stay-pin.	Weight per Fathom.	Breaking Strain.
½ inch.	1 oz.	13½ lbs.	6 tons.
1 " "	3½ "	54 "	24 "
1¼ " "	12 "	191 "	60 "
2 " "	28 "	215 "	99 "
2½ " "	40 "	273 "	136 "

By the Chain Cables Act of 1871 (34 and 35 Vict. c. 101), certain associations and bodies are licensed to erect machines for testing, both by tensile and breaking strain, all chain cables and anchors; and it is forbidden to sell or purchase, under penalty of £50, any chain cable or any anchor weighing more than 168 lbs., which has not been duly tested.

**CABLE-MOULDING**, in Architecture, is a moulding cut in the form of a rope, the twisting being prominently shewn. It was much used in the later Norman style.

**CABLING**, the moulding by which the hollow parts in the flutes of columns and pilasters in classical architecture are often partially filled. The C. seldom extends beyond the third part of the shaft from the ground.

**CABO'CHED**, or **CABOSSED**, an heraldic term, from the old French word *cabochie*, the head. When the head of an animal is borne, without any part of the neck, and exhibited full in face, it is said to be caboched.

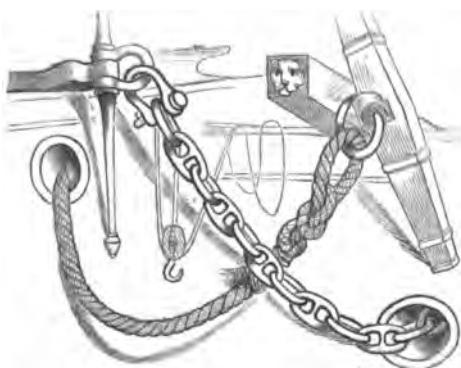

Stag's Head Caboched.

**CABOO'SE**, or **CAMBOOSE** (Danish, *kabye*, a cook's room in a ship; Ger. *cabuse*, a little room), is the name of the kitchen or cook-room in a merchant-ship. In coasting-vessels, the term is applied to a portable cast-iron stove on the deck, where food is cooked.

**CABOT**, the name of two Venetians, father and son, both celebrated as navigators and discoverers.

—**JOVANNI CABOT**, or **CABOTTO**, the father, whose business compelled him to reside much in Bristol, was appointed by Henry VII., March 5, 1496, to the command of a squadron of five vessels on a voyage of discovery in the Atlantic Ocean. In this expedition he was accompanied by his sons Ludovico, Sebastiano (born at Bristol, 1477), and Sanzio. On the 24th of June 1497, the coast of Labrador, North America, was sighted. The merit of this discovery has been generally ascribed to the navigator's second son, Sebastian C., the most scientific of the family; but an extract from a chart preserved by Hakluyt mentions the father before the son. The expedition returned in August 1497. In 1498, a second was made, with what results we do not know; and in 1499, a third to the Gulf of Mexico. About this time, Giovanni, the father, appears to have died, and we hear no more of *Sebastian* till 1512, when he entered the service of Ferdinand, king of Spain. During the year 1515, he was engaged in revising maps and charts, in connection with his profession, and in planning an exploration of the North-west Passage to Asia, which, however, was laid aside on account of the death of Ferdinand in 1516. C., who seems to have been no favourite with the Spanish courtiers, was now subjected to a series of contemptible insults. This usage induced him to return to England, and in 1517, he was appointed by Henry VIII. to the command of an expedition to Labrador. He reached lat. 67° N., and entered Hudson's Bay, where he gave names to several places; but the expedition proved on the whole a failure, on account of the cowardice or malice of his vice-commandant, Sir Thomas Perte. C. now entered again into the Spanish service, was made pilot-major of the kingdom by Charles V., and commanded an expedition which examined the coast of Brazil and La Plata, which he attempted to colonise. In

Chain and Hemp Cables.

middle of every alternate length, and one joining-shackle in each length. The stay-pins, to strengthen the links, are of cast iron. The bar or rod from which each link is made, has the two ends cut diagonally; it is bent into the form of a nearly complete oval ring; and then the two ends are joined and welded, the stay-pin being at the same time introduced at the proper place. Besides the ordinary links, there are end-links, joining shackles, splicing-tails, mooring-swivels, and bending-swivels. The sizes of chain cables are denoted by the thickness of the rod-iron selected for the links. The following table gives certain ascertained quantities concerning the cables in ordinary use:

1531, he returned to Spain, and resumed his old situation; but in 1548, he once more betook himself to England, where he was well received by King Edward VI., who made him Inspector of the Navy, and gave him a pension. To this monarch he seems to have explained the variation of the magnetic needle in several places, which he was among the first, if not the very first, to notice particularly. In 1553, C. was the prime mover and director of the expedition of Merchant Adventurers which opened to England an important commerce with Russia. It is not known exactly when C. died.—*Memoir of Sebastian Cabot (Lond. 1831).*

CABOTZ. See CUZO.

CA'BRA (ancient *Megabrum*), a town of Spain, in the province of Cordova, 30 miles south-east of the city of that name. C. is irregularly built between two hills, and surrounded with gardens; vineyards in the neighbourhood produce excellent wine. It is chiefly agricultural; but it has manufactures of woollen, linen, hats, soap, earthenware, &c. Pop. 12,000.

CABRAL, or CABRERA, PEDRO ALVAREZ, the discoverer of Brazil, was descended from an old and patrician Portuguese family. Nothing is known of his early life, save the fact, that he must have recommended himself by talent and enterprise to King Emanuel of Portugal, who, after the first voyage of Vasco de Gama, appointed C. to the command of a fleet of 13 vessels, carrying 1200 men, and bound for the East Indies. On the 9th March 1500, he sailed from Lisbon. To avoid the inconvenience of being becalmed on the coast of Africa, he took a course too far westerly, fell into the South American current of the Atlantic, and was carried to the unknown coast of Brazil, of which he claimed possession for the king of Portugal, April 24, 1500, naming the new country 'Terra da Santa Cruz.' After sending home one vessel to bear news of this great accidental discovery, C. sailed for India; but on the 29th of May, four of his vessels foundered, and all on board perished, including Diaz the great navigator; and soon afterwards three more vessels were lost. C. therefore landed at Mozambique, on the east coast of Africa, of which he first gave clear information, and also discovered (August 23) the Antchedives Islands, of which he described correctly the position. Hence he sailed to *Calicut*, where, having made the terror of his arms felt, he was permitted to found a factory; entered into successful negotiations with native rulers, and thus established the first commercial treaty between Portugal and India. He returned from India, bringing with him a considerable booty, and arrived in the port of Lisbon, July 31, 1501. It appears probable that the king was dissatisfied with the results of the expedition (although it had annexed Brasil to the crown of Portugal), for subsequently we find no mention made of C. among other discoverers. At the request of C., Sanchez de Tora wrote a description of the coast of Sofola. C.'s voyages are described in Ramusio's *Navigatio e Viaggi*, 3 vols. (Venice, 1563; new ed., Venice, 1835).

CABRERA, a small island in the Mediterranean, lying off the southern point of Majorca. It is about three miles in length and breadth, with an irregular coast, and is little else than a barren calcareous rock. The only interest attached to C. is, that during the war in the Peninsula it formed a Spanish dépôt for French prisoners, who were crowded in thousands into the desolate spot, and treated with great barbarity; of which an account is given in a popular work, entitled the *Adventures of a French Sergeant*.

CABRERA, DON RAMON, the boldest leader of

the Carlist party in Spain, was born at Tortosa, in Catalonia, 31st August 1810. The death of Ferdinand, in 1833, gave the signal for a civil war, and first brought C. into notice. Placing himself at the head of some guerilla troops, he joined the Absolutists, or partisans of Don Carlos, and by his vigilance, energy, and daring soon rose to be second in command in the Maestrazgo district. Throughout Aragon and Valencia his name became a by-word for cruelty. After penetrating as far south as Andalusia, his forces were completely routed by the royal troops, on the borders of Aragon, and he himself, severely wounded, escaped with difficulty into the woods. It was now rumoured that C. was dead, when all at once he reappeared at the head of 10,000 foot and 1800 horse. Invading the province of Valencia, he overthrew the royal army at Buñol, 18th February 1837, and again on the 19th March at Burjasot; but was in his turn vanquished at Torre-Blanca, and once more compelled to seek a hiding-place. Shortly after, he re-opened the war with fiery energy. Madrid itself was threatened by C., who, about this time, received the title of Count of Morella for his vigorous defence of the fortress of that name, and was also appointed governor-general of Aragon, Valencia, and Murcia. The Carlists now believed that the triumph of absolutism was approaching, when the treachery of the Carlist general, Marotto, changed the whole aspect of affairs, and Don Carlos fled from Spain. C. held out until Espartero forced him to quit the country in the summer of 1840. He then entered France, where he was taken prisoner, and confined for a short time in the fortress of Ham. In 1845, he strongly opposed Don Carlos's abdication of his rights. On the outbreak of the French revolution in 1848, he renewed the struggle on behalf of absolutism in Spain; but the adventure proved a miserable failure, and on the 17th January 1849, he recrossed the Pyrenees, to live in retirement. He afterwards married a wealthy English lady, Miss Marianne Catherine Richards. He took part in the struggles in Spain in 1873.

CABU'L, a river in Afghanistan, rises in lat. 34° 21' N., and long. 68° 20' E., on the southern declivities of the Hindu Kush or Indian Caucasus. Its source is 8400 feet above the level of the sea; and an eastward run of 320 miles, with a fall of about 7600 feet, along North Afghanistan, through the Khyber Mountains, and across Peahawur, carries it into the Indus, opposite to Attock, in the Punjab. The point of confluence marks the head of navigation on the main stream, while the tributary itself is practicable about 50 miles upwards for craft of 40 or 50 tons. By means, therefore, of the two taken as one line, there exists an available communication of about 1000 miles between the Khyber Mountains and the Indian Ocean. The C. washes the cities of Cabul, Jalalabad, and Dobundee.

CABU'L is the name given to that part of Afghanistan (q.v.) which lies south of the Hindu Kush, and is drained by the Cabul river. It extends from the south of Ghiznee to the Hindu Kush, and from Bamian (q.v.) to the Khyber Pass. This region has long occupied a prominent position in the world. Through it, as the passage from Persia to India, Alexander the Great marched in order to complete his eastern conquests; from it issued Mahmoud of Ghiznee, the first Mohammedan invader of Hindustan.

The city of Cabul, from which the surrounding territory takes its name, has 60,000 inhabitants, and stands in lat. 34° 30' N., and long. 69° 6' E., near the

## CACAO—CACHOLOT.

point where the river, here crossed by three bridges, ceases to be fordable. Elevated about 6400 feet, and overtopped, within a short distance to the north, by pinnacles of the Hindu Kush, about 14,000 feet higher than itself, C. has a severe winter, and a temperate summer, ranging from 75° to 85° F. The city, in addition to its being fortified as a whole, is separated into different quarters, for the purposes of defence, by stone walls—the Bala Hissar, or citadel proper, being on the east, and the Kuzzil-bashes or Persians having a strongly fortified quarter on the south-west. In the days of Sultan Baber, C. was the capital of the Mogul empire. In more recent times, it has witnessed some of the most momentous events in Anglo-Indian history. In 1839, it was taken by the British : in 1841, it was lost through a treacherous outbreak, which led (6th January 1842) to the massacre of about 4000 soldiers and 12,000 followers ; and, finally, after being recovered by General Pollock in the same year, it was abandoned, its bazaars and public buildings having previously been burned to the ground.

After the death of Dost Mohammed, Ameer of Afghanistan, Shere Ali, the son whom he had selected as his heir, had to fight for the possession of C. with Uzful Khan, his elder brother, and the son of the latter, Abdulrahman, who had married a daughter of the Khan of Bokhara. Shere Ali was at first unsuccessful. On May 21, 1868, Uzful entered C. in triumph, and was proclaimed Ameer of Afghanistan. He applied to Sir John Lawrence, the Indian viceroy, to recognise him, but the request was declined on the ground that Shere Ali remained in possession of a large part of Afghanistan. At the death of Uzful, his brother Azim took the title of Ameer, not of Afghanistan, but of C. and Candahar. Azim was not, however, allowed to preserve these possessions. In the end of 1868, Shere Ali, aided by his son Yakoob, obtained possession of C., which was then restored to its original and proper position of capital of Afghanistan (q. v.).

**CACAO.** See COCOA.

**CACCA'MO**, a town in the province of Palermo, Sicily, about 6 miles south-west of Termi, with a population of 6394.

**CA'ERES**, a town of Spain, capital of the new province of Caceres, is situated on a river of the same name, about 25 miles west of Truxillo, in a rich agricultural district. It is famous for its bacon ; has manufactures of linen, woollens, leather, hats, soap, &c. ; dye-works and flour-mills, and a large trade in the produce of the district. It is the *Castra Caecilia* of the Romans, and many relics of its antiquity are still found. It is rich in architecture of the feudal period, and has one of the largest and finest bull-rings in Spain. Pop. 12,000.

**CA'ERES, NU'VA**, a town of the Philippines, in the province of South Camarines, on the island of Luzon. It is situated on the river Naga, or Santa Cruz, between the Bay of San Miguel and the Gulf of Ragay, about 175 miles south-east of Manila. Pop. 12,000.

**CACHA'O**, capital of the province of Tonquin, and the largest city of the kingdom of Anam (q. v.), having an estimated population of 100,000. It stands about 100 miles from the sea, on the Tonquin River, which is thus far navigable for small-craft. It has a considerable trade, sufficient to have at one time attracted English and Dutch factories. The exports are bullion, silks, and lacquered ware ; and the imports are pepper, arms, long cloths, chintzes, and manufactured goods generally.

**CACHA'R**, or HAIRU'MBO, a district of

British India, in the presidency of Bengal, to the S. of Assam, between 24°—26° N. lat. and 92°—93° 30' E. long. With an area of 1285 sq. m., it contained, in 1871, 205,027 inhabitants. It is mostly mountainous and uncultivated. Its principal river is the Barak, which, after a singularly tortuous course of 350 miles, enters the Brahmaputra about 40 miles above Dacca. The territory produces rice, cotton, tea, sugar, timber, bamboo, iron-ore, wax, and ivory ; and imports salt, cloths, tobacco, and ghee or half-liquid butter.

**CACHE** (Fr. a lurking-hole), the name given by parties of travellers in the great western prairies of the United States to places for concealing provisions and other articles. Designing to return on their tracks after crossing the Rocky Mountains, they disburden themselves of what articles can be spared, and to conceal them from the Indians, construct places of deposit in the wilderness. The making of a C. is a matter of much labour and ingenuity. A hole is dug to a depth of perhaps six or eight feet and several feet broad, and then the articles being interred, the surface is replaced with the utmost possible care. The excavated earth is also carefully removed, so as to leave no trace whatever of the excavation. The situation of the C., however, is known to the party by some landmark, and returning months afterwards, they probably find its contents undisturbed.

**CACHET, LETTRES DE.** See LETTRES DE CACHET.

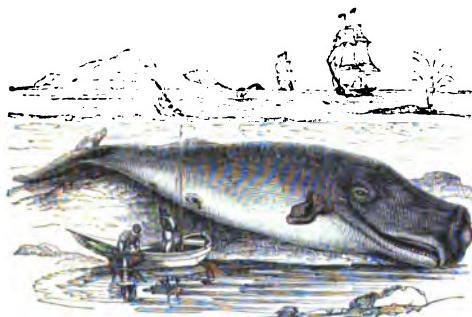

**CACHEXIA**, a name applied by physicians sometimes to a group of diseases, and sometimes to the constitutional state accompanying a particular disease—e.g., Cancerous C., Gouty C., Mercurial Cachexia. The word is derived from the Greek *kakos*, bad, and *hexis*, a habit, and signifies simply a *bad habit of body*, without reference to the cause of illness. From Cullen's having in modern times given extensive circulation to the word, as indicating a large group of chronic diseases, in most of which there are complicated changes in the blood and in the solid textures, C. has come to be chiefly employed with reference to diseases in which the general nutrition of the body is at fault, and in which the local disorders are supposed to be the result of a constitutional cause. Thus, Cancerous C. indicates the peculiar impoverished state of the blood and general debility which are associated with the deposits of cancer in various parts of the body ; Gouty C., the state of the general system in gout, as opposed to the mere local attack of gout in the foot, &c. The cachexies differ from the fevers in being much slower in development, and, for the most part, in having no natural termination at a fixed period. See CRISIS.

**CA'CHOLONG**, a beautiful mineral, regarded as a variety of Opal (q. v.). It is sometimes called Pearl Opal, or Mother-of-pearl Opal. It is generally of a milk-white colour, rarely with a yellowish or reddish tinge, opaque and dull or pearly and shining, and has a flat conchoidal fracture. Among the localities in which C. is found are the Giants' Causeway and the Faroe Islands.

**CA'CHOLOT, SPERMACETI WHALE**, or, by contraction, **SPERM WHALE** (*Physeter macrocephalus* or *Catodon macrocephalus*), one of the largest of the *Cetacea* (q. v.), very peculiar in form and appearance, much sought after not only on account of the oil, but still more on account of the Spermaceti (q. v.) which it yields. Ambergris (q. v.) is also obtained from it. The C. belongs to the family of *Cetacea* called *Physeteridae*, or *Catodontida*, of which some naturalists still think that there is only one well-ascertained species. There appears, however, to be pretty good reason for thinking

## CACHOLOT.

that at least two species exist, both of which are occasional visitors of the British shores—the Common C., having no dorsal fin, and the High-finned C. (*Physeter Tursio*), having a very high dorsal fin. The Common C. has a very wide geographical range. It may almost be said to inhabit all seas, although it is most abundant in those of the southern hemisphere. It is not of frequent occurrence on the European shores, although it sometimes enters the Mediterranean, and is occasionally stranded on the coasts of Britain. An individual, fifty-four feet long and thirty in circumference, ran ashore on Cramond Island in the Firth of Forth in 1769, and was very particularly described in the Philosophical Transactions by Mr Robertson of Edinburgh. Twelve were caught at Walderwick, on the Suffolk coast, in 1788. The C. sometimes reaches the length of seventy or eighty feet. The head is enormously large, forming about one-half of the entire bulk of the animal, and occupying more than one-third of the entire length. From the head, the body tapers to the tail, and at last rather rapidly. The general colour is very dark gray, nearly black on the upper parts, lighter beneath. Old males, or, in the language of the South Sea whalers, old bull-whales, usually have a large gray spot on the front of the head. The muzzle is very obtuse, almost as if suddenly cut off in front, the breadth of it almost equalling the thickness of the body. In a protuberance on the upper part of it, is the blow-hole, which is

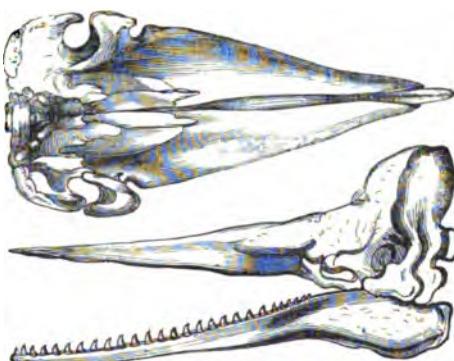

Cacholot, or Sperm Whale.

single, situated a little on the left side, and in form not unlike the letter S elongated. The mouth is very large and wide; and the throat, unlike that of the Greenland whale, is very wide, sufficiently so to admit the body of a man. The upper jaw projects some feet beyond the lower, and is destitute both of teeth and whalebone; the lower jaw has from 20 to 25 teeth on each side, according to the age of the animal. The teeth are conical and slightly recurved, projecting about two inches from the gum. The lower jaw is extremely narrow, the two branches being in contact throughout the greater part of its length: it fits into a groove in the upper, in which are cavities for the teeth. The eyes are small, and placed far back in the head, above the angles of the mouth; the left eye is said to be smaller than the right. Just above the eyes, the dorsal line rises considerably; the dorsal fin is also represented by a protuberance about half-way between the neck and the tail; and these parts are seen above water in the ordinary swimming of the animal, which is at the rate of from 3 to 7 miles an hour, and just under the surface of the water, although when alarmed it swims with greater velocity, striking the water upward and downward with its tail with great force.

The pectoral fins are small, and seem scarcely if at all to aid in progression, which is accomplished by the large and powerful tail-fin. The tail-fin is very broad, and is divided into two lobes, called by South Sea whalers *the flukes*.

The enormous head of the C. is in great part occupied by a cavity in front of and above the skull, called by whalers *the case*, which is a receptacle for spermaceti (q. v.). This substance being light, it is

Skull and lower jaw of Cacholot.

not wonderful that the animal in swimming raises its head above the surface of the water, which it also often does even when at rest, 'like a black rock in the ocean.' The *case* frequently holds as much as ten large barrels of spermaceti. It is not formed of bone, but of a strong tendinous integument, and is divided into compartments communicating with each other. The substance which it contains is in a semi-fluid state, but hardens on cooling: it consists of spermaceti and oil; the oil is separated by draining and squeezing, and the spermaceti further purified, till, instead of being a yellow unctuous mass, in which state it is brought home by the whalers, it assumes a beautiful pearly white, flaky, almost crystalline appearance. When the spermaceti whale is killed, and towed alongside the whaling-ship, the *case* is emptied of its valuable contents through a hole made in front of the muzzle, and by means of a bucket attached to a pole. The spermaceti was at one time imagined to be the brain of the whale; what purpose it serves in the animal economy, is not well known, except that already alluded to of giving buoyancy to the forepart of the huge body; and perhaps this is its chief use, respiration even more than progression depending on it; but it is distinct enough from the brain, which is comparatively very small, and is indeed, as well as the skull which contains it, small in proportion to the whole bulk of the creature. Cavities filled with spermaceti are distributed over the body, and even ramify through the external fat or blubber, although the principal mass is in the head. The blubber of the C. is not nearly equal in thickness to that of the Greenland whale, being only about fourteen inches thick on the breast of a large whale, and from eight to eleven inches on other parts of the body. It is called by whalers the *blanket*, is removed from the body of the captured whale in great strips, and is heated in large pots, the skin of the whale serving for fuel, when the oil known as SPERM OIL (q. v.) flows from it. The *junk*, a thick elastic mass, which occupies the forepart of the head, immediately under the *case*, yields also a considerable quantity of sperm oil.

The C. feeds upon fishes and cephalopodous mollusks. Squids and cuttle-fishes appear to be its

chief food. It is gregarious in its habits, and the herds are called *schools* by whalers. Five hundred or more have been seen in a single herd. Large herds generally consist of females, with only a few males; herds of young males also occur; when solitary individuals are met with, they are almost always old males. Terrible conflicts often take place among the males, and it is not unusual to find the lower jaw deformed in consequence of having been dislocated or broken in them. See WHALE-FISHERY.

CACI'QUE, or CAZI'QUE, the designation given to the chiefs of Indian tribes in works relating to the central and southern parts of America. The word was derived by the Spaniards from the language of the former inhabitants of St Domingo.

CACODÆMON. See DEMON.

CA'CODYLE, or KA'KODYLE, is an organic substance containing carbon, hydrogen, and arsenic ( $C_6H_5As$ ). It has recently been proposed to employ the oxide of C. ( $C_6H_5AsO$ ) as a deadly agent in war. This compound, otherwise known as *Cade's fuming liquor* or *alkarene*, has the remarkable property of taking fire spontaneously when exposed to the air, and evolving abundant fumes of arsenic. Thus, a shell filled with it would, on bursting, saturate a space of ground, or the rigging or deck of a man-of-war, with a liquid which would quickly take fire of its own accord, and besides causing destruction by burning, would likewise spread death by its fumes.

CACONGO, or MALLEMBA, an independent state of South Guinea, Africa, extending along the South Atlantic Ocean, in lat. 5° S., and stretching south-east as far as the river Bell. Its limits interiorly are not well defined. The country is generally flat, and the soil fertile. The principal towns are Kinguele, and Cacongo and Mallemba on the coast, the last once a great mart for slaves.

CA'CTÆ, or CACTA'CEÆ, a natural order of exogenous plants, consisting of succulent shrubs of very singular appearance. Linnaeus included all the C. in the single genus *Cactus*, which is now divided into a number of genera; the name *Cactus*, however, still continuing in popular use, common to the whole order. Nearly 500 species are known, but the real number is probably much greater. The C. are, without exception, natives of America, and their extraordinary forms constitute a remarkable feature in the vegetation of its warmer regions. All of them have fleshy stems, either simple or branched, often very soft and juicy; but in many, at least when old, having an easily distinguished woody axis, composed of annual rings, and covered with a layer of inner bark, so that the thick fleshy part may be regarded only as a layer of bark. Most of them are leafless; the *Peregrinae* alone have true leaves, which are fleshy; and the *Opuntiae* have rudimentary leaves, which soon fall off; but, instead of leaves, most of the order have clusters of hairs or prickles, where buds are formed in their stems, and these are very numerous, even in the species which in ordinary circumstances most rarely develop branches. The multiplicity of curious forms exceeds imagination; in many species (*Melocactus*, or *Melon Thistles*), the stem swells out into a globe; in others (*Torethistles*), it rises up as a column with many angles; in others (*Opuntia*, Indian Figs, or Prickly Pears), it divides in leaf-like articulations; in some (*Peregrina*) it assumes a tree-like form, in which the thick stem bears a head of branches, and reaches a considerable height, sometimes even 30 or 40 feet. Those which have angular, ribbed, and channelled, or flat and two-edged stems, shew a tendency to the cylindrical

form as the stem advances in age. Some species have long creeping or trailing stems. The whole organisation of the C. adapts them for the endurance of long droughts; they vegetate vigorously during a

Melon Cactus or Thistle (*Melocactus*).

part of the year, and then rest; the very absence of leaves concurring with the absence of pores or *stomata* in their tough skin to enable them to resist the action of a dry atmosphere and powerful sun-shine, and to occupy arid soils and bare rocks, on which they are very generally found, often covering large tracts. Some of them grow rapidly on old lavas, and disintegrate them by their penetrating roots, thus preparing a soil for other plants; and the Prickly Pear is often planted in Sicily by the mere insertion of a branch or joint of it in a fissure of lava. Many species occur as *epiphytes* (q. v.) on the trees of American forests. Some also grow on high mountains, a few even reaching almost to

Cochineal or Nopal Cactus (*Opuntia Cochinellifera*), with Cochineal Insects.

the border of the snow. The plants of this order are a great boon to the regions in which they chiefly abound, which are, at least during great part of the year, very destitute of water; their stems containing a store of insipid and wholesome juice, of which both men and cattle avail themselves.—Some species, as the Prickly Pear (q. v.),

produce a pleasant fruit.—The fruit of *Opuntia Tuna* affords a valuable pigment of the richest carmine colour.

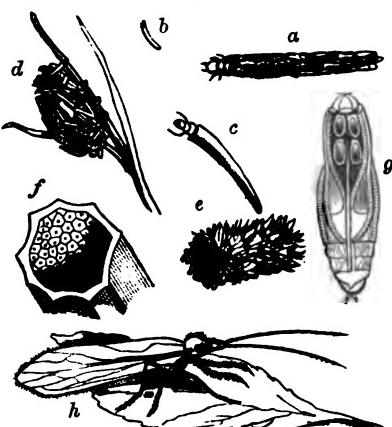

The flowers of the C. are in general very short-lived; those of some night-flowering species, as of *Cereus grandiflorus*, well known in our hothouses, endure only for part of a single night. In the greater number, they are large and splendidly coloured, in some they are very fragrant. The order is regarded as botanically allied to *Mesembryaceæ* (q. v.) and to *Grossulariaceæ* (q. v., Gooseberry, Currant, &c.).

The cultivation of the C. in green-houses and hothouses has been much in fashion for more than 30 years. The gardener must imitate the natural conditions of their growth, by giving water freely during a few months, and withholding it almost entirely during the rest of the year. Most of them are easily propagated by branches, taken off, and allowed to dry a little before being planted. The *Melocactus*, which do not readily produce branches, are made to do so by cutting off or burning out the central bud, that the means of propagating them may be obtained.

**CADDICE, or CADDICE-FLY (*Phryganeæ*),** a Linnean genus of insects of the order *Neuroptera*, a family in subsequent entomological systems, and constituted by Mr Kirby into a distinct order, *Trichoptera* (Gr. hairy-winged). The caddice-flies certainly differ in important particulars from the other neuropterous insects, and exhibit points of resemblance to the *Lepidoptera*. They have no mandibles, and the maxilla and lower lip are membranous and united; the head is small, with prominent eyes, and two additional small simple eyes situated on the forehead; the antennæ are long and bristle-like, composed of very numerous indistinct joints. Both wings and body are generally very hairy, and the wings, when at rest, are raised, and meet above the back like those of butterflies, from which, however, they differ very much in form, being much more elongate: the legs are long. Caddice-flies are extremely active, particularly in the evening and at night, when the

cylindrical form, the head and first three segments hard, the remainder—the abdominal segments—soft. To the thoracic segments are attached the feet, six in number, as in the perfect insect. The larva lives always in water, feeding on aquatic vegetables. It spins by its mouth silken threads, by means of which, together with a viscid substance, it attaches together—and often in a very symmetrical manner, and with interesting peculiarities which differ in the different species—small hard substances, such as small stones, bits of stick, or small shells, even although they happen to contain living inmates, and thus constructs a case for itself, in which its soft body is protected, and from which only the head and hard thoracic segments are voluntarily protruded. When it changes into the pupa state, in which it differs little from the perfect insect, except in the imperfectly developed wings, it fixes its case to some solid substance beneath the water, and closes the two extremities with a kind of grating, which admits the free passage of water, necessary for respiration. Before assuming the perfect form, the pupa of the larger species breaks out of its case by means of a pair of hooks on the forepart of the head, and swims actively by means of the hind legs, or crawls by the other two pair. Many of the smaller species bring their pupa case to the surface of the water, and there take wing from it as from a boat. The species of caddice-fly are very numerous, and they are said to be more so in the north than in the south of Europe. About 200 British species have been described.—The angler looks for cad-bait about the edges of streams and under stones, or on the stalks of water-cresses, and other aquatic plants. As a bait for angling, the caddice is almost as deadly as the May-fly, and more so, in clear running streams, than the ordinary worm; the usual-sized bait-hook is used, upon which two of the baits are fixed, the angler proceeding exactly as in ordinary worm-fishing.

**CADE, JACK,** a historical character, leader of an insurrection which broke out in Kent, June 1450. Little is known of his personal history, further, than that he was an Irishman, and an illegitimate relation of the Duke of York, and hence called himself Mortimer. With 15,000 or 20,000 armed men of Kent, C. marched on London, and encamped at Blackheath, whence he kept up a correspondence with the citizens, many of whom were favourable to his enterprise. The court sent to inquire why the good men of Kent had left their homes; C., in a paper entitled 'The Complaint of the Commons of Kent,' replied, that the people were robbed of their goods for the king's use; that mean and corrupt persons, who plundered and oppressed the commons, filled the high offices at court; that it was 'noised that the king's lands in France had been aliened'; that misgovernment had banished justice and prosperity from the land; and that the men of Kent were especially ill-treated and overtaxed, and that the free election of knights of their shire had been hindered. In another paper, called 'The Requests by the Captain of the Great Assembly in Kent,' C. demanded that the king should resume the grants of the crown, which he complained the creatures about the royal person fattened on, the king thus being compelled to live on taxation; that the false progeny of the Duke of Suffolk should be dismissed; and that the Duke of York and others should be restored to favour, and a number of persons punished. The court sent its answer in the form of an army, before which C. retreated to Sevenoaks, where he awaited the attack of a detachment, which he defeated. The royal army now objected to fight against their countrymen; the court made some concessions, and C. entered London on the 3d July.

Various shapes of Caddice Cases, and perfect Insect: a, case of bark; b, case of sand; c, case of sand, magnified; d, case of grass stems; e, case of grass; f, orifice of case, shewing the silk grating, magnified; g, pupa; h, stone, or caddice-fly.

smaller species often fly in great numbers above streams and ponds. These insects are most interesting, however, on account of their larva, of which the larger kinds are the well-known Caddice-worms, or Cad-bait of anglers. They are of a long, almost

## CADELLE—CADENCY.

For two days, he maintained the strictest order; but he forced the mayor and judges to pass judgment upon Lord Say, one of the king's hated favourites, whose head C.'s men immediately cut off in Cheapside. On the third day, some houses were plundered, the leader himself, it is said, setting the example. C., who at night lodged his army in the Borough, got news that the citizens intended to prevent his entrance into the city on the morrow, and in the night he made an attack on the bridge, but was defeated. A promise of pardon now sowed dissension among his followers, who dispersed, and a price was set upon C.'s head. He attempted to reach the Sussex coast, but was followed by an esquire, named Alexander Iden, who fought and killed him, July 11. His head was stuck upon London Bridge, as a terror to traitors.

**CADELLE** (*Trogosita Mauritanica* or *caraboides*), an insect sometimes found in granaries in Britain, but seemingly imported from more southerly countries, where, as in France, its larvae often commit great ravages among stored corn. They also live on bread, almonds, and even rotten wood. When full grown, they are about three-quarters of an inch long, flattened, fleshy, rough with scattered hairs, whitish, tapering towards the head; which is black, horny, and furnished with two curved jaws. The perfect insect is a glossy beetle of a deep chestnut colour, marked with dotted lines. It belongs to the family of *Xylophagi*, of the order *Coleoptera* (q. v.), section *Tetramera*. The name C. is French.

**CADENCE**, in Music, is the finish of a phrase (in German, *Schlusfall*), of which there are three principal species—viz., the whole, the half, and the interrupted cadence. The whole C., which finishes on the harmony of the tonic, is also called the perfect C., and is always used at the end of a composition, and frequently called the final cadence. In its most perfect use, it consists of three chords—the one before the final being always the dominant, as for example :

The half C., also called the imperfect C., is used to mark the termination of an idea or phrase, like the colon and semicolon; shewing a considerable division, but at the same time that a continuation is necessary. The harmony of the half C. is the reverse of the whole C., as it falls from the tonic to the dominant, and sometimes to the subdominant, as follows :

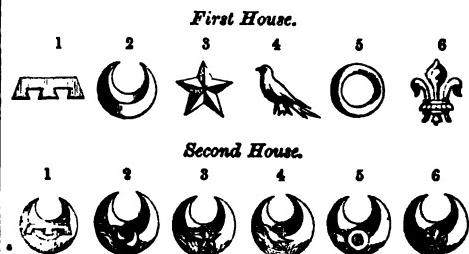

In the interrupted C. (Ger. *Trugschluez*; Ital. *Cadenza d'inganno*), the preparation for the ordinary perfect C. is made; but instead of the harmony of the tonic following the dominant, another harmony quite strange is introduced, so that the ear is deceived. The more particular the preparation for the usual C. is made, the more strange and unexpected is the interruption, which can be made in so many ways that Reicha, in his *Traité de*

*Haute Composition Muscale*, gives 129 interrupted cadences. The following are those generally in use :

**CADENCY** (from Lat. *cado*, to fall or decline). The marks by which the shields of the younger members of families are distinguished from those of the elder, and from each other, is an extensive, and, in so far as that term can be applied to heraldry at all, an important branch of the science. No distinction is usually made by writers on heraldry, and probably the practice of heralds in general scarcely admits of any being made, between *marks of C.*, *differences*, *distinctions*, or even *brisures*, though the last term is pretty constantly, and quite appropriately used to include not only differences in general, but also abatements (q. v.) or bearings by which the arms of the family are broken or diminished. See **BASTARD BAR**. But there is a manifest convenience in the practice which is usually followed in Scotland, of appropriating the label, the crescent, the mullet, and the rest of the series of marks, commonly known as marks of C., to the purpose of distinguishing the sons from the father, and from each other, during the father's lifetime; and of adopting other distinctions—such as the bordeur of various kinds, the chief engrailed, embattled, and the like, as differences between the coats of brothers, after the death of their father, and of the houses descended from them. Another very common mode of differencing the shields of brothers in early times, was by changing the tinctures; but this is now regarded as too extensive a change for such a purpose. The method of differencing by means of the ordinary marks of C. will

*Distinction of Houses:*

In the First House, the first, second, &c., sons are denoted by 1, the label; 2, the crescent; 3, the mullet; 4, the martlet; 5, the annulet; 6, the fleur-de-lis; 7, the rose (not figured in the cut); 8, the cross moline; 9, the double quatrefoil. In the Second House, or family of the second son, the first son is denoted by (1) the crescent, with the label upon it; the second, by (2) the crescent, with the crescent upon it; and so on. In the Third House, or family of the third son, the first son is denoted by the mullet, with the label upon it; the second, by the crescent, with the crescent upon it; and so on.

be understood from the accompanying illustration. Fanciful reasons have been imagined by heralds for assigning these different marks to the different sons.

The differences at present used by the royal family will be found in most of the peerages. The rule with regard to them seems to be that, unlike subjects, they all bear the label of three points argent; but the label of the Prince of Wales is plain, whilst those of the other princes and princesses are charged with crosses, fleurs-de-lis, hearts, or other figures, for the sake of distinction. One of the most

## CADENZA—CADIZ.

frequent reasons for matriculating the arms of the younger branches of families of distinction in the Lord Lyon's Register, is that they may be properly distinguished from those borne by the head of the house.

**CADENZA**, in Music, an ornamental succession of notes introduced at pleasure by the performer at the finishing of a phrase.

**CADER IDRIS** (Chair of Idris, a reputed giant), a picturesque mountain in Merionethshire, Wales, 5 miles south-south-west of Dolgelly. It consists of an immense ridge of broken precipices, 10 miles long, and 1 to 3 miles broad; the highest peak reaching an elevation of 2914 feet. It is composed of basalt, porphyry, and other trap rocks, with beds of slag and pumice. The view from the summit, which is very extensive, includes the Wrekin in Shropshire, and St George's Channel almost to the Irish coast.

**CADET, MILITARY** (Fr. *cadet*, younger, junior in service—allied in derivation and meaning to *cadency* (q. v.) in heraldry), is a term applied in a general sense to a junior member of a noble family as distinguished from the eldest; and in France, any officer junior to another is a C. in respect to him. In a strict military sense, however, a C. is a youth studying for the public service.

In England, military cadetship has presented two aspects, according as it related to the East India Company's or to the royal service. When the Company possessed political and military authority in India, there were about 5000 English officers in their pay. Those who commanded the Company's own regiments had been professionally educated by the Company. A youth, nominated by the directors, was examined as to his proficiency in an ordinary English education, and admitted between the ages of 14 and 18 to Addiscombe School or College, near Croydon. If a probation of six months resulted satisfactorily, he entered upon a two years' course of study. If he passed through this ordeal well, he became a C. in the Company's service, receiving pay or salary, and being available for service in India, as opportunity might offer. The system of Indian cadetship underwent various modifications by the introduction of competition in the appointments, and by the transference of the Company's powers to the Crown; and ceased in 1861, when the accession of fresh officers to the local Indian armies was stopped.

The second aspect of military cadetship in England, adverted to above, is that of the Royal or Queen's cadets. The arrangements in operation until recently will be found noticed under SANDHURST COLLEGE; and the present arrangements are given under STAFF COLLEGE, and WOOLWICH ACADEMY.

**CADET, NAVAL**, is the lowest grade of officer in the royal navy. The cadets enter the royal service at 12 to 14 years of age. Every captain, on being appointed to a ship in commission, is allowed to nominate one C.; every flag-officer (admiral, &c.), two, on receiving his flag; but all the rest are nominated by the First Lord of the Admiralty, subject to regulations recently made concerning competitive examinations. The candidates are examined at the Royal Naval College at Greenwich; if they pass, they are sent for three months to a training ship at Portsmouth or Plymouth, to learn the elements of rigging and seamanship. If they do not progress sufficiently in the training ship, they are rejected; but if the report is favourable, they become cadets, and are put into sea-going ships. While on board, the C. is expected to watch and learn as much as possible of what is going on—saluting officers, tying knots,

splicing ropes, arranging rigging, learning technical terms, going aloft, keeping the log, keeping watch, &c. If the C. serves satisfactorily for 3 months in a training ship, and 15 months in a sea-going ship, he becomes eligible for the rank of midshipman. The cadets mess with the midshipmen on shipboard. There were 132 cadets on the navy estimates for 1873—1874, receiving each a shilling a day as pay.

**CADETS' COLLEGE**. A college with this designation was established in 1858 by a remodeling of the Junior Department of the Royal Military College at Sandhurst. Its objects were, to give a sound military education to youths intended for the army, and to facilitate the obtaining of commissions when the education was finished. The age of admission was between 16 and 19. The friends of a youth, able to pay the sums of money presently to be named, applied to the commander-in-chief for permission to place the youth on the list of candidates; this permission was usually granted on production of satisfactory certificates and references. The youth might go up for examination on any half-year. The list of subjects included English composition, continental languages, mathematics, history, geography, natural sciences, experimental sciences, and drawing. After the examination, the candidates were reported to the commander-in-chief in their order of merit. Those who had the most marks were admitted as cadets as soon as vacancies occurred in the college. When entered, they studied for two years on a great variety of subjects connected with military science and practice. The friends supplied clothing, books, and instruments. The annual payment for education, board, and lodging varied from £100 per annum down to £20; the highest sum being demanded for 'the sons of private gentlemen,' while the lowest was deemed sufficient for 'the sons of officers of the army or navy who had died in the service, and whose families were proved to be left in pecuniary distress.' Twenty of the youths were 'Queen's cadets,' sons of officers 'who had fallen in action, or had died from the effects of active service, and had left their families in reduced circumstances.' These 20 cadets were admitted and educated gratuitously. The cadet system was abolished in 1870. Sub-lieutenants of cavalry and infantry, styled 'student officers,' who have done duty with a regiment for about 12 months, are now required to attend the college at Sandhurst, and go through a course of study for a year. At the end of it, on passing a satisfactory examination, they are promoted to the rank of lieutenant, and rejoin their regiments.

**CADETS' FUMING LIQUOR**. See CACODYLIC.

**CADI**, an Arabic word signifying a judge or person learned in the law, the title of an inferior judge amongst the Mohammedan nations, who, like the Mollah (q. v.), or superior judge, must be chosen from the higher ranks of the priesthood, as all law is founded upon the Koran.

**CADIZ** (ancient *Gades*), an important commercial city of Spain, capital of the modern province of the same name, which forms a part of the great division of Andalusia; is situated at the extremity of the long narrow isthmus of the Isle of Leon, in lat. 36° 32' N., and long. 6° 17' W. The Atlantic Ocean washes its western and part of its southern side, and on the north and north-east it is enclosed by the Bay of Cadiz, a deep inlet of the Atlantic, forming an outer and an inner bay. Connected by only a narrow strip of ground (in some places not above 200 yards across) with the mainland, C. is admirably situated for defence; but though it has several sea and land fortifications, these are by no means considered

impregnable. The town, which is surrounded by walls, forms nearly a square, each side being about a mile and a half in length. The houses being built of white stone, the city presents a remarkably bright and clean appearance from the sea. The streets are well paved and lighted, regular, but narrow, and there are some pleasant public walks, the most frequented of which is the Alameda. It has few public buildings of note; its two cathedrals are, on the whole, but poor specimens of ecclesiastical architecture, and its pictures, with the exception of one or two excellent pieces by Murillo, are of little value. C. declined greatly as a commercial city after the emancipation of the Spanish colonies in South America; but owing partly to the recent extension of the railway system in Spain, and partly to the establishment of some new lines of steamers, the trade has, within the last sixteen years, revived considerably. To shew this, the value of the imports in 1856 was £1,383,435; in 1871, it was £2,044,861. So the values of the exports in the same years were £1,870,015 and £5,358,991. The number of sailing-ships which entered the port of C. in 1871 was 669, with a tonnage of 167,518; of steamers, 484—tonnage, 178,862. The exports consist of wine, olive-oil, fruits, salt, and metals; and the manufactures of glass, coarse woollen cloth, soap, hats, leather, &c. Pop. about 72,000.

C. is one of the most ancient towns in Europe, having been built by the Phoenicians, under the name of Gaddir, 347 years before the foundation of Rome, or about 1100 B.C. It afterwards passed into the hands of the Carthaginians, from whom it was captured by the Romans, who named it Gades, and under them it soon became a city of vast wealth and importance. Occupied afterwards by the Goths and Moors, it was taken by the Spaniards in 1262. In 1587, Drake destroyed the Spanish fleet in the bay; nine years later, it was pillaged and burned by Lord Essex; and in 1625 and 1702, it was unsuccessfully attacked by other English forces. After the revolution of 1808, C. became the headquarters of the insurrectionary junta, by whose orders it was separated from the mainland. The French, in February 1810, commenced a blockade, which they vigorously persevered in, capturing several of the forts, until August 25, 1812, when the victories of the Duke of Wellington forced them to abandon it. The city was besieged and taken by the French in 1823, and held by them until 1828. In the Spanish revolution of 1868, C. played a distinguished part.

**CADMIA** is the term applied to the crust formed in zinc furnaces, and which contains from 10 to 20 per cent of cadmium.

**CADMIU**M is a metal which occurs in zinc ore, and, being more volatile than zinc, rises in vapour, and distils over with the first portions of the metal. See ZINC. C. is represented by the symbol Cd, has the atomic weight or equivalent 55·74, and the specific gravity 8·6. It is a white metal, somewhat resembling tin; is malleable and ductile; fuses at 442° F., and rises in vapour a little above 600°. It is rarely prepared pure, and is not employed in the arts as a metal, though one or more of its salts have been serviceable in medicine. The sulphide of C., CdS, occurs naturally as the mineral *Greenockite*, and when prepared artificially, is of a bright yellow colour. It is known as CADMIUM YELLOW, and is of great value to the artist. A great variety of tints are produced by mixing it with white-lead. Much of what is sold as Naples Yellow (q. v.) is thus prepared; but the genuine Naples Yellow has a greenish tint, which renders it easily distinguishable from the imitation. Cadmium

Yellow, however, has many valuable qualities, which are causing it rapidly to supersede Naples Yellow.

**CADMUS** (according to Apollodorus and others) was the son of Agenor and Telephassa, and the brother of Europa. When the latter was carried off by Zeus, he and his brothers, as also their mother, were sent in quest of her, with injunctions from Agenor not to return without her. Their search was vain, and the oracle at Delphi told C. to relinquish it, and to follow a cow of a certain kind which he should meet, and build a city where it should lie down. He found the cow in Phoenicia, followed her to Boeotia, and built there the city of Thebes, about 1550 B.C. The myth of C., however, like other early Greek myths, abounds in contradictions, and it is wholly impossible to disentangle the historical facts from the meshes of fable in which they are imprisoned. To him is ascribed the introduction into Greece of an alphabet of 16 letters, derived from Egypt or Phoenicia, and the discovery of brass, or introduction of its use.

**CADOU DAL**, GEORGE, a distinguished leader in the Chouan or Royalist war in Brittany, was born near Auray, in Lower Brittany, where his father was a miller, in 1771. He was among the first to take up arms against the Republic, and soon acquired great influence over the peasants. Captured in 1794, he was sent as a prisoner to Brest, from which he soon made his escape, imprisonment having only increased his loyal ardour. Annoyed at the dissensions between the Vendean generals and the emigrant officers, and the disasters consequent thereon, C. organised an army in which no noble was permitted to command, and which Hooche, with all his great military talents, was unable to subdue or disperse. In 1799, C. was the soul of the conspiracy to overthrow the First Consul, and place a Bourbon on the throne; but the events of the 18th Brumaire disarranged the plans of the conspirators. Bonaparte recognised C.'s energy and force of character, and offered to make him a lieutenant-general in his army, which offer C. refused, as well as another of a pension of a hundred thousand francs, if he would only consent to remain quiet. Bonaparte attempted to arrest him, but he fled to England, where, in 1802, he conspired with Fichet for the overthrow of the First Consul. With this design he went to Paris, but was arrested, condemned, and executed June 25, 1804. C. was a man of stern honesty and indomitable resolution. 'His mind was cast in the true mould; in my hands he would have done great things,' was Napoleon's estimate of him.

**CADU'CEUS**, the winged staff of Mercury, or Hermes, as he was called by the Greeks, which was supposed to give the god power to fly. The C. in the actual world was the staff or mace carried by heralds and ambassadors, from which circumstance, no doubt, it came to form one of the attributes of the messenger of the gods. Originally, it was simply an olive-branch, the stems of which were afterwards formed into snakes, in accordance with several poetical tales invented by the mythologists. One of these was to the effect that Mercurius, having found two snakes fighting, divided them with his rod, and that thus they came to be used as an emblem of peace. Many miraculous virtues were ascribed to the caduceus. On Caduceus, the coinage of antiquity, the C. is often given to Mars, who holds it in the left hand, a spear being in his right, to shew how peace and war alternate. It is also seen in the hands of

Hercules, Bacchus, Ceres, Venus, &c. Amongst the moderns the C. is used as an emblem of commerce, over which Mercury was the presiding divinity.

CÆCILIA (Lat. *cæcus*, blind), a genus of reptiles, formerly placed among serpents, on account of their form, although, in their anatomical structure,

Two-banded Cecilia:

peculiarities were observed allying them to Batrachians, with which they are now ranked, the important fact having been ascertained of their breathing by gills when young, and undergoing a metamorphosis. The body is almost cylindrical or worm-like, the head small, the eyes very small, and nearly hidden by the skin; in some species, indeed, imperfect or wanting, upon which account the name C. was given to them, and an attempt has been made to transfer to them the English name Blindworm, commonly given to the *Anguis fragilis*. The skin is smooth, viscous, and annularly wrinkled, appearing naked, although, upon dissection, minute scales are found disposed between its wrinkles, at least in some species. The vertebrae are articulated as in fishes and in some of the other lower Batrachians, not as in serpents, and the skull is united to the first vertebra by two tubercles. The ribs are imperfectly developed, and much too short to encircle the trunk.—The original genus C. has been subdivided, now forming a family, *Ceciliidae*. The species are inhabitants of warm climates, and of marshy or moist places.

CÆCUM (Lat. *cæcūs*, blind), a blind sac; that is, a sac or bag having only one opening, connected with the intestine of an animal. In man, there is only one C., very small, and apparently not performing any important function, situated at the extremity of the small intestine, where it terminates in the large intestine or colon. In many of the mammalia, however, and particularly in most of those which are herbivorous, it is comparatively large, and is found to secrete an acid fluid resembling the gastric juice. It therefore appears that, where the nature of the assimilatory process is such as to require the detention of the food for a considerable time, this provision is made for it, in order that digestion may be more completely accomplished. The C. is entirely wanting in some quadrupeds, as in bats, and the bear and weasel families. Birds have two cæca, which are generally long and capacious in those that are omnivorous or granivorous, and the position of which is the only circumstance that marks the division of the intestine into two parts, the small and the large intestine, or the *ileum* and the *colon*. In reptiles, a C. is of very rare occurrence. Fishes have none in the position occupied by those of quadrupeds and birds, but many of them have cæca attached to the intestine at its uppermost part, and very generally regarded as appendages of the stomach. The number of these cæca is, however, extremely various; sometimes there are only 2, and sometimes more than 100. The number is different even in very nearly allied species of the same family; thus, there are only 6 in the smelt, but 70 in the salmon; 24 in the herring, and 80 in the shad. In some fishes, as the cod, the cæca consist of large trunks ramified

into smaller ones.—The intestinal canal of some of the *Insectivora* is furnished throughout its whole length with numerous cæca, no other organ corresponding to a stomach appearing to exist.

CÆDMON, the first Anglo-Saxon writer of note who composed in his own language, and of whom there are any remains. The date of his birth is unknown, but his death occurred about 680 A.D. He was originally a cow-herd, attached to the monastery of Whitby, and, according to Bede, 'even more ignorant than the majority of his fellows, so that in the evenings, when the domestics assembled in the hall to recreate themselves with music after the labours of the day, Cedmon was frequently obliged to retire, in order to hide his shame when the harp was moved towards him.' One night, however, as he was sleeping in the stable-loft, a stranger appeared to him, and commanded him to sing. C. declared his ignorance, but the stranger would take no refusal, and imposed on the poor cow-herd the sublime task of hymning the glories of creation. Suddenly, a poetic inspiration seized him, and he began to pour forth verses. When he awoke from his dream, the words remained fast-rooted in his memory, and were recited by him to others with new confidence. The Abbess Hilda, and the learned men who were with her in the monastery, immediately declared that he had received the gift of song from Heaven. He was now educated, became a monk, and spent the rest of his life in composing poems on the Bible histories and on miscellaneous religious subjects, many of which have been preserved, and are altogether in bulk nearly equal to the half of *Paradise Lost*, to parts of which some of them bear a striking resemblance. Satan's Speech in Hell is characterised by a simple yet solemn greatness of imagination, which may possibly have influenced at some period of his life the more magnificent genius of Milton.

CÆLATU'RA. See CHASING.

CAHN, the chief town in the department of Calvados, France—formerly the capital of Lower Normandy—is situated on the left bank of the Orne, about 9 miles from its mouth, 122 miles west-north-west of Paris. C. is built in the middle of a fertile plain; its streets are wide and clean, it has several fine squares, and many noble specimens of ancient Norman architecture. Among the best examples are the churches of St Etienne, founded by William the Conqueror, and which contained his monument, erected by William Rufus, and destroyed by the Huguenots in 1562; La Trinité, called also *Abbaye aux Dames*, founded by Matilda, wife of the Conqueror; St Nicholas, now used as a shot-factory; St Pierre, and St Jean. The castle, founded by the Conqueror, and finished by Henry I of England, was partially destroyed in 1793. There are several beautiful promenades in the city, which has manufactures of lace, blonde, crêpe, cutlery, cotton-yarn; breweries, dye-works, wax-bleaching, and ship-building yards. Its Angora gloves, made from the unwashed, undyed fur of Angora rabbits, which are reared in the district, are celebrated. Quarries in the neighbourhood produce an excellent stone, called Caen Stone (q.v.). Trade is facilitated by a maritime canal connecting the port with the sea, and also by the railway connecting it with the Paris and Rouen line; those to Cherbourg and Tours; and that to Flors, opened in 1867, which affords C. communication with Granville. Nothing is known of C. before the 9th century. It was a place of importance in 912, when it came into the possession of the Normans, under whom it increased rapidly. William the Conqueror and his queen made it their residence, and greatly

CAEN STONE—CAERNARVON.

improved it. In 1346, it was taken and pillaged by the English, who again captured it in 1417. It was held by them until 1450, when the French compelled them to surrender. During the revolution of 1793, several of the Girondist chiefs, proscribed by the Jacobins, went to C., and organised a revolt against the Mountain, which proved unsuccessful. Pop. (1872) 32,999.

**CAEN STONE.** The neighbourhood of the town of Caen, in Normandy, has been celebrated for its stone-quarries from a very early period. The excellence of the stone, and the facility of transport by sea, led to C. S. being very extensively used in England in the 15th and 16th centuries. In 1460, the Abbot of Westminster obtained a licence to import C. S. for the repairs of the monastery. Later, it became a regular article of importation, and in 1582 it is rated at the custom-house at 6s. 8d. the ton. Winchester and Canterbury cathedrals, Henry VII.'s Chapel at Westminster, and many country churches, are built of C. S., which is still frequently used in England. The stone is an oolite, resembling Stonesfield slate, but without its slaty structure. The quarries are subterraneous, and the stone is brought up through vertical shafts in blocks 8 or 9 feet long, and about 2 thick.

**CAERLE'ON** (Castle of the Legion), a small but ancient town in Monmouthshire, on the right bank of the Usk, 2 miles north-east of Newport. It is the Ica Silurum of the Romans, and is supposed to have been the capital of the Roman province Britannia Secunda, now Wales, and the residence of the famous King Arthur. It was the seat of an ancient archbishopric, which was removed to St Davids about 519 A.D. An abbey of Cistercian monks existed here before the Reformation. C. was an important place in the 12th c., but it was afterwards ruined by the frequent wars between the Welsh and Anglo-Saxons. Many Roman relics have been found here, as aqueducts, baths, pavements, altars, tiles, coins, inscriptions, and statues; many of the smaller antiquities are deposited in a museum in the town; besides half-melted ore and cinders, and the remains of a fortress, with walls 12 feet thick and 1800 yards long, and of an amphitheatre, called King Arthur's Round Table, 222 by 192 feet in size. Pop. (1871) 1306. The chief occupation is the manufacture of tin-plates.

**CAERMARTHEN** (Welsh, *Caer Fyrdlyn*, the *Maridunum* of Ptolemy), a seaport town, capital of Caermarthenshire, South Wales, on the right bank of the Towy, 9 miles from Caermarthen Bay. It lies in a picturesque situation, but the streets are irregular, steep, and often narrow. The Towy is navigable for vessels of 200 tons up to the town, and salmon and sewin are caught in the river. There are tin and iron works near the town. C. exports tin-plates, cast iron, timber, marble, bark, slates, lead ore, bricks, grain, butter, and eggs. The Welsh language is used in most of the churches. C. is a county borough, having a separate jurisdiction from the shire. It unites with Llanelli in returning one member to parliament. Pop. (1871) 10,488. There is a college for Welsh teachers. Near C. are the remains of two Roman camps. In the 5th c., Merlin, the Welsh prophet, is said to have been born here. It was long the residence of the native princes of South Wales. Caermarthen Castle often changed hands in the contests of the Welsh chiefs with each other, and in the subsequent wars with the Saxons and Normans.

**CAERMARTHENSHIRE**, a maritime county in South Wales, on the Bristol Channel; bounded N. by Cardigan, from which it is separated by

the Teify; E by Brecknock; S. by Glamorgan and Caermarthen Bay; and W. by Pembroke. It is the largest of the Welsh counties; length, 53 miles; greatest breadth, 33 miles; area, 974 square miles, nearly a third of which is waste. The county is mountainous in the north and east, and is characterised by productive though narrow valleys and deep, wooded glens. Caermarthen Van or Beacon rises to the height of 2596 feet, being the greatest elevation in the county. The coast of C. is marshy, and is all situated on Caermarthen Bay, which washes also small portions of the coasts of Glamorgan and Pembroke, in 17 miles across, 10 miles deep, 35 in circuit, and receives the rivers Taff or Tave, Towy, and Lloughor. The chief rivers of C. are the Towy, Cothy, Taff, and Teify. The Towy has a course of 60 miles, of which 50 are in Caermarthenshire. It yields plenty of salmon, sewin, trout, eels, and lamprey, and is navigable for the last 9 miles of its course. On this river is the celebrated vale of the Towy, 30 miles long, with an average breadth of 2 miles. C., north and west of the Towy, comprising three-fourths of the county, consists of lower Silurian clay-slate and grauwacke. In the south-east corner of the county is a band of carboniferous limestone and grit, to which succeeds a small part of the South Welsh coal-field of Glamorgan and Monmouth, chiefly composed of stone-coal and culm. The mineral productions of the county are iron, coal, copper, lead, slates, lime, dark-blue marble. These, with tinned iron, grain, cattle, horses, sheep, and butter, are exported. The climate of C. is mild, but moist; the soil is stiff and poor in the uplands, affording pasture for small cattle; but the rest of the county is well wooded, and in the south part along the rivers very fertile. Oats and barley are the chief crops. The chief towns are Caermarthen (the county town), Llanelli, Llandeilo-vawr, Llanddover, Newcastle-in-Emlyn, and Kidwelly. The chief manufactures are woollens and hides. Pop. (1871) 115,710. The county contains remains of so-called Druidical circles, dolmens, and Roman roads, besides many baronial and ecclesiastical ruins. In this county originated the 'Rebecca' riots, which in South Wales, in 1843—1844, were directed against the turnpike-gates.

**CAERNA'R VON** (*Caer-yn-ar-Fon*, Fort opposite Mon or Anglesea), a parliamentary and municipal borough and seaport in North Wales, the capital of Caernarvonshire, situated near the south end of the Menai Strait, on the right bank of the Seiont, 245 miles north-west of London. C. has a castle situated at the west end of the town, the building of which was commenced by Edward I. in 1284. It is one of the noblest ruins in the kingdom, the walls being still entire, and enclosing an oblong of three acres. The walls are 7 to 9 feet thick, and are pierced by a covered gallery, with loopholes to discharge arrows. There are thirteen embattled towers, with five, six, or eight sides, and surmounted by turrets. The gateway under the great square tower has four portcullises. The town itself was once surrounded by walls and round towers. These walls, with several of the gates, still exist, but are now within the town. The streets are narrow, but regular, and at right angles to each other. In the churches and chapels, the services are in Welsh and English. C. unites with Pwllheli, Nevin, Criccieth, Conway, and Bangor in returning one member to parliament. In 1872, 812 vessels, with a burden of 55,986 tons, entered, and 360 vessels, with a burden of 39,216 tons, cleared the port, chiefly small-craft and steamers to and from Liverpool. The harbour admits of ships of 400 tons. The chief exports are copper ore, coal, and slates. There is also a great

iron and brass foundry. C. is a bathing-place, and is much frequented by tourists, on account of its vicinity to the grandest scenery in North Wales. Many families of the upper ranks reside in and around the town. Pop. (1871) 9449. Half a mile from C. are the remains, covering seven acres, of Segontium, or Caer Seiont, a Roman station or city. Gold, silver, and copper coins and ornaments, and other Roman relics, have been found here. There is a Roman fort on the left bank of the Seiont, still almost complete, with walls 11 feet high, and 6 feet thick, and with parallel rows of holes 3 inches in diameter. C. was the seat of the native princes of North Wales down to 873. In 1284 was born here the first Anglo-Norman Prince of Wales, afterwards the unhappy Edward II. In 1294 the town and castle were burned, and the English inhabitants massacred by the Welsh under Madoc, the illegitimate son of Llewelyn, a native prince of Wales. From a rocky height near Uxbridge Hotel, there is a fine view of Snowdon and the island of Anglesea.

CAERNARVONSHIRE, a maritime county in North Wales, bounded N. by the Irish Sea; E. by Denbigh, with the Conway between; S. by Merioneth and Cardigan Bay; and W. by Caernarvon Bay and the Menai Strait, the latter separating it from Anglesea. It is 51 miles long; greatest breadth, 22 miles; average, 9; area, 544 square miles, of which  $\frac{1}{4}$  is in pasture, and only  $\frac{1}{16}$ th in tillage. The surface is mountainous, and is traversed by the grandest and highest ranges in South Britain, and it is the highest and most mountainous county in North Wales. The Snowdonian or chief range runs through the middle of the greatest length of the county, from south-west to north-east, and is very bold and rocky. It attains its greatest elevation in Snowdon (q. v.), 3571 feet, in the centre of the county, and the highest mountain in South Britain. Caernarvon Bay is 30 miles across, 15 long, with 2 to 30 fathoms water, and communicates with the Irish Sea through the Menai Strait, which is 17 miles long, and  $\frac{1}{2}$  to 4 miles broad. The rivers of C. are numerous, but small, from the nearness of all parts of the county to the sea. The Conway, navigable for 10 miles, which runs along the east border, is the chief. Almost all the streams flow through small lakes or tarns—of which there are 50 or 60 in the county—around the central or Snowdonian group of mountains. There are many fine cataracts on these streams. The mineral products of C. are copper, lead, zinc, coal, roofing and writing slates, alab. chimney-piers, honestone. The slate-quarries employ many thousands of workmen. The climate is mild in the peninsular part of C., but severe among the hills. The chief branch of rural industry in C. is the rearing of black-cattle for the dairy, and of small sheep. Wheat, oats, barley, and potatoes are raised in the valleys. Pop. (1871) 106,121. The chief towns are Caernarvon (the county town), Bangor, Pwllheli, Conway, Nevin, and Criccieth. In addition to the above boroughs, several flourishing towns have recently sprung into existence in the county—Llandudno, Tremadoc, and Bethesda being the principal. It returns two members to parliament—one for the county, and one for the six chief towns. Connected with C. is the Chester and Holyhead Railway, on the great route from London to Dublin, which crosses into Anglesea by the Britannia Tubular Bridge over the Menai Strait. C. contains the remains of British or Celtic camps and hill-forts, especially around Snowdon, several dolmens and stone circles, and some ancient castles. The Snowdonian mountains were long the stronghold of the Welsh against the Romans, Saxons, and Normans in their efforts to subjugate

Wales, and here the Welsh were at last defeated in 1283 by Edward I.

CÆSALPINIA, a genus of trees of the natural order Leguminosæ (q. v.), the type of the sub-order *Casalpinieæ*. This sub-order is characterised by irregular flowers, which are not papilionaceous (q. v.), and contains upwards of 700 known species, among which many are notable for their purgative properties, as Senna (q. v.); some produce eatable fruits, as the Tamarind (q. v.), the Carob (q. v.), and the West Indian Locust Tree (q. v.); some yield resinous and balsamic products, as Copava (q. v.), Aloë-wood (q. v.), &c.; some produce important dye-woods, as Logwood (q. v.), Brazil Wood (q. v.), Camwood (q. v.), &c.; and some are trees of great size, and very valuable for their timber, as the Purple-heart (q. v.) and the Wallaba (q. v.), trees of Guiana. No species of the sub-order is British, and it generally belongs to warm climates.—The genus C. contains a number of species, trees with pinnate or bipinnate leaves, natives of the warm parts of Asia and America, which yield the Brazil Wood, Pernambuco Wood (see BRAZIL WOOD), and Sappan Wood (q. v.) of commerce, also the astringent pods called Dividivi (q. v.), used in tanning.

CÆSAR, the name of a patrician family of the *Julia Gens*, one of the oldest in the Roman state, claiming to be descended from Iulus, the son of Aeneas. When or from what cause the surname of C. was first acquired, is in the highest degree uncertain. Spartianus, in his *Life of Aelius Verus*, mentions four different opinions respecting its origin: 1. That the word signified an elephant in the language of the Moors, and was given as a surname to one of the Julii because he had killed an elephant; 2. That it was given to him because he had been cut (*cæsus*) out of his mother's womb after her death; 3. Because he had been born with a great quantity of hair (*cæsaries*); or, 4. Because he had azure-coloured eyes (*cæsi*). The opinion to which we most incline is the third of these, but who was the original 'shock-head' of the gens we cannot say; the first, however, mentioned in history is Sex. Julius Caesar, prætor in 208 B.C. The greatest individual of the family, and one of the greatest men the world has ever seen, was

CÆSAR, CAIUS JULIUS, son of a Roman prætor of the same name, was born 12th July, 100 B.C. Two external circumstances conspired to determine his political sympathies in favour of democracy, and against a republican oligarchy: the first was the marriage of his aunt Julia with Caius Marius; the second, the marriage of C. himself, in 83 B.C., with Cornelia, daughter of L. Cinna, one of the principal enemies of Sulla. The anger of the dictator at this cost C. his rank, property, and almost his life itself. Feeling that he would be safer abroad for a time, he went to Asia, 81 B.C.; but on learning the death of Sulla (78 B.C.), he hurried back to Rome, where he found the popular party in a state of great ferment, and anxious to regain what it had lost under the vigorous despotism of the aristocratic dictator. C., however, took no part in the attempts of Lepidus to overthrow the oligarchy; but he shewed his political leanings by prosecuting (77 B.C.) Cn. Dolabella—a great partisan of Sulla—for extortion in his province of Macedonia. To improve his eloquence, he went to Rhodes to study under the rhetor Apollonius Molo. In 74 B.C., he returned to Rome, where he had been elected pontifex, and now for the first time threw himself earnestly into public life. In the year 70 B.C., he attached himself to Pompey, whose political actions at this time were of a decidedly democratic character. In 68 B.C., C. obtained a questorship in Spain.  
489

On his return to Rome (67 B.C.), he married Pompeia, a relative of Pompey, with whom he was daily becoming more intimate. In 66 B.C. he

was elected to the curule aedileship, and lavished vast sums of money on games and public buildings, by which he increased his already great popularity. For the next few years, C. is found steadily skirmishing on the popular side. In 63 B.C. he was elected pontifex maximus, and shortly after, praetor. During the same year occurred the famous debate on the Catiline conspiracy, in which the aristocratic party vainly endeavoured to persuade the consul, Cicero, to include C. in the list of conspirators. In 62 B.C., Pompey returned from the East, and disbanded his army. Next year, C. obtained the province of *Hispania Ulterior*. His career in Spain was brilliant and decisive. On his return, he was elected consul, along with M. Calpurnius Bibulus. Shortly before the passing of the agrarian law (59 B.C.), C., with rare tact and sagacity, had reconciled the two most powerful men in Rome, who were then at variance, Pompey and Crassus, and had formed an alliance with them, known in history as the *First Triumvirate*. Both of these distinguished men aided C. in carrying his agrarian law; and to strengthen still further the union which had been formed, C. gave Pompey his daughter, Julia, in marriage, though she had been promised to M. Brutus; while he himself also married Calpurnia, daughter of L. Piso, his successor in the consulship. On the expiry of his term of office, he obtained for himself, by the popular vote, the province of *Gallia Cisalpina* and *Illyricum* for five years, to which the senate added—to prevent the popular assembly from doing so—the province of *Gallia Transalpina*. Nothing could have been more favourable for C.'s aims. He had now an opportunity of developing his extraordinary military genius, and of gathering round him an army of veterans, whom perpetual victory should inspire with thorough soldierly fidelity and devotion to his person. This was the very thing he wanted to give him a reputation equal to that of his coadjutors, Pompey and Crassus, whom, in genius, he far surpassed. Leaving, therefore, the political factions at Rome to exhaust themselves in petty strife, C., in 58 B.C., after the banishment of Cicero, repaired to his provinces, and during the next nine years, conducted those splendid campaigns in Gaul, by which, had he done nothing else, he would have 'built himself an everlasting name.' C.'s first campaign was against the Helvetii, whom he totally defeated near Bibracte (Autun). Out of 368,000 only 110,000 remained. These were commanded by C. to return home, and cultivate their lands. The eyes of the Gauls were now turned upon the new conqueror. His help was solicited, among others, by Divitiacus, an Aduan chief. This involved C. in a second war with a German prince, named Ariovistus, who was utterly overthrown; and now C., having in the course of one campaign successfully

concluded two important wars, led his troops into winter-quarters.

Next year (57 B.C.) occurred the Belgic war, in which C. successively routed the Suessiones, Bellovaci, Ambiani, and Nervii, who, alarmed at the progress of the Roman arms, had entered into an alliance with each other against the invaders. When the senate received C.'s official dispatches, it decreed a thanksgiving of 15 days—an honour never previously granted to any other general. During the winter and the spring following, C. stayed at Luca; and after spending large sums of money in hospitality, and in other less praiseworthy purposes, he departed for Gaul, where the flames of war had burst out in the north-west. The Veneti, a maritime people of Brittany, were the chief instigators of the insurrection. C.'s plans were laid with consummate skill, and were crowned with the most splendid success. The Veneti were totally defeated, and most of the other Gallic tribes were either checked or subdued. C. wintered in the country of the Aulerici and Lexovii (Normandy), having, in the course of three campaigns, conquered Gaul. Next year (55 B.C.), Crassus went to Syria, and Pompey to Spain, while C.'s provincial government was prolonged for five years. He now undertook a fourth campaign against two German tribes who were about to enter Gaul. He was again successful; and pursuing the fleeing enemy across the Rhine, spent eighteen days in plundering the district inhabited by the Sigambri. He next invaded Britain, about the autumn; but after a brief stay in the island, returned to Gaul. The Roman senate, astonished at his hardihood and his successes in regions where no Roman army had ever been before, accorded him a public thanksgiving of 20 days. In 54 B.C., C. opened his fifth campaign by a second invasion of Britain. On his return to Gaul, C. was compelled—on account of the scarcity of corn, arising from drought—to winter his army in divisions. This naturally aroused the hopes of the Gauls, who thought the time had come for recovering their independence. An insurrection broke out in the north-east of Gaul, which was at first partially successful, but was ultimately crushed. C. resolved to winter at Samoabriga (Amiens), in the vicinity of the malcontents. In 53 B.C., C. commenced his sixth campaign. It was chiefly occupied in crushing a second insurrection of the Gauls. C. now returned to Northern Italy, that he might be able to communicate more easily and securely with his friends at Rome. That city was gradually becoming more anarchic, the evils of weak government more apparent; the hour for decisive action seemed to be approaching, and doubtless C.'s heart beat with expectation of the mighty future, when all at once the plot that Fate was weaving in his favour, appeared to be completely marred by a tremendous rebellion over the whole of Gaul, headed by a young warrior named Vercingetorix. It was in the dead of winter when the news came to C., who instantly saw that, at all hazards, he must preserve his fame and his army. Leaving, therefore, Pompey to succeed at Rome, he hurried to meet the insurgent hordes. His great difficulty was to collect his scattered legions. First crossing, with some Cisalpine and provincial troops, the mountains of Auvergne, though they lay six feet deep in snow, he suddenly appeared among the Arverni, who, terrified at his unexpected approach, sent for their chief, Vercingetorix, to come to their assistance. This was what C. wished. After some wonderful exhibitions of military skill, and numerous successes, Vercingetorix was shut up in Alesia (Aisne in Burgundy) with all his infantry. C. besieged him, and though harassed by nearly 300,000

Gauls without, who attempted, but in vain, to break through the well-defended Roman lines, forced Vercingetorix to capitulate. Many of the tribes now hastened to submit to C., who prudently determined to winter among the vanquished. The senate, of course, voted him another public thanksgiving. Next year (51 B.C.), C. proceeded to quell the tribes who still held out. This he successfully accomplished, and having in addition reduced the whole of Aquitania, passed the winter of his eighth campaign at Nemetoenna, in Belgum, where he spent the time both in a magnanimous and politic manner. The Gallic princes were courteously and generously treated; the common people were spared the imposition of further taxes, and everything was done to render it possible for him to visit Italy with safety in the spring. This he did, and took up his residence at Ravenna, where he was informed of everything that was going on by the tribune C. Curio. There can be no doubt that at this moment he was the most popular man in the state, while his soldiers were devoted to him with a loyalty as enthusiastic as that which Bonaparte inspired when fresh from his Italian victories.

Meanwhile, Pompey, whose vanity could not endure the greatness of C., had been gradually veering round again to the aristocracy, whose dread of the new conqueror was hourly increasing. After much futile diplomatic finessing on all sides, the senate carried a motion 'that C. should disband his army by a certain day; and that if he did not do so, he should be regarded as an enemy of the state.' The tribunes, Mark Antony and Q. Cassius put their veto on this motion; but they were violently driven out of the senate-chamber, and fearing for their lives, they fled to C.'s camp. The senate, in the madness of their terror, now declared war, and intrusted the conduct of it to Pompey, whose pride in the invincibility of his military prowess hindered him from taking the necessary measures for the defence of the state. He fancied that his name would bring thousands to his standard, and he was even led to believe that C.'s troops were willing to desert their general: the result of which delusion was, that when hostilities formally commenced, he had hardly any soldiers except two legions which had recently been in the service of his rival. C., on the other hand, perceiving that the time for decisive action had at length come, harangued his victorious troops, who were willing to follow him anywhere; crossed the Rubicon (a small stream which separated his province from Italy Proper), and moved swiftly, amid the acclamations of the people, towards Rome. Pompey fled to Brundusium, pursued by C., but contrived to reach Greece in safety, 17th March, 49 B.C. The Italian cities had everywhere gladly opened their gates to the conqueror as a deliverer. In three months, C. was master of all Italy.

C. next subdued Pompey's legates in Spain, who were at the head of considerable forces. On his return, he took Massilia, where he learned that he had been appointed dictator of the republic—a function which at this time he retained only for 11 days, but these were honourably distinguished by the passing of several humane enactments. Pompey, now thoroughly alive to the magnitude of his danger, had gathered in Egypt, Greece, and the East, a powerful army, while his fleet swept the sea. C., however, crossing the Adriatic at an unexpected season, made a rush for Dyrrachium, where Pompey's stores were; but was nevertheless outstripped by his opponent. Pompey entrenched his army on some high ground near the city, where he was besieged by C. The first encounter was favourable to Pompey, who drove back C.'s legions with much loss. The latter now

retreated to Thessaly, followed by his exulting enemies. A second battle ensued on the plains of Pharsalia, 9th August, 48 B.C. Pompey's army was utterly routed; Pompey himself fled to Egypt, where he was murdered. See POMPEY.

No sooner had the news reached Rome, than C. was again appointed dictator for a year, and consul for five years. He was invested with tribunicial power for life, and with the right of holding all the magisterial comitia except those for the election of the plebeian tribunes. He did not, however, return to Rome after the battle of Pharsalia, but went to Egypt, then in a distracted condition on account of the disputes regarding the succession. Out of love for Cleopatra (who subsequently bore him a son), he entered upon the 'Alexandrine War,' in which he was successful, and which he brought to a close in March 47 B.C. He next overthrew a son of Mithridates, near Zela, in Pontus, August 2 of the same year, and arrived in Rome in September. He was once more appointed dictator, and the property of Pompey was confiscated and sold. Before the close of the year, he had set out for Africa, where his campaign against the Pompeian generals, Scipio and Cato, was crowned with victory at the battle of Thapsus, 6th April, 46 B.C. Cato committed suicide at Utica, and with such irresistible celerity was the work of subjugation carried on, that by the end of the summer, C. was again in Rome. Now occurred that display of noble and wise generosity which proves C. to have been possessed of a great magnanimous nature. He was not a man that could stoop to the vulgar atrocities of Marius or Sulla, and so he majestically declared that henceforth he had no enemies, and that he would make no difference between Pompeians and Caesarians. His victories in Gaul, Egypt, Pontus, and Africa, were celebrated by four great triumphs, during which the whole Roman populace was feasted and feted by the magnificent liberality of the dictator.

He now proceeded to check, by wholesome enactments, as far as in him lay, the social evils which had long flourished in the city. During the year 46 B.C. also, he conferred a benefit on Rome and on the world by the reformation of the calendar, which had been greatly abused by the pontifical college for political purposes. After quelling an insurrection which now broke out in Spain, where Pompey's sons, Cneius and Sextus, had collected an army, he received the title of 'Father of his Country,' and also of *imperator*, was made dictator and *prefectus morum* for life, consul for 10 years; his person was declared sacred, and even divine; he obtained a body-guard of knights and senators; his statue was placed in the temples; his portrait was struck on coins; the month Quintilis was called Julius in his honour; and on all public occasions he was permitted to wear the triumphal robe. He now proposed to make a digest of the whole Roman law for public use, to found libraries for the same purpose, to drain the Pontine Marshes, to enlarge the harbour of Ostia, to dig a canal through the Isthmus of Corinth, and to quell the inroads of the barbarians on the eastern frontiers; but in the midst of these vast designs he was cut off by assassination on the Ides (15th) of March, 44 B.C. The details of this crime—the greatest disaster that could have befallen the Roman world, as subsequent events shewed—are too familiar to require narration. It is sufficient to say that, of the sixty aristocrats who were in the conspiracy, many had partaken of C.'s generosity, and all of his clemency. A few, like Brutus, out of a weak and formal conscientiousness, based on theory rather than insight, were probably offended by C.'s desire

to change the form of government into a hereditary monarchy; but the most, like Cassius, were inspired by a spleenful hatred of the dictator, and the base ambition of regaining power at all hazards.

C., who was 56 years of age when he was murdered, was of a noble and kingly presence, tall of stature, and possessing a countenance, which, though pale and thin with thought, was always animated by the light of his black eyes. He was bald-headed (at least in the latter part of his life), wore no beard, and though of a rather delicate constitution naturally, he ultimately attained to the most vigorous health. His besetting sin was sensuality; but without meaning to detract from the criminality of his conduct in this respect, it may be said that it was as much the sin of the times in which he lived as his own, and that the superlative grandeur of his position gave a prominence to his licentiousness which a more humble lot would have escaped. His intellect was marvellously versatile. In everything he excelled. He was not only the first general and statesman of his age, but he was—excepting Cicero—its greatest orator. As a historian, he has never been surpassed and rarely equalled in simplicity and vigour of style, and in the truthfulness with which he narrates events of which he was an eye-witness. He was, in addition, a mathematician, philologist, jurist, and architect, and always took great pleasure in literary society. Most of his writings have been lost, though their titles are preserved; but we still possess his invaluable *Commentarii* (generally known as ‘Cæsar’s Commentaries on the Gallic and Civil Wars’). The *editio princeps* was printed at Rome 1449. C.’s life was formally written in ancient times by Suetonius and Plutarch, while notices of him are found in Dion Cassius, Appian, Velleius Paterculus, and Cicero.

CÆSARE'A (*Turris Stratonis*), called by the natives ‘Kaisari’yeh.’ This once proud and splendid seaport, perhaps one of Herod’s most magnificent works—a Grecian town with its temples, amphitheatre, baths, &c., imported into Syria—was situated on the coast of Syria, 95 miles south of Beyrouth, and 37 miles north of Jaffa.

In 65 A.D., Gessius Florus, the worst of all the petty tyrants that had afflicted Judea, was appointed governor of Cæsarea. About that time, a terrible revolution, which commenced at C., broke out all over Judea. It arose from a dispute between the Syrian and Jewish citizens of C. as to which of them the city really belonged to; and some idea may be formed of the extent of the insurrection from the fact, that above 20,000 Jews were massacred in C. in the space of one hour; 13,000 in one night at Scythopolis; 50,000 at Alexandria; 8000 at Joppa; and 10,000 at Damascus.

C. was occupied by the Crusaders; after them, it seems to have gradually decayed into nothingness. It is now a heap of half-buried ruins, with a few miserable stone houses inhabited by fishermen.

CÆSARE'A PHILI'PPI (*Panium*). This town, mentioned in Matt. xvi. 13, was situated about 20 miles north of the Sea of Galilee. It was distinguished from the Cæsarea on the coast of Syria by the appendage of ‘Philippi,’ given to it in honour of Philip the Tetrarch, who repaired the city. It is now a heap of ruins, overgrown with bushes and grass.

CÆSA'REAN OPERATION (*cædo—cænæ*) has, from very ancient times, been the popular name for *Hysterotomy* (*hystera*, uterus; *tome*, section). Pliny distinctly alludes to it in his *Natural History* (lib. vii. cap. ix.), saying that Cæsar was so called from being taken by excision out of the womb of his mother, and that such persons were called *Cæsones*

(*Cæsar a caso matris utero dictus; quæ de causa Cæsones appellati*). In his case, the mother must have survived the operation, as Aurelia was alive when her son invaded Britain.

The pages of a popular work scarcely allow of the details of such a proceeding, but we may state that the first incision is made exactly in the middle line of the body, to the length of 6 or 7 inches. When the uterus is exposed, it must be carefully opened, the child lifted out, and then the after-birth. The uterus now contracts, and sinks down into the pelvis, the wound is closed, and opium is given to the patient to allay pain and nervous irritability.

In Great Britain, the C. O. has been rarely performed, most likely from the skill of the accoucheurs rendering such a proceeding unnecessary; but still several cases are on record where not only the child but the mother was saved. Some women, indeed, seem to have accepted it as their usual method of delivery, having several children, each requiring to be removed through an abdominal incision; one woman submitted to it seven times. It has also been successfully performed in most unfavourable circumstances. In the year 1500, a sow-gelder operated successfully on his own wife; an illiterate Irish midwife, Mary Donally, operated with a razor on a poor farmer’s wife in January 1738, and removed a dead child; her patient completely recovered, so as to be able to walk a mile on foot on the 27th day after the operation. Nay, a negro woman in Jamaica cut herself open with a butcher’s knife, removed her infant, and recovered. Practitioners are not quite decided as to the circumstances which justify the performance of this severe operation on the living female, but all agree on the propriety of at once removing by it the child of a recently dead woman. Numa Pompilius decreed that every pregnant woman who died should be opened; and the senate of Venice, in 1608, decreed that practitioners should perform, under heavy penalties, the C. O. on pregnant women supposed to be dead. In 1749, the king of Sicily decreed the punishment of death to medical men who omitted to perform it on women dying when advanced in pregnancy. Of course, to be of any use, it must be performed immediately, in the method briefly described above.

CAFFA. See KAFFA.

CAFFEINE, or THEINE ( $C_{10}H_{10}O_4N_4 \cdot 2HO$ ), is the alkaloid or active principle of Coffee (q. v.) and Tea (q. v.). When isolated, it forms beautiful white crystals, with a silvery lustre, which are soluble in water, alcohol, and ether. It is present in coffee to the extent of about 1 per cent., and in ordinary or Chinese tea, from  $2\frac{1}{2}$  to 6 per cent., and is also found in Paraguay and Guiana teas. It may be extracted from coffee or tea by making a decoction in hot water, and adding acetate of lead, which causes a precipitate of caffeoannate of lead. When the latter is acted on by sulphuretted hydrogen, the lead is separated, and the C. left in solution. On evaporation of the liquid, and recrystallisation from alcohol, the C. separates in crystals.

CAFFER BREAD, a name given to several species of *Encephalartos*, trees of the natural order *Cycadaceæ* (q. v.), which, like many others of that order, have much starch in their stems, and afford food to the natives of South Africa. They are also called Bread-trees.

CAFFERS. See KAFIRS.

CAFFRARIA. See KAFFRARIA.

CAFFRISTAN. See KAFIRISTAN.

CAGAYA'N SOOLOO', an island of the Asiatic Archipelago, in lat.  $6^{\circ} 58' N.$ , and long.  $118^{\circ} 28' E.$  It is about 20 miles in circumference, well wooded

## CAGLIARI—CAGLIOSTRO.

and elevated.—Cagayan is also the name of a province on the island of Luzon, one of the Philippines.

CA'GLIARI, the capital of the island of Sardinia, situated on the side of a hill, on the north-east shore of a spacious bay, and on the south coast of the island, in lat. 39° 13' N., long. 9° 8' E. It has a spacious and safe harbour, defended by several forts, and is the emporium of all the trade of the island. The town contains many public buildings and churches, some of which are said to be very splendid; but its streets, for the most part, are very narrow, steep, and dirty. C. has a population of (1872) 32,834. It has also a dock-yard, and a good road was some years ago constructed from C. to Sassari, the second city in the island, and to some of the more considerable places. Steamers ply very frequently between C. and Genoa; and it is now united to the continent of Europe by a line of electric telegraph.

CAGLIARI, PAOLO, best known as *Paolo Veronese*, an Italian painter of great eminence, was born at Verona in 1532. He first studied under his uncle, Antonio Badile, a respectable artist, and afterwards settled in Venice, where he rapidly acquired both wealth and reputation. He had for contemporaries both Titian and Tintoretto, and was held in equal admiration with these famous painters. The church of San Sebastiano, in Venice, contains many of his productions, which are reckoned the most important of his earlier period—i. e., the period before he visited Rome, when he first became acquainted with the master-pieces of Raphael and Michael Angelo. The influence of the Roman school on his style was so happy, that, on his return, he received the honour of knighthood from the Doge. He died 19th April 1588. C. is remarkable for the fertility of his imagination. His design is generally noble, his composition rich, and his execution truthful. In the invention of details, especially, he is inexhaustible, and often overloads his pictures with ornament. One peculiarity of his works is the frequent introduction of splendid architectural backgrounds, which, however, were generally painted by his brother Benedetto. The most celebrated of his productions is the 'Marriage Feast at Cana of Galilee,' now in the Louvre at Paris. It is 20 feet high, and 30 in length, and contains 130 figures. Besides these may be mentioned 'The Calling of St Andrew to the Apostleship,' 'The Feast of Simon,' and the 'Presentation of the Family of Darius to Alexander.'

CAGLIOSTRO, COUNT ALESSANDRO DI, a notorious impostor, who, in the latter part of the 18th c., travelled through Europe, and whose adventures afford considerable insight into the social characteristics of his times. He was born at Palermo, of poor parentage, June 2, 1743, and his true name was GIUSEPPE BALSAMO. Carlyle's picture of him when a boy—'brass-faced, vociferous, voracious'—is probably accurate, and already prophesies the bold and boisterous quack. When 13 years old, he ran away from the seminary of St Roch, and was afterwards sent to a monastery at Cartagiore. Here he became assistant to the apothecary of the monastery, and picked up that scanty knowledge of chemistry and medicine, which was afterwards found quite sufficient to impose upon so many respectable individuals. His conduct in the monastery was in keeping with his character, but finding it too contracted a sphere for the development of his ambitious genius, he left it, or was ejected, and for a time led 'the loosest life' in Palermo. When 26 years old, he found it highly advisable to leave his native place. In company with a certain sage named Althotas, C. is vaguely represented as travelling

first in some parts of Greece, Egypt, and Asia. At Rome, 'his swart, squat figure first becomes authentically visible in the Corso and Campo Vaccino. He lodges at the sign of the Sun in the Rotunda, and sells etchings there, very hard up at this time. In Venice, 'the bull-necked forger contrived to marry a very pretty woman named Lorenza Feliciana, who became a skilful accomplice in his schemes, and captivated many admirers, while C. picked their pockets. C. now made the tour of Italy with great success as a physician, philosopher, alchemist, free-mason, and necromancer! Next, he extended his victorious career through some parts of Germany, and especially carried on a lively business in his 'elixir of immortal youth,' which became very popular among the ladies. By virtue of this fine medicine, the count assured his patients that he had already attained his 150th year, while his young and charming wife often talked affectionately of her son as 'a commander in the Dutch navy.' Through Courland, the count and his accomplice advanced triumphantly to the court of St Petersburg, where he seems to have first made a failure; for the Empress Catharine, aided by her Scotch physician, Rogerson, a keen-witted native of Annandale, who sceptically examined his famous 'Spagiric food,' and pronounced it 'unfit for a dog,' penetrated his real character, and made him the subject of a comedy. C. soon found it convenient to vanish. We next find him at Warsaw, discoursing on his pet Egyptian masonry, medical philosophy, and the ignorance of doctors, but he has the misfortune to be unmasked by a certain Count M. This, however, had little effect on the stupid credulity of C.'s dupes—belonging, it must be remembered, to the upper classes, who in that age, according to Carlyle, were at once sensual, infidel, and superstitious—so that they persisted for a time in 'distending his pockets with ducats and diamonds,' which, however, his lavish dissipation soon scattered to the winds—for this prophet of a new physical and moral regeneration, and inventor of an 'invaluable pentagon for abolishing original sin,' was a desperate gambler. In 1780, he went to Strasburg; and soon afterwards we find him in Paris, still founding lodges of 'Egyptian free-masons,' holding nocturnal meetings for calling 'spirits from the vasty deep,' &c., and scandalously simulating the character and deeds of a philanthropist. From Paris he came over to England, where he was cordially received by the followers of Swedenborg. On his return to Paris (1785), he became distinguished at court, was intimate with the weak and credulous Cardinal Rohan, and played a prominent part in the affair of the Diamond Necklace (q. v.). This lodged him in the Bastille; but he cleared himself by a statement which gained credit, and, after being liberated, carried on his adventures once more in England, but feebly, the sunshine of success now obviously growing dim: in short, the count, in gloom and foreboding, disappeared from the island. But the market in Germany, too, was closed, a general distrust having been excited by the revelations of one of the count's dupes. Elsewhere, also, these began to fail him. 'At Aix, in Savoy, there are baths, but no gudgeons in them'; at Turin, he is ordered off by the king; a similar fate befalls him at Roveredo; at Trent, we catch a glimpse of him, 'painting a new hieroglyphic screen,' which, however, attracts no more the gaping crowd; lower still, 'he pawned diamond buckles; finally, his wayward wife—in whom, perhaps, because of her womanhood, the enormous lie and quackery first breaks up—longs to be in Rome by her mother's hearth, by her mother's grave, where so much as the shadow of refuge awaits her.' In

## CAGNOLA—CAILLIE.

May 1789, he entered the city; on the 29th December, the Holy Inquisition detected him founding 'some feeble ghost of an Egyptian lodge.' He was imprisoned, and condemned to death for free-masonry. His sentence was commuted to imprisonment for life in the fortress San Leon, where, in spite of his 'elixir of immortal youth,' he died, 1795, aged 52 years. His wife ended her days in a convent. His *Mémoires Authentiques*, posthumously circulated in Paris, were not authentic.—See Carlyle's *Miscellaneous Essays*, art. Count Cagliostro.

**CAGNOLA**, LUIGI MARCHESE, a distinguished Italian architect, was born at Milan in 1759—died 1833. Belonging to an ancient and wealthy family, he could afford to follow the bent of his own inclination, and devoted himself earnestly to the study of architecture. His master-works are two triumphal arches. The first is the famous *Arco della Pace*, in Milan, commenced in 1807, but not finished until 1833. It is constructed of white marble, and, with the exception of the *Arc de l'Etoile*, in Paris, is both the largest and noblest structure of the kind in Europe, reaching a height of 78 feet. On the top of the arch is a bronze figure of Peace, in a car drawn by six horses, while the sides are richly adorned with innumerable bas-reliefs. The second forming the *Porta di Marenga*, or *Porta Ticinese*, is also a work of great beauty, and is much admired. Besides these may be mentioned the *Campanile* (Bell-tower) at Urgnano, in the Bergamese.

**CAGOTS** is the name given to a tribe of men, of manners and customs akin to those of the gypsies, who are found scattered through various parts of Bearn and Gascony, in France. They are usually thought to be the descendants of the Visigoths, who remained in France after their defeat by Clovis, in the 5th century. Until the French Revolution of 1790, they received even worse treatment than that which generally falls to the lot of the remnants of conquered races. They were forced to wear a peculiar dress, were forbidden to practise all but the most menial trades, and were obliged to live isolated, either in separate villages or in separate quarters of the towns. So complete was their estrangement from the other inhabitants, that they were forced to enter the churches by doors specially set apart for them. Since that Revolution, they have been placed, as regards the law, on an equal footing with other citizens, but socially they are still regarded as a degraded race. Their language has been, so far back as is known, a corrupt dialect of that spoken in the surrounding country; but their blue eyes, fair hair, and fair complexion, mark them out as ethnologically distinct, and speak to a Teutonic origin. From a great liability to the diseases afflicting cretins, probably caused by their exposed manner of life and insufficient nourishment, they were at one time erroneously thought to belong to that unfortunate class. Tribes, whose history and present condition greatly resemble those of the C., are to be found in Brittany, where they receive the name of 'Caqueux'; and in Poitou, Maine, and Anjou, where they receive the name of 'Colliberts.' See Michel's *Histoire des Races Maudites de la France et de l'Espagne* (History of Outcast Races in France and Spain), Par. 1847.

**CAGSA'NA**, a town near the southern extremity of the island of Luzon, Philippines, with a population of about 13,000.

**CA'HIR**, a town in the county of Tipperary, Ireland, on the Suir, beautifully situated at the east end of a valley between the Galtees and Knockmealdown Mountains, 8 miles north-west of Clonmel. In the town is the seat of the Earl of Glengall, with a park which extends along the river for two

miles below the town. Cahir Castle, an ancient irregular Norman structure of considerable extent, is situated on a rock on the left bank of the Suir. It was taken by the Earl of Essex in 1599, and by Cromwell in 1650: it has been lately restored. C. has extensive flour-mills, and a population of 2900.

**CAHORS** (anciently, *Divona*), a town in the department of Lot, France, is situated on a small rocky peninsula, formed by a bend of the river Lot—here crossed by three bridges—about 60 miles north of Toulouse. The streets of C. are steep and narrow, and present many specimens of antique architecture. It has a fine cathedral, and several Roman remains, including those of a magnificent aqueduct. There is an obelisk to Fénélon, who was student at the university here. The town was taken and pillaged by Henri of Navarre in 1580. It has manufactures of cotton-yarn, woollens, leather, paper, glass, &c.; the district produces wine in considerable quantities. The population in 1872 was 11,416.

**CATOOS**, or **CAY'OS**, or **KEYS**, a term applied to numberless rocky inlets of the West Indies, and that generally with a reference to some more considerable island in the neighbourhood. Thus, to take the Bahamas as an instance, there are the Keys of Providence, of Eleuthera, of Abaco, &c. But more specifically the name is often appropriated to the more southerly members of the group just mentioned—North, West, East, Grand, and other Keys together covering about 450 square miles, and containing about 3000 inhabitants. They lie between 21° and 22° N. lat., having been transferred, with a local president, from the government of Bahama to that of Jamaica. The revenue is about £9000. The imports are valued at nearly £30,000; and the exports (consisting chiefly of salt) at £25,000.

**CA'IFA**, or **HAIF'A**, a seaport on the coast of Syria, situated exactly opposite Acre, upon a spur of Mount Carmel, and on the south side of a wide semicircular bay, four miles across. It is the ancient Hæfæ, or Sycaminopolis. It covers but a small space of ground, and contains no edifice of any note except a few minarets. The houses are built of rough unhewn sandstone, plastered over with lime—the roofs flat. Pop. about 2000—Molems, Christians, and Jews. C., having a better anchorage than Acre, is fast eclipsing that city as a port, and in recent years almost all the trade of Acre has been transferred to it. Consular agents from England, France, &c., have, within twenty years, been established at C.; and among other improvements are a coffee-house and billiard-room, things rare in Syria. Several cargoes of barley, wheat, and sesame seed are yearly shipped at C., and exported to Great Britain and France. C. is surrounded by beautiful gardens of palm, olive, orange, citron, fig, mulberry, and pomegranate trees.

**CAILLIE**, RENÉ or AUGUSTA, a French traveller, noted for his journey to Timbuktu, was born 19th September 1799, at Manzé, in the department of Deux-Sèvres. Having gone to Senegal, and engaged in trading with the natives, he learned, about 1826, that the Geographical Society of Paris had offered a premium of 10,000 francs to the first traveller who should reach Timbuktu. Provided with a stock of goods for barter, C. started from Sierra Leone, March 22, 1827, and after some delay caused by illness, he reached the mysterious city in April 1828, where he remained 14 days. On leaving Timbuktu, he accompanied a caravan across the Sahara Desert, reaching the coast at Tangier. After hearing and examining his statements, the Society awarded to him the offered prize, with a pension of

1000 francs, and the order of the Legion of Honour. His notes of travel, arranged by M. Jomard, were published under the title *Journal d'un Voyage à Tembouktou et à Jenne dans l'Afrique Centrale, &c.* (3 vols., Par. 1830). In England, doubts were raised as to the veracity of C., but without just grounds. C. died at his estate, in the neighbourhood of Paris, May 25, 1838.

CAIN, the first-born of Adam and Eve. His history, as recorded in the book of Genesis, is mysterious and inexplicable, and the traditions which a later superstition has gathered round it, have thrown no light whatever on its dark perplexity. As the first murderer, his memory has always been profoundly execrated by the Christian Church; yet such is the perversity of human nature, that one sect—if not more—of the pseudo-Gnostics found his actions and character so much to their liking, that they called themselves *Cainites* (130 A.D.), and invented an explanation of his alleged crime, which, like most of the Gnostic heresies in the early church, sprang out of the deep-rooted fundamental error of the ‘two principles.’ The Cainites believed that C. was the offspring of the intercourse of a superior Power with Eve, and Abel of an inferior Power; that their characters corresponded to their paternal parentage, and that the slaying of Abel only symbolised the victory of the superior over the inferior Power. The subsequent punishments of C. were regarded as the persecutions of Abel’s father—i.e., the Jewish God. For the same reason, they highly honoured all the reprobates of the Old Testament—such as the people of Sodom, Esau, Korah, Dathan, and Abiram—whom they looked upon as the victims of the hatred of Jehovah. It is unfortunate that we possess only distorted and fragmentary accounts of this, as of all the other heretical sects. The Cainites are also said to have denied the dogma of the resurrection of the body, to have rejected the New Testament, and accepted a gospel of Judas, the betrayer, whom they also revered for the singular reason that his crime, by procuring the death of Christ, secured the salvation of men.

CAINOZOIC (Gr. ‘recent life’), a geological term, synonymous with Tertiary, introduced with other words by Mr Phillips, to avoid the confusion which attended the use of the terms primary, secondary, and tertiary, owing to the various meanings attached to them by geologists.

ÇA IRA (French for ‘It will go on!’), the well-known refrain of the song beginning with—

‘Ah, ça ira, ça ira, ça ira!  
Les aristocrates à la lanterne!’

which must always be remembered as associated with the most terrible scenes of the French Revolution. Like the *Marseillaise*, the *Carmagnole*, and the *Chant du Départ*, it became a French national song, and was styled the *Carillon National*. The melody, taken from another song, is said to have been a favourite air with the unhappy Queen Marie Antoinette.

CAIRD, REV. JOHN, D.D., a minister of the Established Church of Scotland, and one of the most eloquent living preachers in Great Britain, was born at Greenock in 1820. He studied at the university of Glasgow, and in 1845 was ordained to the pastorate of the church of Newton-upon-Ayr, whence in 1847 he was translated to Lady Yester’s, Edinburgh. Here his popularity was extraordinary, but the demands made on his physical energies were so great, that he found it necessary to retire to the country, and accepted, in 1849, the country charge of Errol, in Fifehire. A sermon which he preached before the Queen in 1855, in the church of Crathie,

and which was published, by royal command, under the title of *The Religion of Common Life*, was universally admired throughout Great Britain; translated on the continent under the auspices of Chevalier Bunsen, who wrote a preface to it, and suddenly carried the fame of the author into all parts of the Protestant world. In 1857 Dr C. accepted a call to Glasgow. In 1858, he published a volume of sermons, marked by beauty of language, strength of thought, and earnest sympathy with mankind. He received the degree of D.D. in 1860. In 1862, he was appointed Professor of Divinity, and in 1873, Principal of Glasgow University.

CAIRN, or CAERN, a Celtic word signifying a protuberance, a heap, a pile. In that sense, it appears in the names of hills and other natural objects in Scotland, Ireland, Wales, Cornwall, and Brittany. It is also applied to artificial heaps of unhewn stones, which, among archaeologists, have come to be generally known as ‘cairns.’

These are several kinds of cairns. The simplest and most common form seems to be a conical pile of stones of no great size. Next is what may be called the fenced or ringed C.—a heap of stones girdled round by large unhewn stones set upright in the ground. Some cairns have two, and a very few have three such concentric girdles; in some instances, there are concentric rows of upright stones within the cairn. Many cairns are found in the neighbourhood of the circles of unhewn stone pillars which antiquaries used to style ‘Druidical.’ In a few instances, cairns are found at the end of an avenue of standing stones. Some cairns are fenced round by a narrow ditch and a small earthen rampart. A very few cairns have unhewn flat stones on their tops; a still smaller number are surmounted by an unhewn stone pillar. A few are oblong in shape.

Cairns were erected, doubtless, for several purposes. It appears from record that they were often raised to distinguish the marches or boundaries of lands. One C. near Balmoral, on the Highland Dee, is said to have been erected as a musterings-place for the men of Strathdee, who took its name, *Cairn-na-cainne*, or ‘C. of Remembrance,’ for their slogan or war-cry. In later times, places where great crimes had been committed were marked by cairns; thus, ‘Muahet’s C.’ in the Queen’s Park at Edinburgh, shews the spot where a wife was murdered by her husband, under circumstances of peculiar atrocity, in 1720. But that the great purpose of the C. was sepulchral, is shewn by the human remains found in so many of them. ‘*Diejectis et eritis, ossa inveniuntur, et quibusdam honor nominis adhuc manet*,’ says Robert Gordon of Straloch, writing of Scotch cairns in 1654. ‘For the cairns or heaps of stones in several parts of Ireland,’ wrote Thady O’Roddy in 1617, ‘some of them were heaped as monuments of battles, some made in memory of some eminent persons buried in such a place.’ A Highland suppliant would have said to his benefactor: *Curri mi doch er do charse*, ‘I will add a stone to your cairn.’ The bones found in cairns are generally calcined or half-burned, and enclosed either in what are called cists—small rude coffins of unhewn stones—or in urns of earthenware, which, again, are in many cases protected by stone cists. Along with the bones are often found flint arrow-heads, flint axe-heads, stone hammers, stone rings, glass beads, implements of bone, bones of horses and oxen, spear-heads, and other weapons of bronze. In some instances, human bones are found unburned, enclosed in stone cists about three feet long, or, more rarely, of the full size of a man. In one case, as many as seventeen stone cists were found in one cairn.

Many cairns are of considerable size. Each of three cairns at Mensie, near Fraserburgh, in Aberdeenshire, was about 300 feet in circumference, and about 40 feet high. A C. in the parish of Minnigaff, in Galloway, was 891 feet in circumference. Several of the larger cairns are what is called 'chambered'—that is, have internal galleries or cells. Of three large ringed cairns at Clava, on the banks of the Nairn river, near the battle-field of Culloden, one was found to contain a gallery, about 2 feet wide, leading from the south side of the C. to a circular chamber in the centre, about 15 feet in diameter, built of unhewn and uncemented stones, each course overlapping the other so as to meet at the top in that sort of rude dome which has received the name of the 'beehive house' (q. v.). The Boss C., on the moor of Dranawdow, in the parish of Minnigaff, had two galleries crossing each other—each 80 feet long, 4 feet wide, and 3 feet high.

But of all the 'chambered' cairns, the most remarkable is that at New Grange, on the banks of the Boyne, near Drogheda, in Ireland. It is 400 paces in circumference, and about 80 feet high, and is supposed to contain 180,000 tons of stones. In 1699, it was described by Edward Llwyd, the Welsh antiquary, as 'a mount or barrow, of very considerable height, encompassed with vast stones, pitched on end, round the bottom of it, and having another, lesser, standing on the top.' This last pillar has disappeared; of the outer ring of pillars, ten still remain, placed at about ten yards one from another. 'The cairn,' says Mr Wakeman in his *Archæologia Hibernica* (Dublin, 1848), 'in its present ruinous condition, presents the appearance of a grassy hill partially wooded; but, upon examination, the coating of earth is found to be altogether superficial, and in several places the stones, of which the hill is entirely composed, are laid bare. The opening [which is nearly square, and lined by large flags] was accidentally discovered about the year 1699. The gallery, of which it is the external entrance, communicates with a [dome-roofed] chamber or cave nearly in the centre of the mound. This gallery, which measures in length about 50 feet, is, at its entrance, 4 feet high; in breadth about 3 feet. Towards the interior, its size gradually increases; and its height, where it forms the chamber, is 18 feet. The chamber is cruciform, the head and arms of the cross being formed by three recesses—each containing a basin of granite. The sides of these recesses are composed of immense blocks of stone, several of which bear a great variety of carving, supposed by some to be symbolical. The majority of these carvings must have been executed before the stones had been placed in their present positions. The length of the passage and chamber from north to south is 75 feet, and the breadth of the chamber from east to west 20 feet. Of the urns or basins in the recesses, that to the east is the most remarkable. It is formed of a block of granite, and appears to have been set upon, or rather within, another of somewhat larger dimensions.' The Irish antiquaries believe that the chambered C. of New Grange—'the Cave of Achadh Aldai' as it was called, from Aldai, the ancestor of the Tuatha De Danaan kings—was opened and rifled by the Norsemen in 862. About a mile from it, on either side, are other two cairns of nearly equal size, named Knowth and Dowth. The latter was opened in 1847, and found to contain a gallery, a cruciform chamber, a basin or sarcophagus, and carved stones, all of the same type as those of New Grange. Engravings of the sculptures, in both cairns, are given in Mr W. R. Wilde's *Boyne and Blackwater*, pp. 192–207 (Dublin, 1850); and some of them are obviously of the same

character with sculptures found in Scandinavia; at Locmariaquer, and at Gavr Innis, in the Morbihan, in Britanny; in one of the cells of a tumulus opened in 1853 at Pickaquoy, near Kirkwall, in Orkney; among the ruins of an ancient fort at the Laws, near Dundee; at the ancient forts at Rowtin Lynn, and Old Bewick, in Northumberland; and on one of the standing stones near Penrith in Cumberland, called 'Long Meg and her Daughters.'

Cairns are most frequent in stony countries. Where, as in many parts of England, stones are scarce, the barrow or earthen mound came in place of the C., from which it differs only in the materials of which it is made. So also in Scandinavia. Cairns, or *dysær*, as they are there called, are rare in Denmark, but of more common occurrence in Sweden and Norway.

**CAIRNGORM STONE**, or simply CAIRN-GORM, a name often given by jewellers, and particularly in Scotland, to brown or yellow quartz or rock-crystal, because found at Cairngorm, in Aberdeenshire. The same mineral is found in many other localities, as at Olivet near Orleans, in Brazil, and in Siberia. In Cairngorm and the neighbouring district of Mar, it occurs both in the granite rock and in the alluvial soil. It differs from common colourless quartz or rock-crystal only in the presence of a very little oxide of iron or manganese, to which it owes its colour. It is much used as an ornamental stone. The yellow variety is not unfrequently called topaz, although quite different from the true topaz, which it resembles chiefly in colour, having neither its hardness nor its brilliancy. The topaz is, however, sometimes found along with it in the granite and gneiss districts of Mar and Cairngorm. The brown variety is sometimes called SMOKY QUARTZ, and when of a good and uniform colour is by some preferred to the yellow.

**CAIRO** (Arabic, *Musr el Kaherah*, 'the victorious capital'), the capital of modern Egypt, is situated in lat. 30° 2' N., and long. 31° 16' E., in a sandy plain betwixt the right bank of the Nile and the ridge of Mokattam, and near the point of the delta of the Nile. From the foundation of the city in 969, the Fatimite califs of Africa, who brought the bones of their ancestors with them from Kairon, reigned for ten generations over the land of Egypt. The calif Hakem, who built a mosque near Bab-el-Naasr, and who is the supposed founder of the Druse religion, was the third in this succession. In the year 1171, Saladin usurped the throne from the last of the Fatimites. His descendant, Moosa-el-Ashref, was deposed in his turn in 1250; from that time till the year 1517, when the city was stormed and taken by Sultan Selim, C. was governed by a succession of Mameluke kings.

The city of C. occupies about three square miles, and is surrounded by a low wall. Its streets are narrow, dark, crooked, and unpaved, and in some parts arched over. The bazaars, although dark and gloomy, are well and richly supplied. The houses, which are generally two or three stories high, are all built of variegated brick, with interlinings of wood, and have flat roofs. The city is divided into different quarters, one quarter being appropriated to the Turks, one to the Christians, one to the Jews, &c.; so that every religious sect has its own quarter, which is separated from the adjoining one by strong gates at the end of the streets; these are closed at night, and guarded by a porter, who opens the gate when any one wants to pass.

The most remarkable buildings in the city of C. are its minarets and mosques. The minarets are

## CAISSON—CAITHNESS FLAGSTONES.

the most beautiful of any in the Levant, of a prodigious height, and built of alternate layers of red and white stone. The most ancient of all the minarets is that attached to the great mosque of Sultan Taylooon. This mosque was built in the year of the Hegira 265 (879 A.D.), before the foundation of the city, and consists of an immense cloister or arcade built on pointed arches, being the earliest extant in that form. Another magnificent mosque is that of the Sultan Hassan, situated in the place of the Roumayli, near the citadel, and which was finished about the year 1362 A.D. It has two very elegant and high minarets, and the mosque, in consequence of its size, and the thickness of its walls, was frequently seized and made use of as a fortress by the insurgents in the numerous rebellions and insurrections which were always taking place at C. under the rule of the Mameluke kings. Stains of blood are still to be traced on the marble walls of the courtyard.

The population of C. consists of the ruling class, who are all Turks; Arabs, the former conquerors of the land, who form the bulk of the population, all the petty tradesmen and cultivators of the soil being of Arab origin; Copts, who are descended from the original lords of the land, the ancient Egyptians; Jews, Armenians, Syrians, Africans, and Europeans. Pop. (1872) 350,000. The Copts, a mere fraction of the population, completed, in 1867, a fine, lofty, spacious church. Since 1863 the part of C. occupied chiefly by European, American, and Jewish merchants, has been handsomely rebuilt—it having been entirely destroyed by fire that year.

Of objects worthy of note in the environs of C., there may be mentioned the tombs of the califs, situated about a mile beyond the walls, which are magnificent and imposing buildings, forming beautiful specimens of Arabian architecture. The mausoleum of Sultan Bergook is a triumph of Saracenic architecture. The public gardens, which consist of groves of orange, citron, palms, and vines, are very beautiful.

C. is the seat of learning for the East. There is a university or college attached to the mosque of Ezher, and a considerable Oriental library. In this university, grammar, arithmetic, algebra, rhetoric, &c., are taught, and lectures delivered on logic, theology, the exposition of the Koran, moral, criminal, and civil law, &c. The number of students who congregate here from all parts of the Mohammedan world is about 2000, and the instruction is given gratis, the professors subsisting on private instruction and on presents from the wealthy. Besides this university, there are other schools where grammar, writing, and arithmetic are taught, and others devoted to arts and sciences, and engineering. At Abou Zabel, there is also a school of anatomy, medicine, and surgery. The language spoken at C. is Arabic, which, though not the purest, is superior in pronunciation to that spoken in Syria. C. is the official residence of the viceroy of Egypt, and the residence of a consul-general from Great Britain, France, &c. A railway now connects C. with its seaport Alexandria.

CAISSON, in military matters, is a name sometimes given to a tumbril or ammunition wagon. It is more frequently applied, however, to a large wooden chest or frame, loaded with powder, shells, or both, and buried several feet deep in the ground under some fortification, this destructive combination is to be blown up if there be danger of the enemy approaching and taking possession of that particular part of the defence-work. The French give the name of *caisson pour les vivres* to a large chest, carried with the army, and capable of containing 800 rations.

CAISSON, in relation to shipping, is an apparatus for lifting a vessel out of the water for repairs or inspection. It is usually a hollow structure, sunk by letting water into it. There is an air-chamber inside, which allows it to sink only to a certain depth. In that state it is hauled under the ship's bottom, the traps or openings are closed, the water is pumped out, and the caisson rises with the ship upon it.

In another arrangement, a platform is sunk to a certain depth in the water, and is suspended by iron screws from a strong wooden framework; the ship is floated upon the platform, steadied by shores, and lifted high and dry by means of levers, wheels, pinions, and screws.

CAITHNESS, a maritime county, the most northerly on the mainland of Scotland. It is triangular in shape; length from north to south, 40 miles; greatest breadth, 30 miles; area, 616 square miles. Except in the west and south, where the mountain-range (composed of granite and gneiss) dividing C. from Sutherland attains, in its highest point, a height of more than 2300 feet, the general aspect of C. is level and bare, being in great part moorland and destitute of trees, while the sea-coast is bold and rocky, with many bays, inlets, promontories, and caves. On the north coast are Dunnet Head and Duncansby Head; and on the west side of the last-named head is a spot of green turf, called John o' Groat's House, where John de Groot or Groat of Warse settled with his brothers in James IV.'s time, and built a house. There are no navigable rivers in C., and no lakes of importance. The climate is damp and chilly, but snow rarely lies on the plains above a day or two at a time. Thunder is rare, but aurora are seen almost nightly. There are no manufactures, properly so called, although weaving is carried on to some extent. Coal has not been found in C.; the common fuel is peat. The chief crops are oats, bear, turnips, and potatoes. The parts of the surface under tillage are generally a deep fertile loam on a strong till clay. In the north-east, the soil is sandy. The crops are 20 days later in ripening than in the Lothians. The occupants of many of the small farms divide their time between farming and fishing. There are herring, ling, cod, salmon, and lobster fisheries. The herring-fishery in July and August employs about 1500 boats, a part of which come from other parts of the Scotch coasts. Wick is the chief seat of the British herring-fishery. The average number of barrels cured annually in the ports of C. may be stated at 150,000. The other exports are cattle, oats, and wool. C. contains quarries of flag-stone, freestone, and slate. Wick is the only parliamentary borough in C.; another town is Thurso, an old burgh of barony. There were, when the census was taken in 1871, 7185 children in C., and of these, 6608 were receiving education. Pop. 39,992. The county returns one member to parliament, and Wick united with Kirkwall, Dornoch, Dingwall, Tain, and Cromarty, in returning another. A railway, completed in 1874, and extending to Wick and Thurso, connects C. with the south. In early times, C. is supposed to have been inhabited by Celts; these afterwards mixed with Danes and Norwegians. C., in the middle ages, was subject to the kings of Norway. David II. adopted the weights and measures of C. for all Scotland. The Scandinavian origin or mixture of the people of C. is shewn by their tall forms and soft fair features, and their speaking English instead of Gaelic. C. has remains of Picts' houses, round towers, &c.

CAITHNESS FLAGSTONES are dark-coloured bituminous schists, slightly micaceous and calcareous,

valuable on account of their great toughness and durability for pavements, cisterns, and various other purposes, and accordingly are largely exported. They belong to the Old Red Sandstone, and contain abundant remains of fossil fishes.

CAIUS, DR JOHN, the person from whom Caius College, Cambridge, takes its name, was born at Norwich in 1510. His real name was Kaye or Key, which he Latinised into Caius. He was educated at Gonville Hall, university of Cambridge; and at the age of 20, turned into English Chrysostom's *Method of Praying to God*, which was followed by a translation of Erasmus' *On True Theology*. He next went abroad, and resided in Italy for several years, studying medicine. On his return to England, he practised with success at Cambridge, Shrewsbury, and Norwich. Henry VIII. appointed him anatomical lecturer to the Company of Surgeons in London. In 1547, he was elected a fellow of the College of Physicians, of which he was subsequently made president. He also became physician to Edward VI., Queen Mary, and Queen Elizabeth. In 1557, he obtained permission to elevate Gonville Hall into a college, which took the name of Caius College, and of which he became master. This office he held till his death, in July 1573. His principal work is, *A Boke or Councill against the Disease commonly called the Sweate or Sweatyng Sickness. Anno Do. 1552.* C., however, wrote a great number of works on a variety of subjects, critical, antiquarian, and scientific.

CAIUS COLLEGE. See GONVILLE AND CAIUS COLLEGE.

CA'JEPUT (*Melaleuca Cajeputi* or *M. minor*), a tree of the natural order *Myriaceæ*, sub-order *Lepidopermæa*, from the leaves of which the pungent, aromatic, volatile oil, called *Oil of Cajeput*, is obtained by distillation. The C. tree is common on the mountains of the Moluccas. It is rather a small tree, with a crooked trunk, thick spongy bark, white wood (whence the name C., properly *kayuput*, signifying white wood), elliptical-lanceolate alternate leaves, and terminal spikes of white flowers. The greater number of the species are natives of Australia, some of them very beautiful shrubs and frequent ornaments of British hot-houses. Much of the oil of C. of commerce is prepared in the island of Banda. It is said that two sackfuls of leaves yield scarcely three drachms of the oil, which is green, transparent, limpid, with a strong penetrating odour, and agreeable only when much diffused.

CALABA TREE. See CALOPHYLLUM.

CALABAR, the name of a coast district of Upper Guinea, Africa, the limits of which are not clearly defined; but it is usually understood to extend between the river Benin and New Calabar, called by the Portuguese Rio del Rey, and as far north as the Kong Mountains. The surface is low and flat, and the climate unhealthy. Yams, which are the principal food of the inhabitants, are raised in plenty, and also the sugar-cane, and palms, from which palm-oil is obtained in large quantities. The inhabitants are polygamists, and make human sacrifices to good and evil spirits. It has long been a scene of missionary labour, but the converts to Christianity are still few.

CALABAR (OLD), a river of this district, enters the Bight of Biafra, about 52 miles west-north-west of Fernando Po, by an estuary about 9 miles in breadth. It is navigable by steamers for about 200 miles above its mouth, and abounds in crocodiles. The chief towns on its banks are—Duke Town, situated on its estuary; Creek Town, further up, both seats of British missions; Acoono Coono, and Omun.—CALABAR (NEW), a branch of the Niger,

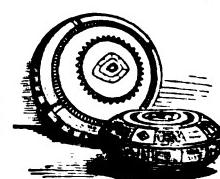

falling into the Bight of Biafra, in lat.  $4^{\circ} 30'$  N., and long.  $7^{\circ} 7'$  E. It has a bar across its mouth, which prevents the entrance of vessels drawing more than 12 feet; but some miles up it has an average depth of 30 feet.

CALABASH TREE (*Crescentia Cujete*), a tree found in the West Indies and in the tropical parts of America, of the natural order *Bignoniaceæ*

Calabash Tree.

(q. v.), suborder *Crescentiaceæ*. In height and size it resembles an apple-tree, and has wedge-shaped leaves, large whitish fleshy flowers scattered over the trunk and older branches, and a gourd-like fruit, sometimes a foot in diameter. The wood of the tree is tough and flexible, and is well adapted for coach-making. But the most useful part is the hard shell of the fruit, which, under the name of calabash, is much used in place of bottles for holding liquids, and for goblets, cups, water-cans, &c. These shells may even be used as kettles for boiling liquids, and they will bear this several times without being destroyed. They are sometimes highly polished, carved with figures, tinged with various colours, and converted into ornamental vessels. The rinds of gourds are sometimes also used for holding liquids, and called calabashes.

Carved Calabashes.

CALABRIA, a district of the kingdom of Italy, forming the whole of the peninsula south of the province of Basilicata. Its greatest length, from the southern border of Basilicata to Cape Spartivento, is about 160 miles. In its northern part it has a breadth in some places of more than 60 miles, which suddenly contracts, between the Gulfs of Sant' Eufemia and Squillace, to not more than 16. Its entire area is nearly 7000 square miles, and its population, in 1871, amounted to 1,206,302. It is traversed throughout its entire length by the Apennine Mountains (q. v.), whose summits in the region in the north of C., known as La Sila, and the Aspromonte, in the south, are crowned with pines, while forests of oak and beech cover their sides. The valleys between the various hills afford rich pasture, especially in the north, to which, in spring-time, whole colonies migrate with their flocks and herds. There is no river of any importance in C.; but the valleys and plains, watered by such

streams as there are, are very fertile, yielding wheat, rice, cotton, liquorice, saffron, the sugar-cane, &c., and also the vine, orange, lemon, olive, fig, and mulberry, in luxuriance. Iron, alabaster, marble, gypsum, and antimony, are among its minerals. The fisheries of its coasts, particularly the tunny and anchovy fisheries, are important, and afford employment to a large number of the population. Manufactures are in a backward state. Silk is the staple article. The district is very subject to earthquakes. For purposes of administration, C. is divided into the provinces of Cosenza, which has a population of 440,468—capital, Cosenza; Catanzaro, with a population of 412,226—capital, Catanzaro; and Reggio, with a population of 353,608—capital, Reggio.

In ancient times, the name C. was given only to the south-east peninsula, nearly corresponding to the modern province of Terra di Otranto, no portion of which is included in modern C., which answers to the ancient *Bruttium*. The name C., as applied to the district now known by that name, appears to have originated with the Byzantines sometime prior to the conquest of the country by the Normans. A colony of the Vaudois or Waldenses of Piedmont was founded in C. in 1340, and for some time enjoyed great prosperity, but was extirpated in 1560—1561. The destruction of this colony is one of the blackest passages of the history of religion in Italy.

The Calabrians are a proud, fiery, and revengeful race. They were long celebrated as among the fiercest of banditti; but the crimes which in former times made them infamous are no longer frequent. They strenuously resisted the power of France during the Napoleonic campaigns, and were not finally subdued until 1810.

#### CALADIUM. See Cocco.

**CALAHORRA**, a town of Spain in the province of Logroño, 24 miles south-east of the city of that name, is situated on the small river Cidacos, about 2 miles from its confluence with the Ebro. C. occupies the site of the ancient *Calagurris*, celebrated in classic history for the obstinate but unsuccessful resistance it offered (78 B.C.) to Afranius, Pompey's legate, when the citizens slaughtered their wives and children for food rather than surrender. C. was the birthplace of Quintilian the rhetorician. It has an old cathedral, and a trade in the agricultural produce of the rich district in which it is situated. Pop. about 6000.

**CALAIS**, a seaport town of France, in the department of Pas-de-Calais, on the Strait of Dover, near its narrowest part, the distance from the town of Dover not being more than 26 miles. The latitude of the new light-house—190 feet in height—is 50° 57' 45" N., long. 1° 51' 18" E. C. is a fortress of the first class. On the south and east, low marshy grounds, which those in the city have the means of submerging, stretch up almost to the walls, which on the north and west are washed by the sea. The town, adjacent country, and port, are commanded by the citadel, which is situated at the west end of the town, while numerous forts, by their cross-fire, defend the weakest points. The harbour, which is nearly dry at low tide, and which has rarely more than from 15 feet to 18 feet of water in it, is formed by two moles, which project about three-quarters of a mile into the sea. Being one of the chief ports of embarkation for travellers from England to France, it has daily steam communication with Dover—with which it is also connected by submarine telegraph—and with London and Ramsgate several times a week. The city, which is entered from the sea by a drawbridge and gate, erected in 1685 by Cardinal Richelieu, is square in form; its streets

are, for the most part, broad and well paved; and its ramparts form pleasant promenades. But it is on the whole a dull place. It has few objects of interest, the most noticeable being the cathedral, with a fine picture of the 'Assumption' by Vandyck. It has become a manufacturing town of some importance. The chief manufactures are bobbin-net (tulle) and hosiery. Numerous mills have been built; steam-engines are multiplying; and the inner ramparts have been removed to make room for factories. Hats and gloves are extensively made. It has also distilleries, salt-refineries, and ship-building. C. sends many boats to fish for herring and cod on the coasts of Scotland and Iceland. Water, which used to be scarce, is now brought in abundance from the neighbourhood of Guinea. Its exports consist of eggs, corn, wine, brandy, &c. In 1873, a school of artillery was established in C. Pop. (1872) 11,554.

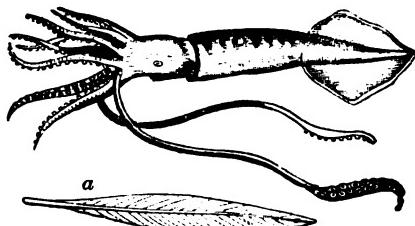

In the 9th c. C. was but a small fishing-village. In the following c., it was much improved by Baldwin IV., Count of Flanders, and enlarged and strengthened by Philippe of France, Count of Boulogne. After a long siege, it was captured by Edward III. of England, whose hard terms, and the self-devotion shewn by six of the citizens, who were saved by Queen Philippa, form one of the most interesting passages of history. The English retained it until 1558, when it was captured by the Duke of Guise, since which time (with the exception of two years, 1596—1598, when it was in the possession of the Spaniards) it has remained in their hands. In 1659, Charles II. of England resided some time here; and about a quarter of a century later, James II. arrived here with French troops for the invasion of England, which the destruction of the French fleet prevented him from accomplishing. Louis XVIII. landed here in 1814, after his exile.

**CALAMANDER WOOD**, a cabinet-wood of the greatest value, resembling rose-wood, but much surpassing it in beauty and durability. The tree which produces it is *Diospyros hirsuta* (see DROSOPHROS), a species of the same genus which produces ebony; it has oblong obtuse leaves, which are downy beneath, and flowers without stalks and crowded; and is a native of the south-east of India, and of Ceylon, particularly of the forests at the base of Adam's Peak. But this tree 'has been so prodigally felled, first by the Dutch and afterwards by the English, without any precautions for planting or production, that it has at last become exceedingly rare,' so that wood of considerable size is scarcely to be procured at any price. It yields veneers of unusual beauty, 'dark wavings and blotches, almost black, being gracefully disposed over a delicate fawn-coloured ground.' Its density is very great, a cubic foot weighing nearly 60 lbs., and it takes an exquisite polish. The name C. W. is supposed to be a corruption of Coromandel wood.

**CALAMARY, SQUID, or SLEEVE-FISH** (*Loligo*), a genus of cephalopodous mollusks of the order *Dibranchiata*, and family *Teuthida*. The body is of an elongated form, firm, fleshy, tapering, and flanked towards its posterior extremity by two triangular fins. The body contains a *gladius*, or internal shell, which is horny and flexible, narrow and pen-shaped, with the shaft produced in front. The mouth is furnished with eight arms. Calamaries have the power of diffusing a dark-coloured fluid around them in the water like the cuttle-fish. The different species are distributed over all parts of the world. Several are found in the British seas. In some seas, however, they abound much more, and form a principal part of the food of some of

## CALAMIANES—CALAMY.

the larger fishes and of whales. The Common C. or Squid (*L. vulgaris*) is of a bluish colour, speckled with purple. It grows to nearly a foot and a half

Common Calamary (*Loligo vulgaris*):  
a, gladius.

in length, without reckoning the head and arms, which add to the length about half a foot more. See CEPHALOPODA.

CALAMIA'NÉS, a group of islands in the Eastern Archipelago, in lat. about  $11^{\circ} 25'$ — $12^{\circ} 20'$  N., and long.  $120^{\circ}$  E. Calamianes, the name of the largest of the group, is about 35 miles long and 15 miles broad, elevated and fertile, with abundance of animals, such as deer and hogs. It has a Spanish settlement.

CA'LAMINE, an ore consisting essentially of carbonate of zinc. The name is said to be derived from the Greek and Latin *calamus*, a reed, because when fused it adheres to the base of the furnace in a reed-like form. Its primary form is a rhomboid, and it occurs in small obtuse-edged crystals, also compact and massive. It is white, yellowish-white, brown, green, or gray; is sometimes opaque, sometimes translucent; is brittle, and has an uneven conchoidal fracture. It occurs in beds and veins in rocks of various kinds, but most commonly in limestone. Mendip, Matlock, Alston Moor, Lead-hills, and Wanlockhead are British localities. C. is an important ore of zinc. In the duchy of Limburg, in the Netherlands, about 1,500,000 lbs. of it are annually extracted from the mines.

CA'LAMINT (*Calamintha*), a genus of plants of the natural order *Labiatea*, nearly allied to BALM (q. v.) (*Melissa*). The COMMON C. (*C. officinalis*, formerly *Melissa Calamintha*) is not unfrequent in England. It has whorls of flowers (*verticillasters*), on forked many-flowered stalks, and serrated leaves, with an agreeable aromatic odour, not unlike that of some kinds of mint. It is used by the country people to make herb-tea, and as a pectoral medicine.—The LESSER C. (*C. Nepeta*), also an English species, is used in the same way.

CA'LAMITE, a genus of fossil plants whose true position has not been satisfactorily ascertained. They appear first in the Devonian rocks, and rise

Fragment of Calamite (*C. cannaformis*).

through the intermediate formations to the Oolitic series, where they are represented by a single species. They reach their culminating point in the Coal-measures where 39 species have been determined. The tall straight stems rose from a swampy clay soil in profusion in the forests of *sigillaria*, and formed a striking and characteristic feature in the coal flora, though they supplied little material for the structure of coal. They are hollow-jointed cylinders, with longitudinal furrows, giving the fossil the appearance of *Equisetum*; from this resemblance,

botanists have generally considered them as huge 'horsetails.' Hooker has been unable to detect any traces of structure, in carefully prepared specimens, or the presence of those siliceous stomata which characterise *Equisetum*, and which would have been preserved in the fossil state, and Fleming has shewn that the furrows are markings on the interior cavity. While, therefore, it is certain that they are not 'horsetails,' the absence of fructification makes every attempt to give them their position but guess-work. Hooker supposes them nearly allied to Ferns, or Club-mosses; Brongniart ranks them among Gymnospermae Dicotyledons. The upper part of the stem, and the foliage, if any, have not been noticed. The root termination was conical, the joints decreasing downwards in size and length. From the scars on the upper portion of each joint, there proceeded filaments, which were supposed to be leaves, but are really roots. These are shewn in the species figured—a species common in the English coal-field.

CA'LAMUS, the reed pen which the ancients used in writing, was made of the stem of a reed growing in marshy places, probably *Arundo Donax* (see REED), of which the best were obtained from Egypt. The stem was first softened, then dried, and cut and split with a knife (*scalprum librarium*), as quill pens are made. To this day, the Orientals generally write with a reed, which the Arabs also call *Kalām*.

CALAMUS, a genus of palms. See RATTAN and DRAGON'S BLOOD.

CALAMUS, a name sometimes given to the Sweet Flag (*Acorus Calamus*). See ACORUS. See also next article.

CA'LAMUS AROMA'TICUS, the name given by the ancients to a plant to which they ascribed important medicinal virtues. It is by no means ascertained what the plant is: the most probable opinion appears to be that of Dr Royle, who supposes it to be one of the sweet-scented grasses which yield the grass-oil (q. v.) of India, to which he has given the name of *Andropogon calamus aromaticus*. See LEMON-GRASS. The C. A. of the Greeks and Romans came from the East. The Sweet *Calamus* and Sweet Cane mentioned in Scripture (Exod. xxx. 23, and Jer. vi. 20) are probably the same with the calamus aromaticus.

CALAMY, EDMUND, an eminent English divine, was born in London, 1600; studied at Pembroke Hall, Cambridge, where he attached himself to the Calvinistic party; and afterwards became domestic chaplain to the Bishop of Ely. In 1626, he was appointed lecturer at Bury St Edmunds, but resigned his office when the order to read the *Book of Sports* began to be enforced. In 1639, he was chosen minister of St Mary's, Aldermanbury, London. He now entered warmly into the controversies of the time, and became noted as a leading man on the side of the Presbyterians. He had a principal share in the composition of *Smectymnus*, a work intended as a reply to Bishop Hall's *Divine Right of Episcopacy*, and one of the most able and popular polemics of the day. Like the mass of the Presbyterian clergy, he was monarchical and not republican in his political opinions. He disapproved, therefore, of the execution of Charles, and the protectorate of Cromwell, and did not hesitate to avow his attachment to the royal cause. He was one of the deputies appointed to meet Charles II in Holland, and congratulate him on his restoration. His services were recognised by the offer of a bishopric, which he refused from conscientious scruples. The increasing tyranny and intolerance of the High Church party compelled him to give up even his royal

chaplaincy. He died October 29, 1666.—Two of his sons were educated for a religious profession : the one, Dr BENJAMIN C., became a High Churchman, and wrote *A Discourse against a Scrupulous Conscience*; the other, EDMUND C., was ejected for nonconformity, and had a son, also named Edmund, who acquired some reputation as the biographer of the ejected clergy.

CALAN'ndo, in Music, an Italian expression, meaning diminishing by degrees from forte to piano; it differs from decrescendo or diminuendo, as the tempo, at the same time, is slightly retarded, but not so much as in ritardando. The proper performance of the C. is purely a matter of good taste and feeling, depending on the performer.

CALAN'DRA. See CORN WEEVIL.

CALANDRO'NÉ, a wind-instrument used by the Italian peasants, on which they play simple melodies, and also sometimes accompany their national songs. It has the holes of the common flute, but the intonation is produced as in the common pipe.

CALAS, JEAN, a Frenchman, remembered as the unhappy victim of fanaticism and the shocking mal-administration of justice, was born at Lacaparedé, in Languedoc, March 19, 1698. He lived as a tradesman in Toulouse, where he had a very good reputation. One evening after supper (October 13, 1761), the eldest son of the C. family, Marc Antoine, a youth addicted to gambling, and subject to fits of deep melancholy, was found hanged in the warehouse. There was not a shadow of a reason for doubting that the unhappy young man had committed suicide; but popular rumour accused the father, or other members of the C. family, of murdering the eldest son, 'because he had contemplated conversion to Catholicism.' It was also asserted that a young man named Lavayse, who was in the house on the fatal evening, had been despatched 'by the Protestants of Guyenne to perpetrate the murder.' The clergy exerted all their influence to confirm the populace in their delusion. At Toulouse, the White Penitents celebrated with great solemnity the funeral of the young man, and the Dominican monks erected a scaffold and placed upon it a skeleton, holding in one hand a wreath of palms, and in the other an abjuration of Protestantism. The family of C. was, in consequence of the popular excitement, brought to trial for the murder, and several deluded and (most probably) some bribed witnesses appeared against them. A Catholic servant-maid, and the young man Lavayse, were also implicated in the accusation. C., in his defence, insisted on his uniform kindness to all his children ; reminded the court that he had not only allowed another of his sons to become a Catholic, but had also paid an annual sum for his maintenance since his conversion. He also argued from his own infirmity that he could not have prevailed over a strong young man, and referred to the well-known melancholy moods of the deceased as likely to lead to suicide ; and, lastly, he pointed out the improbability that the Catholic servant-maid would assist in such a murder. But all his arguments proved unavailing, and the parliament of Toulouse sentenced the wretched man—by a majority of 8 votes against 5—to torture and death on the wheel! With great firmness and protestations of his innocence to the last, the old man died on the wheel, March 9, 1762. His property was confiscated. His youngest son was banished for life from France, but was captured by the monks, and compelled to abjure Protestantism. The daughters were sent to a convent. The young man Lavayse was acquitted, and the widow of C. escaped into Switzerland, where she was so

fortunate as to excite the benevolent interest of Voltaire, who brought the whole affair before the public, and, in his book *Sur la Tolérance*, proved that C. had fallen a victim to religious hatred and popular fanaticism. A revision of the trial followed, and, after full investigation, the parliament at Paris declared (March 9, 1765) C. and all his family innocent. Louis XV. gave to the bereaved family the sum of 30,000 livres; but, strange to say, neither the parliament of Toulouse nor the fanatical monks were ever brought to account for this horrible judicial murder!

CALASA'YA BARK. See CINCHONA.

CALASIA'O, a town of the island of Luzon (Philippines), with a population of 18,000, who are engaged in the manufacture of straw-hats, cigar-cases, &c.

CALASPA'RRA, a town of Spain, in the province of Murcia, 40 miles north-west of the city of that name. The inhabitants, numbering 5275, are chiefly engaged in agricultural pursuits.

CALATABELLO'TA, a town of Sicily, in the province of Girgenti, and 27 miles north-west of the city of that name. In the immediate vicinity is the site of the ancient *Triocala*, the chief fortress of the insurgents in the second Servile war, 103—100 B.C. Pop. about 5000.

CALATAFI'MI, a town of Sicily, in the province of Trapani, situated 8 miles south-west of Alcamo, in a very fertile district. It is ill-built, and has a ruinous old castle. Here, in 1860, the troops of Garibaldi defeated the Neapolitan soldiers. Pop. 8376.

CALATAGIRO'NE, or CALTAGIRO'NE, a city of Sicily, in the province of Catania, about 34 miles south-west of the city of that name. It is well built, with clean wide streets, and has the reputation of great wealth. It has manufactures of cotton fabrics and pottery. Pop. (1872) 25,978.

CALATAÑAZOR, a town of Aragon, Spain, about 10 miles south-west of Soria. It is celebrated for a great victory over the Christians obtained by Al-Mansur in 1001. Pop. 1500.

CALATAYUD, a city of Aragon, Spain, situated on the Jalon, near its junction with the Jiloca, about 48 miles south-west of Saragossa. It is built at the base of two rocky ridges, and out of the ruins of ancient *Bilibis*, which lay about 2 miles to the east. The city is divided into a new and old portion, the former of which is composed of mean old buildings. The latter has some good streets and handsome squares. C. has a noble old castle, and among its other most noteworthy public edifices are the two collegiate churches and the Dominican convent. In the neighbourhood are some curious stalactitical caves. It has manufactures of linen and hempen fabrics, woollens, paper, leather, &c., and a trade in agricultural produce. Pop. 11,037.

CALATRA'VA, an order of knighthood in Spain, instituted at Calatrava (q. v.). The statutes of the order, framed by the chapter-general of the Cistercian monks, were sanctioned by the Bishop of Toledo in 1164, and afterwards by the pope. At subsequent periods, many privileges were added. After the death of the king, their patron, some of the knights were no longer willing to obey the abbot, and they consequently separated themselves from the monks, and elected a grand-master, Don Garcias de Redon. At a later period, they again united themselves to the Cistercians, after they had gained rich possessions from the Moors both in Spain and Portugal. When Castile had fallen into anarchy, and the other kingdoms were

CALATRAVA LA VIEGA—CALCAREOUS SPAR.

exhausting themselves by internal feuds, the war against the unbelievers was almost entirely carried on by the knights of Calatrava. Their almost uniform success, however, gave rise to rashness; the knights were defeated by Emir Jacob ben Yuseff, nearly all of them perished, and Calatrava was occupied by the Moors. After this disaster, the knights transferred their seat to the Castle of Salvatierra, by the name of which they passed for a long time afterwards. A truce of 12 years having been concluded, during which the order revived, the knights were able, at the battle of Las Navas de Tolosa, in 1212, again to turn the tide in favour of the Christians. They then returned to Calatrava. Notwithstanding their splendid achievements, the knights of C. never possessed the vast wealth of their brethren of St James of Compostella (q. v.), a fact which is probably to be accounted for by their having ceded a part of their conquests to the orders of Alcantara and Aviz. But their grand-masters, who were chosen from the highest families in Spain, were very powerful, and exercised a vast influence on public affairs. They did not, however, escape the jealousy of the crown. Two of them were accused of treason, and died on the scaffold; and on the death of the 13th grandmaster, in 1489, the administration of the order was transferred to the king by a bull of Pope Innocent VIII. By way of compensation for the loss of their independence, the knights were permitted to marry once, though they were still bound to make vows of poverty, obedience, and conjugal chastity; and latterly to profess belief in the immaculate conception. Their original costume consisted of a coat of white mail, with a white scapulary, a black cap, and a pilgrim's hood; but this dress the Anti-pope Benedict XIII., in 1397, granted them permission to exchange for a civil apparel. Their present costume

Red Cross of Knights of Calatrava.

is a white mantle, with a red cross cut out in the form of lilies upon the left breast; while the cross of the order has the same symbol on a silver ground. Two convents for nuns were attached to the order, and were at one time richly endowed. The nuns were called 'female commanders,' and wore the dress of Cistercian nuns, with the cross of the order on the left side of the capoch, fastened to the scapulary.

CALATRAVA LA VIEGA, a ruined city of Spain, situated on the Guadiana, about 12 miles north-east of Ciudad Real. In the middle ages it was a strongly fortified place, but nothing now remains but a single tower. Its defence against the Moors, undertaken by Raymond, abbot of Fitero, and Diego Velasquez in 1158, after it had been abandoned by the Templars, is famous on account of its having originated the Order of the Knights of Calatrava, long one of the most honourable in Spain. The town was called C. la Viega, or Old Calatrava, in order to distinguish it from the

502

convent of the knights of the Order of Calatrava, erected in the neighbourhood in 1214, and which was called Calatrava la Nueva.

CALBU'RGA, a town of the Nizam's dominions in Hindustan, about 110 miles to the West of Hyderabad. It stands on a tributary of the Beemah, which is itself a tributary of the Kistna or Krishna. It has been successively the capital of Hindu and Mohammedan sovereignty.

CALCAIRE GROSSIER (Fr. 'coarse limestone'), the French representative of the Bracklesham Eocene beds. It consists of compact, limestones with seams of chert, and intercalated marls and freestones. The fossils are fresh water and marine mollusca; so abundant are they that in one spot near Grignon no less than 400 distinct species have been procured. Associated with the fresh-water remains are the bones of reptiles and mammalia.

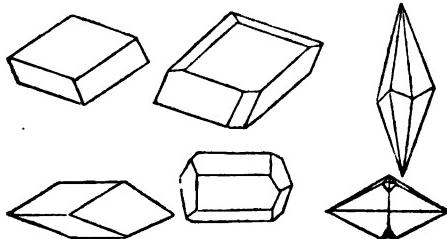

CALCAIRE SILICEUX (Fr. 'siliceous limestone') is the French representative of the Bembbridge Eocene strata. These compact siliceous limestones extend over a wide area in the Paris basin. The few fossils they contain are fresh water and land shells.

CALCAREOUS, in Chemistry, is a term applied to substances containing much lime (Lat. *calc*). Thus, C. waters are those which hold in solution much carbonate and sulphate of lime, and which are generally known as hard waters, and form a deposit in kettles and other vessels when heated therein.—C. rocks are those in which lime forms the prevailing element. They may be chemically formed, as in the case of tufas, where a saturated solution of carbonate of lime in water is deposited from evaporation or other causes; but they are generally aqueous rocks, the materials of which are supplied by animal remains. Thus many rocks, like the mountain-limestone, are composed of shells, corals, and encrinites; while others, like chalk, consist of foraminifera and fragments of other minute testacea. A crystalline structure, varying in degree from the partially crystallised carboniferous limestones to the saccharine statuary marble, is produced in calcareous rocks by metamorphic action. Oolite is a variety of limestone composed of small egg-like grains resembling the roe of fish. The existence of lime in rocks can always be detected by the application of dilute nitric or muriatic acid, when it effervesces from the liberation of the carbonic acid. Pure lime is obtained from calcareous rocks by calcining them—i. e., by driving off the carbonic acid and other volatile matter by heat.—C. soils are produced from the disintegration of calcareous rocks. When the rocks are perfectly pure, they generally yield barren soils, as in many chalk and limestone districts of Britain; but when the lime is mixed with clay, so as to form marl, and has a little vegetable matter added, it forms an excellent though rather light soil. Calcareous soils are difficult of drainage, owing to the property that soft lime has of retaining water, although it easily yields it up by evaporation. Such soils are consequently soon dry at the surface after rain, but yet rarely suffer severely from drought.

CALCAREOUS SPAR, or CALC-SPAR, the name usually given by mineralogists to carbonate of lime, rhombohedral in its crystallisation. It differs from aragonite only in crystallisation. See ARRAGONITE. C. S. occurs in all geological formations, and is one of the most abundant of all minerals. It often completely fills cavities in rocks; and although it has been prevented by want of space from assuming a crystalline form, is readily divided by the knife and hammer into rhombs,

## CALCAREOUS TUFA—CALC-SINTER.

the primary form of its crystals being a rhomboid, of which the greatest angles are  $105^{\circ} 5'$ . Its secondary forms are more numerous than those of any

Calcareous Spar.—Various Forms of Crystals.

other mineral. More than seven hundred have been observed. One of the most common, a rather elongated pyramid, is sometimes called *Dog-tooth Spar*. C. S. is colourless and transparent, except in consequence of impurities which may be present in it; and when perfectly transparent, it exhibits in a high degree the property of double refraction of light, which was first discovered in it by Bartholinus. The presence of foreign substances frequently renders C. S. gray, blue, green, yellow, red, brown, or even black.

The name *Iceland Spar* has often been given to C. S., at least to the finest colourless and transparent variety, because it is found in Iceland, massive in trap-rock. *Slate Spar* is a lamellar variety, often with a shining, pearly lustre, and a greasy feel, of which Wicklow in Ireland, and Glen Tilt in Scotland are localities.

**CALCAREOUS TUFA, CALCO-TUFF, or TUFACEOUS LIMESTONE**, a mineral which in its chemical composition is nearly identical with limestone and marble; but is distinguished by its spongy and cellular structure. It is generally rather soft, brittle, and friable, but sometimes it is sufficiently hard to be used as a building stone. The *tufaceo*, used for building at Rome, is a hard calcareous tufa. The colour of C. T. is generally yellowish-gray, sometimes yellow or yellowish-brown. It occurs massive, or assumes many uncristalline forms, as tubular, botryoidal (like clusters of grapes), cellular, &c. Sometimes it incrusts animal and vegetable remains. It is frequent in the neighbourhood of calcareous springs. It is sometimes used as a filtering-stone.

**CALCEDONY.** See CHALCEDONY.

**CALCEOLARIA** (Lat. *calceolus*, a little shoe), a genus of plants of the natural order *Scrophulariaceæ* (q. v.), of which there are numerous species, natives of South America, chiefly of that part of the Andes which is more than 9600 feet above the sea, a few of them reaching almost to the utmost limits of vegetation; although some are found in lower and warmer situations, and some in the southern extremity of the American continent. They abound so much in some parts of Chili and Peru, as to give a peculiar aspect to the landscape. The calyx in this genus is 4-partite; the corolla, 2-lipped; the lower lip remarkably inflated, so as to form a bag; and the shape of the whole in some species considerably resembling that of a slipper. There are only two fertile stamens, and the capsule is semibivalvular with bifid valves. Some of the species are shrubby, some herbaceous, almost all the herbaceous species being perennial. Many of them have corymbs of numerous showy flowers. Yellow is the colour which chiefly prevails in the flowers of the original species, and next to it purple; but the art of the gardener has succeeded in producing

varieties and hybrids which exhibit many other rich and delicate tints. Calceolarias have been florists' flowers since about 1830, the curious appearance of the flowers combining with their beauty to render them attractive, and in no genus is the production of hybrids more easily or frequently effected. They are easily propagated by cuttings. Few plants require more liberal supplies of water. They are generally treated in Britain as half-hardy or as greenhouse plants. Some of the species are used in South America for dyeing. The roots of *C. arachnoidea*, a parent of many of the hybrids in our gardens, are largely employed in Chili, under the name of *Relbum*, for dyeing woollen cloths crimson.

**CALCINATION, or CALCINING** (see CALX), is the process of heating or roasting in furnaces or in heaps the various metallic ores. It is resorted to as the first stage in the extraction of the majority of the common metals from their ores, and is essentially a process of oxidation.

**CALCIUM** is the metal present in chalk, stucco, and other compounds of lime. It may be obtained by passing a powerful current of voltaic electricity through fused chloride of C. ( $\text{CaCl}$ ), when the metal separates in minute globules. It is a yellowish-white metal, can be rolled into sheets, and hammered into leaves, and is intermediate between lead and gold in hardness. It is represented by the symbol Ca, has the atomic weight or equivalent 20, and has the density 1.578, or nearly half as heavy again as water. At ordinary temperatures, it slowly tarnishes by oxidation; and when placed in contact with water, it rapidly decomposes the water ( $\text{H}_2\text{O}$ ), forming lime ( $\text{CaO}$ ), whilst hydrogen escapes. To be retained bright, C. must be kept under the surface of naphtha. At a red heat, it melts and burns with a dazzling white light, accompanied by scintillations. See LIME.

**CALCOTT, SIR AUGUSTUS WALL, R.A.**, a distinguished English landscape painter, was born at Kensington, London, in 1779. In 1803, he devoted himself to landscape painting; in 1810, was made a member of the Royal Academy; was knighted in 1837; and in 1844, made conservator of royal pictures. His landscapes are remarkable for their beauty, clear definition of objects, good drawing, and truthful natural colouring. He has been called the English Claude, a designation to which he is not altogether unentitled. He died November 1844.

**CALCOTT, JOHN WALL,** a distinguished musical composer, elder brother of the above, was born at Kensington, 1766. Too nervous to be a surgeon, for which he was intended, he devoted his attention to music, and in 1785 won three of the four gold medals annually given by the Catch Club, the admired *O Sovereign of the willing Soul* being one of the successful pieces. During the next ten years, he obtained twenty of the medals given by the same society. In 1785, he was made Bachelor, and five years afterwards, Doctor of music at Oxford. In 1805, he published his *Musical Grammar*; in the following year his mind gave way under the continuous strain to which it had been subject. He recovered again, but only for three years, when he relapsed, and continued insane until his death in May 1821. He was one of the most eminent composers belonging to the British school of music, and especially celebrated for his glee compositions. His choicest productions were published in two volumes by his son-in-law, Mr Horaley, in 1824.

**CALC-SINTER**, a mineral, chemically identical with the purest marble and calcareous spar, but peculiarly characterised by its fibrous structure. It

## CALCULATING MACHINE—CALCULUS.

is formed from water holding carbonate of lime in solution, and occurs generally incrusting the roofs, walls, and floors of caves, particularly those in limestone rocks; often assuming curious and even fantastic forms. Macalister's Cave, in the Isle of Skye, and the limestone caves of Derbyshire, are the most celebrated British localities. But the stalactitic cave of Antiparos, in the Grecian Archipelago, is a far more famous locality for this mineral, which is often called *Calcareous Alabaster*, and used for the same purposes with the true alabaster (q. v.), to which it is in some respects preferable, particularly as not being liable to injury from exposure to the air. Volterra, in Tuscany, is another very famous locality for Cal-sinter.

**CALCULATING MACHINE.** The most remarkable application hitherto made of machinery, is perhaps that through which it has been used to relieve the scientific inquirer to a very great extent of the fatigue of manipulating figures, which consumes so much of his time and energies. Various machines have been constructed for this purpose, differing in the extent of their faculties—to use words more suitable to thinking beings than to engines—and somewhat in the principles of their construction. By the *Ariithmometer*, for instance, a machine invented by M. Thomas of Colmar, all ordinary arithmetical operations are executed without fatigue to the operator; and by a machine contrived by M. M. Scheutz, which rests on the principle of *Differences* (q. v.), on the turning of a wheel, the successive terms of any series whose law may be confided to it, are produced—the machine at the same time printing a large proportion of its results, and thus providing for the accuracy of its tables. It is a fact of which the nation should be proud, that our countryman, Mr Babbage, is universally acknowledged as the instigating and guiding genius in the progress of these remarkable inventions. Among his inventions are a *Difference Engine*, of very comprehensive powers, indeed capable of managing series so complex that the differences of its terms do not reach zero until we ascend to the seventh order (*vide art. DIFFERENCES, CALCULUS OR.*). An immense range of nautical and astronomical tables lie within the limits just defined; and the machine further tabulated approximately any series whatever that can be treated by the *Method of Differences*. While engaged in constructing the *Difference Machine*, Mr Babbage, probably through his increased experience of the capabilities of machinery, was led to form a new conception—that, namely, of the *Analytical Machine*. This has not yet been fully realised; but there is no doubt but that, with proper encouragement, Mr Babbage would successfully construct it. He has actually succeeded so far as to devise the means of making his machine perform all the elementary operations of addition, subtraction, multiplication, and division; and it is clear that all changes that can be produced on quantity are merely combinations of these. If, then, he could but make his machine perform these operations at command, and according to any special order, it could clearly develop any function whatever whose law is ascertained and fixed. A solution of this difficulty was suggested by the Jacquard Loom (q. v.), in which the *cards* oblige a machine capable of working any pattern to work out one particular pattern; and Mr Babbage having succeeded so far as to form a machine capable of executing any development, expects, by means of *cards of operations*, to compel his C. M. to work according to one fixed law, and no other. The withdrawal of the government aid, given to him for a series of years, has, however, much to the public regret and loss, prevented, let us hope

only for a time, the realisation of his views. Both machines will be found described in the third volume of Taylor's *Scientific Memoirs*. [The anticipations above expressed have not been realised. Mr Babbage died in 1871, and nothing farther seems to have been done towards completing the *Analytical Machine*.]

**CALCULUS, or STONE** (in Medicine), a hard concretion formed within the animal body, in consequence of the deposition in the solid form of matters which usually remain in solution. See CONCRETION. The concretions most commonly termed calculi are those formed in the kidneys or bladder (*Urinary C.*); and those formed in the gall-bladder or biliary ducts (*Biliary C.*). Both of these give rise to very painful symptoms, and may even threaten life.

**Biliary C., or Gall-stone**, may generally be presumed to exist when excessively severe pain suddenly arises in the right side beneath the border of the ribs, and when in a few hours jaundice comes on, shewing that some obstruction has existed to the outward flow of the bile. But the absolute proof that these symptoms depend on C. is often wanting. The pain is fortunately transitory, but is more severe while it lasts than almost any other known form of suffering, unless it be that of a C. in the kidney and ureter. It may be relieved by large doses of opium, but the remedy requires to be cautiously given, as even in medical hands fatal accidents have occurred. Gall-stones, when impacted in the ducts, sometimes have proved fatal; but much more frequently they find their way, sooner or later, into the intestines. They are almost invariably composed of cholesteroline (q. v.), with colouring matter and mucus, arranged in layers in a semi-crystalline disposition.

**Urinary C.** is a disease of all ages, but most common in advanced life and in the male sex. It is also very frequent in gouty persons, or among those who pursue sedentary occupations, and live freely. It is rare among those who live much in the open air, or who take much violent exercise, and use little animal food and wine. Among sailors, it is peculiarly rare. In certain parts of the country, the disease is said to be frequent, as in Norfolk, and perhaps along the east coast of Scotland. In India, too, where some of the predisposing circumstances mentioned above can hardly be said to prevail, stone is by no means uncommon. It would appear, therefore, that the predisposing causes of C. are still very imperfectly understood. In its early stages, the disease usually presents itself in the form of *Gravel*, shewn by the passage of numerous very small portions of gritty concretions, which may be observed in the urine as a deposit like sand, or like small grains of Cayenne pepper. When such deposits occur frequently, especially if they are present at the time of passing the urine, and not merely after it has cooled, there is reason to apprehend the formation of calculus. If, in these circumstances, there are pains of a dull character in the loins, with occasional twinges of sharper suffering, no time should be lost in seeking medical advice. If a fit of very severe pain should occur in a person for some time affected with gravel, if the urine be bloody, if agonizing twinges, commencing in the loins, sting downwards into the thigh or the groin, it is probable that a stone has already formed in the kidney, and is being displaced towards the bladder. C. in the bladder is at first attended with little suffering, as compared with that caused by the stone in its passage downwards from the kidney; but unless removed or evacuated, the C. is sure to enlarge, and it then becomes the cause of one of the most painful diseases that afflict humanity. The existence of a stone in the bladder,

## CALCULUS.

however, should never be taken for granted without a surgical examination, as all the symptoms are deceptive in certain cases. The most striking, and perhaps the most trustworthy evidence of stone in the bladder, apart from the use of the sound (see LITHOTOMY), is smarting and burning pain experienced after the bladder has been emptied, together with occasional temporary stoppage in the flow of urine. The correct appreciation of all the symptoms, however, demands considerable familiarity with such cases.

The discovery of the tendency to urinary C. at an early period of its growth, has been greatly aided by the use of the microscope and of chemical tests. Generally speaking, it may be said that whenever the urine, after standing for a few hours, can be observed to contain more sediment than a very slight cloudiness towards the bottom of the vessel, there is room for careful inquiry into the existence of some derangement of the health. But all sediments are not equally apt to determine C., nor is the treatment of the different kinds of sediment at all similar; care should therefore be taken to determine, from time to time, whether the character of the sediment may have undergone a change, so that the treatment may be adapted accordingly.

The chief varieties of urinary C. are—1. Uric acid (red sand); 2. Urates of ammonia, soda, lime, &c. (brick-dust sediment); 3. Phosphates of ammonia and magnesia, lime, &c.; 4. Oxalate of lime; 5. Carbonate of lime (chiefly in domestic animals); 6. Cystine; 7. Xanthic oxide (a very rare form, discovered by Dr Maracet). Calculi are frequently found to be composed of numerous successive layers, having a perfectly distinct chemical composition. Urates and phosphates in particular frequently succeed each other, and form what is called an alternating calculus.

Alternating Calculus—from Dr Maracet's Essay on Calculus :

a, uric acid nucleus; b, oxalate of lime; c, phosphates of lime, and of magnesia and ammonia.

When C. has once fairly formed in the urinary passages, it seems probable that no absolute cure exists except the removal of it, if possible, from the body (see LITHOTOMY and LITHOTRITY); but in the stage of gravel, and still more in the earlier stages detected by careful examination of the urine, much may be done to check the tendency to this distressing and dangerous malady. The chief remedies consist in careful regulation of the diet and mode of living, together with the use of solvents adapted to the particular form of deposit found to be habitually present. See URINE.

**CALCULUS, THE INFINITESIMAL**, otherwise sometimes called the Transcendental Analysis, is a branch of mathematical science which commands, by one general method, the most difficult problems in geometry and physics. The merit of the invention of this powerful mathematical instrument has been claimed for Leibnitz, but is undoubtedly due with equal justice to Newton, who laid the foundations for it in that celebrated section of his *Principia* in which he demonstrates the chief theorems regarding the ultimate values or limits of the ratios of variable quantities. The view of one class of writers is, that these distinguished men invented the C. simultaneously and independently; and it is the fact that Leibnitz's system is unfolded from premises differing somewhat from those of Newton. See FLUXIONS. Another class of writers hold that Newton is the real inventor, and that to Leibnitz no more can be conceded than that he was the first who, using the suggestions of Newton's genius, gave a systematic statement to the principle of the transcendental analysis, and invented its appropriate symbolic language. He had the doctrine of limits before him when he wrote, and did little more than unfold more fully the logic of the processes therein suggested, and exhibit them in algebraical forms.

The Infinitesimal C., both in its pure and applied forms, whether of geometry or mechanics, is a branch of the science of number; its symbols are of the same kind, are operated on according to the same laws, and lead to analogous results. It differs from the other branches of the science of number, such as arithmetic and algebra, in regarding number as continuous—i. e., as being capable of gradual growth and of infinitesimal increase, whereas they deal with finite and discontinuous numbers. It differs from ordinary algebra in another respect. In the latter, the values of unknown quantities, and their relations with each other, are detected by aid of equations established between these quantities *directly*; in the C., on the other hand, the equations between the quantities are not directly established, but are obtained by means of other equations primarily established, not between them, but certain derivatives from them, or elements of them. This artifice is most fertile, for it can be shewn that in the great majority of cases the relations of quantities concerned in any problem may more easily be inferred from equations between their derivatives or elements than between themselves.

It will be seen that the C. created a new notion of number—as continuous or growing. It is now necessary, in order to a proper conception of it, that a precise idea should be formed of a *differential*. The simplest idea of a differential is unquestionably that got by considering number as made up of infinitesimal elements, and a differential or 'infinitesimal' as being the value of the difference between a number at one stage of its growth and at another very near it. Every finite number being—in the view of the C. as first conceived by Leibnitz—composed of an infinite number of these infinitesimal elements, certain axioms at once present themselves regarding infinitesimals; as, for instance, 'that a finite number of them has no value at all when added to a finite quantity.' Many other such axioms readily follow, from which, on this view, the whole theory of the infinitesimal C. may be constructed. But there are logical objections to this mode of forming the theory of the transcendental analysis, and of three views that have been propounded, that now universally accepted as the most logical, and as being capable of the easiest application, is that founded on the method of limits, already referred to as the invention of Newton. The

## CALCULUS.

meaning of a differential on this view will now be explained.

It is clear that the C. can be applied only where numbers may have the continuous character—i. e., where they are or may be conceived as being variable. If two unknown quantities are connected by a single equation only, we clearly have the condition satisfied, as where  $y$  and  $x$  are connected by the equation

$$(1) \quad y = F(x),$$

where  $F$  is a sign denoting some function of  $x$ , as  $\tan x$ ,  $\cos x$ ,  $x^2$ , &c. This equality may be satisfied by innumerable values of  $y$  and  $x$ . One question which the C. solves is, how does  $y$  vary when  $x$  varies? To solve it, and, at the same time, shew how the doctrine of limits affects the definition of a differential, suppose  $x$ ,  $y$ , and  $x + Dx$ ,  $y + Dy$ , to be two pairs of values of the variables which satisfy the above equation; then

$$(2) \quad y = F(x), \quad \text{and} \quad (3) \quad y + Dy = F(x + Dx).$$

From (2) and (3) we have, by subtraction,

$$(4) \quad Dy = F(x + Dx) - F(x);$$

whence we have the ratio

$$\frac{Dy}{Dx} = \frac{F(x + Dx) - F(x)}{Dx}$$

This ratio will generally change in value as  $Dx$  and  $Dy$  diminish, till, as they both vanish, which they must do simultaneously, it assumes the form  $\frac{0}{0}$ .

Taking this form, it ceases to have a determinate actual value, and it is necessary to resort to the method of limits, to ascertain the value to which it was approaching, as  $Dx$  and  $Dy$  approached zero. Let, then,  $dx$  and  $dy$  be any quantities whose ratio is equal to the limiting ratio of the increments  $Dx$ ,  $Dy$ , so that

$$\frac{dy}{dx} = \lim \frac{Dy}{Dx}$$

as  $Dx$  and  $Dy$  approach zero. Then  $dx$  and  $dy$  are the differentials of  $x$  and  $y$ . It may be observed that where  $x$  and  $y$  are connected as above, they cannot vary independently of one another. In the case assumed,  $x$  has been taken as what is called the independent variable, the question being, how does  $y$  vary when  $x$  varies. If  $y$  were made the independent variable, it would be necessary to solve the equation  $y = F(x)$ , if possible, so as to express  $x$  in terms of  $y$ . The result would be an equation  $x = \phi(y)$ . This being obtained, we should find  $\frac{dx}{dy} = \lim \frac{Dx}{Dy}$  as before. It will be seen that on this view differentials are defined merely by their ratio to one another. Their actual magnitude is perfectly arbitrary. This, however, does not render an equation involving differentials indeterminate, since their relative magnitude is definite, and since, from the nature of the definition, a differential cannot appear on one side of an equation without another connected with it appearing on the other.

The idea of a differential being once comprehended, the reader will be able to understand, in a general way, the main divisions of the C., which we shall now briefly delineate. So much is clear from what has been stated, that there must be two main divisions—one by which, the primary quantities being known, we may determine their differentials; and another by which, knowing the differentials, we may detect the primary quantities. These divisions constitute the Differential C. and Integral C. respectively.

1. THE DIFFERENTIAL CALCULUS.—Recurring to the formula already given we know

$$\frac{dy}{dx} = \lim \frac{Dy}{Dx} = \lim \frac{F(x + Dx) - F(x)}{Dx}.$$

It is clear that, in the general case,  $\frac{F(x + Dx) - F(x)}{Dx}$

at the limit will still be some function of  $x$ . Calling it  $F'(x)$ , we have generally  $\frac{dy}{dx} = F'(x)$ .  $F'(x)$  is called the first differential coefficient of  $y$  or  $F(x)$ . Being a function of  $x$ , it may be again differentiated. The result is written

$$\frac{d^2y}{dx^2} = F''(x),$$

$F''(x)$  being the second differential coefficient of  $y$  or  $F(x)$ ; and again  $F''(x)$  may be a function of  $x$ , and so capable of differentiation. Now, it is the object of the differential C. to shew how to obtain the various differentials of those few simple functions of quantity which are recognized in analysis, whether they are presented singly or in any form of combination. Such functions are the sum, difference, product, and quotient of variables, and their powers and roots; exponentials, logarithms; and direct and inverse circular functions. The C. so far is complete as we can differentiate any of those functions or any combination of them—whether the functions be explicit or implicit; and with equal ease we may differentiate them a second or any number of times. This C. is capable of many interesting applications as to problems of maxima and minima, the tracing of curves, &c., which cannot here be particularly noticed.

2. THE INTEGRAL CALCULUS deals with the inverse of the former problem. The former was: Given  $F(x)$ , to find  $F'(x)$ ,  $F''(x)$ , and so on. The present is in the simplest case—viz., that of an explicit function: Given  $\frac{dy}{dx} = F'(x)$ , to find  $F(x)$ . The methods of the Integral C., instead of being general, are little better than artifices suited to particular cases; no popular view can be given of these. In many cases, integration is quite impossible. The explanation of integration by parts, by approximation, definite integrals, and singular solutions, is far beyond the scope of the present work. The reader is referred to any of the numerous text-books on the subject. The Integral C. has applications in almost every branch of mathematical and physical science. It is specially of use in determining the lengths of curved lines, the areas of curved surfaces, and the solid contents of regular solids of whatever form. The whole of the lunar and planetary theories may be described as an application of the integral C., especially of that branch of it which deals with the integration of differential equations. It is applied, too, in hydrostatics and hydrodynamics, and in the sciences of light, sound, and heat. In short, it is an instrument without which most of the leading triumphs in physical science could never have been achieved.

CALCULUS OF VARIATIONS.—The foundation of this C. is a method of differentiation, but of quite a peculiar kind. As above explained, the object of the differential C. is to determine the form which a function, such as  $F(x)$ , will assume if  $x$  receive an indefinitely small increment, such as  $Dx$ . In the C. of variations, the object is to ascertain and lay down the laws of the changes supervening on a slight alteration of the form of the function, or should  $F(x)$  become  $F'x$ . This C. commands with ease a class of problems called problems of isoperimeters, which were formerly insoluble. It has also power over mechanical problems, and many departments of high physics cannot be touched without its aid. Mr Airy and Professor Jellet have both

## CALCULUS—CALCUTTA.

written works on the subject, which may be consulted.

**CALCULUS OF FINITE DIFFERENCES, CALCULUS OF FUNCTIONS, and CALCULUS OF OPERATIONS.**—For brief notices of these growths from the original Transcendental Analysis, see DIFFERENCES, FUNCTIONS, and OPERATIONS.

**CALCUTTA** (*Kali Ghatta*, the ghaut or landing-place of the goddess Kali), the capital of the presidency of Bengal, and metropolis of British India, is situated on the left bank of the river Hooghly, an arm of the Ganges, in  $22^{\circ} 35' N.$  lat., and  $88^{\circ} 27' E.$  long., about 100 miles from the sea by the river. C. was founded by Governor Charnock in the year 1686, by the removal hither of the factories of the East India Company. In 1700, three villages surrounding the factories having been conferred upon the company by the emperor of Delhi, in recognition of a present made to Azim, a son of Aurungzebe, they were forthwith fortified, and received the name of Fort William, in honour of the reigning king; but the place was subsequently termed Calcutta, the name of one of the villages. In 1707, C. had acquired some importance as a town, and was made the seat of a presidency. In 1756, however, a great misfortune befell the rising town; it was unexpectedly attacked by Surajah Dowlah, the Nawab of Bengal, and being abandoned by a number of those whose duty it was to defend the place, it was compelled to yield after undergoing a two days' siege. Only 146 men, however, fell into the enemy's hands; but these were treated with heartless cruelty. Cast at night into a confined cell, about 20 feet square—the notorious 'Black Hole' (q. v.)—they endured the most unheard-of sufferings, and in the morning it was found that only 23 out of 146 had survived the horrors of that night. The city remained in the hands of the enemy until eight months afterwards, when Clive arrived in the country from England. In conjunction with Admiral Watson, Clive succeeded in recapturing the town, and afterwards concluded a peace with the Nawab. Soon after this, and subsequent to the important victory of Plassey, the possessions of the East India Company were greatly extended by means of grants made by the emperor of Delhi, and C. once more resumed its career of progress, and advanced rapidly in prosperity. In 1852, C. was erected into a municipality, the proprietors paying assessments, and electing commissioners to apply the proceeds of these assessments in cleansing, improving, and embellishing the town. In 1837, the population of the town proper amounted to 229,700; in 1872, it had increased to 447,601, and if we include the suburban parts, the number will stand 892,429. Besides these, thousands of the three and a half millions who sleep at night in the surrounding districts of Hooghly and the twenty-four Pergunnahs, flock during the day to C., on foot, by boat, or by railway, to their daily toil. The inhabitants are mostly Hindus; but there is also a good proportion of Mohammedans. About 20,000 are Europeans; 20,000 Eurasians, or the progeny of white fathers with native mothers; and there is a considerable number of Armenians, Greeks, Jews, Parsees, and negroes. The city extends for about five miles along the river, and is somewhat less than two miles in breadth at its broadest part, the area being about eight square miles, and comprised for the most part between the river and the Circular Road, a spacious roadway which marks the landward boundary of the city proper. Beyond this road there lie extensive suburbs, the chief of which are Chitpore on the north, Nunden Baugh, Bahar-Simleah, Sealdah, Entally, and Ballygunge on the east, and Bhowanipore, Allipore, and Kidderpore

on the south. The villages of Sulkeah, Howra, and Seepoor are situated on the opposite side of the river, and contain the salt-golahs or warehouses of the government, extensive manufactorys, dockyards, and ship-building establishments. The appearance of the city as it is approached by the river is very striking; on the left are the Botanical Gardens, destroyed by the cyclones of 1867 and 1870, but since replanted, and the Bishop's College, a handsome Gothic edifice, erected by the Society for the Propagation of the Gospel in Foreign Parts; on the right is the suburb of Garden Reach, with its handsome country seats and beautiful gardens; further on are the government dockyards and the arsenal; beyond these is the Maidan Esplanade, which has been termed the Hyde Park of India, being the favourite place of resort of the *élite* of C. for their evening drive. Here, near the river, lies Fort William, the largest fortress in India, having been constructed at a cost of £2,000,000, and occupying, with the outworks, an area of about half a mile in diameter. It is garrisoned by European and native soldiers, mounts 619 guns, and its armoury contains 80,000 stand of small-arms. Facing the Esplanade, among other fine buildings, is the Government House, a magnificent palace erected by the Marquis of Wellesley. Beyond this, extending northwards along the river bank, is the Strand, two miles in length, and 40 feet above low water, with various ghauts or landing-places. It is adorned by many fine buildings, including the Custom-house, the new Mint, and other government offices, and the appearance given by these and other edifices has gained for C. the appellation of 'City of Palaces.' Among its other places of interest mention may be made of the Sudder Dewanee Adawlut, the principal court of justice; the town-hall, a fine building; the Bengal Club, Writers' Buildings, Bank of Bengal, Jesuits' College, Medical College, university, theatre, besides various churches, mosques, Hindu temples, and pagodas and numerous bazaars. There are a number of monuments throughout the city, the most noticeable being those erected to the Marquis of Wellesley and Sir David Ochterlony. Although the European quarter of the town is distinguished for its fine public buildings and commodious dwelling-houses, the quarters occupied by the natives present a very different appearance, their houses being in most instances built of mud or bamboo and mats, and the streets narrow and unpaved. Considerable improvements have, however, been effected of late; new and wider streets have been opened through crowded quarters; brick houses are fast replacing the huts, and an extensive system of drainage has been carried out, to the no small advantage of the inhabitants. The cyclone of November 1867 destroyed 30,000 native houses, and that of June 1870 was likewise very destructive.

The water supply of C. has recently been very much improved. Formerly, the water was kept in large tanks, interspersed throughout the city, whence it was borne by water-carriers or *bahisties* in large leather bags. But within the past five years, a supply of excellent water has been obtained from the Hooghly, about 15 miles above C., where it is filtered and sent down by pipes in the usual way. The result of this has been a marked improvement in the health of the city. Gas has now taken the place of the oil-lamps which were formerly in general use for lighting the streets at night. Tramways have been recently tried in some of the principal streets, but as yet with little success. A canal girds a part of the city beyond the Circular Road.

The communications of C. afford great facilities for its extensive commerce. There are several

lines of railway to various parts of India; the East Indian to Benares, Delhi, and Multan, its present terminus, whence it is to be continued to Kurachee; the Eastern Bengal, the extension of which to Gulundi was opened in 1871; and the Calcutta and South-eastern to the mouth of the Ganges. The great Indian Peninsula Railway branches off from the East Indian, and connects C. with Bombay and Madras. C. is also connected by electric telegraph with the principal towns of India, and can communicate with England by three different lines. Uninterrupted communication is kept up with Great Britain by numerous and well-appointed steamers and sailing-vessels. This intercourse has been greatly facilitated by the opening of the Suez Canal. Navigation on the Hooghly is dangerous, owing to the shifting sands; and though much has been attempted, little has been effected in the way of remedying the evil. The river, adjacent to the city, varies in breadth from a quarter of a mile to nearly a mile. Ships of 2000 tons can ascend to C.

The growth of scientific and literary societies, here and elsewhere in India among the native communities, indicates a degree of progress and intellectual activity very hopeful for the future of India. The principal of these in C. are the Bengal Asiatic Society, founded in 1784 by Sir W. Jones, possessing a fine library, and a valuable and extensive museum; the Bethune Society, for the promotion of intercourse between European and native gentlemen; the Dalhousie Institute, for the literary and social improvement of all classes of the community; the Bengal Social Science Association, and others. The university of C. was founded in 1857, on the same basis as the London University, and exercises functions over Bengal, the North-west Provinces, Oudh, and the Central Provinces. Colleges have been instituted to prepare undergraduates for the university. In 1871, of 1503 Bengal candidates for admission, 581 passed the required examinations. Other educational institutions are numerous in C. The principal places for religious instruction are Bishop's College, intended chiefly for the education of missionaries and teachers, and the institutions of the Established and Free Churches of Scotland, for the same purpose, all which are ably conducted.

C. may be regarded as the great commercial centre of Asia. One-third of the whole trade of India is done here. In 1872, the exports amounted to £27,477,127, exclusive of treasure, and the imports to £15,667,235. The chief exports are jute, cotton, rice, sugar, indigo, coffee, tea, saltpetre, linseed, shellac, buffalo horns, hides, castor-oil, cutch, gunny bags, &c. The jute exported in 1872 was valued at £4,000,000, the indigo at £2,500,000, and the tea at £1,400,000. In the same year 658 sailing-vessels and 301 steamers, with a total tonnage of 999,614, arrived in the Hooghly; and 637 sailing-vessels and 301 steamers, with a total tonnage of 957,523, sailed. The principal industries are sugar refining, cotton manufacturing, flour, saw, and oil mills, and ship-building docks. Several newspapers are published. There are a few banks and numerous insurance and other companies, with a Chamber of Commerce. Living is comparatively cheap, and most of the luxuries of life, as well as its necessaries, are to be had in the unpretentious shops of C. as readily as in most European towns. The annual fall of rain averages 64 inches; the temperature in the shade ranges in July from 78° to 87°, and in December from 60° to 79°.

C. is the headquarters of the governor-general of India, and the seat of the government, the supreme courts of justice, and of the court of appeal for the lower provinces of Bengal.

CALDAS, or CALDETAS (Lat. *callidus*, hot),  
508

the Spanish for warm springs (*aquas*, waters, being understood), which are very abundant in the Peninsula, where a great number of places have received their names from the presence of these mineral waters; such as C. de Malavella, C. de Estrac, and C. de Mombuy, in Catalonia; C. de Reyes, C. de Cuntis, and C. de Tuy, in Galicia; C. de Talpas, C. de Faveiros, C. de Rainhas, and C. de Renduse, in Portugal. The name has also passed into the topography of the New World. There is a C. in Brazil, which is noted for its hot sulphur springs.

CA'LDER, a river in the West Riding of Yorkshire. It rises in a marsh on the borders of Lancashire, near Burnley, runs tortuously east in the deep valley of Todmorden, past Halifax, Dewsbury, and Wakefield. It then runs north-east, and after a total course of 40 miles, it joins the Aire near Pontefract, that river falling into the Ouse. The C. is important as forming a considerable portion of the canal route through Yorkshire and Lancashire, between the east and west coasts of England.

CA'LDERON (DON PEDRO) DE LA BARCA HENAO Y RIANO, was born in Madrid, in the year 1601, and received his early education in the Jesuit's College at Madrid. Afterwards, at Salamanca, he studied chiefly history, philosophy, and law. His poetical genius was precocious. Before he was 14 years old, he had written a drama, *El Carrero del Cielo* (The Celestial Chariot). In early life he gained, by his poetry, and also by his fertile invention of decorations, &c., for festive occasions, the patronage of several distinguished persons, and, on leaving Salamanca, 1619, was well received by the courtiers at Madrid. Love of military adventure induced him to enter the army, 1625; and, after serving with distinction in Milan and the Netherlands, he was recalled to the court of Philip IV., a prince fond of theatrical amusements, by whom he was employed to superintend various court-amusements, and especially to invent dramas for the Royal Theatre. In the following year C. was made knight of the order of San Jago, and took part in the campaign in Catalonia. Peace brought him back to poetry. The king gave him a pension, contrived to let him cultivate uninterruptedly his fertile dramatic genius, and spared no cost in securing for his plays a splendid initiation on the stage. In 1651, C. received from the head of the order of San Jago permission to enter the church, and, in 1653, was appointed to the chaplaincy of the arch-episcopal church of Toledo; but as this post removed him too far from the court, he was appointed chaplain in the Royal Chapel at Madrid, 1663, and received, with other favours, a pension charged on the revenue of Sicily. In the same year he was appointed a priest in the brotherhood of San Pedro, and, shortly before his death, was elected by his brethren as their *capellan mayor*. He died May 25, 1681, leaving his considerable property to the fraternity of San Pedro, by whom a splendid monument to his memory was raised in the church of San Salvador at Madrid. Fame and pecuniary prosperity had accompanied his career. The chief cities of Spain—such as Toledo, Seville, and Granada—had paid him, from time to time, large sums of money for writing their *Actos Sacramentales*, or *Corpus Christi* pieces. In these compositions, C. excelled all his predecessors, and esteemed them more highly than all his other works, though in many respects the latter display the author's genius quite as remarkably.

Spain numbers C. among its greatest poets, and criticism must allow that many of the defects in his works are to be ascribed to circumstances, and the times in which he lived, rather than to the native

## CALDERON—CALEDONIAN CANAL.

tendencies of his genius. He is characterised by brilliancy of fancy, elegance of versification, and a richness of detail, which from its very abundance often becomes tedious. His collected dramatic works—including many pieces of intrigue, heroic comedies, and historical plays, of which some deserve the title of tragedy—amount to 128. Among his romantic tragedies, the *Constant Prince* (*El Principe Constante*) holds the first rank. Besides these, he wrote 95 *Actos Sacramentales*; 200 *Locas* (preludes); and 100 *Saynetas* (divertissements). His last play, *Hado y Divisa*, was written in his 80th year. His shorter poems have perished; but his dramas have held their place on the stage better than those of Lope de Vega himself. The most complete edition of his dramas appeared at Madrid (9 vols., 1683—1689); another was published by Apuntes (10 vols., Madrid, 1760—1763). Goethe and Schlegel have made him popular in Germany, but in Britain he is not well known, and in France not cared for.

CALDERON, DON SERAPHIN, a living Spanish poet, was born at Malaga about the commencement of the century, studied law at the university of Granada, and in 1822 became professor of poetry and rhetoric there. A volume of poems which he published shortly after procured for him some distinction. Subsequently, he became an advocate in his native city, but still continued faithful to the musea. In 1830, he went to Madrid, where he published anonymously his *Poesias del Solitario* (1833). He also wrote several articles on Andalusian manners for the *Cartas Espanolas*, the only literary journal at that period in Spain. In 1836 he was appointed civil governor of Logroño, but an accident obliged him to return to Madrid, where he devoted himself to collecting MSS. of the old national literature, to be the basis of a great critical edition of the *Cancioneros* and *Romanceros*. C. has likewise written a fine novel, entitled *Cristianos y Moriscos*, in the spirit and style of Cervantes, which was published in the *Collection de Novelas Originales Espanolas*. To the literature of the Spanish Moors he has paid great attention. His latest work is a series of lively sketches of Andalusian life, *Escenas Andaluzas* (1847).

CALDERWOOD, DAVID, an eminent Scottish divine and ecclesiastical historian, descended of a good family, was born in 1575, and about 1604 was settled as Presbyterian minister of Crailing, Roxburghshire. Opposed to the designs of James VI. for the establishment of Episcopacy in Scotland, on that monarch's visit to his native country in 1617, he and other ministers signed a protest against a bill, then before the Scots parliament, for granting the power of framing new laws for the church to an ecclesiastical council appointed by the king, and in consequence he was summoned before the High Commission of St Andrews. Refusing to submit, he was committed to prison for contumacy, and then banished the kingdom. He retired to Holland, and in 1623 published there his celebrated controversial work, entitled *Altare Damascenum*, &c., in which he rigorously examined the origin and authority of Episcopacy. In 1622, a pretended recantation of his protest was published at London by a venal writer, Patrick Scott. While on the continent, C. was known by the quaint appellation of Edwardus Didoclavius, being an anagram on his name Latinised. After King James's death in 1625, he returned to Scotland, and for some years was engaged collecting all the memorials relating to the ecclesiastical affairs of Scotland, from the beginning of the Reformation there to the death of James VI. In 1638, he became minister of Pencaitland, near Edinburgh; and in 1643 was appointed one of the

committee for drawing up the *Directory for Public Worship in Scotland*. He died at Jedburgh in 1651. From the original MS. of his *History of the Kirk of Scotland*, preserved in the British Museum, an edition was printed for the Wodrow Society, in 8 vols., 8vo (Edin. 1842—1845), edited by the Rev. Thomas Thomson.

CALDIERO (ancient *Caldarium*), a decayed town of North Italy, about nine miles east of Verona. Its thermal springs were in repute as early as the 1st c. of the Christian era, and continued to enjoy popularity until the commencement of the 16th c., after which they gradually became neglected, and are now little visited. The Austrians repulsed the French here in 1796.

CALEDONIA, a kind of poetical name applied to Scotland; being a resumption of that given by the Romans to the country north of the Wall of Antoninus, which ran between the Firths of Forth and Clyde. Among the chief tribes of this region were the Caledonii, whence the whole country has been called Caledonia. Tacitus speaks of the Caledonians as having red hair, large limbs; being naked and barefooted; living in tents without cities; supporting themselves by pasturing cattle, by the chase, and by certain ferries; addicted to predatory warfare; and fighting in chariots with shields, short spears, and daggers. They are supposed to have been of Gaelic or Celtic origin, and to have painted their bodies, whence the name Picti or Picts, by which, according to many writers, they were afterwards known. Agricola was the first Roman general to come in contact with the Caledonians. In 84 A.D. he defeated them, now united to repel a common enemy, under their chief Galgacus, at the Mons Grampius, the site of which has not been satisfactorily determined. The Romans overran the north-east of Scotland as far as the Moray Firth, and formed many encampments (of which remains still exist), but they never reduced the country to a Roman province. Roman coins and military relics have been found in connection with these camps. The name of Caledonii disappears about the beginning of the 4th c., when the inhabitants of Scotland begin to be spoken of as Scots (q. v.) and Picts (q. v.).

CALCEDONIA, NW. See NEW CALEDONIA.

CALEDONIAN CANAL, a chain of natural lakes united by artificial canals, running across the north of Scotland in a straight line from north-east to south-west, from the North Sea to the Atlantic, through Glenmore, or the Great Glen of Albin, in Inverness-shire, and touching Argyleshire at the south end. The sea and fresh water lochs in this line are Beauly, Ness, Oich, Lochy, Eil, and Linnhe. The canal was formed to avoid the dangerous and tedious navigation of ships, especially coasting vessels, round by the Pentland Firth, Cape Wrath, and the Hebrides; the distance between Kinnaird's Head and the Sound of Mull by this route being 500 miles, but by the canal only 250, with an average saving of 9½ days for sailing vessels. The C. C. begins in the Beauly Firth, near Inverness, whence a cut of 7 miles joins Loch Ness, which is 24 by 1½ mile. A cut of 6 miles joins Loch Ness and Loch Oich, which is 3½ by ½ mile. Another cut of 2 miles joins Loch Oich and Loch Lochy, which is 10 by 1 mile; and a fourth cut of 8 miles joins Loch Eil at the village of Corpach, 2 miles north of Fort William. This ship-communication is 60½ miles long, 37½ miles being through natural lochs or lakes, and 23 miles by artificial cuts. Each cut is 120 feet broad at surface, and 50 at bottom, and 17 deep. The highest part is Loch Oich, which is 94 feet above

the sea. There are in all 28 locks, each 170 to 180 feet long, and 40 wide, with a rise or lift of water of 8 feet. Eight of the locks, called Neptune's Staircase, occur in succession near the west end of the canal. Some large mountain streams between Lochs Eil and Lochy are conducted in huge culverts under the canal; and by a new cut, the Lochy water is turned into the Spean. The practicability of this great work was first shewn by a survey under government in 1773 by the celebrated James Watt; but it was not till 1803 that it was begun under Mr Telford. The whole line was opened for ships in 1823. After three years of repair, it was re-opened in 1847. Ships of 500 to 600 tons, fully laden, can pass through the canal. The canal and tonnage rates for sailing vessels are each a farthing per mile per ton, and a half of this for vessels under 125 tons. Steamers pay 2*a.* a ton. Of £1,368,203 expended on this canal, from 1803 to 1856, £1,242,387 were voted by parliament, and £90,748 were from canal dues. Heavy gales and rains in December 1848 and January 1849 did much damage to the canal, which was repaired by a government grant of £10,000. For the year ending April 1873, the total number of passages made on the canal was 1885; and the income from tonnage rates, £4713. There is a regular steam-communication along the canal between Glasgow and Inverness. There is romantic and wild mountain scenery on both sides of the canal, besides many other objects of interest to the tourist, such as Fort William, Ben Nevis, Inverlochy Castle, Tor Castle, the ancient seat of Cameron of Locheil, Glen Spean, Glen Roy, with its Parallel Roads, Fort Augustus, the Fall of Foyers, and Inverness.

CALEMBOURG, or CA'LEMBOUR, the French name for a pun (q. v.).

CALENDAR (from CALEND<sup>E</sup>, q. v.), the mode of adjusting the months and other divisions of the civil year to the natural or solar year. The necessity of some division and measurement of time must have been early felt. The phases or changes of the moon supplied a natural and very obvious mode of dividing and reckoning time, and hence the division into months (q. v.—see also WEEK) of 29 or 30 days was, perhaps, the earliest and most universal. But it would soon be observed that, for many purposes, the changes of the seasons were more serviceable as marks of division; and thus arose the division into years (q. v.), determined by the motions of the sun. It was soon, however, discovered that the year, or larger division, did not contain an exact number of the smaller divisions or months, and that an accommodation was necessary; and various not very dissimilar expedients were employed for correcting the error that arose. The ancient Egyptians had a year determined by the changes of the seasons, without reference to the changes of the moon, and containing 365 days, divided into twelve months of 30 days each, with five supplementary days at the end of the year. The Jewish year consisted, in the earliest periods, as it still does, of twelve lunar months, a thirteenth being from time to time introduced, to accommodate it to the sun and seasons; this was also the case with the ancient Syrians, Macedonians, &c. The Jewish months have alternately 29 and 30 days; and in a cycle of 19 years there are seven years having the intercalary month, some of these years having also one, and some two days more than others have, so that the length of the year varies from 358 to 365 days.—The Greeks, in the most ancient periods, reckoned according to real lunar months, twelve making a year; and about 594 B.C., Solon introduced in

Athens the mode of reckoning alternately 30 and 29 days to the month, accommodating this civil year of 364 days to the solar year, by occasional introduction of an intercalary month. A change was afterwards made, by which three times in eight years a month of 30 days was intercalated, making the average length of the year 365½ days. See METONIC CYCLE.

The Romans are said to have had originally a year of 10 months; but in the times of their kings, they adopted a lunar year of 355 days, divided into 12 months, with an occasional intercalary month. Through the ignorance of the priests, who had the charge of this matter, the utmost confusion gradually arose, which Julius Caesar remedied, 46 B.C., by the introduction of the JULIAN CALENDAR, according to which the year has ordinarily 365 days, and every fourth year is a leap-year of 366 days—the length of the year being thus assumed as 365½ days, while it is in reality 365 days, 5 hours, 48 minutes, and 50 seconds; or 11 minutes, 10 seconds less. Caesar gave to the months the number of days which they still have.

So comparatively perfect was the Julian style of reckoning time, that it prevailed generally among Christian nations, and remained undisturbed till the renewed accumulation of the remaining error of eleven minutes or so had amounted, in 1582 years after the birth of Christ, to ten complete days; the vernal equinox falling on the 11th instead of the 21st of March, as it did at the time of the Council of Nice, 325 years after the birth of Christ. This shifting of days had caused great disturbances, by unfixing the times of the celebration of Easter, and hence of all the other movable feasts. And accordingly, Pope Gregory XIII, after deep study and calculation, ordained that ten days should be deducted from the year 1582, by calling what, according to the old calendar, would have been reckoned the 5th of October, the 15th of October 1582; and in order that the displacement might not recur, it was further ordained that every hundredth year (1800, 1900, 2100, &c.) should not be counted a leap-year, excepting every fourth hundredth, beginning with 2000. In this way the difference between the civil and the natural year will not amount to a day in 5000 years. In Spain, Portugal, and part of Italy, the pope was exactly obeyed. In France, the change took place in the same year, by calling the 10th the 20th of December. In the Low Countries, the change was from the 15th December to the 25th; but it was resisted by the Protestant part of the community till the year 1700. The Catholic nations, in general, adopted the style ordained by their sovereign pontiff; but the Protestants were then too much inflamed against Catholicism in all its relations, to receive even a purely scientific improvement from such hands. The Lutherans of Germany, Switzerland, and, as already mentioned, of the Low Countries, at length gave way in 1700, when it had become necessary to omit eleven instead of ten days. A bill to this effect had been brought before the parliament of England in 1585, but does not appear to have gone beyond a second reading in the House of Lords. It was not till 1751, and after great inconvenience had been experienced for nearly two centuries, from the difference of the reckoning, that an act was passed (24 Geo. II, 1751) for equalizing the style in Great Britain and Ireland with that used in other countries of Europe. It was then enacted that eleven days should be omitted after the 2d of September 1752, so that the ensuing day should be the 14th. A similar change was about the same time made in Sweden and Tuscany; and Russia is now the only country which adheres to the old style; an adherence which renders it

## CALENDAR OF PRISONERS—CALENDS.

necessary, when a letter is thence addressed to a person in another country, that the date should be given thus:—April <sup>1</sup> or <sup>June 21</sup>; for it will be observed, the year 1800, not being considered by us as a leap-year, has interjected another (or twelfth) day between old and new style.

The C. of the French Republic remains to be noticed, which was adopted in consequence of a decree of the National Convention in 1793. The midnight preceding the autumnal equinox of 1792 was fixed upon as the new epoch, from which the years were to be reckoned as the Year One, the Year Two, &c. The year was divided into 12 months, each of 30 days, to which new names were given, as *Vendémiaire* (vintage month), *Breumaire* (foggy month), &c.; and instead of weeks, each month was divided into periods of 10 days, called *Primidi*, *Duodi*, *Tridi*, &c. Five complementary days were added at the end of each year, which were the *Fête du Génie*, *Fête du Travail*, &c. By Napoleon's command, this new system was abolished, and the use of the Gregorian C. resumed on January 1, 1806.

**CALENDAR OF PRISONERS**, in the practice of the criminal law in England, is the technical name given to the list of all prisoners' names in the custody of the sheriff of each county, prepared for the assizes. When the business is over, and the trials concluded, the clerk of assize makes out in writing four lists of all the prisoners, with separate columns, containing their crimes, verdicts, and sentences, leaving a blank column, in which, if the judge has reason to vary the course of the law, he writes opposite the names of the capital convicts—to be reprieved, respite, transported, &c. These four calendars, being first carefully compared together by the judge and the clerk of assize, are signed by them, and one is given to the sheriff, one to the jailer, and the judge and the clerk of assize respectively keep another. If the sheriff receives afterwards no special order from the judge, he executes the judgment of the law in the usual manner, agreeably to the directions of his calendar. In every county, this important subject is settled with great deliberation by the judge and the clerk of assize, before the judge leaves the assize-town; but probably in different counties, with some slight variation, as in Lancashire, no calendar is left with the jailer, but one is sent to the home secretary.

**CALENDERING** is the term applied to the process of finishing by pressure the surface of linen, cotton, and other textile fabrics. It is usually done by passing the fabric between cylinders pressed together with great force; hence the origin of the term, which is a corruption of *cylindering*.

The familiar domestic processes of starching and ironing afford the simplest illustrations of the object and result of calendering. The domestic mangle effects the same object as the flat iron, and is a near approach in construction to the C. engines of the manufacturer, no traversing-box of stones being used in the new patent mangles.

The cylindrical C. machine is said to have been introduced into this country by the Huguenots, driven here by persecution. The cylinders were originally of wood, but the liability to warping is a strong objection to these.

The modern calender usually consists of four, five, or six rollers or cylinders set vertically in a strong iron frame, with suitable driving gear, and furnished with weights suspended over a pulley to produce the required pressure. This sometimes amounts to, or even exceeds, 20 tons, including the weight of the rollers. In a five-roller machine, the arrangement is this: The centre roller is of iron or copper, made hollow for the admission of steam or a red-hot

heater, the one immediately above and that directly below it are of paper; and the remaining two, one at the top and the other at the bottom, are of cast-iron. At least one of the rollers is always of paper, as it has more elasticity than metal, and is not liable to warp, like wood. It consists of sheets of brown paper or pasteboard, densely packed and compressed on an iron axis. The edges of these form the surface of the roller, which is turned and polished, an operation of some difficulty.

Before the final rolling in the C. machine, the fabric is first lightly smoothed by passing over warm cylinders. Cotton goods are starched with a starch prepared from flour, and the starch is sometimes thickened with plaster of Paris, porcelain clay, or a mixture of these, to give a fictitious appearance of stoutness, which of course vanishes when the article is washed. For ordinary C. the fabric is then simply passed between plain cylinders, which produces the desired effect by flattening the otherwise round threads. When, by means of a hot cylinder, with a pattern raised upon it, the amount of this flattening is unequal on different parts of the cloth, the beautiful effect known as 'watering' is the result. Glazing is produced by combined rubbing and pressure; the rollers, one of which is heated, being made to move with different velocities, so that one side of the fabric is rubbed as well as pressed by the roller whose surface moves with the greater rapidity. Before the invention of these rubbing cylinders, glazing was effected by rubbing the surface of the fabric with a polished flint. Calendering is done on a very large scale in some manufacturing towns, such as Manchester and Glasgow. In Dundee, where half a century ago it was not the custom to calender the linen at all, there are now more than 1000 hands employed in this branch of industry. Machines similar in construction to the one above described, but with all the rollers of iron, and also called calenders, are used for rolling india-rubber into sheets for coats, shoes, &c.

**CALENDS**. The Romans made a threefold division of the month into *Calends*, *Nones*, and *Idea*. The C. always fell upon the 1st of the month; the Nones in March, May, July, and October, on the 7th; and the Idea on the 15th; and in the remaining months, the Nones on the 5th, and the Idea on the 13th. The C. were so named because it was an old custom of the College of Priests on the first of the month to *call* (or assemble) the people together to inform them of the festivals and sacred days to be observed during the month; the Nones received their name from being the ninth day before the Idea, reckoning inclusively; and the Ideas from an obsolete verb, signifying to divide, because they nearly halved the month. This threefold division also determined the reckoning of the days, which were not distinguished by the ordinal numbers first, second, third, &c., but as follows: Those between the C. and the Nones were termed the *days before the Nones*; those between the Nones and the Idea, the *days before the Ideas*; and the remainder, the *days before the C.* of the next month. Thus, the Ideas of January, happening on the 13th of that month, the next day would not be termed by a Latin writer the 14th, but the 19th before the C. of February, reckoning inclusively, i.e., reckoning both the 14th of January and the 1st of February, and so on to the last, which was termed *pridie Calendas*.

*Ad Calendas Graecas*, a Roman proverbial saying, practically equivalent to 'never.' The Roman C. were often appointed as days for payment of rent, interest, &c.; but as the Greeks had no C., a postponement of payment *ad Calendas Graecas*, simply meant a refusal to pay altogether. It is said that the Emperor Augustus frequently used the phrase, which afterwards became a proverb.

CALENTURE—CALICO-PRINTING.

CA'LENTURE, a Spanish term (*calentura*) applied to a species of temporary delirium or fever occurring on board ship in hot climates, and probably due to the effect of exposure to the direct rays of the sun. The descriptions of the disease seem rather fanciful and contradictory, and the term is nearly obsolete. See *Dictionnaire des Sciences Médicales*.

CALHOUN, JOHN CALDWELL, an eminent American statesman, descended from an Irish family who founded the Calhouns' Settlement in South Carolina, was born at Abbeville, South Carolina, March 18, 1782. Having gained distinction at the bar, he was sent to congress in 1811, where he soon made himself the leader of the war-party against England. Author of the tariff of 1816, so favourable to his native state, he in 1817 was named minister of war by President Monroe, and reduced the confused state of affairs in his department to order, and made a great reduction in the expenditure of the army without sacrificing its efficiency.

This early part of C.'s career was marked by broad and patriotic views, to which his subsequent preference of southern interests presented an unfavourable contrast. The tariff of 1828 not being very favourable to the Southern States, C. still adhered to the government, hoping that the president, Jackson, would veto the measure; but as this hope was disappointed, C. went to South Carolina, and there (1829) carried in the legislature the notorious resolution, 'that any state in the Union might annul an act of the Federal government.' To this decision, Virginia, Georgia, and Alabama gave in their adhesion, and threatened a dissolution of the Union. President Jackson promptly used energetic measures to make this resolution of no effect. C. lost popularity, and despairing of reaching the presidency, resigned his vice-presidency; but soon afterwards was elected into the senate. In 1838, he delivered his famous speech on slavery, and continued to agitate on behalf of the slave-holding interest and for a dissolution of the Union, both with voice and pen, until his death, which took place at Washington, March 31, 1850. In his private character, C. was blameless; but in his career as a statesman he is understood to have implanted in the minds of his partisans those principles which culminated in the late war for the dissolution of the Union. During many years, he had been employed in writing his work on *The Philosophy of Government*, in which he vindicates the doctrine of state sovereignty, and which, along with other works, was posthumously published.

CALIA'NO, a small town of the Austrian Tyrol, situated on the left bank of the Adige, about 9 miles south of Trent. It figures in history as the place where the Austrian archduke, Sigismund, won a signal victory over the Venetians in 1487. Being a place of considerable military importance, it was also contested in the campaigns of 1797 and 1809.

CA'LIBLE, or CALIBER, is a technical name for the diameter of the bore of a firearm, whether a piece of ordnance or a small-arm. The ordinance from which solid shot are projected are usually denoted by the weight of each shot, as 24-pounder, 68-pounder, &c.; but mortars, and such guns as project shell or hollow shot, are more usually denoted by the C., such as 13-inch mortar, 10-inch shell-gun, &c. The C. of the chief kinds of firearm will be noticed under the proper headings; but it may here be observed, generally, that the C. of English ordnance has been greatly increased within the last thirty years, partly by boring up old guns, and partly by casting new.

512

CA'LICO-PRINTING is that department of the art of dyeing which takes cognizance of the production of a coloured pattern on cloth. It appears to have been first practised at *Calicut* in India—hence the term *calico*; and the *pallam-poors*, or large cotton chintz counterpanes, which have been manufactured in the East Indies for centuries, are evidence of the successful practice of the art in that country. From the East Indies, the art spread to Asia Minor and the Levant, thence to Augsburg in Bavaria; from whence, at the beginning of the 18th c., it spread to Alsace in France, to Switzerland, and ultimately to England and Scotland. The term is strictly applicable to the production of coloured patterns on cotton cloth or calico; but as now employed, it includes all the processes followed in the formation of a coloured pattern on cotton, linen, worsted, and silk goods, as also mixtures of two or more of these, such as the fabric called *de laine*, which is composed of cotton and worsted.

The first operation connected with the printing of cloth is the removal of the surface-hairs or minute threads which communicate a fibrous down or nap to the surface of the cloth, and if allowed to remain, would interfere with the uniform application of the colours. The surface down is got rid of by the process of singeing, during which the cloth is drawn over a red-hot iron or copper bar or plate, or through a series of gas jets. The apparatus generally used for *hot-plate singeing* consists of a furnace surmounted by a metal plate, which is sometimes ridged on the surface. The cloth having previously been joined at the ends, to make a long length, and been placed on a winch-roller, is first brought in contact with roller brushes, which raise the nap on the cloth, then passes over the white-hot metal cylindrical bar, and is wound on to a second winch-roller. The process is repeated twice on the face of the cloth, being the surface to be printed on, and once on the back. *Gas-singeing* is accomplished by drawing the cloth through brushes, and then over a horizontal pipe, perforated with rows of small holes, or slit from end to end, so that the gas issuing therefrom burns as a narrow sheet of flame. The cloth is not only allowed to come in contact with the burning gas, but the flame is transmitted through the cloth, and a suction-apparatus is often placed immediately above, so as to draw the flame through more effectually. When well singed, the cloth undergoes the process of bleaching (q. v.), and is thereafter calendered. See CALENDERRING.

There are several modes of applying the colours to cloth, and these are respectively named—1. The Madder style; 2. The Padding style; 3. Topical style; 4. Resist or Reserve style; 5. Discharge style; and 6. China blue or pottery style. These various processes are at one in being intended to fix upon the cloth the different colours; but they differ from each other more or less in the several steps through which the cloth is passed, though occasionally there is little or no line of separation; and at times, the cloth is treated by one method, and subsequently by another style.

The *madder style* is that in which a certain fixing agent or mordant is printed on the cloth, which is then introduced into the colouring matter in a dye-vat, when the mordant, having an attraction alike for the fibre of the cloth and for the colouring matter, acts the part of glue or paste, and cements the colour to the cloth. Originally, madder was the only colouring substance employed in this style; but now-a-days, by far the greater number of dye-stuffs, vegetable and animal, including cochineal, logwood, &c., are attached to cloth in this manner. The fixing agents or mordants generally

## CALICO-PRINTING.

employed are different strengths of *red liquor* (acetate of alumina), *iron liquor* (acetate of iron), and mixtures of these. These are thickened with wheat-starch, potato-flour, roasted starch or dextrine, and gum-arabic, so that the mordant may not run when it is placed on the cloth by the pattern-block or by the printing-machine. After the mordant has been imprinted on the cloth, the latter is hung in a warm airy room, where it can easily dry, but where it is at the same time surrounded by a moist atmosphere. The result is, that the mordant is decomposed, the acetic acid is evolved, and the alumina or iron is left attached to the fibre of the cloth in the state of an insoluble sub-salt, which cannot be dissolved by water. As some of the mordant is still left in its original soluble condition, it is necessary to wash the cloth free from this, else, during the dyeing operation, the soluble part of the mordant would run on to those parts of the cloth not intended to be coloured, and thus produce a blotted appearance. To obviate this, the cloth, having undergone the process of *drying and ageing*, is then introduced into a vat containing water, through which is diffused some cow-dung, dung substitute—a preparation of bone ash, sulphuric acid, carbonate of soda, and glue—or bran. The result of this process of *dunging* is the removal of the soluble part of the mordant, as also the starch or thickening agent, leaving the decomposed or insoluble mordant adhering to the fibre. The terms *dung-fixing*, *substitute-fixing*, and *bran-fixing*, have reference to the employment of one or other of these agents at this stage of the operation. When the cloth has been well washed from the dunging, it is introduced into the vat or dye beck containing the colouring matter. The whole is heated by steam-pipes, and the cloth being placed on a sparrowed reel kept in motion, is repeatedly wound out of the vat, and returned thereto. The result is, that wherever the mordant adhered to the cloth, the colouring matter is attached thereto, and little or no trace of colour adheres to the unmordanted parts. The last operation is the *clearing* or *brightening*, during which the coloured cloth is introduced into warm baths of water containing soda, soap, or for the more delicate tints, bran, and is thereafter acted on by weak acid solutions. The object is to clear the colours, and at the same time to confer upon them the property of resisting the fading action of the air and sun for a much longer time. The different shades of colour which can be obtained from the same madder beck or vat, with different mordants, are very numerous, and include reds, lilacs, purples, chocolates, and blacks. Thus, when a weak solution of red liquor (acetate of alumina) is employed as the mordant, a light red tint is procured; with a stronger aluminous mordant, a deep red is formed on the cloth; with a more or less dilute solution of iron liquor (acetate of iron), the cloth is coloured lilac, violet, or purple; with a strong solution of iron liquor, black is obtained. Indeed, the same piece of cloth stamped in different places with the various strengths of aluminous and iron mordants, and mixtures of these, and immersed in the madder-bath, will be obtained dyed with all the shades mentioned; and in this manner, many of the beautiful variegated coloured dresses and handkerchiefs are prepared for market.

The *padding style* in C. is intended mainly for the impregnation of cloth, in whole or in part, with mineral colouring substances. When the cloth is to be entirely coloured, it is immersed wholly in a vat containing the mordant. When the colour is to appear as a pattern on the fabric, the mordant is applied by a pattern block, or by the printing-machine. In either case, the cloth is thereafter

thoroughly dried, and washed in various solutions, and then introduced into a vat containing the substance to form the colour. Thus, if a piece of cloth is to be entirely impregnated with *chrome yellow*, it is first treated or *padding* in a solution of 8 parts of bichromate of potash ( $KO_2CrO_3$ ) to a gallon of water dried, and then placed in a vat containing a solution of 6 or 8 ounces of acetate or nitrate of lead ( $PbO_2$ , or  $PbONO_2$ ) to the gallon of water. The result is that the chromate of lead ( $PbOCrO_4$ ) is formed in the tissue of the cloth; and when the latter is washed and dried, the yellow colour still adheres to the cloth firm and fast. To print a yellow pattern on cloth, 7 to 9 ounces of acetate of lead, and the same quantity of nitrate of lead, are dissolved in a gallon of water, thickened with starch, and placed upon the cloth according to pattern. After drying, the cloth is first immersed in water containing a little carbonate of soda, and ultimately in a solution of bichromate of potash, when the pattern becomes fixed in bright yellow, insoluble in water. To produce *Prussian blue* on cloth, it is treated with acetate and sulphate of iron, dried, washed with warm chalk-water, and immersed in a very weak solution of yellow prussiate of potash. A pattern in Prussian blue is produced by printing a pattern in the cloth with the iron solutions thickened with gum, and thereafter proceeding as above. Chrome green is produced in a similar way, by using sulphate and acetate of copper, thickened with glue, and thereafter arsenious acid with potash; and so also other colours, such as iron buff or chamois, manganese bronze, &c.

The *topical style* in C. is the process whereby certain colouring matters which are insoluble in water, and cannot therefore be applied to cloth by the modes suggested under the madder and padding styles, are treated at once with the mordant, and the mixture by one operation transferred by block, or otherwise, directly on the surface or top of the cloth, and hence the term *topical*. Indigo, safflower, and arnott are instances of such insoluble colouring substances; and when these and other dye-stuffs, such as logwood and Brazil wood, are treated with water, thickened with starch and nitro-muriate of tin (known as *spirit*) added, with occasionally a little of other salts, such as nitrate of copper, the result is the formation of *spirit-colours*, which can be printed on the surface of cloth, and possess a certain degree of fixity. The permanency of these *spirit-colours*, however, is very much increased, and the general appearance improved, by afterwards subjecting the goods to the action of steam in a wooden chest or box, when the term *steam-colours* is applied.

The *resist style* in C. is that in which certain materials are placed on the surface of cloth, to protect it from the adherence of the mordants, and, consequently, to keep that part of the cloth from being attacked by the colouring matter. These materials are termed resists, reserves, or resist-pastes, and they are divisible into mechanical and chemical. The *mechanical resists* are such substances as fats, resins, oils, wax, and pipe-clay. A common resist for silk and woollen goods is a mixture of  $\frac{1}{4}$  of resin and 1 of suet; and it is principally in the colour-printing of silk and woollen dresses and handkerchiefs that mechanical resists are employed, though they are occasionally used for the printing of cottons. The chemical resists may act on the mordant or on the colour. Thus, if it be desirable to remove the mordant, and thus leave certain parts of the cloth unable to attach colour, the printing of a pattern with some acid substance on the cloth will form with the mordant a soluble salt, which can be readily removed by

washing, whilst the parts which have not been so acted on by acid are not dissolved away by the washing, and still retain the full power in the colour-vat to cause the adhesion of the colour. For this purpose, where an iron or aluminous mordant has been employed, it is customary to print thereon in the requisite pattern, lemon-juice or lime-juice (containing citric acid), tartaric or oxalic acid, and bisulphate of potassa, or a mixture of two or more of these, thickened with pipe-clay, China-clay, gum-arabic, dextrine (British gum), gum-Senegal, or a mixture of these; occasionally, chloride of tin is employed. Sulphate of zinc, sulphate and acetate of copper, and the chloride of mercury, are used to resist the adherence of indigo blue.

The *discharge style* in C. comprehends the employment of similar materials to those used in the *resist style*, but after the cloth has been coloured or dyed, and for the purpose of discharging the colour, or bleaching the cloth at certain parts, according to pattern. The dischargers for organic colouring matters are chlorine and chromic acid. The chlorine is employed in the form of bleaching-powder (q. v.), and the cloth already dyed is printed with a solution of tartaric acid (or other acid), thickened with pipe-clay and gum, then dried, and passed through a solution of bleaching-powder, when the decoloration occurs, as already explained under **BLEACHING**. The chlorine is also applied by placing a number of folds of coloured cloth between perforated pattern-plates, and subjecting the whole to great pressure; a solution of chlorine (obtained by adding an acid to a weak solution of bleaching-powder) is allowed to percolate down through the perforations of the plates, and the cloth immediately underneath, so that only those spots are bleached, while the rest of the cloth is so highly compressed as to keep the liquid from coming in contact therewith. The well-known Turkey-red handkerchiefs are *pattered* in this way. The chromic acid is generally employed in discharging indigo colour. The cloth, already entirely blue, is soaked or padded in bichromate of potash, and then an acid discharger printed thereon; and wherever the acid discharger (tartaric, oxalic, citric, or hydro-chloric acid) comes in contact with the blue cloth containing the bichromate of potash, chromic acid is liberated, and destroys the colour. Instead of acting upon the coloured cloth, the discharger may be employed to carry off the mordant. Thus, cloth treated wholly with a mordant, and thereafter printed with a pattern in acid, has the mordant removed at those parts where the pattern block has placed the acid. Mineral colours can also be discharged in a similar way.

The *China blue or pottery style* in C. is a modification of the topical style, where indigo is deposited on cloth in the insoluble state, and is thereafter manipulated with, so as to impregnate the cloth with the indigo more or less strongly, and thus produce different shades of blue.

The above descriptions of the various operations in C. have special reference to cotton cloth; and though many steps of the manipulative processes apply equally well to linen, silk, worsted, and de laines (worsted and cotton), yet considerable modifications in mode of treatment and material employed are required in the successful colour-printing of all texture containing animal fibre, such as silk and wool. Where the printing of such fabrics differs essentially from the processes already indicated, special reference will be made under **SILK** and **WOOL**. The different colouring matters employed in C. being identical with those used in dyeing, will be considered under the general popular title **DYE-STUFFS**; and the mode of compounding these

into the various colours and shades, will be more appropriately introduced under **DYING**.

**CALICUT**, a seaport of the district of Malabar, which, though on the west side of the peninsula of Hindustan, yet forms part of the presidency of Madras. In lat. 11° 15' N., and long. 75° 50' E., it is distant from Goa and Bombay respectively 300 and 566 miles. It was the first spot in India visited by Vasco da Gama, being then the chief emporium on the coast, with stately dwellings and magnificent pagodas. So populous and powerful was it, that it twice repulsed the Portuguese, slaying their commander in 1509, and expelling Albuquerque himself, after a momentary success on his part, in 1510. It stands near the mouth of a small river of the same name, appearing to have possessed at one time a tolerably good haven. Gradually, however, this harbour has been filled up with sand; and now its anchorage is merely an open roadstead, at a distance, at least for large vessels, of two or three miles from land. Independently of this physical disadvantage, the ravages of war and the competition of superior localities contributed to the decay of Calicut. Accordingly, in 1792, when it fell into the hands of the English, the city was little better than a ruin. Since then, it has made considerable progress, and has been estimated to contain about 20,000 inhabitants. From C., *calico* is understood to have derived its name, just as *cambric* from Cambray, in the north-east of France.

**CALIF** (Turk., a successor), the title of Mohammed's successors in temporal and spiritual power, from which the historians of the middle ages designated the Arab empire founded by these princes, the **CALIFATE**. This empire, for two or three centuries, exceeded even the Roman empire in extent. As Mohammed died without leaving any sons, a contest arose concerning the inheritance of his power, which terminated (632 A.D.) in the triumph of Abubekr (q. v.), one of his fathers-in-law, over Ali, his nephew and son-in-law. Abubekr now assumed the title of Califet-Resul-Allah—i.e. Representative or Deputy of the Prophet of God. He sent forth his armies for the extension of Mohammedanism, and after several victories over the forces of the Byzantine empire, conquered Syria. He was succeeded in 634 by Omar, another father-in-law of Mohammed, by whom Egypt and Jerusalem were annexed to the calificate. He assumed the title of Emir-al-Mumenin—i.e. Prince of the Faithful—a title which all subsequent califs retained. Othman, a son-in-law of the Prophet, was the third C., and was elected by six persons appointed by Omar before his death. During his reign (644–656 A.D.), the Arabian empire grew with extraordinary rapidity, being extended into Persia, and westward along the north coast of Africa as far as Ceuta. The Byzantine emperors recovered Egypt; but it was wrested from them again at a prodigious expense of blood. The people of Medina elected Ali-ben-Abi-Taleb as C. upon the death of Othman. The Shiites regard him as the first true Imam or high-priest, and honour him and his son Hassan almost equally with Mohammed himself. Contests against rivals prevented him from doing much for the extension of the calificate. Moawijah, the governor of Damascus, having made himself really independent during Ali's life, and having extended his power over Syria, Egypt, and part of Arabia, became C. in 661, and founded the dynasty of the Ommiades, making the calificate hereditary. He removed the seat of the calificate to Damascus. His armies ravaged Asia Minor, and laid siege to Constantinople, but could not take it. He made important conquests, however, in Central Asia. The calificate did not remain long in the

family of Moawijah, and it frequently happened that in one or other of the subject countries a governor raised himself to a temporary independence; and rival califs frequently contended for power. Abdalmelek (685—705 A. D.) united all the Moslems under his dominion. Under his son, Walid I, the califate reached its zenith of prosperity, the Arabs conquering Turkestan in 707, Galatia in 710, and Spain in 711. Under Hesham, the progress of the Arabs in the west was arrested by Charles Martel at Tours (732 A. D.) and at Narbonne (736 A. D.). The dynasty of the Ommiades in Asia terminated with Merwan II. in 752, giving place to that of the Abbasides. But a branch of the Ommiades founded an independent califate at Cordova, and another founded one in Arabia, which subsisted till the 16th century. Abul-Abbas (750—754 A. D.), the first Abbaside C., signalled himself by his cruelty and the torrents of human blood which he shed. His successor, Abu-Jafar, called Al-Mansur, a patron of the arts, but a persecutor of Christians, founded Bagdad (q. v.), and removed the seat of the califate thither. From the beginning of the 9th c., the Arab empire, which had suffered much from corruption and internal disorganisation under the last califs of the Ommiade dynasty, and had never completely recovered, shewed increasing signs of decay. Even under the C. Harun-al-Raschid, whose praises the eastern poets were accustomed so much to celebrate, independent kingdoms were established (800 A. D.) by the Aghlabides in Tunis, and the Edrisides in Fez. In 821, Taher, the governor of Khorassan, made himself independent, and established a dynasty there, and other governors of provinces followed his example. But under the C. Al-Mamun, the Arabians conquered Sicily and Sardinia, the former of which they held till it was taken from them in 1035 by the Normans; and the latter, till it was conquered by the Pisans in 1051. The C. Motassem (833—842 A. D.) was the first to employ Turkish soldiers; but the practice was followed by his successors; and the Turkish body-guard soon became a formidable power in the califate, and about the middle of the 9th c. assumed the right of deciding the succession to the throne. Many of the califs, meanwhile, were base voluptuaries, and of the others, some were of little capacity, and their power rapidly declined. Ere the middle of the 10th c., the califs themselves exercised a mere nominal sovereignty, whilst the emirs, like the mayors of the palace towards the close of the Merovingian dynasty among the Franks, possessed all real power. The princes of the Fatimide dynasty, which succeeded that of the Aghlabides in Tunis, having made themselves masters of Egypt in 970, assumed the title of C., so that there were now three califates—at Bagdad, at Cairo, and at Cordova. In the 11th c., the califs of Bagdad were still acknowledged as the spiritual chiefs of all the Moslems; but their temporal power scarcely extended beyond the walls of Bagdad. Bagdad itself became the prey of a Mongol horde in 1258, and the representative of the califs fled to Egypt, where, under the protection of the Mamelukes, who had made themselves masters of that country in 1250, he retained his title and spiritual power, which he transmitted to his successors, who continued to reside there till the Turks conquered Egypt in 1517, when the last of them was carried to Constantinople; and since that time the Turkish sultans have assumed the title of C., and claimed to be regarded as the spiritual chiefs of all the Moslems, a claim to which little respect has ever been paid except within the limits of their own empire.

**CALIFORNIA.** This name was at first applied to a peninsula on the west side of Mexico, but was

gradually extended to an indefinite portion of the adjoining continent, as far north as the parallel of 42°. The original C., however, and its augmentation were distinguished from each other as Old and New, Lower and Upper. In 1848, partly by conquest and partly by purchase, continental C., down to the parallel of 32° 28', was ceded to the United States. After existing as a *territory* for two years, it was, in 1850, constituted one of the United States, bounded N. by Oregon, E. by Nevada and Arizona, S. by Lower C., and W. by the Pacific. Between the two Californias of the present day, the American one and the Mexican one, there is nothing in common but the name.—1. *Mexican C.* is the peninsula above mentioned, which, though considerably longer than Great Britain, is yet so narrow as to be very little larger than Scotland. From end to end, it is one ridge of mountains, which here and there rise to about 6000 feet above the sea. A few favoured spots yield fruits and grains in abundance; but, generally speaking, the productions are unimportant, for even trees, and those of no great size, are found only towards the southern extremity of the country. The population certainly does not exceed 10,000—the oldest and most considerable town, Loretto, on the east side, containing barely 1000 inhabitants. On the west side is the magnificent harbour, peculiarly valuable on a coast so destitute of shelter, formed by the Bay of Magdalena and the island of Santa Margarita.—2. *American C.*, vaguely claimed, under the name of New Albion, by Drake for England in 1579, lay unoccupied till 1767, when it was invaded by Franciscan friars, the successors in Mexico of the newly expelled Jesuits. These zealous apostles, backed, when necessary, by armed coadjutors, planted various missions, bringing under their influence, such as it was, the great mass of the aborigines. Under such circumstances, the new province became pre-eminent, even in Spanish America, for everything that could paralyse the progress of a community. Anglo-Saxon speculators engrossed most of the trade; American trappers walked through the land as if it had been their own; the Muscovites established, in the north, a town under the ominous title of *Ross* or *Russia*; and a Swiss adventurer of the name of Sutter, who had carved out for himself a *New Helvetia*, virtually set the government at defiance. But the discovery of gold in Sutter's mill-race during 1847, and the political transfer of 1848, taken together, changed, as if by a miracle, the aspect of affairs. The matchless harbour of San Franciso became the grand mart on the Pacific, presenting a centre of attraction to the restless and energetic of every race and every clime. Between 1850 and 1852, the population increased from 92,597 to 264,435; in 1855 the population was 327,000; and in 1870 it was 560,247. The total amount of gold reported, for exportation, at the custom-house of San Francisco, from 1849 to 1864 inclusive, was valued at 695,684,879 dollars. From this, about 45,000,000 dollars may be subtracted from the yield of C., as coming from Nevada, Idaho, British Columbia, Arizona, and Mexico; but to the remainder 150,000,000 should be added for gold shipped, but not reported at the custom-house. The total yield of gold in this state, previous to 1868, was about 900,000,000 dollars. It possessed the richest quicksilver mine in the world—that of New Almaden—annual production about 2,600,000 lbs. The total yield of precious metals in C. in 1871 was 20,000,000 dollars. In 1864, 15,000 tons of copper were exported, to be smelted at Swansea and Boston; platina, too, has been found in many of the placers. There is coal in nearly all the coast counties; and asphaltum is pro-

CALIFORNIA—CALIXTINES.

duced by many springs along the southern coast. The yield of wheat in 1870 was 16,676,702 bushels; of barley, 8,783,490. In the year 1867, 4,000,000 gallons of wine and 400,000 gallons of brandy were made, the product of 30,000,000 vines. Silk culture is making rapid progress; and the woollen factories of C. consume nearly 6,000,000 lbs. of wool annually. In 1868, San Francisco alone produced 3,000,000 dollars worth of iron castings.

The country is mountainous, and is cut into coast and interior by a subordinate range from Oregon. The interior is subdivided into the valleys of the Sacramento and the San Joachim—two rivers from the north-east and the south-east, which enter the noble haven of San Francisco. Of those two valleys, the former is the more important, both as being the chief seat of the 'diggings,' and as leading through the Rocky Mountains by the comparatively level route of Fremont's Pass. Thus does the north section of C., with its rare combination of inland and maritime facilities, promise to contend successfully with the Isthmus of Darien and Central America as a route for connecting the Atlantic with the Pacific. C., with a lovely and salubrious climate, produced fruits and grains freely, under advantageous circumstances of soil and situation. In the growth of timber, however, it appears to be almost unrivalled. Fremont measured one tree that was 21 feet in diameter, or 66 in circumference; and another has been seen, which, with a length of 150 yards, is nearly 120 feet in girth. Besides the capital, the state contains the cities of Sacramento, Marysville, and Stockton; and the towns of Placerville, San Jose, Vallejo, Sonora, Shasta, Sonoma, Monterey with a pretty well-sheltered anchorage, and San Diego with the second best port in the state.

**CALIFORNIA GULF** or, an arm of the Pacific Ocean, which divides the peninsula above described from the rest of Mexico. It was originally known as the Sea of Cortez, having been discovered under his auspices, and explored by himself; and it has, from its shape, been occasionally designated the Adriatic of the New World. It is 700 miles in length, and varies in width from 40 to 100 miles. At its northern extremity, it almost touches the territory of the United States, receiving therefrom the united streams of the Gila and the Colorado. The gulf contains many islands, particularly towards its head, and has long had a pearl-fishery. At the east side of its entrance stands Mazatlan, on a river of the same name, now the most frequented port of the neighbouring regions.

**CALIGULA**, CAIUS CESAR AUGUSTUS GERMANICUS, Roman emperor (37—41 A.D.), the youngest son of Germanicus (nephew of Tiberius) by Agrippina, was born, 31st August, 12 A.D., at Antium, and was educated in the camp, where the soldiers gave him the by-name C., from the half-boots (*caligae*) which he wore. On the death of his brother Drusus, he was made augur in his stead; and on the death of Tiberius (37 A.D.), who, it was suspected, had received foul-play at his hands, it was found that he had been appointed co-heir along with the grandson of Tiberius, but the senate and the people allowed C. supreme and sole authority. In the beginning of his reign, he appeared hardly likely to fulfil the threat of Tiberius, who had talked of educating C. 'for the destruction of the Roman people.' He was, to appearance, lavishly generous and merciful, pardoning even those who had been the instruments of cruelty against his own family. But this ostentatious magnanimity was itself a disease, an unwholesome affectation, founded on no principle, or even humanity of heart, and co-existed with the most savage voluptuousness and

lust. Consequently, when illness, the result of his vicious life, had weakened his faculties, the lower qualities of his nature obtained the complete mastery. In addition to the senseless prodigality with which he commenced his career—expending in one year the enormous wealth left by Tiberius (720 millions of sestertes)—he began to manifest the most barbarous propensities. He banished or murdered his relatives, excepting his uncle Claudius and sister Drusilla (with whom he carried on incestuous intercourse); filled Rome with executions, confiscating the estates of his victims; amused himself, while dining, by having victims tortured and slain in his presence; and uttered the wish 'that all the Roman people had but one neck, so that he might decapitate Rome at a blow!' To vie with Xerxes, he made a bridge of ships over the bay between Baia and Puteoli (a distance of three Roman miles and six hundred paces), and celebrated the exploit by a costly banquet on the middle of the bridge, and by collecting on it great numbers of people, and causing them to be drowned. His favourite horse was stabled in a palace, fed at a marble manger with gilded oats, was made a member of the college of priests, and afterwards raised to the consulship. As a climax to all his absurdities, he declared himself a god, and had temples erected, and sacrifices offered to himself. To gratify his monstrous desires, he shrank from no infamy; he robbed, plundered, and taxed his subjects to a degree which seems almost incredible, and when even these means proved insufficient, he established a brothel in his own palace, and sent out his slaves to solicit the public patronage for it. At length a conspiracy was formed against him, and he was assassinated 41 A.D.

**CALIPPIC CYCLE.** See PERIOD.

**CALITRI**, a town of Italy, in the province of Avellino, near the Ofanto, and about 7 miles east-north-east of Conza. It has a population of 6200, who are chiefly engaged in agricultural pursuits. Sheep are reared to a considerable extent in the vicinity.

**CALIVER** was a matchlock or firearm about midway in size and character between an arquebus and a musket; it was small enough to be fired without a rest or support.

**CALIXTINES**, a Bohemian religious sect, so named from the Latin *calix*, a cup, because they contended for giving the cup, as well as the consecrated wafer, to the laity. Their confession of faith (1421) contained the following articles: 1. That the word of God ought to be freely and regularly preached by the priests of the Lord throughout Bohemia; 2. That the eucharist in both kinds ought to be administered to all burdened with 'no mortal sins' according to the language and command of the Saviour; 3. That the clergy should separate themselves from secular affairs; 4. That all 'mortal sins,' and especially public ones, such as debauchery and simony, and any other disorders contrary to the law of God, should be prevented or punished by those who were the lawful authorities in such matters. In other main points they were moderate followers of John Huss, and were opposed to the more extreme sect of Taborites (q. v.). Their peculiar articles of faith were conceded by order of the council at Basel (1433); and having prevailed over the Taborites in the conflict which took place at Boehmischesbrod 30th May 1434, they became the dominant party in Bohemia, and exercised considerable influence over political affairs. Gradually, however, the C. lapsed from the severity of their four articles, while the schism of the energetic Taborites, and later of the Bohemian Brethren (q. v.), rendered them completely

## CALIXTUS—CALL OF THE HOUSE

powerless. At the beginning of the 16th c., they had ceased to possess any importance, and only served to prepare the way for Protestantism.

**CALIXTUS, GEORG** (properly, *Callesen*), an eminent theologian of the Lutheran Church, was born 15th December 1586, at Melley, in Holstein; studied at Flensburg and Helmstedt; and, in 1605, became professor of philosophy in the latter of these cities. Two years after, he betook himself to theology, and attracted great attention by the breadth and originality of his views. After travelling for some time in Germany, Holland, England, and France, where he made the acquaintance of the most learned men of his time, he returned to Helmstedt in 1613, and was appointed professor of theology. His genius, the depth of his knowledge, and his large experience of the world and of men, which he had acquired in his travels, developed in him a spirit of great tolerance towards all who held their religious opinions honestly, whatever these might be. Although his dissertations on the Holy Scripture, transubstantiation, communion in one kind, &c., are acknowledged by learned Catholics to be about the most solid and admirable which have been composed by Protestants against the distinctive doctrines of Catholicism, he was, on account of some statements in his work, entitled *De Precipuis Religionis Christianae Capitibus* (Helmstedt, 1613), which seemed favourable to Catholic dogmas, and of others in his *Epitome Theologiae Moralis* (Helmstedt, 1634), *De Tolerantia Reformatorum*, &c. (Helmstedt, 1658), declared guilty of abominable heresy by the adherents of the letter of the Concordienformel—i. e., the Lutherans, men who now possessed nothing of the great reformer but his animosity. C. seems to have felt, what many devout hearts still feel, that the polemical harshness of Lutheranism is a serious obstacle in the way of a great Catholic Christianity, and that Protestantism must assume another form still before it can hope to become the religion of Europe. Under this conviction, C. endeavoured to shew that the oldest and most fundamental articles of the Christian faith—viz., the facts embodied in the ‘Apostles’ Creed’—were common to all Christian sects. In subsequent dissertations, having stated that the doctrine of the Trinity was less distinctly taught in the Old than in the New Testament, and that good works were necessary to salvation; and finally, at the religious conference of Thorn, in 1649, whither he was sent as a mediator by the Elector of Brandenburg, having been on more intimate terms with the Calvinistic than the Lutheran theologians, C. was accused of apostasy. Fortunately, however, he had powerful friends, who stood firmly by him, and through their help he was enabled to retain his professorial chair to the end of his life. He died 19th March 1656.

**CALL**, a term often used in reference to various theological and ecclesiastical subjects.—1. The command or invitation to believe in Jesus Christ, is designated the *call of God*, or the *gospel call*. Calvinistic theologians make a distinction between a *general call* and a *special or effectual call*. The former is addressed, they say, to all to whom the word of God comes; but it is insufficient of itself to induce any man to the act of faith, and requires, in order to its efficacy, that it be accompanied by the special and irresistible grace of the Holy Spirit. They are careful, however, to state that the general or outward calling by the word always precedes and accompanies the special and effectual calling by the Spirit. The notion of an inward call by the Spirit of God in the soul, unconnected with outward calling by the word, belongs not

to Calvinistic, but to mystic theology.—2. A call to office in the church, and particularly to the ministry of the gospel, is regarded by Christians generally as proceeding from God; and the Church of England requires of candidates for ordination an express profession that they trust they are so moved of the Holy Ghost.—3. A call by the people who are to be under the pastoral care of a minister has been generally regarded in the Christian church as necessary to the establishment of the pastoral relation. But there have been great differences of opinion as to what constitutes a sufficient call, and great differences of practice with regard to it. Some of the principal ecclesiastical dissensions in Scotland have had their origin in this question. The election of a pastor by the *Christian people* of his *parish* or *congregation*, has been contended for by many as the true call, or the best kind of it; others, approving of patronage with certain limitations, have contended no less earnestly for the right of the people to be consulted, so that without their concurring by a call, the patron’s presentee should not be held entitled to be inducted into the pastoral office; and according to the practice of the Church of Scotland, this concurrence has been always at least formally sought. Questions concerning the call and its proper value were supposed to have been determined by an act (usually called the Earl of Aberdeen’s Act), passed when the *Disruption* of the Church of Scotland took place in 1843, but have begun again to be agitated within the Established Church. See SCOTLAND, CHURCH OF; FREE CHURCH OF SCOTLAND; and PATRONAGE.

**CALL**, a stipulated sum to be paid towards a share in a joint-stock undertaking. For example, in a £10 share, there are usually at least four calls of £2, 10s. each, the calls being made at intervals of not less than three months.

**CALL**, a military musical term meaning a signal on the trumpet.

**CALL** is a metal whistle used by the boatswain and his mate on shipboard. Various strains or kinds of sound produced denote signals or orders for hoisting, heaving, lowering, veering, belaying, letting-go, &c. These sounds are as much attended to by seamen, as those of the drum, bugle, and trumpet are by soldiers. At one time, a gold call, with a chain, used to be the badge of an admiral.

**CALL OF THE HOUSE** is an imperative summons to every member of parliament of either House on some particular occasion, when the sense of the whole House is deemed necessary. In the *House of Lords*, when any urgent business is deemed to require the attendance of the lords, it has been usual to order the House to be called over; and this order has sometimes been enforced by fines and imprisonment upon absent lords. On some occasions, the Lord Chancellor has addressed letters to all the peers, desiring their attendance, as on the illness of George III., 1st November 1810. The most important occasion on which the House was called over, in modern times, was in 1820, for the trial of Queen Caroline.

When the *House of Commons* is ordered to be called over, it is usual to name a day which will enable the members to attend from all parts of the country. The interval between the order and the call has varied from one day to six weeks. If it be really intended to enforce the call, not less than a week or ten days should intervene between the order and the day named for the call. The order for the House to be called over is always accompanied by a resolution, ‘that such members as shall not then attend, be sent for, in custody of the serjeant-at-arms.’ And it was formerly the custom to desire

## CALL TO THE BAR—CALLIPERS.

the Speaker to write to all the sheriffs to summon the members to attend. On the day appointed for the call, the order of the day is read and proceeded with, postponed, or discharged, at the pleasure of the House. If proceeded with, the names are called over, according to the counties, which are arranged alphabetically. The members of a county are called first, and then the members for every city or borough within that county. The counties in England and Wales are called first, and those of Scotland and Ireland in their order. This point is mentioned, because it makes a material difference in the time at which a member is required to be in his place.—See *May's Proceedings in Parliament, on Attendance of Members.*

**CALL TO THE BAR** is the formal expression by which the admission of law-students to the rights and privileges of the degree of barrister in England and Ireland is publicly announced. In Scotland the corresponding expression is *Passing Advocate*. See **BARRISTER**, **INNS OF COURT**, and **ADVOCATES, FACULTY OF**.

**CALLANDER**, a village in Perthshire, on the left bank of the Teith, 16 miles north-west of Stirling, and to which there is a branch of the Scottish Central Railway. It lies in a beautiful and romantic situation, surrounded by high mountains and Highland lakes. Hence it is much frequented by tourists, who make this place a centre to visit Benledi, the Trossachs, the Bracklin Falls, and Loch Lubnaig, Vennachar, Achray, and Katrine. There is a large and commodious hotel, well provided with carriages and horses. Pop. (1871) 1870.

**CALLA' O**, the port of Lima, the capital of Peru, connected with that city by a railway of 6 miles in length. It stands in lat. 12° S., and long. 77° 13' W. The harbour has a commodious quay with a fine pier. The roadstead is large, free from rocks, and safe, being sheltered by the island of San Lorenzo. The exports are specie, copper, cotton, bark, and hides. C. contains about 20,000 inhabitants. It is only about 120 years old, the original city having, in 1746, been submerged and destroyed by an earthquake.

**CALLI'CHTHYS** (Gr. *kalos*, beautiful, *ichthys*, a fish), a genus of fishes of the family *Siluridae* (q. v.), having the body almost entirely covered by four rows of large, hard, narrow, scaly plates, two rows on each side. The head is also protected by a sort of helmet. The mouth is small, the teeth very small; two long barbules hang from each angle of the mouth. The species of this genus are natives of warm climates, particularly of South America. They are interesting because, when the streams or pools which they inhabit dry up, they make their way across the land to some other piece of water, even although at a considerable distance. They also sometimes bury themselves in the mud of wet meadows, out of which they are digged. They have no special organs for carrying a supply of water with them, like the climbing perch, but are supposed to retain a little between the plates of their body. A still more interesting part of the natural history of these fishes is their making regular nests, generally of leaves, in which they deposit their eggs, near the margin of the water, at the beginning of the rainy season, the male and female uniting in watching them until they are hatched. These habits are shared by the species of the allied genus *Doras*, in which the lateral plates are broader, keeled, and each ending in a spine.

**CALLIGONUM**, a genus of plants of the natural order *Polygonaceae* (q. v.), having a quadrangular fruit (*achenium*, q. v.), winged at the angles. The

best known species is *C. Pallasia*, a succulent shrub found on the sandy steppes near the Caspian Sea, and in the lower part of the basin of the Volga, where its acid fruit and its also acid shoots often serve to allay the thirst of the Kalmucks and of weary travellers. Its root strikes deep into the sand, is swollen at its upper part, and when cut there, gives out a nutritious gum resembling tragacanth (q. v.), which is also obtained by pounding and boiling it, and on which the Kalmucks feed in times of scarcity.

**CALLIMACHUS**, an eminent poet, grammarian, and critic of the Alexandrian period, flourished about the middle of the 3d c. B.C. He was of a distinguished family at Cyrene, in Libya; taught grammar and belles-lettres in Alexandria; was a favourite of Ptolemy Philadelphus, and his successor, Ptolemy Euergetes; and was made principal librarian of the Alexandrian Library. He wrote many works on the most various subjects (Suidas mentions 800), but only fragments are extant; nor have we many of his poems; but the poems which we have, bear the marks of an age when the artificial had obtained a preference over the natural.

**CALLING THE DIET** is the Scotch term for *Arraignment* (q. v.), although the forms are different. In Scotland, excepting in cases of high treason, there is no grand jury, but the procedure is briefly as follows: Before a prisoner can be tried, a written or printed copy of the indictment preferred against him must have been served fifteen days before the trial, with a copy of the list of witnesses to be examined against him, and also of the jury panel. When, therefore, he is placed at the bar of the court, and called on to plead, he is presumed to know the nature of the charge made against him. But if it be desired by him, or by his counsel, the clerk in the first instance reads the indictment aloud in open court—the same being a well-prepared syllogistic statement of the facts, which the prosecutor is prepared to prove. He is then called upon to state his objections to the relevancy, and to have such relevancy disposed of by the court, before being called on to plead to the fact. If the judgment of the court is in favour of the objection, the prosecution for the time fails, and the prisoner is sent back to jail, to abide another indictment, unless the prosecutor chooses to abandon the case against him altogether. See **INDICTMENT**, **VERDICT**, **DEFENCE**.

**CALLINGER**, one of the hill-forts of Bundelkund (q. v.), elevated about 700 feet above the adjacent plain, and separated from a neighbouring range of mountains by a ravine of 1200 yards in width. It is in lat. 25° N., and long. 80° 32' E., being 112 miles to the south-west of Allahabad. From its position and size, C. must at one time have been a place of great strength. It was stormed by the British in 1812. At the south-east base of the rock stands a town of the same name, which, though it is now much decayed, yet bears testimony to its ancient extent and grandeur. The locality is famous for its excavated temples of Siva.

**CALLIONYMUS**. See **DRAGONET**.

**CALLIOPE** (i. e., the sweet-voiced) was, according to the ancients, the first of the Muses (q. v.), and presided over epic poetry, or over poetry in general. She was said to be the mother of Orpheus, of the Sirens, &c. She was usually represented with a style and wax tablets.

**CALLIPERS**, a kind of compasses with curved legs, used by turners and other workmen for measuring the diameters of cylindrical, spherical, and other curved work. The C. are laid over the work, and opened or closed until both points just touch the

periphery; then the C. are laid upon a rule, and the extent of their opening measured, or the size is compared with a pattern.

**CALLISTHENES**, of Olynthus, was the son of Hero, a cousin of Aristotle. C. was born about 360 B.C.; he was educated by Aristotle along with Alexander the Great. He devoted himself to the study of natural and political history, and accompanied Alexander the Great in his expedition to India. He incurred the displeasure of the courtiers and royal favourites, and of Alexander himself, who was displeased by his remonstrating against his intended assumption of divine honour, and in general by his bold, indiscreet, outspeaking ways; and he was put to death on a pretended charge of treason, 328 B.C. Only a few fragments of his historic works remain, and these are not valuable. The *History of Alexander* ascribed to him, of which there are several MSS. in the Paris Library, is evidently a production of the 7th c., and rather a romance than a history.

**CALLITHRIX**. See SAGOUIN.

**CALLITRIS**. See SANDARACH.

**CALLO'SITIES**. See CORNA.

**CALLOT**, JACQUES, one of the most eminent artists of his time, was born at Nancy, 1592. Proceeding to Rome, he commenced drawing and engraving under Thomassin in his eighteenth year. He next went to Florence, where, by numerous spirited etchings, he gained great fame, and engraved for Cosmo II., Grand Duke of Tuscany, a series of plates of court-festivals, &c. When his patron died (1621), C. returned to his native place, and increased his reputation by a copious series of etchings, including six plates of the siege of Breda. By order of Louis XIII., who invited C. to Paris, etchings of the sieges of Rochelle and the Ile Rhé were executed; but C. refused to commemorate by art the capture of his native town, and, declining the pension offered by the king, returned to Nancy, where he died, 1635. His activity as an artist was marvellous. Of his engravings, 1800 are still preserved at Dresden. As helps to a vivid conception of the manners conditions of life, events, &c., in the 17th c., they are invaluable. C.'s 'Mémoires de la Guerre,' a series of 18 plates, are especially celebrated.

**CALLUNA**. See HEATH.

**CALLUS**. This term was employed in old surgical works, and is still used popularly, to indicate the exuded material by which fractures of bones are consolidated together. If the broken ends are accurately adjusted to each other, there is no projection of C., but merely a slight deposition of it between the two surfaces; if, however, the adjustment is not accurate, the C. is effused in such quantity as to fill up any interspaces that may exist, and as often to form a considerable hard swelling round the seat of the fracture; any excess is, however, usually absorbed during the last stage of the repair of a fracture. When the broken ends are allowed to move upon each other—which, of course, should be always prevented, if possible—a ferule of new bone, encircling both fragments for some little distance, so as to splice them together, till they are united by a permanent C., is formed; this is termed a *provisional callus*.

**CALMET**, AUGUSTINE, an exegetical and historical writer, and learned Benedictine, was born at Mezin-la-Horgue, near Commerce, February 26, 1672, and, in 1699, entered the order of Benedictines. In 1698, he was appointed teacher of philosophy and theology in the Abbey Moyen-Moutier; in 1704, sub-prior of a convent of learned monks at

Münster, in Alsace; and in 1706 he went to Paris, to superintend the publication of his *Commentary on the Bible*. He was afterwards appointed prior at Lay (1715), Abbot of St Leopold (1718), Abbot of Senones in Lorraine (1728), and died at Paris, October 25, 1757. His exegetical writings have been commended and studied with advantage by both Roman Catholics and Protestants. The *Commentary on the Bible* (23 vols., Paris, 1707–1716), though marked by the author's deficient knowledge of the oriental languages, contains valuable researches in biblical antiquities. C.'s *Historical and Critical Dictionary of the Bible* (4 vols., Paris, 1722–1728) was translated into English, German, and other languages, and has passed through many editions. His other works—a *History of the Bible*, and of the Jews (1718), and a *Universal History* (1735–1771)—are mere compilations; but his *History of Lorraine* is founded on original researches. Solid criticism and vigorous intellect are wanting in all his works.

**CALMS**, or CALM LATITUDES, are those parts of the ocean, near the equator, which are subject to total absence of wind for long periods together. The part of the ocean where C. are most looked for, is between the region of the trade-winds and that of the variable winds. See WINDS. It is almost as much dreaded by seamen as a region of storms, for the ship is unnavigable; and during a calm of many weeks, food and water may be nearly exhausted, at a point too far from land for boats to reach it. Where a calm occurs unexpectedly, it is likely to be followed by violent storms.

**CALMUCKS**. See KALMUCKS.

**CALNE**, a parliamentary borough and ancient town of Wiltshire, on the river Marden, 31 miles north-north-west of Salisbury. It lies in one of the many valleys in the chalk escarpment of this part of England, with the plateau of the Marlborough Downs and Salisbury Plain on the east and south. In 1863, a branch line was opened to C., six miles from the Chippenham station of the Great Western Railway. The manufacture of woollens, formerly carried on, has become quite extinct; but there is a flax factory at which a considerable number of persons, male and female, are employed. There is also a weekly corn-market. Pop. of the town in 1871, 5315. The parliamentary borough, formerly returning two members to parliament, but now only one, includes part of Blackland and Calstone. Many Roman remains have been found here. The West-Saxon kings had a palace at Calne, but no traces of it now remain. At a synod held here by St Dunstan in 977, relative to the celibacy of the clergy, the floor of the room in which the synod sat gave way, precipitating all to the ground but St Dunstan, who presided. On an almost perpendicular declivity 3 miles east of C. is the figure of a horse, 157 feet long, in a spirited attitude. It was cut out in white chalky ground in 1780 by Dr Allsopp, and is visible 50 miles off. Dr Priestley resided at C. 1770–1780.

**CALO'ER**. See BOHEMERA.

**CALOMARDE**, DON FRANCISCO TADEO, COUNT, a Spanish statesman, was born in 1775 at Villel, in Aragon. He studied at Saragossa, where he passed as an advocate. After the expulsion of the French, and the return of Ferdinand VII. in 1814, C. was among the first to hurry to Aragon, and do homage to him as an absolute monarch. As a reward of his obsequious calumny, he obtained the highest office in the *Secretaría General de Indias*, but lost it on account of accepting a bribe. On the restoration of the constitution in 1820, he unsuccessfully courted the favour of the Liberals; but when the French army in 1823 enabled the king once

## CALOMEL—CALORIC ENGINE.

more to rule despotically. C. was appointed secretary of the *Cámara del Real Patronato*, one of the most influential offices in the kingdom. Not long after, the king made him Minister of Justice. While he held this function, he persecuted the Liberals with cold-blooded savagery, recalled the Jesuits, reopened the monasteries, and closed the universities. He also secretly favoured the party of Don Carlos ; but, on the other hand, by treating any unseasonable outbreak with a strictness bordering on cruelty, he preserved himself from the suspicion of being implicated in their schemes. In 1833, when Ferdinand was supposed to be on his death-bed, he was prevailed on by C. to reintroduce the Salic Law, by which Christina was excluded from the throne, and Don Carlos, the favourite of the Absolutists, appointed his successor. This excited the hatred of the nation ; and Ferdinand recovering, abolished the law. To avoid imprisonment, C. fled to France. He died at Toulouse in 1842.

**CALOMEL** is the popular name given to one of the compounds of mercury ( $Hg$ ) and chlorine ( $Cl$ ), and known to scientific chemists as the subchloride of mercury ( $HgCl$ ). It is prepared by taking two equal portions of mercury, dissolving one portion in hot concentrated sulphuric acid ( $SO_3$ ), which forms sulphate of mercury ( $HgOSO_4$ ), thereafter adding the second part of the metal, and triturating the whole in a mortar till the metal becomes incorporated with the sulphate of mercury. This mixture is then added to one-half its weight of common salt ( $NaCl$ ), and heated in a retort, when C. sublimes, and condenses in the cool part of the receiver, as a fine white powder. A minute portion of corrosive sublimate which accompanies it, is removed by washing with water. C. is very dense. It is not soluble in water, and sparingly so in acids. It turns black on the addition of lime-water, potash, soda, or ammonia ; and when heated in an iron spoon, or on a knife, it does not char, but rises in vapour, sublimes unaltered, and readily condenses again on any cool surface held near it. Although C. has been more used in British practice than any other preparation of mercury, it is not known to have been employed before the 17th century. Its medicinal virtues will be treated of with the other mercurials. See MERCURY.

**CALONNE, CHARLES ALEXANDRE DE**, Controller General of Finance in France under Louis XVI., was born, January 20, 1734, at Douay. Possessing superior abilities, he studied law, and having filled successively various offices, was made, in 1783, Controller General of the Treasury. In this capacity he soon gained favour among the courtiers, who had complained of the parsimony of Turgot and Necker. C., though he found French finance in a deplorable state, was determined not to seem poor, gave brilliant entertainments, paid off the debts of his patron the Count of Artois, supplied the queen with sufficient pocket-money, granted pensions and gratuities to his supporters and favourites, paid off arrears, and purchased the residences of St Cloud and Rambouillet ! His means of raising money were perfectly simple—he borrowed, anticipated, issued chancery-edicts, and prolonged and augmented extraordinary taxation in a style never known before. The parliament resisted these measures, but C., backed by royal authority, carried them into execution. The crisis necessarily arrived ; and in 1786, when the people could bear the extraordinary taxation no longer, C. advised the king to convoke the Assembly of the Notables, and proposed to abolish the privileges (exemption from taxes) of the noble and wealthy, to take the duty off salt, to abolish *sacage* (feudal or compulsory service to the lord of the manor), and

to distribute the burden of taxation more equally. The people and the aristocracy demanded a con-vocation of the States General, instead of the Assembly of the Notables ; but C. boldly proceeded with his plan, opened the Assembly of the Notables, February 2, 1787, and in a pleasant and florid oration, described the general prosperity of French industry and commerce, and brought his speech to a climax by confessing that the annual deficit of the treasury had risen to 115 millions of francs, and that during the time from 1776 to 1786, the government had borrowed no less a sum than about 1250 millions ! The Notables, instead of proceeding with C.'s plan of reorganisation, demanded from him a statement of accounts. Not being able to give this satisfactorily, he was stripped of his dignities, and banished to Lorraine. After this, C. resided chiefly in England, until in 1802 he obtained from Bonaparte permission to return to France, where he died, in very embarrassed circumstances, October 30, 1802.

**CALOPHYLLUM** (Gr. beautiful leaf), a genus of trees of the natural order *Guttiferae* (q. v.), natives of warm climates. Some of the species yield valuable timber, as *C. angustifolium*, the PINEY TREE, which grows at Penang, and in the islands to the eastward of the bay of Bengal, and furnishes the beautiful straight spars called *Peon*. The resinous products of some species are valuable, and among them are some of the substances known by the name of TACAMAHACA (q. v.). *C. Inophyllum*, which yields true East Indian Tacamahaca, is a very large and beautiful umbrageous tree, often planted for its shade and the fragrance of its flowers, which are white and in loose axillary racemes. It is one of the most valuable timber-trees of the South Sea islands. The timber resembles mahogany, being of equally close texture, although of lighter colour, and very durable. The leaves are oblong and obtuse ; the fruit—which in all this genus is a globose drupe or stone fruit—is about the size of a walnut ; and a fixed oil is expressed from its kernel, which is used for lamps, &c. A similar oil is expressed from the seed of *C. Calaba*, the CALABA TREE of the West Indies, which also has white sweet-scented flowers, and of which the timber is used for various purposes, particularly for staves and cask-headings.

**CALO'RIC**, a term for Heat (q. v.).

**CALORIC ENGINE**. This was the name given by Captain Ericson to his latest *air-engine*. There seems no reason for the change of name, unless it were meant to distinguish it from the previously well-known, though hitherto unsuccessful air-engines of the Meers Stirling. We shall in this article treat air and calorific engine as synonymous terms.

It is a well-known law, applicable to all thermodynamic engines, that (presupposing the merely mechanical part of the machine to be perfect) the heat converted into work bears the same proportion to the total heat given to the fluid that the range of temperature bears to the highest *absolute* temperature of the fluid. Thus supposing an engine to receive steam\* at the temperature of  $275^{\circ}$  F., and discharge it at that of  $120^{\circ}$  F., the fraction of heat which it can convert into work will be  $\frac{275 - 120}{275 + 461}$  or about 21 per cent. of the total heat of the fluid. This proportion would be, of course, greatly reduced in practice, owing to imperfections in the machinery, but these being equally likely to occur in all prime movers, we need not consider them here. The lowest limit of temperature available being practically con-

\* The law is the same for steam, air, or any other fluid whatever.

## CALORIMETER—CALOTYPE PROCESS.

stant, fixed either by the temperature of the atmosphere, or that obtainable in a condenser; it follows that greater economy can only be looked for in the direction of increase of initial temperature. In ordinary steam-engines, in which the pressure and temperature increase simultaneously, the latter is limited by the former, which in its turn is kept by considerations of safety, comparatively low. When, however, superheated steam (steam to which additional heat has been imparted without the corresponding addition of pressure) or heated air is used, the temperature is limited only by the power of the metals composing the machine to resist the destructive action of heat, or the chemical action of the fluid at that temperature. Heated air possesses the advantage over superheated steam as a motive power, that with it an explosion, in the usual sense of the word, is rendered almost impossible, and that, if one were to occur, it would be comparatively harmless. It also, of course, enables the boiler to be dispensed with.

Air-engines, in their principal working parts, are very similar to ordinary steam-engines. The heated air is introduced into a cylinder, in which works a tightly fitting piston, which is thus compelled to move up and down, and transfers its motion to a revolving shaft by means of a piston and connecting-rod in the usual manner. The motion of the piston results in all cases from the expansion of the heated air; the air is heated by means of a furnace, is introduced below the piston, raises it, and then is allowed to escape into the atmosphere. Air-engines are almost invariably single-acting; they are sometimes worked simply by heated air, and sometimes with the air which, having passed through the furnace, is mixed with all the gaseous products of combustion. The latter method has the immense advantage that it utilises the heat which would otherwise be rejected into the chimney. The total efficiency of the machine is thus increased, although the efficiency of the engine proper, between the given pair of temperatures, remains the same.

The more heat carried away by the discharged air—the higher its temperature, in other words—the smaller evidently is, *ceteris paribus*, the range of temperature of the machine, and the less, therefore (as already explained), will be its efficiency. The distinctive principle of the Messrs Stirling's air-engine, as of the later C. E., consists in utilising a great part of this wasted heat, and thus economising fuel. This is effected by means of a 'regenerator,' or, more properly, 'economiser,' consisting of a chamber filled with metallic sieves of wire-gauze, through which the hot air is made to pass *outwards* from the cylinder, after having performed its work on the working-piston of the engine. As much of the heat of the escaping air is taken up by the regenerator, and its temperature thus reduced, the range of temperature of the machine is correspondingly increased. The fresh air entering the cylinder for the next stroke was compelled to pass *inwards* through the regenerator, and abstracted from it the heat left in it. In this way it did not require to receive so much heat in the furnace as would otherwise have been the case, and thus economised fuel.

This method of preventing waste of heat was first discovered by the Rev. Dr Stirling, who obtained a patent for it in 1816. In working with air at the ordinary pressure of the atmosphere, however, the engine was found to require to be of large dimensions as compared to a steam-engine of the same power; and in order to obviate this objection, compressed air was used, the idea originating with Mr James Stirling, C.E. Several other difficulties were successfully surmounted by the Messrs

Stirling, and eventually two improved engines were constructed, one of which was tested to fully 40 horse-power. This latter engine did all the work of the Dundee Foundry Company regularly for upwards of three years, during which period they employed no other motor. At the end of this period it was laid aside, principally owing to the repeated failure of one of the heating vessels.

Captain Ericsson, in his attempt to introduce his C. E. in the ship which bore his name, experienced precisely the same difficulties and disappointments, and tried nearly the same remedies as the Messrs Stirling. There seems little doubt, however, that he actually believed his 'regenerator' was to make the *same heat* do work over and over again—to be a kind of perpetual motion—and under these circumstances it is not to be wondered at that his machines (notwithstanding some not very creditable manoeuvring on the part of their upholders) entirely failed, and that in two years (1835) they were replaced by steam-engines.

An excellent popular development of the theory of air-engines, by the late Professor Rankine, will be found in the *Edinburgh Philosophical Journal*, January 1855.

CALORIMETER, a measurer of the degree of heat (q. v.).

CALOTROPIS. See MUDAR.

CALOTTISTES (*Le Régiment de la Calotte*), a society of witty and satirical men, in the time of Louis XIV., who were headed by two officers in the king's body-guard, named Torsac and Aimon. Their name was taken from the word *calotte* (a 'small cap,' worn by monks over the tonsure), and their amusement consisted in sending to any public character who had exposed himself to ridicule, a 'patent,' authorising him to wear the *calotte*, as a covering for the weak part of his head. The armorial bearings of the *Régiment de la Calotte* consisted of various symbols of folly, with the motto, 'C'est régner que de savoir rire.' When Torsac, its first 'generalissimo' died, the society—which occupied a position of satirical hostility to the French Academy—drew up a burlesque funeral oration, manufactured out of the pompously eulogistic phrases that the academicians were in the habit of using. As the society became audacious, and did not spare even royalty itself, it was dissolved by the minister Fleury. The *Mémoires pour servir à l'Histoire de la Calotte* (Basel, 1725) is an amusing little book. During the Restoration, the title *Régime de la Calotte* was applied to the priestly administration of affairs.

CALOTYPE PROCESS (Gr. *kalos*, beautiful, *typos*, impression), a title comprehending a variety of methods for the production of negative photographs on paper; and so named by the inventor, Mr Henry Fox Talbot, who exhibited the result of his experiments in the year 1840. The principle involved in the C. P. depends on the susceptibility to the action of daylight of a surface chemically prepared, and the practice consists in the preparation, and exposure in the camera, of a sheet of paper, having on one surface an even and finely divided layer of iodide of silver, nitrate of silver, and an organic acid; the image obtained on this surface being subsequently developed with gallo-nitrate of silver. It will be unnecessary here to describe the various modifications which have been introduced with the object of imparting a high degree of sensibility to the paper; one process—the best—will suffice to describe the manipulation.

Good English paper, sized with gelatine, should be chosen, the foreign starch-sized papers being unsuitable, on account of the solutions sinking in too deeply, and thus impairing that sharpness of

outline which should be possessed by a good negative. The paper is then floated on one side, and for a moment only, on a solution of iodide of silver in iodide of potassium; prepared by adding freshly precipitated iodide of silver to a strong solution of iodide of potassium. It is then dried, and plunged into a dish containing distilled water, which, by removing the soluble iodide of potassium, precipitates the iodide of silver in an even and finely divided condition over the whole surface of the paper, which in this state will keep good for twelve months. It is now ready to receive the sensitive coating; this operation, which is called exciting the paper, is performed in the following manner: Two solutions are prepared—one, a saturated solution of gallic acid in cold distilled water, called solution A; the other, a solution of 50 grains of nitrate of silver in one ounce of distilled water, to which one dram of glacial acetic acid has been added; this is called solution B. The iodised paper obtained as above is now laid on a board having a piece of clean blotting-paper on it a little larger than the paper to be excited, and the following solution brushed over it with a clean Buckle's brush—distilled water, 1 oz.; solution A, 15 drops; solution B, 15 drops. This mixture, prepared in a chemically clean glass vessel, should be freely applied, and the excess absorbed by clean blotting-paper. The paper is now ready for exposure in the camera, and may be at once placed in the dark slide; or a stock may be thus sensitised, and preserved between folds of blotting-paper until required for use. The time of exposure—varying from three minutes to a quarter of an hour—is determined by the diameter and focal length of the lens employed, the aperture of the diaphragm or stop, and the amount of light prevailing at the time. The development of the latent image, an operation which, like the preceding, is of course conducted in a room illuminated only by yellow light, is accomplished by applying freely and uniformly over the whole surface solution A; and when the image begins to appear, applying a second quantity, to which a few drops of solution B have been previously added, to increase the intensity. The whole operation of development occupies about a quarter of an hour; and when the details are fully out, the picture should be washed with water, and fixed, by immersion in a solution of 1 part of hyposulphite of soda to 4 parts of water; it is then again freely washed in frequent changes of water during several hours; it is lastly dried and waxed; when it may be regarded as a finished negative, from which positive prints may be obtained, having the lights and shadows as in nature. See POSITIVE PAINTING.

CALOYERS, a general name for the monks of the Greek Church. The name is a corruption of two Greek words, *kalos* and *gerón*, and signifies 'good old man.' The C. follow the order of St Basil, and are divided into three ranks: the novices, called *Archari*; the ordinary professed, called *Microchemi*; and the more perfect, called *Megalochemi*. It is always from among them that bishops and patriarchs are chosen, because they are generally members of the most distinguished families of the upper and middle classes. The C. also furnish the only learned theologians in Greece at the present day. Their monasteries are very numerous. The most celebrated in Asia is that of Mount Sinai, founded by the Emperor Justinian, and endowed with a revenue of 60,000 crowns. In Europe, Mount Athos alone has twenty, the inmates of which have so great a reputation for sanctity, that even the Turks seek an interest in their prayers. The C. are obliged to labour for the benefit of their monastery as long as they continue in it. Their religious services occupy an unnaturally large portion of their time, beginning

522

at midnight, and continuing at intervals until sunset. They observe four Lents: the first, of eight weeks, in commemoration of the resurrection of our Lord; the second, of three weeks, in honour of the holy apostles; the third, of fourteen days, in commemoration of the Assumption of the Virgin; and the fourth in commemoration of the Advent.—There are also female C., or Greek nuns, who likewise follow the rule of St Basil.

CA'LPEE, a city of Bundelkund, on the right bank of the Jumna, in lat. 26° 7' N., and long. 79° 48' E. In 1871, it had a population of 21,000. It is an entrepôt for the cotton of the neighbouring district. It has manufactures of cotton and paper, and is celebrated for the beauty of its refined sugar. It became British by capture and cession, respectively, in 1803 and 1806. It is 51 miles to the south-west of Cawnpore, and is closely linked with it in the history of the insurrection of 1857—1858, as the headquarters of the Gwalior Contingent.

CALPENTY'N, a long and narrow peninsula on the west side of Ceylon, in lat. 8° 14' N., and long. 79° 53' E. The neck is so low as to be overflowed during the north-east monsoon, so that it is transformed into an island.

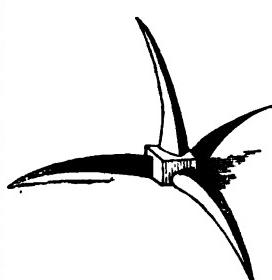

CALPU'RNIUS. The Calpurnia gens was, by its own account, one of the oldest plebeian clans in Rome; but it does not figure in history till the time of the first Punic war. The family names, in the time of the Republic, were Bestia, Bibulus, Flamma, and Piso.—MARCUS CALPURNIUS BIBULUS is known as the hostile but incapable colleague of Caesar (q. v.) in the consulate. He was put up by the aristocratic party, who spent vast sums to carry the election. He finally joined the Pompeian party, had command of the fleet intended to prevent Caesar's passage to Greece, and died 48 B.C., before the battle of Dyrrhachium. Among the Roman women of this family, two are celebrated—CALPURNIA, the daughter of Calpurnius Piso (consul 58 B.C.), and the last wife of Caesar, who seems, from the scanty notices of her we possess, to have been a quiet domestic woman, full of love and solicitude for her great husband; and CALPURNIA, the daughter of L. Calpurnius Bestia, wife of P. Antistius, who killed herself when her husband was murdered by order of the younger Marius, 82 B.C.

CALTANISETTA, a fortified town of Sicily, situated on a fertile plain near the Salsò, about 23 miles north-east of Girgenti. It has mineral springs and extensive sulphur-works. Pop. (1872) 26,156.

CA'LTHA. See MARSH MARIGOLD.

CALTO'NICA, a town of Sicily, about 15 miles north-west of Girgenti. It has pretty extensive sulphur-works and salt-works. Pop. 7000.

CA'L TROP, CA'LTHROP, or CA'LTHORP, in military warfare, is a four-pronged piece of iron, each prong about four inches in length. When it is wished to check the approach of the enemy's cavalry over a plain, or of his besiegers in the ditch of a fortification, caltrops are sometimes thrown down; from their shape, one prong is sure to stand upright, and may work terrible mischief to the enemy's horses or men.

Caltrop.

## CALUIRE—CALVELLO.

**CALUIRE**, a town of France, in the department of the Rhone, situated on the left bank of the Saone, about three miles north-north-east of Lyon. It has three annual fairs. Pop. (1872) 6773.

**CALUMBA**, or **COLO'MBO**, very extensively used in medicine, is the root of *Cocculus palmatus*, a herbaceous plant of the natural order *Menispermaceæ* (q. v.). It is said to derive its name from Colombo in Ceylon, although the C. now chiefly in use is the produce of Mozambique. The flowers in this genus have 12 sepals and petals in all, similar in appearance, and disposed in four rows. The male and female flowers are on separate plants. *C. palmatus* has nearly circular leaves with 5–7 lobes, on long hairy foot-stalks, and solitary axillary racemes of small green flowers, the racemes of the male plants branching. The fruit is a drupe, or 1-seeded berry-like fruit, about the size of a hazel-nut, densely clothed with long hairs. The stem is annual and twining; the root perennial, consisting of clustered spindle-shaped fleshy tubers, with a brown warty epidermis, and internally deep yellow. The plant is not cultivated: the root is collected where it grows wild in dense forests. It is dug up in March, cut into slices, or short cylindrical pieces, and dried in the shade. In this state it appears in commerce, having a greenish-yellow tint, a very bitter taste, and a faint aromatic odour. Its bitterness is ascribed to a somewhat narcotic principle called Calumbine, and to *Berberine*, an alkaloid originally discovered in the Barberry (q. v.), which is also present in it. C. is regarded as one of the most useful stomachics and tonics. It is demulcent, not at all stimulant, and capable of being employed in cases in which almost every other tonic would be rejected by the stomach. It is sometimes given to allay vomiting. It has been found very useful in diarrhoea and dysentery. It is administered in the form of powder, infusion, or tincture. Similar properties seem to reside in the roots of the species of *Cocculus* generally.—The very poisonous seed known by the name of *COCULLUS INDICUS* (q. v.), belongs to a plant of a different but allied genus.—The root of *Fraxera Walleri* is sometimes fraudulently substituted for C., and has been called American Calumba Root. It does not agree with C. in its properties, but, besides its very different appearance, it may be distinguished by its undergoing no such change of colour when touched with tincture of iodine, as in true C. Root is produced by the presence of starch. See *FRASERA*.

**CALUMET**, the ‘peace-pipe’ of the North American Indians, is a tobacco-pipe having a stem of reed about two feet and a half long, decorated with locks of women’s hair and feathers, and a large bowl of polished marble. It plays an important part in the conclusion of treaties, of which, indeed, it may be described as the ratifier. After a treaty

Calumet, or Pipe of Peace.

has been signed, the Indians fill the C. with the best tobacco, and present it to the representatives of the party with whom they have been entering into alliance, themselves smoking out of it afterwards. The presentation of it to strangers is a mark of hospitality, and to refuse it would be considered an act of hostility.

**CA'LUMNY**. An ancient regulation of the

Scotch law obliged litigants to give their *oath* of C.—that is, they swore, either by themselves or by their counsel, that the facts alleged by them were true, although in practice this oath was not usually put unless one of the parties required it of his adversary. In the modern practice, however, of the Court of Session, this oath is confined to actions for divorce, and other consistorial cases—the object being to guard against collusion between the husband and wife. See *DIVORCE*.

**CALUMNY, LAW AS TO.** See *LIBEL*.

**CALU'SO**, a town of N. Italy, in Piedmont, province of Turin, about 11 miles south of Ivrea, and connected with Turin by railway. Pop. 6000.

**CALVADOS**, a maritime department in the north-west of France, bounded N. by the English Channel, and E., W., and S. by the departments of Eure, Manche, and Orne. It is formed out of a part of the old province of Normandy. The principal rivers are the Touques, Orne, Dives, Seulle, Drome, and Vire. The coast, which has few bays or inlets, is partly formed by bold ridges, and partly by sand-downs, cliffs, and reefs. The reef extending between the mouths of the Orne and the Vire, called Calvados, after one of the vessels in the Spanish Armada shipwrecked here, and from which the department takes its name, is very dangerous to navigation. The soil of the department is generally fertile, especially in the valleys, supplying rich pastureage for horned cattle, sheep, horses, and swine, which constitute the principal wealth of Calvados. The climate is healthy, though changeable. Iron, marble, slate, and coal are found. There are various manufactures, and the coast-fisheries are of some importance. C. has an area of 2130 square miles, with a population in 1872 of 454,012, and is divided into six arrondissements. Caen is the capital.

**CALVAERT**, DIONYS, called also DIONISIO FLAMMINGO, a distinguished painter, especially in landscape, was born at Antwerp in 1555. He settled early at Bologna, where he opened a school, and had among his students the celebrated Domenichino, Guido, and Albani, who were afterwards, however, pupils of the Caracci. Many excellent pictures by him are still preserved at Bologna. He died in 1619.

**CALVARY, MOUNT**, the scene of our Saviour’s crucifixion, is an eminence which lay at the north-west, and just on the outside, of the ancient city of Jerusalem. Calvary, or Calvaria, is a translation into Latin of the Hebrew word Golgotha, signifying a ‘skull,’ either because the mount was a place of public execution, or because it was shaped like a human skull.

**CALVARY**, in Roman Catholic countries, is a representation of the various scenes of the passion and crucifixion of our Lord, either in a chapel, or external to the church, as at St Jacques at Antwerp. It consists of three crosses with the figures of Christ and the thieves, usually as large as life, surrounded by a number of figures, representing the various personages who took part in the crucifixion. At Aix-la-Chapelle, the C. is a church on the top of a hill, surrounded by twelve sculptured stones, each marking an event which took place on the journey of the Saviour to Mount Calvary. The approach to the C. is called the *Via Dolorosa*, each of the stones marking what is called a station, at which the pious say a prayer in passing.

**CALVELLO**, a town in the province of Basilicata, Italy, pleasantly situated on a hill-slope about 13 miles south of Potenza. It has two convents. Pop. 6550.

## CALVENTURA ISLANDS—CALVIN.

**CALVENTURA ISLANDS**, off the coast of Arracan, in the Bay of Bengal, their centre being in lat. 16° 53' N., and long. 94° 20' E. The group consists of two divisions—one to the south-east, which is composed of two lofty and well-wooded islets; and another to the north-west, which presents seven bare rocks, chiefly of fantastic shapes.

**CALVI**, a seaport on the island of Corsica, situated on a peninsula in the Gulf of Calvi, about 38 miles west-south-west of Bastia, lat. 42° 35' N., long. 8° 43' E. It is strongly fortified, and has a good port, with a high light at its entrance, and a considerable export trade. C. was captured by the English in 1794, after a siege of 51 days. Pop. 1746.

**CA'LVILLE**, a kind of apple, of which there are numerous sub-varieties. The calvilles diminish in thickness from the middle towards the calyx, where they form a point; they have regular ribs, and a large open seed-chamber; also a pleasant smell, and are unctuous to the touch. They are never altogether streaked; they have a fine loose flesh, with a flavour somewhat resembling that of the raspberry or strawberry. The White Winter C. is in high repute both as a culinary and dessert apple; it is very extensively cultivated on the continent of Europe.

**CALVIN**, JOHN, one of the most eminent of the reformers of the 16th c., was born at Noyon, in Picardy, on the 10th of July 1509. His father, Gerard Cauvin or Calvin, was procureur-fiscal of the district of Noyon, and secretary of the diocese. He was one of six children—four sons and two daughters. All the three sons who survived were bred ecclesiastics; and the reformer himself, while still only 12 years of age, was appointed to a chaplaincy in the cathedral church of Noyon. This he held as a means of support during the period of his education, and even for some short time after he had entered on his reforming career. C. was educated in circumstances of ease, and even affluence. The noble family of Mommor, in the neighbourhood, invited him to share in the studies of their children; he was in some measure adopted by them; and when the family went to Paris, in his 14th year, he accompanied them, and participated in the benefits of the higher instruction which was there attainable. He was entered as a pupil in the Collège de la Marche, under the regency of Mathurin Cordier, better remembered, perhaps, by his Latin name of Corderius. It was under this distinguished master that C. laid the foundation of his own wonderful mastery of the Latin language. During this early period, he was distinguished by the great activity of his mental powers, and the grave severity of his manners. His companions, it is said, surnamed him the ‘Accusative.’

For awhile, his attention was directed to the study of law. His remarkable talents seemed to promise great success in this branch of study, and his father sent him, with the view of prosecuting it, to the university of Orleans, then adorned by Pierre de l’Etoile, one of the most famous jurists of his day, and afterwards president of the Parliament of Paris. At Orleans, he continued the same life of rigorous temperance and earnest studiousness for which he was already noted. Beza says, that, after supping moderately, he would spend half the night in study, and devote the morning to meditation on what he had acquired. His undue habits of study seem to have laid thus early the foundation of the ill-health which marked his later years. It was while a law-student in Orleans that he became acquainted with the Scriptures, and received his first impulse to the theological studies which have made his name so

distinguished. A relative of his own, Pierre Robert Olivetan, was there engaged in a translation of the Scriptures; and this had the effect of drawing C.’s attention, and awakening within him the religious instinct which was soon to prove the master-principle of his life. We cannot say as yet that his traditional opinions were unfixed, or that he had embraced with any decision the Protestant opinions that were spreading everywhere; but the seeds of the new faith were now beyond doubt sown in his heart, and from this time, although he still continued for awhile longer to pursue his legal studies, his main interests appear to have been religious and theological. From Orleans he went to Bourges, where he acquired the knowledge of Greek, under the tuition of a learned German, Melchior Wolmar, to the influence of whose spiritual instructions he was also greatly indebted. He began here to preach the reformed doctrines, and passed over into the ranks of Protestantism, under the slow but sure growth of his new convictions, rather than under the agitation of any violent feeling. Here, as everywhere, his life presents a marked contrast to that of Luther.

He proceeded to Paris in 1533, which at this date had become a centre of the ‘new learning,’ under the teaching of Lefevre and Farel, and the influence of the queen of Navarre, sister of Francis I. The Sorbonne itself had not escaped the infection. There was a growing religious excitement in the university, in the court, and even among the bishops. This, however, was not to last. The king was soon stirred up to take active measures to quell this rising spirit; and the result was that C. and others were obliged to flee for their lives. The story is that C. narrowly escaped, having descended from his window by means of his sheets, and fled, under the guise of a vine-dresser, a friend of his, in whose clothes he concealed himself. After this he repaired for a short time to his native place, resigned the preferment he held in the Roman Catholic church, and for a year or two led a wandering life, sheltered in various places. We find him at Saintonge; at Nerac, the residence of the queen of Navarre; at Angoulême, with his friend Louis Tillet; then for a brief while at Paris again, strangely enough expecting a meeting with Servetus, who had expressed a desire to see and confer with him. Persecution against the Protestants at this time raged so hotly, that C. was no longer safe in France; and he betook himself to Basel, where he is supposed to have prepared the first edition of the *Institutes of the Christian Religion*, and whence he certainly issued, in the year 1535, the famous preface addressed to Francis I. The concentrated vigour of this address, its intensity of feeling, rising into indignant remonstrance, and at times a pathetic and powerful eloquence, make it one of the most memorable documents in connection with the Reformation. It is throughout a noble defence of the righteous character of the reformed doctrines, and their support alike in Scripture and in history. The energetic decisiveness and moral zeal of the future teacher and legislator of Geneva, speak in every page of it. After completing this great service to the cause of Protestantism, he made a short visit to Italy, to Renée, the Duchess of Ferrara. Finally, he revisited his native town; sold the paternal estate, which had devolved to him on the death of his eldest brother; and bidding adieu, set out in company with his younger brother and sister on his way to Strasburg. The direct road being rendered dangerous by the armies of Charles V., which had penetrated into France, he sought a circuitous route through Savoy and Geneva.

The result of this journey was memorable for the cause of the Reformation. Arrived in Geneva, he

met there his friend, Louis Tillet, who communicated the fact of his arrival to Farel, then in the very midst of his struggle to promote the Reformation in the city and neighbourhood. Farel hastened to see him, and urge upon him the duty of remaining where he was, and undertaking his share of the work of God, under the burden of which he was like to fail. C. did not at first respond to the call. He was given, he himself says, to his 'own intense thoughts and private studies.' He wished to devote himself to the service of the reformed churches generally, rather than to the care of any particular church. A life of intellectual and theological labour was that which at that time was most congenial to him. By some strange insight, however, Farel penetrated to the higher fitness of the young stranger who stood before him, and he ventured, in the spirit of that daring enthusiasm which characterised him, to lay the curse of God upon him and his studies if he refused his aid to the church of Geneva in her time of need. This seemed to C. a divine menace. 'It was,' he said, 'as if God had seized me by his awful hand from heaven.' He abandoned his intention of pursuing his journey, and joined eagerly with Farel in the work of reformation.

Such was the beginning of C.'s great career in Geneva. Having entered upon his task, he soon infused an energy into it which crowned the struggling efforts of Farel with success. The hierarchical authority was already overturned before his arrival; the citizens had asserted their independence against the Duke of Savoy, whose alliance with the corrupt episcopate, which was the direct governing influence in the place, had called forth the patriotic as well as the religious feelings of the people. The magistrates and people eagerly joined with the reformers in the first heat of their freedom and zeal. A Protestant Confession of Faith was drawn out, approved of by the Council of Two Hundred, the largest governing board of the city, and then proclaimed in the cathedral church of St Peter's as binding upon the whole body of the citizens. Great and marvellous changes were wrought in a short time upon the manners of the people; where licence and frivolity had reigned, a strict moral severity began to characterise the whole aspect of society. The strain, however, was too sudden and too extreme. A spirit of rebellion to the rule of the reformers broke forth; they refused to yield to the wishes of a party animated by a more easy and liberal spirit than themselves, and known in the history of Geneva under the nickname of Libertines; and the consequence was, that they were both expelled from the city after less than two years' residence.

C. retreated to Strasburg, where he had meant to go when arrested in his course at Geneva. Here he settled, and devoted himself to theological study, and especially to his critical labours on the New Testament. Here, also, in October 1539, he married the widow of a converted Anabaptist. The marriage appears to have proved a happy one, although not of long duration.

The Genevans found, after a short time, that they could not well get on without Calvin. His rule might be rigid; but an authority, even such as his, which might gall from its severity, was better than no settled authority at all; and the libertine party seem to have been unable to construct any efficient and beneficent form of government. Accordingly, they invited C. to return; and after some delay on his part, in order to test the spirit in which they were acting, he acceded to their invitation, and in the autumn of 1541, after three years' absence, once more made his entry into Geneva.

Now, at length, he succeeded in establishing his

plan of church-government, in all its forms and details. By his College of Pastors and Doctors, and his Consistorial Court of Discipline, he founded a theocracy, with himself at the head of it, which aimed virtually to direct all the affairs of the city, and to control and modify both the social and individual life of the citizens. Not without a struggle, it may be supposed, did he succeed in his great autocratic scheme. The Libertines, although dishonoured by their ineffectual attempts to maintain order in the city, and uphold its rights and dignity, still remained a strong party, which was even augmented, after C.'s return, by men such as Amy Perrin, who had strongly concurred in the invitation to C., but who were afterwards alienated from him by the high and arbitrary hand with which he pursued his designs, as well as by their own schemes of ambition. The struggle with this party lasted with various fortune for no less a period than fifteen years, and was only terminated in 1556, after a somewhat ridiculous *émeute* in the streets. Amy Perrin and others, driven from the city, were executed in effigy; and the reformer's authority from this date confirmed into an absolute supremacy.

During the period of this long struggle with the Libertines, C. had many other disputes, in which he conducted himself with no less heartiness and zeal. The most remarkable of these were his controversies with Sebastian Castellio, Jerome Bolsec, and above all, Michael Servetus.

C. had become acquainted with Castellio at Strasburg. They entertained at first a warm friendship for each other, and C. shewed great zeal in assisting Castellio, whose poverty and learning had attracted his sympathy. When he returned to Geneva, he invited Castellio to join him there, and procured for him the title of Regent or Tutor in the gymnasium of the city. There was little similarity, however, in the characters of the two men, and the diversity of their tastes and views soon became apparent. The learning of Castellio was intensely humanistic; a classical spirit and a somewhat arbitrary opinionativeness moulded all his studies; and as soon as he began to apply himself to theology, he came into conflict with Calvin. In a letter to Farel in 1542, we find C. speaking of the freaks of 'our friend Sebastian, which may both raise your bile and your laughter at the same time.' These freaks relate to Castellio's notions of Scriptural translation, and his refusal of C.'s offer to revise the version which he had made of certain parts of Scripture. Then, two years later, when Castellio desired to enter into the ministry, C. dissuaded the council from accepting him, on account of some peculiar opinions which he held. These were certain rationalistic views as to the authenticity and character of the Song of Solomon, the descent of Christ into hell, and also about election. After this, Castellio left Geneva for awhile, but soon returning, he attacked the views of C. openly. After a violent scene in church, which is painted in C.'s letters very strongly, he was forced to leave the city. The two old friends, now declared enemies, did not spare each other henceforth. The fate of Servetus drew forth an anonymous publication, attacking with keen logic and covert and ingenious sarcasm the Genevan doctrines. This publication was attributed by both C. and Beza to Castellio, and they replied to him in no measured terms, stigmatising him as a 'deceiver and vessel of Satan.' One fact really disgraceful to C. in the controversy deserves not to be passed over. Sunk in great poverty, Castellio was obliged, in his old age, to gather sticks on the banks of the Rhine at Basel, as a means of support. C. did not hesitate to accuse

him of stealing the sticks. Such polemical truculence may well make us turn away in disgust and indignation.

The controversy with Bolsec belongs to a later period. Jerome Bolsec was originally a Carmelite monk, but he had thrown aside the habit, and taken himself to the practice of medicine in Geneva. He was led to attack C.'s doctrine of predestination. As soon as C. heard of this, he led him to understand that he was not at liberty to question the Genevan doctrine. He and the other clergy dealt with him; but after repeated disputations Bolsec was found incorrigible, and was sentenced to banishment from the city. Cast out of the theocratic community, he ultimately rejoined the Roman Catholic Church, and revenged himself in a somewhat mean way against C. by writing his life in a spirit of detraction and slander.

Of all these contests, however, the most memorable is that with Servetus. A melancholy interest encircles the name of this great heretic, which the criminal tragedy of his death keeps always fresh and vivid in the minds of all who hate intolerance, and who love truth rather than dogmatism. The character of Servetus himself has little to do with this interest. He seems to have been more of a vain, restless, and enthusiastic dreamer, than of a calm and patient inquirer. In his very dreams, however, and the vague audacities of his speculation, there is a kind of simplicity and unconscious earnestness that wins sympathy. He had entered into various connections with C., even from the time of his early residence in Paris; particularly, he had sent him various documents containing the views, fully developed in his work subsequently published under the title of *Restitutio Christianismi*. C. never concealed his abhorrence of these views; and in a letter to Farel as early as 1546, he threatens that if Servetus should come to Geneva, he would do what he could to bring him to condign punishment: *Nam si venerit, modo valeat men arthritas, vivum extre nunquam patiar*. The history of his seizure and condemnation at Vienne by the Catholic authorities, and especially of C.'s share in the correspondence which led to his seizure, is very complicated and obscure. It has been maintained that C. was the instigator, through a creature of his own of the name of Trie, of the whole transaction; it is certain that he forwarded to the authorities, through Trie, private documents which Servetus had intrusted to him, with a view to the heretic's identification, and as materials for his condemnation. Servetus was sentenced to be burned, but effected his escape, and, after several months' wandering, he was found at Geneva. It was his intention to proceed to Italy, where he hoped his opinions might meet with some degree of toleration, and he arrived at Geneva on his way. This is the explanation of an event otherwise unaccountable. Having ventured to church, according to the common account, he was recognised, apprehended, and conveyed to prison by C.'s order, just as he was about to leave the city. The particulars of his trial are full of interest, but too lengthened to be detailed here. It lasted, with various interruptions, for two months. He attacked C. with the most foul epithets, and C. retorted with a virulence and foulness quite equal to his own. At length, on the 26th of October 1553, sentence was passed upon Servetus, condemning him to death by fire. C. used his influence to have the mode of death alleviated, but without success. On the very next morning, the sentence was put into execution. On an extended eminence at some distance from the city, Servetus was fastened to a stake surrounded by heaps of oak-wood and leaves,

with his condemned book and the MS. he had sent to C. attached to his girdle; and, amid his agonising cries, the fire was kindled, and the wretched man expiated his heresy amidst the flames. Whatever apologies may be urged for this memorable crime, it must remain a mournful and scandalous blot on the history of the Reformation. The disgrace of it has particularly attached to C., and with some justice, from the special and unhappy relation which he bore to the whole transaction; but most of the Reformers are no less implicated in it. The wise Bullinger defended it, and even the gentle Melanchthon could only see cause for gratitude in the hideous tragedy.

After the execution of Servetus, and the expulsion of the Libertines, two years later, C.'s power in Geneva was firmly established, and he used it vigorously and beneficially for the defence of Protestantism throughout Europe. By the mediation of Beza, he made his influence felt in France in the great struggle that was there going on between the hierarchical party, with the Guises at its head, and the Protestants, led by Condé and Coligny. In 1561, his energies began to fail. He had been long suffering from bad health, but his strength of will and buoyancy of intellect sustained him amid all his bodily weakness. In the year now mentioned, his bad health greatly increased, and although he survived for more than two years, he never regained any vigour. He died on the 27th of May 1564.

Very different estimates, it may be imagined, have been formed of C.'s character, according to the point of view from which it is contemplated. None, however, can dispute his intellectual greatness, or the powerful services which he rendered to the cause of Protestantism. Stern in spirit, and unyielding in will, he is never selfish or petty in his motives. Nowhere amiable, he is everywhere strong. Arbitrary and cruel when it suits him, he is yet heroic in his aims, and beneficent in the scope of his ambition. Earnest from the first, looking upon life as a serious reality, his moral purpose is always clear and definite—to live a life of duty, to shape circumstances to such divine ends as he apprehended, and, in whatever sphere he might be placed, to work out the glory of God.

He rendered a double service to Protestantism, which, apart from anything else, would have made his name illustrious: he systematised its doctrine, and he organised its ecclesiastical discipline. He was at once the great theologian of the Reformation, and the founder of a new church polity, which did more than all other influences together to consolidate the scattered forces of the Reformation, and give them an enduring strength. As a religious teacher, as a social legislator, and as a writer, especially of the French language, then in process of formation, his fame is second to none in his age, and must always conspicuously adorn the history of civilisation. Among C.'s most important works are: *Christianae Religionis Institutio* (Basel, 1536); *De Necessitate Reformanda Ecclesie* (1544); *Commentaries sur la Concordance ou Harmonie des Evangelistes* (Gen. 1561); *In Novum Testamentum Commentarii* (edited by Tholuck, in 7 vols., Halle, 1833—1834); *In Libros Psalmorum Commentarii* (edited by Tholuck, 1836); *In Librum Genesim Commentarii* (edited by Hengstenberg, 1838). A collection of C.'s Letters, compiled from the original MSS., and edited with historical notes by Dr Jules Bonnet, were translated into English by D. Constable, 2 vols., 1855—1857. The best edition of C.'s whole works is that of Amsterdam, 1671, in 9 vols. fol. By the 'Calvin Translation Society,' in Edinburgh, his works have been collected, translated into English, and issued

## CALVINISM—CALYPTRÆA.

in 51 vols. 8vo, 1843—1855, a series of books procurable at a moderate price.

CALVINISM is the system of religious doctrine associated with the name of Calvin, and supposed to distinguish the churches more particularly called the Reformed, in contradistinction to the Lutheran and Anglican churches. Calvin's doctrinal views are laid down at length in his *Institutio Christianæ Religionis*, first published in 1536. It was not till many years later, however, that the name of C. came to be attached to a certain set of doctrinal opinions, and not till the rise of Arminius (q. v.) and the synod of Dort (q. v.) in 1618, that these opinions may be said to have been polemically marked off from others with which they are generally contrasted, and to which they are recognised as standing in opposition.

The difference of thought expressed in the Arminian and Calvinistic systems is as old as the history of Christian doctrine. In almost every point, Augustine may be said to have anticipated Calvin; while Pelagius and the eastern divines, such as Chrysostom, represented a type of opinion upon the whole consonant to that which in more modern times has been opposed to Calvinism. In the Roman Catholic Church, since the Reformation, the same opposition of thought has presented itself in the famous contest of Jansenism and Jesuitism.

The main point of distinction in the two systems or modes of Christian opinion, is as to the operation of divine grace in the salvation of sinners. In the one system, this operation is considered as predetermined and absolute; in the other, as merely prescient, and in some sense conditioned. *Predestination* and *Irresistible Grace* are the great key-notes of C.—its two main points. Others were added in opposition to Arminianism—viz., *Original Sin*, *Particular Redemption*, and the *Perseverance of the Saints*; but the first of these is not peculiarly Calvinistic, and the last two are merely corollaries from the doctrines of Predestination and Grace. Predestination is, in fact, the one distinguishing doctrine of the system, as it was of Augustinianism, of which C. was merely the revival. The divine will, apprehended as decreative and predestinating, is necessarily *irresistible* in its efficacy, *select* in its objects, and *persevering* in its results. The characteristic of C., therefore, is that it is a speculative Christian system, springing from a single great principle, carried out rigorously into all its logical consequences.

The Church of England, in its earlier history, was Calvinistic in its creed, although mediæval and Catholic in its ritual. Puritanism was nothing else than a movement to reduce it altogether to a Calvinistic model. In the re-action which followed this movement, the Church of England, while retaining its original articles, nearly parted with its Calvinistic faith; and throughout the 18th c., its chief divines are conspicuously Arminian or latitudinarian. But with the revival of the evangelical party in the end of the century, C. revived; and it still maintains, if not an absolute sway, yet a powerful influence over many minds in the Anglican establishment, while it is the professed creed of a great proportion of the dissenters.

The Church of Scotland, along with the other Presbyterian churches in this country, and the large and numerously increasing bodies of Presbyterians in America, all hold to the Westminster Confession of Faith, the most elaborate and formal expression of Calvinistic doctrine that exists. But while holding to the same Calvinistic standard, these churches shew many varieties of actual opinion; and in the history of Presbyterianism, C. has shewn a tendency in its logical development to pass into

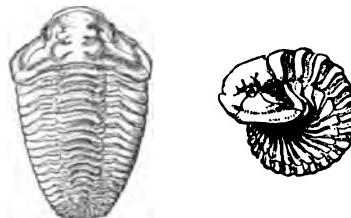

Rationalism or Unitarianism. This is conspicuously the case in the church of Geneva itself, and some of the old Puritan churches of America. It still remains, however, as opposed to Arminian, Socinian, or any cognate forms of the same type of doctrine, the most living and powerful among the creeds of the Reformation.

CALX is the Latin term for quicklime. As quicklime is produced by burning limestone, the alchemists applied the term C. to the product obtained by burning any ore or other mineral substance; and calcination (q. v.) to the process.

CALYCA'NTHUS (Gr. calyx-flower), a genus of plants of the natural order *Calyanthaceæ*, an order allied to *Rosaceæ*, and of which only a few species are known, natives of North America and Japan—shrub, with square stems, which are of remarkable structure, having around the central woody axis four smaller imperfect ones. An aromatic fragrance characterises this order. In the genus C., the bark and leaves possess it as well as the flowers. The bark of *C. floridæ*, a native of Carolina, has been used as a spice and carminative, and has acquired the name of Carolina Allspice, or American Allspice. The flowers are of a chocolate colour.

CALYDO'NIAN BOAR. Once upon a time, according to a Greek myth, a certain Eneus, king of Calydon, the ancient capital of Aetolia, omitted a sacrifice to Diana, whereupon the goddess, in her rage, sent into his fields a frightful boar, which committed great devastation. No one had the courage to hunt it except Meleager, the son of Eneus, who, calling to his help the bravest heroes of Greece—Theseus, Jason, Nestor, and others—pursued and slew the monster. Later writers, however, affirm that he found it impossible to destroy the animal, until Atalanta, his mistress, aided him by piercing it with an arrow.

CALYMENE, a genus of the fossil order Trilobites (q. v.). It differed from the other genera of the order in the individuals having the power of rolling themselves into a ball, so that they are often found

*Calymene Blumenbachii.*

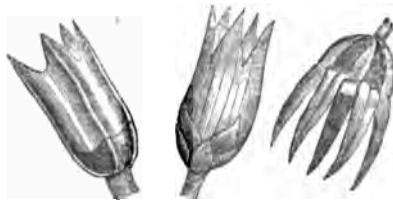

coiled up like an oniscus, i. e., hog-louse—*vulgo*, a slater. The genus is characteristic of the Silurian formation. The species we figure has been long known as the 'Dudley Locust.' It is remarkable as a very long-existing species, passing from the Caradoc beds to the Ludlow rocks. Twenty species have been described.

CALYPSO, in Grecian legend, was, according to Homer, the daughter of Atlas, and inhabited the solitary wooded isle of Ogygia, far apart from all gods and men. Ulysses being thrown upon her island by shipwreck, she treated him kindly, and promised him immortality if he would marry her. He was fascinated by her charms, but unwilling to desert his wife and his native land; she detained him, however, seven years, and bore him two sons. On his departure, she died of grief.

CALYPTRÆ'A (Gr. *kalyptra*, a head-dress), a

genus of gasteropodous mollusks, of the order *Pectinibranchiata*, the type of a family, *Calyptreidae*, formerly included in the genus *Patella*, or Limpet, when the mere form of the shell was more regarded in classification than the structure of the animal, and still known as Chambered Limpets, Cup-and-Saucer Limpets, Bonnet Limpets, and Slipper Limpets. The shell is limpet-shaped, but the apex is more or less spiral, and has a calcareous process from its inner surface for the attachment of a principal muscle. The *Calyptreidae* differ much in shape, some being very flat, and others very conical; some elongated and slipper-like. The species are generally natives of the shores of warm climates. Only two are British.—*Calyptreidae* are common in the older fossiliferous rocks.

CA'LYX (a term originally Greek), in Botany, the outermost of the circles of modified leaves which surround the parts of fructification, and along with them constitute the flower. Within the C. there is generally at least a second circle of leaves, called the corolla (see COROLA and FLOWER); but this is sometimes wanting, and the C. is the only envelope of the parts of fructification. The leaves of which

Calyx of Thorn Apple, Pink, and Campanula.

the C. is composed are called *sepals*, when quite separate from each other; but they often grow together into a tube at the base, and the C. is then said to be *monosepalous* or *gamosepalous* (*mono*, one; *gamos*, union). The sepals are generally simple and without stalks; they are generally green, and differ much less widely from ordinary leaves than the petals or leaves of the corolla; sometimes, however, they are *petaloid*, and brightly coloured, as in *Fuchsia*. The C. and corolla of many endogenous plants resemble one another almost completely, and the common term *perianth* (q. v.) is then very generally employed. In some plants, the C. passes insensibly into the corolla, and it is not easy to distinguish the innermost sepals from the outermost petals. The C. is in such cases often composed of more circles of leaves than one. The C. occasionally falls off when flowering is over (*deciduous*), as in *Ranunculus*; sometimes even when it commences (*aducent*), as in the poppy; generally it remains till the fruit is ripe (*persistent*), and is then much enlarged and more brightly coloured, as in *Phytoecia*. It often becomes fleshy, and forms the seeming fruit, as in the rose.—The glumes (q. v.) of grasses, &c., used to be regarded as a C., to which, however, they have no proper analogy.

CAM, or GRANTA, a river of England, which, rising in Essex, flows north-east through Cambridgeshire, and after a course of about 40 miles, joins the Ouse 3½ miles above Ely. It gives its name to the town of Cambridge, which stands upon it, and below which it is navigable, and is classic on account of the boat-races on it by Cambridge students.

CAMAL'DOLITES, a religious order founded in the vale of Camaldoli, near Arezzo, in the Apennines, in 1018, by St Romuald, a Benedictine monk, and a

member of the noble family of the Dukes of Ravenna. From Italy it spread into France, Germany, and Poland. The brethren, who wear a white garment, are, and have always been, characterised for the excessive rigidity of their monastic rule; but except to shew to what lengths in a cruel mortification of natural life man can proceed, they have been practically useless in the world. The order is now almost extinct.

CAMARGUE. See BOUCHES DU RHONE.

CAMARI'LLA, a Spanish word, diminutive of *camara*, literally signifies a little chamber. As *camara* is used to designate, *par excellence*, the chamber of the king of Spain, the royal chamber, so C. is also used to designate his private chamber or cabinet, the place where he receives his most intimate friends, courtiers, sycophants, and all the moral refuse that naturally gathers round a weak throne. Hence, in the political language of modern Europe, it has come to signify the influence exercised on the state by secret and unaccredited councillors, in opposition to the opinions of the legitimate ministry, an influence which in Spain particularly is most pernicious. The word first obtained this meaning in the time of Ferdinand VII., who was excessively addicted to the unkingly habit of listening to the insinuations of the companions of his pleasures.

CAMAY'EU AND MO'NOCHROME are terms by which painting in one colour is designated. The ancients painted thus both in gray (*en grisaille*) and in red. Pictures of several tints, but where the natural colours of the objects are not copied, are said to be *en camayeu*. As one colour generally prevails, we speak of blue, red, yellow, green camayeu. Polidori Caravaggio, for example, so overlaid his other colours with brown, that his works give the impression of monochrome paintings. Drawings in Indian ink, red and black chalk, pencil, &c., as well as engravings, may be said to be *en camayeu*.

CAMBACÉRÈS, JEAN JACQUES RÉSOU, Duke of Parma, and High Chancellor of the French Empire, under Napoleon, was born at Montpellier, October 18, 1753. In 1791, he was appointed president of the criminal court in his native place. Afterwards, as member of the National Convention, he took a prominent part in sketching the new code of laws, and distinguished himself by his moderation. He denied the right of the Convention to condemn the king, and, when this was done, argued in favour of a reprieve. After the revolution of the 9th Thermidor (July 27, 1794), C. was elected president of the Convention, and, as head of the Committee of Public Safety, was active in procuring peace with Prussia and Spain. His enemies having succeeded in expelling him from office, he engaged himself in legal studies, and laid before the council of Five Hundred the sketch of a civil code which afterwards formed the basis of the *Code Napoleon*. In 1796, C. was for a short time made president of this council. After the changes made in the Directory, he was made Minister of Justice, assisted in the revolution of the 18th Brumaire (November 9, 1799), was made Second Consul, and faithfully attached himself to the interest of Napoleon, by whom he was raised to the office of High Chancellor of the Empire, and in 1808 was made Duke of Parma. He endeavoured to dissuade Napoleon from the projected invasion of Russia, but in this instance his advice was vainly given. In 1813, when Napoleon took the field against the allies, C. was left as president of the regency, and in this capacity accompanied the empress to Blois, 1814. From this place he sent to Paris his vote for the abdication of Napoleon. During the Hundred Days,

## CAMBAY—CAMBRAI.

against his own will, he was made Minister of Justice, and President of the Chamber of Peers. After the second restoration, C. lived privately in Paris for some time; but in 1816, was exiled for having taken part in the execution of Louis XVI. In 1818, his civil and political rights were restored, and he returned to Paris, where he lived retired to the time of his death, March 5, 1824. Among the men of the Revolution, C. was one of the few whose activity was peaceable and truly progressive. His services in the establishment of law were great. His nature was mild and candid, and his intellect very acute.

**CAMBAY**, a city, district, and gulf at the north-west extremity of the peninsula of Hindustan.—1. C., the city, stands at the head of its gulf, and on the right bank of the Myhee, in lat.  $22^{\circ} 18' N.$ , and long.  $72^{\circ} 39' E.$ , being 76 miles to the north-north-west of Surat. It contains about 10,000 inhabitants, having been at one time much more populous—ruinous palaces, mosques, and tombs, and an excavated temple of considerable pretensions, attest its former magnificence and extent. The main cause of its decay has been the gradual obstruction of its seaward navigation. It still exports grain, cotton, and ivory, besides its renowned manufactures in bloodstone and carnelian.—2. C., the district, contains an area of 350 square miles, stretching in N. lat. from  $22^{\circ} 9'$  to  $22^{\circ} 41'$ , and in E. long. from  $72^{\circ} 20'$  to  $73^{\circ} 5'$ . It is attached to the presidency of Bombay, though under the government of a nawab of its own. Pop. 175,000.—3. C., the gulf, extends in N. lat. between  $21^{\circ}$  and  $22^{\circ} 10'$ , and in E. long. between  $71^{\circ} 50'$  and  $72^{\circ} 40'$ , measuring 80 miles in length, and averaging 25 in breadth. In proportion to its size, it receives a vast quantity of fresh water—on the west, the Gooma, Oolowtee, Gelya, and Setroonjee; on the north, the Saburmuttee and Myhee; and on the east, the Nerbudda and the Taptee. The inundations of so many rivers, and the ebb and flow of tides, which fall and rise 30 feet, conspire not only to elevate the bottom, but also to generate movable quicksands.

**CAMBER**, in Ship-building, implies a slight arching or convexity upwards. A 'cambered' ship is one in which the floor is higher in midships than at the stem and stern.—The name 'camber' is also given to a small dock in a dockyard, for containing boats, and for loading and unloading timber.

**CA'MBERWELL**, once a rural village, now a suburb of London, on the south side of the Thames.

Camberwell Beauty:  
a, larva or caterpillar; b, pupa;  
c, perfect insect;

the colours rich and velvety. The margin of the

wings exhibits tooth-like angularities. The antennae are terminated by a knob. The caterpillar feeds on the willow. It is black, with white dots and a row of large red spots down the back, and is rough with soft spines.—When Camberwell was more rural than now, and abounded in willows, this butterfly was sometimes taken there.

**CA'MBIO, CA'MBIST.** The former of these two words is the Italian for *exchange*; the latter, for a *money-changer*. Cambist is also used figuratively as the title of a book in which the moneys, weights, measures, &c., of various nations are given in the equivalents of some particular one. For instance, Kelly's *Universal Cambist* gives these in English, and the *Cambista Maltese* in Italian.

**CA'MBIUM** (Lat. *cambio*, to change), in Botany, a layer of mucilaginous viscid matter, particularly abundant in spring, interposed between the woody layers and the bark of trees and other stems. Delicate cells (*Cambium cells*) are formed in it, which certainly fulfil important functions in the formation of new wood, although, notwithstanding much investigation by some of the greatest vegetable physiologists of our time, the nature of these functions is still very imperfectly ascertained. The medullary rays are connected with the C. cells, and these cells gradually elongate into the shape which belongs to those of woody tissue. The C. layer is found only in exogenous stems.

**CAMBO'DIA, or CAMBO'JA** (native name, *Kan-pou-chi*), an extensive country of the Indo-Chinese Peninsula, formerly a feudal dependency of Siam; now, lying as it does to the north and east of the French portion of Cochin-China, a protectorate of France. The present ruler was crowned at Houdon, the capital of C., in 1864. He has accorded to his protector, France, the right of settlement on the river Cambodia, at the point where its four arms meet before descending into the sea. See COCHIN-CHINA.

**CAMBO'GE.** See GAMBOGE.

**CA'MBORNE**, a town of Cornwall, 11 miles north-west of Falmouth. It is surrounded by very productive copper, tin, and lead mines. C. church has a stone inscription of the 10th century. Pop. (1871) 7757.

**CAMBRAI**, a city of France, in the department of the Nord, about 32 miles south-south-east of Lille. It is situated on the right bank of the Scheldt, is strongly fortified and well built, with tolerably wide, but irregular streets, and many picturesque old houses. The cathedral, archiepiscopal palace, town-house, and theatre are among the principal public buildings. The city was greatly injured in 1793, when the revolutionists, among other vandalism, razed the fine cathedral. They also disentombed the remains of Fénelon, who was archbishop here, and melted his lead coffin into bullets. A monument, however, by David the sculptor was erected (1825) in the new cathedral, in memory of the immortal author of *Télémaque*. The manufactures of the city are important, consisting of cambric—so called from its manufacture here—linen-thread, lace, cotton-yarn, beet-root sugar, soap, starch, leather, &c. It has also a trade in agricultural produce. The population, in 1872, was 19,156.

C. was known to the Romans under the name of *Camaracum*, and it was then one of the chief cities of the Nervii. It was fortified by Charlemagne, and was long governed by its own bishops, to whom Charles the Bald ceded it. The celebrated league against the republic of Venice, which comprised the pope, the emperor of Germany, and the kings of France and Spain, was entered into here in 1508.

## CAMBRIA—CAMBRIDGE.

and takes its name from the city. Here also were concluded treaties between the French king and the German emperor in 1529, and in 1724—1725 between Charles VI and Philip V. of Spain. During 1815—1818 it was the head-quarters of the British army of occupation.

CA'MBRIA, the ancient name of Wales, the Britannia Secunda of the Romans. The name is derived from that of Cimbri or Cymri, by which the Welsh have always called themselves. See BRETTA AND SCOTS.

CAMBRIAN ROCKS, the name given by Professor Sedgwick to the oldest known fossiliferous rocks, on account of their extensive development in North Wales. Their true limits have been the subject of considerable controversy. When Sedgwick first described them, they were considered inferior to the Silurian measures. Subsequent examination has shewn that they are the equivalents of rocks previously described by Murchison as Lower Silurian; and accordingly, geologists generally, following the classification of the government geological surveyors, confine the term to an extensive series of gritstones, sandstones, and slates, which underlie the Silurian Lingula beds. In Anglesea, these rocks have been metamorphosed in one place into chlorite and mica schists; in another, into gneiss, and all traces of organisms have been destroyed. In North Wales they are less altered, but have as yet proved unfossiliferous. In the Longmynd (Salop), there is an apparent thickness of 26,000 feet, which may be, however, owing to folds in the beds. A few fossils have been noticed here, consisting of a fucoid plant or two, the tracks of annelids, and the fragments of a supposed trilobite, called *Palaeopyge Ramsayi*. In Ireland, similar rocks occur, containing two species of a small branched zoophyte, named *Oldhamia*, and numerous tracks and burrows of sea-worms.

CA'MBRIC, a general term applied to the finest and thinnest of linen fabrics. It is said to be derived from Cambrai, where such goods were first made. Some of the finest cambries of the present day are produced in Switzerland. Scotch C. is really a muslin, being made of cotton with the fibre twisted very hard, to imitate real or linen cambria.

CA'MBRIDGE, the chief town of the county so named, lies 48 miles north-north-east of London. It takes its name from the river Cam, which was anciently called the Granta. By the Saxons, C. appears to have been known as GRANTABYCGE, which is found with many slight variations of spelling, and probably became abbreviated into CANTARIOON. It is also supposed that C., and not the adjacent village of Grantchester, was the GRANTMASTER of the Saxons. There are, however, traces of a camp at Grantchester. In 870, the Danes ravaged the country hereabouts, and are said to have destroyed the town. King John, in the second year of his reign (1200 A.D.), granted a charter to the town, permitting it to have a guild of merchants, and in 1207, confirmed the burgesses in their privileges in perpetuity. In 1225, they paid a fine of 50 marks for having their liberties; and in 1227, Henry III confirmed their charters. The town has sent two members to parliament from the earliest period. The university sends two members of its own. The population of the municipal borough in 1871 was 30,078, that of the parliamentary borough, 33,996. C. has 18 churches belonging to the Church of England, besides chapels belonging to the Baptist, Congregationalist, and other bodies. The most curious church is that of the Holy Sepulchre, which is one of the few in England that have a round tower. The town is not generally pretty or

picturesque, but the gardens at the backs of the colleges, by the Cam, are extremely beautiful in the summer months. Its architectural features depend chiefly on the college and university buildings.

CAMBRIDGE, UNIVERSITY OF, one of the two ancient institutions of the kind existing in England. Overlooking several fabulous accounts of its origin, its true history may be said to begin at the opening of the 12th century. It was in 1110 that Joffrid, Abbot of Croyland, sent over to his manor of Cottenham, near Cambridge, Gislebert, his fellow-monk and professor in divinity, with three other learned monks. These came over to Cambridge, and in a hired barn taught their sciences, and in a short space of time drew together so great a number of scholars, that in the second year of their coming no single building was able to contain them. Perhaps even this statement is doubtful. At anyrate, when Alfred of Beverley was student here—viz., 1129 A.D.—there were as yet no public halls or hostels, but each one lived in his own hired lodging.

The first regular society of students was that of Peterhouse, founded in 1257. About this time, students began to live together in hostels, under the rule of a principal, at their own charges. These hostels were named after the saints to whom they were dedicated, the churches which they adjoined, or the persons who formerly built or possessed them. In the year 1280, there were as many as 34, and some of them contained from 20 to 40 masters of arts, and a proportionate number of younger students; but all these hostels decayed by degrees when endowed colleges began to appear. Trinity hostel survived all the rest, and continued to 1540. The hostels were the beginning of what may be called the college system, which distinguishes the sister-universities of Oxford and Cambridge from those of Edinburgh, London, and the continent. See UNIVERSITIES.

It was between the latter part of the 13th and the close of the 16th century that all these royal and religious foundations were endowed which now constitute the university. Hugh de Balsham has the honour of being the first benefactor in this way. Michael House was founded by Harvey de Stanton in 1324, and King's Hall by Edward III. in 1332, both of which were absorbed into Trinity College by Henry VIII. in 1546. Clare Hall, as it used to be called, one of the earliest, and now one of the prettiest colleges in Cambridge, was founded by the Countess of Clare in 1326. Henry VI. has left himself an imperishable monument in the splendid foundation of King's College; and his queen, Margaret, commenced the foundation of Queens' College, which was added to by Elizabeth Widville, queen of Edward IV. Lady Margaret, Countess of Richmond and Derby, mother of Henry VII., founded Christ's College and St John's at the beginning of the 16th c., and also the Divinity Professorship named after her. Henry VIII. appropriated part of the spoils of the monasteries to the foundation of Trinity College, and Queen Mary augmented the endowment. The five Regius Professorships were endowed by Henry VIII. Cambridge was frequently visited by the plague, and university proceedings were suspended by it in 1642 and 1666. In 1643, Cromwell took possession of the town, and the most eminent loyalists were expelled from the university. Almost all the colleges had sent their plate to the king at Nottingham. As might be expected, little was done for the university in this troubled century; indeed no new colleges were added until the founding of Downing College in 1800.

The predominance of the religious element in the college-discipline is to be attributed as much to the circumstances and manners of the times in which

the colleges were founded, as to the piety of the founders themselves. There had been, from very early times, 'Religious Houses,' and these were in many cases united with the new collegiate foundations. There were, for example, the Dominicans, or Preaching Friars, whose house is now turned into Emmanuel College. The friars who lived in these convents were capable of degrees, and kept their 'acts,' or exercises for degrees, as other university men. There were, however, frequent quarrels between them and the other students. To the same cause is to be traced the condition of celibacy, upon which, with few exceptions, the fellowships were formerly tenable. Masters of colleges and professors may all marry, and the restriction in the case of Fellows has lately been removed or relaxed at most of the colleges. In like manner, the obligation to take holy orders as the condition of holding a fellowship, has been greatly relaxed at all the colleges. At St Peter's there are 11, and at Trinity Hall 10 lay fellowships.

The present university statutes were confirmed by Queen Victoria, by order in council, July 31, 1858. The governing body is the senate, and the building where they meet is called the senate-house. All university laws are approved by an elected body called the council, before they are submitted to the senate. The executive powers are intrusted to a chancellor, high-steward, vice-chancellor, commissary, and assessor. The public orator is the voice of the senate upon public occasions. The proctors superintend the discipline and morals of all persons in *statu pupillari*; they are present at all congregations of the senate, read the 'graces,' and take the votes. The registry is responsible for the graces being offered in due form, and has charge of the university records. There are three terms in this university—the Michaelmas or October term, the Lent term, and the Easter term. To take an ordinary B.A. degree, a student must reside nine terms. The M.A. degree follows three years after. Dissenters are not excluded by the terms of the new statutes from taking degrees, except in divinity.

With respect to the admission of students, their university course, expenses, and proceedings in degrees, the following information may be useful: There are four classes of students—viz., *Fellow Commoners* and *Noblemen*, *Pensioners*, *Sizars*, and the more distinguished students who are elected *Scholars* on the foundation of their college. The first class are so called from their dining at the Fellows' table; they wear silk or embroidered gowns, and pay heavier fees. The Pensioners are the great body of students who are not on the foundation, and who pay for their own commons, viz., dinners in hall, &c., and for their chambers. The Sizars are the poorer students, who are admitted at lower charges than the pensioners, but wear the same dress, and are no longer subject to the performance of menial offices as they once were. Some of the colleges, especially St John's and Trinity, have very liberal endowments for the sizars, and very considerable pecuniary assistance is given to the more deserving of them, so that no youth of real ability, industry, and good character, need be deprived by poverty of the advantages of a university education. Non-collegiate students have lately been admitted to the university under special rules. The Scholars are elected, by examination, from the pensioners and sizars; they are on the foundation of the college, have rooms and commons free, and other emoluments. The Fellows are subsequently elected from the scholars and the students who have distinguished themselves in the Tripos examinations. Vacancies are, as a rule, filled up from members of the college, but many follow-

ships are open to the competition of the whole university. The usual age of admission is from 17 to 20. Before a student can be admitted, he must obtain a certificate from some master of arts of the university of being sufficiently instructed in Latin, Greek, and Mathematics; this certificate must be sent to the tutor of the college, along with the caution-money, which, in the case of a pensioner, amounts to £15. At some colleges there is an examination previous to matriculation in addition to the above.

Residence is commenced in the October Term. It is usual, particularly at the larger colleges, to have the name entered on the college boards for a term or two previous; but this is not necessary now, as it used to be, in order to keep such terms with a view to the degree. When the undergraduate comes into residence, he is called a 'Freshman,' in his second year, a 'Junior Soph,' in his third year, a 'Senior Soph.' The ordinary B.A., or Bachelor of Arts degree, may be taken in the ninth term of residence—viz., in the third June after coming up. The subjects of examination are partly fixed, partly variable. They are the *Acts of the Apostles* in Greek, one Greek and one Latin classic, *The History of the English Reformation*; *Euclid*, Books I., II., III., IV., and Propositions 1—6 of Book VI.; together with certain parts of Algebra, Mechanics, and Hydrostatics. The candidates for examination for degree are called Questionists.

Candidates for mathematical 'honours' do not go up till the end of their tenth term—i.e., the Christmas three years after coming up. The examination embraces the whole range of pure mathematics, and mathematics as applied to natural philosophy. The successful candidates are arranged in a Tripos—i.e., in three classes, called respectively Wranglers, Senior Optimes, and Junior Optimes; the first mathematician of the year is called the Senior Wrangler. The Smith's Prize Examination for the best mathematician sometimes reverses the decision of the tripos.

The examination for classical 'honours' is one term later still, and the candidates are arranged in a tripos, and distinguished as First, Second, and Third Class. Very accurate scholarship is required to obtain a good place in this tripos. The examinations for degree are called 'Great Go.' The previous examination, which comes in the second year of residence, is called 'Little Go.' Students who intend to graduate in classical honours, are required to take mathematical honours in Little Go. The previous examination is one Greek and one Latin author, one of the Gospels in Greek, Paley's *Evidences of Christianity*, and Elementary Mathematics. After passing the 'Little Go,' the examinations for the ordinary B.A. degree consist of a 'General' and a 'Special' examination, the subjects in the former being similar to those in the Little Go. The Special Examination is, at the option of the student, in Theology, Moral or Natural or Applied Science, or Law. Lectures are given by the following professors: Regius Professor of Laws, Regius Professor of Physic, Professor of Moral Philosophy, Professor of Chemistry, Professor of Anatomy, Professor of Modern History, Professor of Botany, Professor of Geology, Jacksonian Professor of Natural Philosophy, Downing Professor of the Laws of England, Downing Professor of Medicine, Professor of Mineralogy, Professor of Political Economy. Besides these, the university has Regius Professors of Greek, Hebrew, and Divinity, a Lady Margaret and a Norrisian Professor of Divinity, two Arabic Professors, the Lucasian Professor of Mathematics, and the Lowndes's Professor of Astronomy, Professors of Latin, Sanscrit, and International Law. Degrees in honours are given in Law and in Natural and

## CAMBRIDGE—CAMBRIDGESHIRE.

Moral Science, without requiring further proficiency in the normal studies of the place, classics and mathematics, than is ascertained by passing the Little Go. The fees for the different degrees will all be found in the *Cambridge Calendar*. There are different fees at the different colleges in addition to the university fees. It will be sufficient to state, that for the B.A. and M.A. degrees, the fees amount to about £12 and £25 respectively.

The great prizes at the university are the *Fellowships*, of which there are about 360, some open to all candidates without restriction, but conditions of tenure as to marriage and holy orders vary at different colleges. Their value varies from £100 to £300 per annum, and the Senior Fellowships are often £500 or more. There are also stipends attached to all the college offices—e. g., those of Dean, Bursar, Steward, &c. The office of Tutor is one of great honour and emolument. The Chancellor gives annually two gold medals to the two commencing bachelors who, having taken a senior optime's degree in mathematics, shew themselves the greatest proficients in classical learning. The Members of Parliament for the university give annually four prizes for the best dissertations in Latin prose. There are numerous other university distinctions, for which see the *Cambridge Calendar*. The annual revenue of the university and colleges is about £340,000 (*Univ. Com. Report*, vol. i., 1874).

The following is a list of the colleges in the order of their antiquity. A particular notice of each college will be found in its alphabetical place.

Name.	Founded.	Undergraduates in 1872.
St Peter's College, or Peter-house,	1257	49
Clare College,	1326	78
Pembroke College,	1347	52
Gonville and Caius College,	1348	151
Trinity Hall,	1350	138
Corpus Christi, or Benedict College,	1351	134
King's College,	1441	34
Queens' College,	1448	36
St Catharine's College or Hall,	1473	48
Jesus College,	1496	137
Christ's College,	1505	94
St John's College,	1511	421
Magdalene College,	1519	46
Trinity College,	1546	557
Emmanuel College,	1584	74
Sidney Sussex College,	1598	62
Downing College,	1800	41

Students whose names are not on the boards of any college, and are allowed to pursue their studies and proceed to degrees, were 57 in number at the above date.

Few of the colleges present an imposing façade to the streets—King's is, perhaps, the only one of which this may be said—but the quiet and picturesque beauty of the courts in the interiors is very pleasing. Dr Whewell, the late Master of Trinity College, built a new hostel in connection with Trinity, which is considered to be in very good taste. Amongst the other public buildings of Cambridge are to be mentioned the Senate-house, where university examinations are held, degrees conferred, and all public business of the university conducted. The Fitzwilliam Museum is the finest of the modern additions to the university. Viscount Fitzwilliam bequeathed, in 1816, £100,000 South-sea Annuities, the interest of which was to build and support a museum. He left also a very valuable collection of books, paintings, &c., as a nucleus for future contributions. G. Basevi was the architect. The University Library is a fine mass of buildings of different periods, and contains at present more than 170,000 volumes. The Geological Museum contains the original collection of Dr Woodward, which, out of respect to the founder, has been kept in its original

state, unmixed with more recent and vastly more numerous and interesting acquisitions. The university is indebted for many of these geological treasures to Professor Sedgwick. The Mineralogical Room contains the valuable collections of the late Sir A. Hume, Charles Brooke, and Henry Warburton. The Pitt Press is a Gothic structure built in honour of Mr Pitt, who was educated at Cambridge. It contains the university printing-offices, which are very extensive, and well conducted. There is also a good Anatomical Museum.

There is a very good hospital, founded under the will of Dr Addenbrooke in 1753. The Observatory contains some very fine instruments, amongst which is to be noted a large equatorial telescope, presented by the Duke of Northumberland in 1835. The object-glass is 12 inches in diameter, and 20 feet focal length.

For the most recent information about the university studies, &c., the *Cambridge Calendar* for the current year should be consulted; for the history, biography, and antiquity, see Fuller's *History of Cambridge*; Dyer; Caius; Le Keux' *Memorials*; Cooper's *Annals*; Cooper's *Athenæ Cantabrigienses*; *Graduati Cantabrigienses*.

CAMBRIDGE, a town of the state of Massachusetts, on the Charles River, 3 miles to the north-west of Boston (q. v.). Here, in 1638, within eighteen years after the landing of the Pilgrim Fathers, was founded Harvard University by the Rev. John Harvard, who bequeathed it a legacy of about £780, and which has gradually been endowed to the amount of 1,000,000 dollars, so that its vested income must be at least 60,000 dollars or £12,000. The oldest, it is also generally considered the best, institution of the kind in America. In addition to the collegiate department proper, the university includes a theological school, a law school, a medical college, and a department for such as wish to prepare themselves for business avocations without going through a classical course. In 1870 the alumni amounted to 1107. The town of C. is rapidly advancing in population, the census in 1830, 1840, and 1850 respectively having been 6072, 8409, and 15,215; that of 1870 was 39,634.

CA' M BRIDGESHIRE, an inland county of England, in lat. 52° 1'—52° 45' N., long. 0° 31' E., and 0° 16' W. Its greatest length, from north to south, is about 50 miles, and its breadth 30 miles, with an area of 857 sq. miles. Pop. (1871) 186,906. About three-fourths of the county consists of arable land, meadow, and pasture, the rest being fens. The surface of C., except in the south, which is somewhat elevated and on the chalk formations, is marshy and flat, thinly wooded, and with villages and churches here and there on slight elevations, called 'ey's' or islands. The upper greensand, which in some places near Cambridge comes to the surface, yields in rich abundance the curious fossils miscalled coprolites (q. v.), which are of great value as an artificial manure. Their value is in some places equal to that of the land itself. The northern part of C. forms part of the Bedford Level. The chief rivers are the Ouse, which crosses the middle of the county from west to east, with its tributary the Cam; the Nene, which borders the county on the north; and the Lark. These are all navigable to a certain extent. C. is an agricultural county. In the higher parts, the land produces fine crops of beans and wheat. Many cattle and sheep are now supported on the thin chalky soils. The black spongy soil of the fens consists of mud mixed with decayed vegetable matter, and when drained and burned, produces, in dry years, heavy crops of cole-seed, wheat, oats, barley, hay, potatoes, hemp, and flax. Horses, cattle,

## CAMBUSLANG—CAMEL.

sheep, and pigeons are also reared in the fens. The Isle of Ely, part of the fen-tract, and within the Bedford Level, is famed for garden vegetables; and the meadows of the Cam yield fine butter and cream-cheese. The chief towns of C. are Cambridge, the county town; Ely, Wisbeach, March, Thorney, Linton, Soham, Newmarket, and Royston. The manufactures of C. are mostly such as belong to an agricultural county. There are paper and parchment mills, and coarse earthenware is manufactured. Needle-making is also carried on to some extent. C. returns 3 members to parliament. This county was anciently the seat of a powerful tribe—the Iceni. It was crossed by several British and Roman roads, in some parts now covered by several feet of peat-soil. Remains of Roman camps, sea-embankments, and villas, occur, and Roman antiquities, as coins and urns, have been found. There are some ancient—supposed pre-Roman—ditches miles in length. One of these, the Devil's Ditch, with an elevated vallum, having a slope of 52 feet on one side and 26 feet on the other, is about 100 feet broad. In the 9th and 10th centuries, C. was the scene of severe contests between the Danes and Saxons. The Isle of Ely and its monks withstood William the Conqueror for 8 years. C., and especially the Isle of Ely, suffered much in the civil wars of Stephen, John, Henry III., and Charles I. There formerly existed 36 religious houses in Cambridgeshire. Since Charles I.'s time, much has been done to reclaim the fen-lands by embanking rivers and cutting new channels for them.

### CAMBUSLANG. See WHITEFIELD.

CAMBYSES, second king of the Medes and Persians, was the son of Cyrus and Cassandane, and succeeded his father in the monarchy, 529 B.C. C. is the Greek form of his name, the ancient Persian name is Kabujiya. In 525 B.C. C. invaded Egypt, defeated Psammetichus, the king of Egypt, at Pelusium, and in six months made himself master of the whole country. He meditated further conquests, but was not permitted to carry his designs into effect; the Tyrians, upon whom his maritime power depended, refused to serve him against the Carthaginians; an army which he sent to take possession of the temple of Jupiter Ammon, perished in the desert; and one which he led in person against the Ethiopians, was compelled to return from want of provisions. C. now addicted himself to excessive intoxication, and perpetrated horrid cruelties in Egypt; the accounts of which, however, depending upon his enemies the Egyptian priests, are doubtless exaggerated. It is probable, however, that his tendency to epileptic fits, along with the arbitrary disposition induced by success and power, caused him to indulge in violent and capricious acts of tyranny. The Egyptians believed him to be mad. A pretender to the Persian throne having appeared, C. marched against him, but died on the way in Syria, 521 B.C.

CAMDEN, CHARLES PRATT, EARL OF, a younger son of Sir John Pratt, Chief Justice of the Court of King's Bench in the reign of George I., was born in 1714. Educated at Eton and Cambridge, he studied for the law, and was called to the bar in 1738. Not until 1752, however, when he defended a bookseller successfully against a government prosecution for libel on the House of Commons, did C.'s prospects appear very promising; from this time his success was certain. In 1757, he was appointed Attorney-general, and four years afterwards, accepted a seat on the bench in the Court of Common Pleas. Judge in the trial of Wilkes, he declared his opinion emphatically that the action of

government in this case, by general warrants, was altogether illegal—an opinion which, chiming in with public sentiment at the time, made him the most popular of judges. In 1765, he was created Baron C. of Camden Place, Kent, by the Rockingham administration; to whose American policy, and to their treatment of Wilkes, notwithstanding, he offered constant opposition. The following year, when he was made Lord Chancellor, he did not abandon his principles; and four years after—the Duke of Grafton being then prime minister—he supported an amendment made by Chatham on the government address, and resigned his place. His judicial career ended here; henceforth, he was entirely a political character, and for more than 20 years took an active part against the ill-advised American policy pursued by Lord North, and in discussions on the law of libel, in which he maintained the popular view. As a judge, he is held in high estimation, though his manner was somewhat undignified. He filled the office of President of the Council in the Rockingham administration in 1782, and also from the following year until his death, under Pitt. He died April 1794.

CAMDEN, WILLIAM, one of the most distinguished scholars and historians, and the most laborious and painstaking antiquary of the 16th c., was born in London, where his father was a paper-stainer, in May 1551. His education, commenced at Christ's Hospital, was completed at St Paul's School, and at Oxford. In 1576, he was appointed second master of Westminster School; and it was while discharging the duties of this office that he undertook the work which has made his name famous, his *Britannia*, giving an account of the British Isles from the earliest ages, which, written in elegant Latin, was first published in 1586. It at once brought him into communication with the learned men of his time. Before 1607, the work had passed through six editions, being greatly enlarged and improved by the indefatigable industry of the author. The book, at first but a comparatively small single volume, has received much additional matter from other writers. The best known edition of C.'s *Britannia*, is that of Edmund Gibson, in English, 2 vols. fol. Of this great work of C., Bishop Nicolson said it was 'the common sun whereat our modern writers have all lighted their little torches.' In 1593, C. was appointed head-master of Westminster School; and four years later, he was made Clarenceux King-at-arms, an appointment which gave him more time for the pursuit of his favourite studies. His other most important works are—*Annals of the Reign of Elizabeth*; *A Collection of Ancient English Historians*; *An Account of the Monuments and Inscriptions in Westminster Abbey*; and a *Narrative of the Gunpowder Plot*. He died in 1623, at the age of 72, and was buried in Westminster Abbey. Before his death, he endowed a professorship of history at Oxford. The 'Camden Society,' for the publication of early historical and literary remains, is so named in his honour.

CAMEL (*Camelus*), a genus of quadrupeds of the order *Ruminantia*, of which only two species exist, both of great use to mankind. This genus is the type of the family *Camelidae*, to which there belongs only one other genus, *Auchenia* (q. v.), including the llama, alpaca, &c. The whole number of species of *Camelidae* is, therefore, very small, and they seem to belong originally to limited regions, both in the Old World and in the New. To the peculiarities of these regions, they exhibit a wonderful completeness of adaptation. The family is regarded as forming a sort of link between the orders *Ruminantia* and

## CAMEL.

*Pachydermata.* The dentition differs from that of all other ruminating animals, particularly in the presence of incisors or cutting teeth in the upper jaw; camels having also canine teeth in both jaws, and the llama and its congeners in the lower jaw of both sexes; and differences equally important appear in the feet, which have not the cloven hoof common to all the rest of the order—two short toes with separate hoofs adapted to one another—but two elongated toes, each tipped with a small nail-like hoof, the feet resting not upon the hoofs, but upon elastic pads or cushions under the toes.—In the camel, the toes are united by a common sole, thus resting upon one extended pad, instead of having each a separate one, as in the genus *Auchenia*; the broader expanse of the foot enabling the animals of the one genus more easily to traverse the loose sand of the desert, whilst the separation of the toes in the other is suited to the uneven surface of rocky heights. The camels are also distinguished by the females having four teats, whilst those of the other genus have only two; and by a hump or humps upon the back, of which the llama and its congeners exhibit no trace. The long neck, small head, prominent eyes, and tumid and cleft upper lip, with considerable prehensile power, are common to both genera; but with much similarity of form, as well as of particular characters, the *Camelidae* of the Andes exhibit a gracefulness of outline which strongly contrasts with the gaunt angularity of those of the eastern deserts. Camels are indeed animals of uncouth appearance. Of the two species, that known as the Arabian C. (*C. Dromedarius*) has only one hump on the back, whilst the Bactrian C.

Bactrian Camel.

(*C. Bactrianus*) has two. Some confusion has arisen from the occasional employment of the name *Dromedary* as a designation of the former species, it being, however, more properly limited to a particular variety of that species, more slender and graceful than the ordinary variety, and of much greater fleetness. Buffon's notion, that the hump is a badge of servitude, and the consequence of harsh treatment throughout many generations, is singularly at variance with what we know of its uses. The hump on the C.'s back is a wonderful provision of nature, to adapt the animal to the endurance of long abstinence from food, or subsistence on very scanty supplies, to which it is often subjected in the desert, and without a capacity for which it would be comparatively of little value to man; and the wide deserts across which he journeys and transports his merchandise by its aid, would be altogether unpassable. The hump is, in fact, a store of fat, from which the animal draws as the wants of its system require; and the Arab is very careful to see that the hump is in good condition before the commencement of a journey. After it has been much exhausted, three

554

or four months of repose and abundant food are necessary to restore it. The backbone of the C. is as straight as that of other quadrupeds.—Another very interesting adaptation to the desert is to be noticed in the thick sole which protects the feet of the C.

Inside of a Camel's Foot:

A, is the cushion on which the animal treads, shewn as lifted out of its bed.

from the burning sand, and in callousities of similar use on the chest and on the joints of the legs, upon which the C. rests when it lies down to repose, or kneels, as it does for various purposes, and is taught to do that it may be loaded, or that its rider may mount upon its back.—The wedge-shaped cutting-teeth of the lower jaw are also particularly fitted for browsing on shrubby plants, such as the desert produces—the camel's thorn, tamarisk, &c., which form a large part of the food of the C.; the eyes are furnished with long eyelashes, to protect them from the glare and from the drifting sand; whilst the exclusion of the sand from the nostrils is also provided for by a power of closing their oblique openings at will. But most interesting of all is the provision made for the C.'s endurance of long drought, by the lining of the inside of the second stomach, or honeycomb bag, and of a portion of the first stomach or paunch, with great masses of cells, in which water is stored up and long retained. This store of water is well known to the Arabs, who, when sore pressed by thirst, sometimes avail themselves of it by killing some of the camels of the caravan.—The first stomach of the *Camelidae* is divided into two compartments by a muscular band—one of the points of difference between them and the other ruminants. Muscular bands, proceeding from this principal one, and intersected by other muscular bands, nearly at right angles, form the cells for containing water. It may be added here, that the senses both of sight and smell are extremely acute in the C., and that it is capable of discerning water at a great distance.

The Arabian C. carries twice the load of a mule. The Bactrian C. is sometimes loaded with 1000 or even 1500 lbs. weight, although not generally with so much. The East India Company had at one time a corps of camels, each mounted by two men, armed with musketoons. The use of the C. for the conveyance both of travellers and merchandise has won it the name of the *ship of the desert*. A caravan sometimes contains 1000, sometimes even 4000 or 5000 camels. The supply of food carried with the caravan for the use of the camels is very scanty: a few beans, dates, carob-pods, or the like, are all that they receive after a long day's march, when there is no herbage on which they may browse. The pace of the loaded C. is steady and uniform, but slow: it proceeds, however, from day to day, accomplishing

## CAMELFORD—CAMEO.

journeys of hundreds of miles at a rate of about 2½ miles per hour. Some of the slight dromedaries, however, can carry a rider more than 100 miles in a day. The motion of the C. is peculiar, jolting the rider in a manner extremely disagreeable to those who are unaccustomed to it; both the feet on the same side being successively raised, so that one side is thrown forward, and then the other.

The C. produces only one young one at a time, or rarely two. It lives 30 or 40 years.

The patience of the C. has been celebrated by some authors; and the cries by which it expresses its sense of injury when a heavy load is placed upon its back have been pathetically described. With all its general submissiveness, however, the C. is resentful of injury, and during the rutting season it becomes particularly vicious.

The flesh and the milk of the C. are much valued by the Arabs as articles of food. The dung is used for fuel, and it was from the soot of this dung that the sal-ammoniac, formerly imported from Egypt, was obtained by sublimation, whilst the sources from which that substance is now procured were unknown. The hair is used for the manufacture of cloth, some kinds of which are coarse, and others comparatively soft and fine. C.'s hair is also imported into Europe for the manufacture of the pencils or small brushes used by painters.

The C. can now scarcely be said to exist anywhere in a wild state.

A fossil species of C. (*C. Sivalensis*), larger than either of the existing species, has been discovered in the tertiary deposits of the Sewalik Hills, in Hindustan.

CA'MELFORD, a town in the north-west of Cornwall, near the source of the Camel (crooked brook), 14 miles west of Launceston. It lies in a high and hilly tract near the moors. Pop. about 1000. C. is said to have been the scene of a battle, in 542, between King Arthur and Mordred, his nephew, when both were slain. The West Saxons, under Egbert, had a battle with the Britons here in 823. The ruins of King Arthur's Castle, Tintagel, stands on the high rocky coast, 4 miles north-west of Camelford. Two miles north of C. are the celebrated slate-quarries of Delabole, employing a large number of men. Macpherson, the author or translator of Ossian, was member of parliament for C. in 1791, but the Reform Act of 1832 disfranchised the borough.

CAMELLIA, a genus of plants of the natural order *Ternstroemiaceæ* (q. v.), natives of China, Japan, and the north of India—some of which are now among the most common and admired greenhouse shrubs in Britain and other countries too cold for their cultivation in the open air, receiving the same sort of attention which is bestowed on other florists' flowers, and with the same result, of an endless multiplication of beautiful hybrids and varieties. The best known and most esteemed is *C. Japonica*. Its leaves are ovate-elliptical, almost acuminate and serrate, shining; the flowers without stalks, mostly solitary, large, and rose-like. It is a native of Japan; and there and in China it has been carefully cultivated from time immemorial. In its wild state, it has red flowers; and the red single C. is much used by gardeners as a stock on which to graft the fine varieties, the flowers of which are generally double, and in many cases most completely so. Many of them are of Chinese or Japanese origin; many have been raised by cultivators in Britain, continental Europe, and America. Their colours are very various; and the varieties also differ much in the form and position of the petals. It adds to the value of the C. that its flowering time is in autumn, winter, and spring. By those

who can afford the expense, entire houses are often devoted to the culture of camellias. Some cultivators are careful to protect them from direct sunshine, others recommend an opposite treatment in this particular; it is agreed by all that free access of air is of great importance, and that water must be given very liberally, yet with such caution that the soil may never remain soaked after the immediate wants of the plant are supplied. The cultivation of camellias in the windows of houses is often attended with disappointment, from the buds dropping off when almost ready to expand, which is generally owing either to a neglect or an excess of watering; an apparently slight mistake, either of the one kind or of the other, being very speedily productive of this evil. Too much heat at this time is also apt to cause the flower-buds to fall off. The C. flowers well, when the temperature is kept not very much above the freezing-point, but frost it cannot bear. In the south of England, some of the varieties are occasionally trained to walls in the open air, receiving a little protection in winter. The proper soil for camellias is a loose black mould; a little sand and a little peat are often advantageously mixed with loam to form it. Camellias are often propagated by cuttings, often by layers; but the finest varieties very generally by grafting or by inarching. The single C. is also propagated by seed, and in this way the best stocks for grafting are procured.—Of the other species of C., the most hardy, and one of the most beautiful, is *C. reticulata*, from which not a few of the varieties now in cultivation are partly derived.—*C. oleifera* is extensively cultivated in China—not, however, in the more northerly parts—for its seeds, from which an oil is expressed after boiling, very similar to olive oil, and much in use as an article of food and otherwise in the domestic economy of the Chinese. The seeds of almost all the species, however, yield this oil.—*C. Sasangua* bears the name of SASANQUA TEA. It is cultivated in China for the sake of its flowers, which are said to be used for flavouring certain kinds of tea.

### CAMELOPARDALIS. See GIRAFFE.

CAMEL'S THORN (*Alhagi*), a genus of plants of the natural order *Leguminosæ* (q. v.), sub-order *Papilionaceæ*, containing a number of herbaceous or half-shrubby species, natives chiefly of the deserts of the east, having simple leaves, minute stipules, racemes of red flowers, and jointed pods with one seed in each joint. These plants are of great importance on account of the food which they afford for camels, where other vegetation is far from being abundant; and camels are particularly fond of them. *A. camedorum*, a herbaceous species, yields a kind of Manna (q. v.), which appears in the form of drops, as of honey, on the leaves, and gradually hardens. A similar exudation is yielded by *A. Nipalensis*, another herbaceous species; but it is not certain that the manna of Persia and Bokhara is produced, as has been alleged, by *A. Maurorum*, a shrubby species two or three feet in height, which certainly does not yield it in India or Egypt; the supposition that this exudation results from some peculiarity in the climate of Persia and Bokhara, being perhaps less probable than that of a mistake concerning species not very dissimilar.

CA'MEO (Ital. *cameo*). Gems cut in relief are called cameos, in opposition to those that are hollowed out so as to yield a raised impression, which are called *Intaglios*. The term C., however, is applied more especially to those diminutive pieces of sculpture which are prepared from precious stones having two strata or layers of different colours, the undermost of which is left to form the

## CAMEO—CAMERA LUCIDA.

background, the object to be represented being cut in the upper one. The stone generally used for this purpose by the ancients was the variegated onyx.

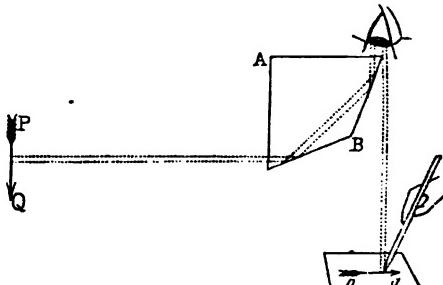

The art of C.-cutting is of great antiquity. It is believed to have been of Asiatic origin, and to have been practised by the Babylonians, from whom the Phoenicians carried it into Egypt. From the Egyptians, it was transmitted to the Greeks, who brought it to great perfection; and latterly it was practised very extensively, and more successfully than perhaps any other art, in Rome. To what extent the gems, commonly called Etruscan, are in reality early Greek, is a subject of dispute amongst the learned. It was not till a comparatively late period—the age following Praxiteles—that C.-cutting became popular in Greece; and it was in the courts of the successors of Alexander that it was chiefly patronised. At this period, cameos were very extensively used, not only as personal ornaments, but in cups, vases, candelabra, and other objects of domestic luxury. Paterae and other vessels were frequently worked out of a single stone, upon which were exhibited a whole series of figures of the most exquisite workmanship. Many of the antique cameos which have been preserved are wonderfully beautiful both in design and execution. The finest specimen in existence is said to be the Gonzaga C., formerly at Malmaison, now at St Petersburg. It represents the head of a prince and his wife, probably Ptolemy I and Eurydice. Winkelmann mentions a C. representing Perseus and Andromeda, in such high relief, that almost the whole contour of the figures, which are of the most delicate white, is detached from the ground. It belonged to the painter Mengs, and at his death was purchased by the Empress Catharine of Russia. The only other gem which Winkelmann is disposed to rank with that just mentioned, is 'the Judgment of Paris' in the cabinet of the Prince Piombino at Rome. Of cameos of the Roman time, many fine specimens are to be found in the continental museums. The most celebrated C. in England is the 'Cupid and Psyche,' in the Marlborough Collection, by Tryphon, who is supposed to have lived in Macedon under the immediate successors of Alexander. The stones on which many of these cameos are cut are of surprising, and, in modern times, unequalled size and perfection. They are supposed to have been procured by the ancients through their oriental and African commerce. Cameos do not seem to have been made in medieval times; but the art revived in Italy, under the auspices of the Medici; and the production of cameos, both in *pietra dura* and in shell, has there become a branch of art-manufacture of considerable importance. Impressions from antique cameos in glass, sulphur, porcelain, and other materials, are produced in many places; and for artistic purposes, possess all the value of the originals.

*Glass Cameos.*—The manufacture of cameos from artificial substances was not unknown to the ancients. One of the most beautiful specimens of an imitation of C. in glass is the famous Barberini or Portland Vase, now in the British Museum. The ground is blue, the figures, which are in low relief, being of a delicate, half-transparent white. See PORTLAND VASE. Many fragments of the same kind of manufacture exist in other cabinets, but that which we are fortunate enough to possess is believed to be the only perfect example.

*Shell Cameos.*—The art of imitating cameos in shell, which has now attained to such perfection as to rival the delicacy and finish even of antique workmanship, and which is a process quite as artistic as their production from gems, is of modern invention. The shells, like the stones,

chosen for this purpose, are such as possess layers of different colours. The most useful are the *Bull's Mouth*, the under layer of which is red, resembling the sardonyx; the *Black Helmet*, which has a dark onyx ground; and the *Queen's Conch*, of which the ground is of a pinkish hue. These shells have three strata, the undermost of which forms the ground, the figure being sculptured in the second, and the third serving to mark the hair, wreaths, armour, and other more prominent objects. The portion of shell having been prepared of the requisite size, form, and thickness by various mechanical means, it is fixed by some adhesive substance—usually resin—to a small block of wood, of such form and thickness as to be conveniently grasped by the artist in his left hand. The outline of the object or objects to be represented is then sketched with a pencil, and, in the case of portraits, is usually copied from a previous pencil-sketch on paper. The pencil-marking on the shell is then followed with a scratch-point, and the surrounding white substance is removed by means of files and gravers. This latter process, which is more mechanical than the rest, is usually performed by an assistant. The artist then proceeds slowly and carefully to work out his subject by the use of smaller tools; those used at last for deepening the finer lines being scarcely larger than ordinary darning-needles. The manufacture of shell-cameos in Rome commenced about 1805, and is said to have been of Sicilian origin. The art was at first confined to Italy; but during the last 35 years, it has been carried on in Paris to a greater extent than even in Rome, though not with equal success. A large proportion of the whole cameos manufactured in France are imported into England, and many of them are mounted as brooches, and exported to the United States and the British colonies. Saolini and Giovanni Dies have long been celebrated as artists in shell-cameo in Rome, whilst Girometti has enjoyed a similar reputation for his works in *pietra dura*.

**CAMERA LU'CIDA**, an optical instrument constructed of various forms, and for various purposes. Dr Wollaston's C. L., intended to facilitate the perspective delineation of objects, consists of a small quadrilateral prism of glass, of which AB in the annexed figure is the perpendicular section, held in

Camera Lucida.

a brass frame, which is attached to an upright rod, having at its lower end a screw-clamp, to fix it to the edge of a table. The prism being at the height of about a foot from the table, has its upper face horizontal. Two of its faces, as in the figure, are at a right angle at A; the contiguous faces make respectively with them angles of  $67\frac{1}{4}$ °; so that the remaining obtuse angle at B contains  $135^{\circ}$ . Rays coming from an object PQ, and falling nearly perpendicularly on the first surface, enter the prism,

## CAMERA LUCIDA—CAMERA OBSCURA.

and undergo total reflection at the contiguous surface (see DIOPTRICS); they then fall at the same angle on the next surface, and are totally reflected again; finally, they emerge nearly perpendicularly to the remaining surface. An eye, as in the figure, then receives the emergent pencil through one part of the pupil, so that an image,  $pq$ , of the object is seen projected upon a sheet of paper upon the table. The rays from the drawing-pencil passing the edge of the prism, enter the other part of the pupil; and the pencil and image being seen together upon the paper, a sketch of the latter can be taken. There is, however, a practical difficulty—the image and the drawing-pencil are at distances sensibly different from the eye, and so cannot be seen together distinctly at the same time. To obviate this, a plate of metal, with a small aperture as an eye-hole, is placed at the edge under the eye, so that the rays through the prism, and those from the drawing-pencil, which both pass through the eye-hole, form only very small pencils. By this, the difficulty is greatly diminished. It is still, however, difficult to use the instrument satisfactorily; and though many acquire great readiness in its use, others have never been able to attain the same facility. The instrument is remarkable for its small bulk and portability. A good one will pack in a box 8 inches by 2, and half an inch deep. Besides this form of the C. L., which is the most common, there are others. Its simplest form is merely a piece of smooth glass fixed at an angle of  $45^{\circ}$  to the horizon. An image from a horizontal object falling on this glass will be perfectly reflected, and that in the vertical, so that the eye looking vertically down will see the image, and, owing to the transparency of the glass, the artist will be able to trace it out upon paper below. In this case, however (see CATOPTRICS), the image will be inverted.

**CAMERA OBSCURA** (literally, a dark chamber), an instrument invented by Baptista Porta in the 16th century. It is known in its simplest form as a familiar toy, consisting of a rectangular box, furnished at one end with a lens whose focal length is equal to the length and depth of the box; at the opposite end of which a plane reflector is placed at an angle of  $45^{\circ}$ , which throws the image of any objects to which the lens may be directed on a piece of ground-glass on the top of the box in a non-inverted position, so that they may be viewed or sketched from as in nature.

The C. O. being now an indispensable article in the practice of photography, has received a number of recent improvements, which make it rank as a scientific instrument. The principle, however, involved in the simplest and most refined forms is the same, and may be illustrated and made intelligible by the following experiment: Let a small hole be bored in a window-shutter, and the room be darkened. If, now, the beam of light entering the room by this hole be intercepted by a sheet of white paper, held at a small distance from the hole, an inverted image of objects without will be seen upon the paper. By placing a small convex lens over the hole, this image is rendered much more distinct, or sharp, in photographic language. Moreover, it will be found that, at a certain distance from the hole, the image attains a maximum degree of sharpness; and that if the paper be removed from this point to any position either nearer to the hole or further from it, the image becomes indistinct and confused. At the point of greatest distinctness, the image is said to be focused. Such being the principle of the camera, it is evident that in practice the instrument may assume many forms, provided always that it consists of a darkened box or chamber having a hole at one end for the insertion of a lens, or combination

of lenses, and at the other a screen, generally made of ground-glass, on which to receive the image. Fig. 1 will at once give an idea of a very common and

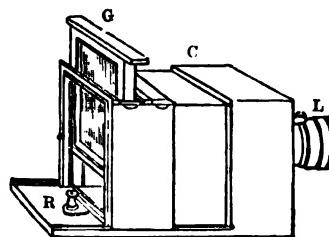

Fig. 1.

simple form of camera. C is the body of the instrument, made of any opaque substance; L, the tube or tubes, generally formed of brass, and containing one or more lenses; G, the obscured or ground-glass, upon which the image is thrown for the purpose of adjusting the focus; R, the rack behind, by means of which, and the double sides of the camera, the body of the instrument may be lengthened or shortened till the image on the ground-screen is accurately focused. This rack is most frequently placed upon the tubes carrying the lenses. The interior of the whole apparatus is blackened, to prevent reflection of the rays falling on their sides, and to impart greater distinctness to the picture. S, in fig. 2,

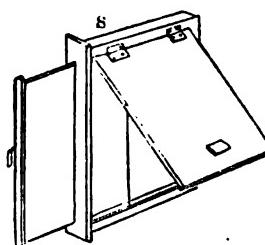

Fig. 2.

represents the *camera-slide*. This is a thin dark box, and is used for conveying a sensitive plate from the operating-room to the camera, and back again after exposure. It consists of a rectangular frame, made to fit exactly into the back of the camera when the focusing-screen is removed. At the back is a hinged door, by means of which the plate is introduced into the slide; and in front is a shutter, which is pulled up when the plate is to be exposed, and shut down after the time requisite for the action of the light upon the plate has expired. It must be constructed so that, when substituted for the focusing-screen G (fig. 1), the surface of the prepared plate, which is intended to receive the image, shall correspond exactly in distance from the lens with the ground-surface of the focusing-screen. The plate rests upon projections of silver wire in the corners of the slide; and the same slide may be used for plates of different sizes, by introducing into it thin frames of suitable dimensions also furnished with silver-wire corners.

Photographic cameras are generally required for one of three purposes—viz., portraits, landscapes, or copying; and for each of these it is necessary to make suitable modifications in the construction of the instrument. A camera has, however, been recently contrived which combines within itself the conditions necessary for all contingencies. It is

## CAMERARIUS—CAMERONIAN REGIMENT.

called Martin's Universal Portrait, Landscape, and Copying Camera, and consists, primarily, of a base-board, 30 inches long and 11 inches wide, divided into three pieces, and hinged together by means of broad brass hinges, so as to diffuse the bearing as much as possible, and bolted together when in use by sliding panels of mahogany, extending across the entire width of the base-board. This base-board being grooved on its outer edges, allows the sliding portions of the camera to be moved from one end to the other, so as to alter the relation between object, lens, and image *ad infinitum*.

What may be regarded as the body of the camera, is of the same construction as an ordinary expanding camera (fig. 1), except that it is furnished with additional apertures for camera slides, and the front (C) and the back are united by means of an accordion or bellows body of suitable length to extend from one end of the base-board to the other.

**CAMERA RIUS**, JOACHIM—originally, *Liebhard*, which name he changed into C., because his fore-fathers had been *Kammerer* (chamberlains) at the court of the Bishop of Bamberg—was born at Bamberg, April 12, 1500, and died at Leipac, after a life devoted to literature, April 17, 1574. He was by nature earnest and taciturn; but the extent of his knowledge, his sobriety of opinion, strength of character, and, when he pleased, overpowering eloquence, won for him the esteem of all his contemporaries. His works, of which several still remain valuable, include an excellent biography of Melancthon, and a collection of letters by this reformer; also annotations on Cicero's *Quæstiones Tusculane* (1525), *Elements of Rhetoric*, *Commentarii Lingua Graeca et Latina* (1551), and *Epistola Familiare* (1583—1595), giving interesting notices of his times.—His son, JOACHIM C. (b. 1534, d. 1598), was one of the most learned physicians and botanists of his age.

**CAMERINO** (ancient *Camerium*), a town of Central Italy, formerly capital of the delegation of the same name, situated on a hill at the foot of the Apennines, 41 miles south-west of Ancona. It has a cathedral, occupying the site of a temple to Jupiter, a university, and some manufactures of silk. Its bishopric dates from the 3d c.; and it was made an archiepiscopal see in 1787. Pop. 6000.

**CA'MERON**, JOHN, a famous scholar and divine, was born at Glasgow about the year 1580, and educated at the university of that city, where, in his 20th year, he held an appointment as reader in Greek. In 1600, he set out to travel in France, where his ability and erudition secured for him a philosophical professorship in the university of Sedan. He afterwards acted as a Protestant clergyman at Bordeaux, and, on the death of Gomarus, was appointed to the divinity chair in the university of Saumur, an appointment he held until 1620. Returning to Britain, he was appointed professor of divinity at Glasgow; but in less than a year he returned to Saumur; thence to Montauban, where he received a divinity professorship. Here his opposition to the party who advocated a civil war made him many enemies, by one of whom he was stabbed in the street; and he died from the effects of the wound in 1625. He was considered one of the best scholars of his time; in biblical criticism, he was inclined to be perverse; where there was a difficulty, he usually chose the opposite view to that held by other divines, especially Beza. His theological opinions were of a somewhat lax character, his works being said to be the foundation of Amyraut's doctrine of universal grace.

**CAMERON**, RICHARD, a Scottish Presbyterian preacher in the 17th c., who suffered death for the

cause he espoused, and from whom the religious sect ordinarily called Cameronians (q.v.) has been named. C. belonged to the extreme party, who held by the perpetually binding obligations of the Solemn League and Covenant (see *Covenants*), which were set aside at the restoration of Charles II. Along with some others, he strenuously resisted those measures that reinstated the Episcopal Church in Scotland, and that proscribed the meetings for public worship of unauthorised religious bodies. Contrary to law, he persisted in preaching in the fields, and became obnoxious to government, to which, indeed, he finally assumed an attitude of defiance. In June 1680, he, in company with about twenty persons of equal zeal, well armed, entered the town of Sanquhar; and in the market-place they formally renounced their allegiance to Charles II., who had so grossly abused his power, and declared war against him and all his adherents. After this act, they retired to the hills between Nithsdale and Ayrshire, where they succeeded in evading capture for a month, though a price of 5000 marks had been set upon C.'s head by government, and 3000 upon the heads of the others. On the 20th July 1680, however, they were surprised by a vastly superior force in Aird's Moss, and after a brave fight, C. was killed. His hands and head were cut off, and sent to Edinburgh, where they were fixed upon the Netherbow Port. C. ranks as a martyr, and has an honourable place in the history of *Scots Worthies*.

**CAMERON HIGHLANDERS**, the designation given to the 79th Regiment of infantry in the British service, in consequence of the corps having been raised by Allan Cameron of Errach in 1793. Originally, it consisted of 1000 men, but a second battalion was added in 1804. This gallant regiment, which wears the Highland garb, performed distinguished services in the peninsula and at Waterloo, and has been engaged in the chief warlike struggles of more recent times.

**CAMERO'NIAN REGIMENT**, the 26th Regiment of infantry in the British service, so called from having had its origin in a body of Cameronians (q. v.) during the Revolution of 1688 in Scotland. Taking advantage of the zeal and courage of the Hillmen or Cameronians, the Convention which sat at Edinburgh induced a number of them to assist in completing the work of the Revolution, which, as was still imagined by some, was to re-establish things according to the letter of the Covenants. A regiment of Cameronians was accordingly organised; each soldier being induced to enlist on the understanding that the special object of the corps was 'to recover and establish the work of Reformation in Scotland, in opposition to popery, prelacy, and arbitrary power, in all the branches and steps thereof, till the government in church and state be brought to that lustre and integrity which it had in the best of times.' (See *Burton's History of Scotland*, vol. i. p. 49.) Thus was formed the celebrated C. R., with the youthful Lord Angus as colonel, and William Cleland as lieutenant-colonel and actual commander. Under Cleland, not yet in his 30th year, the regiment was sent northwards to quell the insurrection, after the fall of Viscount Dundee. Surrounded by from 4000 to 5000 Highlanders, the Cameronians, only 800 strong, gallantly defended themselves during a whole day in Dunkeld, August 21, 1689. In this terrific struggle, the brave Cleland was killed. The Cameronians, whom, considering the issue of the Revolution, we must suppose to have been entrapped into military service, were afterwards employed in the foreign wars of William III., greatly to the scandal of that stern portion of the

## CAMERONIANS—CAMILLUS.

Presbyterians who founded the Cameronian sect. As the 26th of the line, the regiment has ever done credit to its origin; being distinguished alike for gallantry in the field, and for its good and orderly conduct in garrison.

**CAMERO'NIANS**, the religious sect in Scotland alluded to in the notice of Richard Cameron, from whom the body has been popularly named. Its official designation, however, is that of Reformed Presbyterians. No doubt, the principles of the body are those for which Cameron contended and died; but it assumed no distinct form till after the Revolution of 1688; and it might briefly be defined as consisting of a small party of Presbyterians, who objected to the Revolution settlement in church and state, and desired to see in full force that kind of civil and ecclesiastical polity that prevailed in Scotland from 1638 to 1649. According to the Solemn League and Covenant, ratified by the parliaments of England and Scotland, and also by the Assembly of Divines at Westminster in 1643, Presbyterianism was to be maintained in the kingdoms of England, Scotland, and Ireland, and popery, prelacy, superstition, heresy, schism, &c., were to be extirpated. The Covenanters in Scotland contended, as is well known, under much suffering, for this species of Presbyterian supremacy throughout the reigns of Charles II. and James VII. (II.). As a measure of pacification at the Revolution, Presbytery was established in Scotland by act of parliament 1690; but it was of a modified kind. Substantially the church was rendered a creature of the state, more particularly as regards the calling of General Assemblies; and equally to the disgust of the extreme party whom we refer to, prelacy was not only confirmed in England and Ireland, but they saw that there was a general toleration of heresy—i. e., dissent. In sentiment, if not in form, therefore, this uncompromising party repudiated the government of William III. and his successors, and still maintained the perpetually binding obligations of the Covenantants. Unquestionably, these C. acted under strong convictions, and only desired to carry out to a legitimate issue those principles which have always mingled with the theories of the Presbyterian Church of Scotland; but which, for prudential considerations, have been long practically in abeyance. In short, it is in the standards of this sect that we have to look for a true embodiment of the tenets held by the great body of English and Scotch Presbyterians of 1643. Others gave in to the Revolution settlement, and afterwards found cause to secede. The C. never gave in, and, of course, never seceded. Although thus, in point of fact, an elder sister of the existing Church of Scotland and all its Secessions, the Cameronian body, as has been said, did not assume a regular form till after the Revolution; and it was with some difficulty, amidst the general contentment of the nation, that it organised a communion with ordained ministers. The steadfastness of members was put to a severe trial by the defection of their ministers; and for a time, the people were as sheep without a shepherd. At length, after their faith and patience had been tried for 16 years, they were joined by the Rev. John M'Millan, from the Established Church, in 1706. In a short time afterwards, the communion was joined by the Rev. John M'Neil, a licentiate of the Established Church. As a means of confirming the faith of members of the body, and of giving a public testimony of their principles, it was resolved to renew the Covenants; and this solemnity took place at Auchensach, near Douglas, in Lanarkshire, in 1712. The subsequent accession of the Rev. Mr Nairne, enabled the C. to constitute a presbytery at Braehead, in the parish of Carnwath, on

the 1st of August 1743, under the appellation of the Reformed Presbytery. Other preachers afterwards attached themselves to the sect, which continued to flourish obscurely in the west of Scotland and north of Ireland. For their history and tenets, we refer to the *Testimony of the Reformed Presbyterian Church* (Glasgow, John Keith, 1842). Holding strictly to the Covenants, and in theory rejecting the Revolution settlement, the political position of the C. is very peculiar, as they refuse to recognise any laws or institutions which they conceive to be inimical to those of the kingdom of Christ; from which cause many of them formerly isolated themselves from general society, and refused several of the responsibilities and privileges of citizens. At the same time, it is proper to say, that if zealous and uncompromising, they are also a peaceful body of Christians, who, under the shelter of a free and tolerant government, are left unmolested to renew the Covenants as often as fancy dictates. In 1873 the sect numbered 5 presbyteries, comprising altogether 43 congregations in Scotland, one of which was in Edinburgh and 5 in Glasgow. Connected with the body, there are congregations in Ireland and North America.

**CAMEROON'S**, a river of Upper Guinea, Africa, which enters the Bight of Biafra from a north-east direction, in about lat. 4° N., long. 9° 40' E., by an estuary some 20 miles in breadth. Its length is not certainly known, but for 40 miles upwards its breadth averages nearly a quarter of a mile, its depth varying in the dry season from 2 to 20 feet. The left bank of the river is steep and high, the right for many miles low and swampy, and covered with mangroves. There are several populous and thriving villages on its banks, whose inhabitants carry on an extensive trade in palm-oil, and ivory, obtained in great quantity from dead elephants, which have perished in search of water in a great morass inland.—C. is also the name of a cape on one of the islands of the estuary.—C. PEAK is the name of the culminating-point in the C. Mountains, which in lat. 4° 13' N., and long. 9° 10' E., has an elevation estimated at 13,000 feet.

**CAMETA**, a town of Brazil, on the left bank of the Tocantins, which joins the estuary of the Amazon from the south. It is 85 miles to the south-west of Para or Belem. It has a fertile district attached to it, which is estimated to contain 20,000 inhabitants.

**CAMILLUS**, **MARCUS FURIUS**, a celebrated Roman patrician, who first makes his appearance as consular tribune, 403 B.C. His military career was a series of unbroken successes, according to the accounts which have come down to us; but these accounts have been shewn by Niebuhr to possess a considerable admixture of mythological or poetic fiction. In 396, C. was made dictator, during the Veantine war, in which he mined and captured the city of Veii; but the proud splendour of his subsequent triumph offended the Roman populace, who were still further displeased when C. demanded a tithe of the spoils of Veii, in order to fulfil a vow made to Apollo, on condition of victory. In 394, C. was again elected consular tribune, and besieged the Falernii, who after bravely defending themselves, were led by a magnanimous act of C. to yield unconditionally. Afterwards, C., being accused of peculation, and foreseeing certain condemnation, banished himself from Rome, 391, and lived in retirement at Ardea, until Brennus, at the head of his wild Gauls, had swept through Etruria, and captured and destroyed the whole of Rome except the Capitol. C. was now recalled, and

appointed dictator a second time. He achieved a decisive victory over the invaders, rebuilt Rome, and obtained new victories over the Volsci, and others. In 386 B.C., he was elected dictator for the third time, but refused the office. In 381 B.C., C. was victorious in the war of Rome against Praeneste and other Latin towns; and in 368 B.C., he was elected to his fourth dictatorship, but abdicated during the same year. In 367 B.C., when war broke out with the Gauls, C., though 80 years old, accepted the dictatorship for the fifth time, defeated the barbarians near Alba, and made peace between patricians and plebeians. After this, he erected near the Capitol a temple to Concord, and, having retired from public life, died 365 B.C., of the plague, lamented by the whole Roman people.

CAMISARDS. See CEVENNES.

CA'MLET (from Arab. *chamal*, fine) is properly a fabric made from the hair of the Angora-goat (q. v.). The camlets made in Britain are either wholly of wool, or of wool mixed with cotton or linen, and spun hard.

CAMOENS, LUIS DE, the epic poet of Portugal, was born about 1524, at Lisbon, and studied the ancient classics at Coimbra. On his return to Lisbon, he fell in love with a lady of honour, Catharina d'Atayada. This affair was the beginning of all the poet's misfortunes. Having been banished by royal authority to Santarem, C. joined the expedition of John III. against Morocco, and lost his right eye in a naval engagement with the Moors in the Strait of Gibraltar. On his return to Lisbon, his bravery as a soldier was no more honoured than his genius as a poet. Disappointed in all his hopes, he determined to leave for ever his native land, and sailed for India, 1553. Offended by certain abuses of the Portuguese authorities in India, C. ventured to expose them in a satire, entitled *Disparates na India*, 'Follies in India,' in which he treated even the viceroy with ridicule. For this offence, the poet was banished, 1556, to Macao, where he lived several years, and was engaged in writing *Os Lusiadas*. Here C. held the unpoetical but probably lucrative post of administrator of the effects of deceased persons; and having saved, as he thought, a competency for his future life, was recalled from his banishment, 1561. Unhappily, in returning to Goa, he suffered shipwreck, and lost all his property, excepting his epic poem. After other wanderings and misfortunes, C. took ship for Lisbon, where he arrived in 1569, with no other wealth but his epic. He dedicated *The Lusiad* to the young king, Sebastian, who was very gracious; but, nevertheless, all the real patronage bestowed on C. consisted of a very small pension (about £4), and permission to remain at the court of Lisbon. Even this small pittance was taken away after the death of Sebastian, and C. was left in such poverty, that a faithful Indian servant begged in the streets of Lisbon for the support of the great epic poet of Portugal. C.'s lyric poems, written during this time of destitution, contain many pathetic lamentations. He died obscurely in the hospital at Lisbon, 1579; and sixteen years afterwards, when it was proposed to erect a splendid monument to his memory, there was some difficulty in finding his burial-place.

*The Lusiad* (*Os Lusiadas*, 'the Lusitanians') celebrates the chief events in the history of Portugal, and is remarkable as the only modern epic poem which is pervaded by anything like the true national and popular spirit of ancient epic poems. It is a gallery of epic pictures, in which all the

great achievements of Portuguese heroism are represented. Among the most famous passages are the tragical story of Inez de Castro, and the apparition of the giant Adamastor, who appears as the Spirit of the Storm to Vasco da Gama, when crossing the Cape. The versification of *The Lusiad* is extremely charming. Patriotic sentiments pervade the whole work. Besides his epic poem, C. wrote sonnets, odes, elegies, eclogues, epigrams, satires, epistles, and three comedies—*Os Amphitryoes* (after Plautus), *King Seleucus*, and *Filodemo*. The latest and best complete edition of his poems appeared in three volumes (Hamburg, 1834). The best edition of *The Lusiad* was published in Paris (1817), reprinted in 1819, and again, with emendations by Berdier, in 1823. *The Lusiad* has been translated into Spanish, French, Italian, English, Polish, and German.

CAMOGLIA, a town of Northern Italy, on the Gulf of Genoa, about 13 miles east-south-east of the city of that name. Its inhabitants, amounting to 5809, are chiefly engaged in fishing.

CA'MOMILE. See CHAMOMILE.

CA'MOUFLET, in Military Pyrotechny, is a stinking composition enclosed in paper-cases. It is used in siege-works, to blow into the faces of the sappers and miners, when hostile parties come within reach of each other, and thus to distress and confuse them.

CAMP (Fr., from Lat. *campus*, a plain, or level field). The signification of this word in English is rather that which belonged to the Latin *castrum*, an encampment, or *castra*, a collection of tents, huts, and other structures, for the accommodation and protection of troops, than that which its etymology would more directly indicate. The regular system of encampment ultimately adopted by the Romans, was forced upon them by degrees. The most complete account of it is furnished to us by Polybius. A plan will be found in Dr Smith's *Dictionary of Greek and Roman Antiquities*, constructed for the purpose of illustrating his description. When a Roman army was about to encamp, a tribune and several centurions were sent on before, to select a suitable site for the purpose. As soon as the locality was determined on, they chose the spot for the praetorium or general's tent, and marked it with a white flag. Around the praetorium, as a sort of centre or heart to the whole system, the rest of the C. was laid out. It was generally placed on an elevated position, in order that the general might have the rest of the encampment under his eye, and be able to transmit his orders with greater facility. Polybius himself tells us, that the best conception which can be formed of a Roman C. of the more permanent kind is by regarding it as a military town, resembling in many respects no doubt that which has recently grown up at Aldershot (q. v.). The streets were broader than those usually to be found in towns, the wider ones measuring 100, and the narrower 50 feet; and the *forum*, as its name indicates, was a sort of public market-place. A space of 200 feet was left vacant all round between the tents and the ramparts, partly to afford space for the arrangements of the army, and for stowing away any booty that might be captured, but chiefly to protect the soldiers' huts from incendiary attempts from without. In form, the Roman C. was square, except in the case in which it was intended to embrace within its ramparts four legions, or two consular armies, when it became an oblong rectangle. The C. was surrounded by a fosse or trench (*fossa*), which was generally 9 feet deep and 12 broad. On the top of the rampart, which was of earth, there were

## CAMP EQUIPAGE—CAMPAGNA DI ROMA.

stakes. The labour of constructing the rampart and the fosse was divided between the allies and the Roman legions, the former making the sides along which they were stationed, and the legions the rest. The task of superintending the construction of the C. amongst the Romans was intrusted to the tribunes; amongst the allies, to the prefects. Before the arrival of the troops, the different parts of the C. were so distinctly marked out and measured off, that they at once proceeded to their respective stations, as if they had entered a well-known city, and were marching to their quarters. The discipline of the C. was of the strictest kind. The tribunes administered an oath against theft both to freemen and slaves, and two maniples were chosen to keep the *via principalis*, which was a place of general resort, clean and in good repair. The other occupations connected with the C., too numerous to be mentioned here, were portioned out in like manner; and the superintendence of the whole was intrusted to two tribunes chosen by lot from each legion, and appointed to serve for two months. The prefects of the allies possessed a similar authority, which, however, seems to have been limited to their own troops. Every morning at daybreak, the centurions and horsemen presented themselves to the tribunes, and these, in their turn, received their orders from the consul. The watch-word for the night, marked on a four-cornered piece of wood, was given out with much formality. The night was divided into four watches, each of three hours' length; and there was a curious arrangement for ascertaining that guard was kept with vigilance. The soldiers of the watch companies received from the tribune a number of small tablets, with certain marks upon them, and these tablets were collected during the night by the horsemen whose duty it was to visit the posts, from such of the guards as they found on duty. Where these inspectors found the guards asleep or absent, they called upon the bystanders to witness the fact, and then passed on to the next. In the morning, the inspectors appeared before the tribunes, and gave up the tablets they had received, when the guards whose tablets were not produced were required to account for them. A regular scale of rewards and punishments was established in the camp. In comparing the encampments of the Romans with those of his own countrymen, Polybius tells us that the Greeks trusted mainly to a judicious selection of their ground, and regarded the natural advantages which they thus secured as supplying in a great measure the place of artificial means of defence. The Greeks, consequently, had no regular form of C., and no fixed places were assigned to the different divisions of the army. When the practice of drawing up the army according to cohorts, introduced by Marius and Caesar, was adopted, the internal arrangements of the C. experienced a corresponding change. Latterly, even the square form was abandoned, and the C. was made to suit the nature of the ground. It was always held to be of importance, however, that the C. occupied a defensible position; that it could not be overlooked; and that it had a command of water.

When stationary camps (*cæstra stativa*) came into more general use, we hear of several parts which are not mentioned by Polybius, for example, the infirmary (*vætædinarium*), the farriery (*veterinariū*), the forge (*fabrica*), &c.; and as a great variety of troops then came to be employed, they must, of course, have had new stations appointed to them in the camp. Many of the stationary camps ultimately became towns, and to this is ascribed the origin of most of the towns in England the names of which end in *ester* or *chester*. Amongst the most perfect

of those which retained the form of the simple encampment, is that at Ardoch in Strathearn, Perthshire, in the grass-covered mounds and ridges of which most of the divisions of the C. have been distinctly traced by antiquaries. For further information on this subject, the reader is referred to General Roy's *Military Antiquities in Great Britain*, and the *Caledonia Romana* of the late Mr Robert Stuart. In these works will be found ample accounts of some of the more remarkable Roman camps in Britain; those described by Roy being rendered intelligible by large engravings.

It is believed that, during the middle ages, the plan adopted by the Romans in their camps was more or less adhered to, seeing that the weapons employed, which mainly determined the character of the troops, were nearly the same. In Britain, before the arrival of the Romans, and also during the Saxon and Danish periods, the camps, usually circular in form, appear to have been somewhat rude in character, with the cavalry grouped round the standard in the centre, and the infantry placed near the front.

The principles of castrametation, or camp-formation, underwent much change after the invention of gunpowder, owing to the necessity for defending the C. from artillery. Modern camps, of different kinds, will be found described under ENCAMPMENT.

**CAMP EQUIPAGE** is a general name for all the tents, furniture, fittings, and utensils carried with an army, applicable to the domestic rather than the warlike wants of the soldier. In the days when armour was worn, the C. E. was enormously heavy and complicated. In the present day, a certain amount of C. E. is provided for a given number of troops. See ENCAMPMENT, TENT, &c.

**CAMP FOLLOWERS** are the sutlers and dealers in small-wares who follow an army. In India, owing to the peculiar habits and customs of the Hindus, and the large number of servants retained by English officers, the C. F. are in immense number: comprising servants, sutlers, cantiniers, hostlers, water-carriers, snake-charmers, dancers, conjurors, and women. In February 1839, when a Bengal army of 15,000 men left Shikarpoor for Afghanistan, it was accompanied by no fewer than 85,000 C. F.: the commander took with him six weeks' food for the whole 100,000. All English commanders in India find this regulation a very burdensome one. Even in European armies, however, C. F. are regarded as necessary; they are under the control of the commanding officer, and are subject to the Articles of War—not, however, in cantonments, only in the field. French armies are accompanied by women much more largely than English.

**CAMPAGNA DI ROMA**, a town of Italy, in the province of Salerno, is situated between high mountains, about 20 miles east of the city of Salerno. It has a fine cathedral, several convents, and a large annual fair. Pop. 8192.

**CAMPAGNA DI ROMA**, an undulating, uncultivated, and unhealthy plain of Italy surrounding Rome, including the greatest part of ancient *Latium*, and forming the late papal delegation of Frosinone and a great part of the Comarca di Roma. Its length is variously stated, arising from the fact that different authorities measure it from different points. But supposing the name to apply to the district extending from Cape Linaro, south of Civita Vecchia, to Terracina, beyond the Pontine Marshes, its length is about 90 miles; and its breadth inland, to the Alban and Sabine hills, is stated at from 27 to 40 miles. A broad strip of sandy plain skirts the Mediterranean. The ground, which never rises above 200 feet above the sea, is almost entirely

## CAMPAIGN—CAMPANIA.

volcanic, and the lakes are formed by craters of extinct volcanoes. The vapours rising from this district, and especially from the Solfatara (q.v.), produce the pestilential atmosphere styled *Aria Cattiva*. The number of inhabitants is very small, and in summer they are driven from the C. by its pestilent air, and seek shelter in Rome and other neighbouring places. In autumn, herdsmen descend from the Apennines to the C. with their herds, the pasture in some parts being rich and abundant. This district was not always uncultivated and depopulated as we now find it, for Domitian and Hadrian built here their splendid villas. Wars and devastations, the 'black-death' (q. v.) in the 14th c., which greatly thinned the population, and inundations from the Tiber, have been the main causes of the present state of the C.; but, according to Livy, it was always an unhealthy district, even when well cultivated. Some of the popes, especially Pius VI., have endeavoured to drain the Pontine Marshes, and, during the dominion of the French in Italy, General Miollis made great improvements in drainage, timber-planting, and cultivation in the Campagna.

CAMPAGN generally means a connected series of military operations, forming a distinct stage or step in a war. Under the old system of warfare, when armies kept the field only during the summer months, a C. was understood to include all that was done by an army from the time it took the field till it went again into winter-quarters. Now that winter is no longer allowed to arrest military operations, it is more difficult to say where one C. ends and another begins. Some writers make a C. include all the steps taken to accomplish some one immediate object.

CAMPAN, JEANNE LOUISE HENRIETTE, reader to the daughters of Louis XV., was born in Paris, October 6, 1752. She was favoured by Marie Antoinette, and gave her royal patroness numerous proofs of her fidelity. When the unfortunate queen was conveyed to the Temple, she wished to share her captivity, but was refused entrance by Petion. During the Reign of Terror, she remained concealed at Combertin. After the fall of Robespierre, she opened a boarding-school at St Germain-en-Laye, which was patronised by Josephine Beauharnais, who sent her daughter Hortense to it. In 1806, Napoleon appointed her lady-superintendent of the Institution at Ecouen for the education of the daughters of the officers of the Legion of Honour. After the Restoration, this institution was suppressed, and Madame C. retired to Mantes, where she died, May 16, 1822. She is chiefly remembered on account of her interesting works—*Mémoires sur la Vie Privée de la Reine Marie Antoinette* (4 vols., 5th ed., Par. 1824), *Journal Anecdotique* (Par. 1824), and *Correspondance Insérée avec la Reine Hortense* (2 vols., Par. 1835)—giving recollections of the court of Louis XV., of Marie Antoinette, the Revolution, and some traits from the private character of Napoleon.

CAMPANA, LA, a town of Andalusia, Spain, situated on the Madre-Vieja, a tributary of the Guadalquivir, about 37 miles east-north-east of Seville. The inhabitants, numbering 5380, are engaged chiefly in agricultural pursuits, and in weaving and brick-making.

CAMPANARIO, a town of Extremadura, Spain, about 62 miles east-south-east of Badajos. It is an ill-built place, with narrow, uncared-for streets. It has manufactures of linens and ropes, and a trade in the agricultural produce of the neighbourhood. Pop. 5400.

CAMPANELLA, TOMMA'so, a Dominican monk celebrated for his philosophical ability, was born in

1568 at Stilo in Calabria, and studied at Naples and Cosenza. The writings of Telesius first awakened his doubts respecting that pile of artificial dogmas styled the 'scholastic philosophy.' The results of his studies were given in his *Philosophia Sensibus Demonstrata, &c.* (Naples, 1591), which contained a defence of Telesius. His superiority in disputations exposed him to the hatred and false accusations of the orthodox monks and schoolmen. He was in consequence compelled to flee from Naples to Rome, and thence to Florence, Venice, and Bologna. Afterwards, he returned to Calabria, but having involved himself in a political conspiracy, he was seized and confined in a Neapolitan dungeon for 27 years; tried five times, and tortured seven; accused of heresy; and declared the author of a book which had been published thirty years before he was born. In 1628, Pope Urban VIII. had him brought to the prison of the Inquisition at Rome, but immediately liberated him, and treated him in a very generous manner. After being again persecuted by the Spanish government, C., who had formed the friendship of the French ambassador at Rome, the Due de Noailles, obtained a letter of introduction to Cardinal Richelieu, and secretly left for France, where he was graciously received. He died in the Dominican monastery of St Honors, near Paris, 1639. Most of his works—*De Gentilismo non Retinendo* (Paris, 1636), *Astrologorum Libri VII.* (Lyon, 1629), *Prodrumus Philosophiae Instauranda* (Frankfort, 1617), *Exordium Metaphysicae Nova, De Senectu Rerum et Magia* (Frankfort, 1620)—were written during his imprisonment. His philosophical views give expression to that confused fermentation of new ideas which was characteristic of the close of the 16th and opening of the 17th c.—bold and clear opinions strangely mingled with commonplaces and with astrological dreams and fancies. It may seem strange that C. should have been patronised by the pope; but this favour was gained, not by his speculative works, but by several writings in defence of the Roman Catholic Church. His *De Monarchia Hispanica Discursus* is a work of great power and value, comprising a sketch of the political world of C.'s time, with special reference to Spain. It was translated into English during Cromwell's Protectorate.

CAMPANIA, anciently a province of Central Italy, having Capua as its capital (now subdivided into the provinces of Benevento, Naples, Salerno, Avellino, and Caserta), with a pop. (1871) of 2,754,592, was bounded on the S. by Lucania, E. by Samnium, N. by Latium, and W. by the Tyrrhenian Sea. It was one of the most productive plains in the world, producing in extraordinary abundance corn, wine, and oil; and both by Greek and Roman writers is celebrated for its soft and genial climate, its landscapes, and its harbours. It was the *regio felix* of the Romans, who built here many of their most splendid villas, &c. Through it passed the Appian Way, the greatest high-road of Italy. The promontory Misenum, Mount Vesuvius, the river Vulturnus, the towns Baia, Cumae, Linternum, Putoli, Naples, Herculaneum, Pompeii, Nola, Salernum, Capua, &c., belonged to Campania. It was the oldest Greek settlement in Italy, having been colonised, according to the later chronologers, about 1050 B.C.; but this is in all probability too early a date. It was next conquered by the Etruscans, and several of the towns above mentioned, such as Capua and Nola, were founded by that people. The Etruscans then succumbed to the more warlike and hardy Samnites, who, in their turn, yielded to the irresistible valour of Rome (340 B.C.). Through all these vicissitudes of conquest, the substratum of the people remained as at the beginning. The mass of the Campanians

## CAMPANILE—CAMPBELL.

were essentially of Oscan race, and Oscan they remained. Indeed, it is mainly from them that our knowledge of the Oscan language is derived, and one of their towns—Atella, between Capua and Naples—had the honour of introducing upon the early Roman stage a species of popular drama or comedy, which was greatly relished for its quaint and vigorous humour. See ATELLA.

CAMPANILE (Ital., from Mid. Lat. *campana*, a bell), a name adopted from the Italian to signify a bell-tower of the larger kind, and usually applied only to such as are detached from the church. Scarcely any of the existing bell-towers of England answer to the Italian conception of the C., but it is said that there was a very fine one at Salisbury, 200 feet in height, which was destroyed by Wyatt. In Italy, they are found everywhere—at Bologna, Padua, Ravenna, Cremona, Venice. Perhaps the most remarkable are the so-called 'leaning tower' of Pisa, and the C. of Florence. The former, which is circular in form, is decorated with columns and arcades to the summit of its eight stories, and presents a very imposing appearance, reminding the traveller of the Coliseum at Rome, from which, and the now destroyed Septizonium, the idea of it is said to have been taken by the architects Bonano of Pisa, and Wilhelm of Innernbruck. But though less curious, the famous C. of Giotto is perhaps even more worthy of the traveller's attention. It was erected in 1334, with the express object of surpassing both in height and in richness of workmanship, any of the remains of antiquity. In form, it is a parallelopiped, and is of the same dimensions from bottom to top. Though it is very lofty—267 feet—it consists of only four stories, of which the tallest are the uppermost and undermost; and the windows in the upper story are rather larger than those in the two beneath, the object being to counteract the diminution to the eye occasioned by the greater distance. The effect of this arrangement has been much praised by architects; but there seems ground for scepticism as to its advantages. The style is the real Italian Gothic, which unites simplicity with great richness of ornamentation. The original design of Giotto was that a spire of 100 braccia in height should have surmounted the present structure, and on the summit may be seen the four great piers from which it was intended that it should have risen. The splendid C. of Florence, in its present condition, must thus be regarded only as a fragment. There is a fine C. at Seville, 350 feet in height, which was built by Guever the Moor in 1568. It is called La Giralda, from a brazen figure, which, though it weighs a ton and a half, turns with the wind.

CAMPANULA (Lat., a little bell), a genus of plants of the natural order *Campanulaceæ* (q. v.), distinguished by a bell-shaped corolla with five broad short segments, filaments dilated at the base, a 2—5-cleft stigma, and a top-shaped capsule with 2—5 cells, opening by lateral clefts below the calyx segments. The species are very numerous, chiefly but not exclusively abounding in the northern parts of the world, and the more elevated districts of the temperate zones. They are mostly herbaceous, some of them annual. The name BELL-FLOWER is common to many of them, and is often extended to all. The flowers are in general beautiful, and many of the species are therefore frequent ornaments of flower-borders. Of the native British species, the most common, and one of the most beautiful, is the HAREBELL (q. v.) or BLUEBELL (*C. rotundifolia*). The CANTERBURY BELL (*C. Medium*) is a very beautiful annual, which has long been so generally sown in flower-borders in Britain, that it is almost as

familiar to every one as the most common field-flowers. It is a native of the central parts of Europe.—Medicinal virtues were formerly ascribed

Harebell (*Campanula rotundifolia*).

to some species, particularly in affections of the throat, wherefore *C. Trachelium*, frequent in woods in England, has received the name of Throatwort; but they are now regarded as inert.—The roots of some are reckoned among esculents, as those of the RAMPION (q. v.), (*C. Rapunculus*), occasionally cultivated in Britain, and much more generally in some parts of continental Europe.

CAMPANULACEÆ, a natural order of exogenous plants, herbaceous or half shrubby, with a bitter milky juice; leaves without stipules, and generally alternate; the calyx usually 5-lobed, its tube adhering to the ovary; the corolla monopetalous, inserted into the top of the calyx, usually 5-lobed and regular; the stamens inserted into the calyx, and alternate with the lobes of the corolla; the fruit with two or more many-seeded cells, crowned with the withered calyx and corolla, and opening by division of the cells (*loculicidally*); the seeds fixed to the axis, and having fleshy albumen. About 500 species are known, natives chiefly of the temperate and colder climates of the northern hemisphere, where their blue or white flowers are among the finest ornaments of fields and woods. The roots and young leaves of some species are eatable, as is the half-fleshy fruit of *Canaria Campanula*, a native of the Canary Islands.

CAMPBELL, the family name of the Lords of Argyle. The origin of the family has not been satisfactorily ascertained. One theory makes it of Anglo-Norman origin; another traces its descent through a long line of Celtic chiefs to King Arthur. It first appears in record towards the end of the 13th c., when it held lands in Ayrshire and Argyle. The chiefs of the family having taken a prominent part in public affairs, the most distinguished are noticed under the head ARGYLE.

CAMPBELL, SIR COLIN, LORD CLYDE, one of the bravest soldiers and most distinguished generals of modern times, was born in Glasgow, in 1792. His father was a cabinet-maker, named John Maciver, but Colin assumed the name of Campbell, to gratify an uncle on the mother's side. He entered the army as an ensign in 1808; fought through the war in the Spanish peninsula

with distinction, and took part in the expedition to the United States in 1814. In 1842, he attained the rank of colonel, and in the same year he was present at the attack on Chusan, in China, and for his services there received honourable mention in the *Gazette*. He next served in the Punjab, commanding the left at the battle of Chillianwallah. For his conduct in this battle, Lord Gough awarded him the highest praise in his dispatch to the governor-general of India. He next commanded in the Peashawur district with uniform success against the hill-tribes. On the breaking out of the Crimean war in 1854, he was appointed to the command of the Highland Brigade, and took a prominent part at the battle of the Alma; and afterwards at Balaklava, where, with the 93d Highlanders, which he did not even form into square, he beat back the Russian cavalry, who were swooping down on the port, with its accumulation of shipping and stores. His services in this war were rewarded with promotion to the rank of major-general, and he was also created a Knight Grand Cross of the Order of the Bath, and received the Cross of the French Legion of Honour. He was appointed Inspector-general of Infantry, and in 1857, commander of the forces in India, then engaged in quelling the Indian mutiny, which by his energy and judgment was soon utterly subdued. One of the most notable characteristics of C.'s generalship, was the care he took of the lives of his men, all his victories being won with the minimum expenditure of the blood of his soldiers. For his exploits in India, C., in 1858, was created a peer of the realm, with the title of Baron Clyde, and appointed a general, the East India Company granting him an annuity of £2000. C. arrived in Britain from India in 1860, and died August 1863.

CAMPBELL, GEORGE, D.D., an eminent theological writer, was born at Aberdeen in 1719. He was educated for the law, but abandoned that profession for the study of divinity. In 1746, he was ordained minister of Banchory Ternan, a parish lying some miles south-west of Aberdeen; and in 1759, he was appointed Principal of Marischal College. His first work was his famous *Treatise on Miracles*, in answer to Hume. The dispute concerning miracles has assumed a new form in the present century, and C.'s arguments would not meet all the objections which the modern school of rationalists urge; but the work in its own day was greatly admired, and characterised as 'one of the most acute and convincing treatises that has ever appeared on the subject.' It was speedily translated into French, Dutch, and German. In 1771, C. was elected Professor of Divinity in Marischal College. In 1776, he published his *Philosophy of Rhetoric*, which is still a standard work on the subject. His last work was a *Translation of the Gospels, with Preliminary Dissertations and Notes*. He died April 6, 1796. After his death appeared his *Lectures on Ecclesiastical History*.

CAMPBELL, JOHN (CAMPBELL), LORD, High Chancellor of England, son of a minister of Cupar, in the county of Fife, Scotland, was born in 1779. He was at first destined to follow his father's profession, and was sent while still a mere boy, to the neighbouring university of St Andrews. C. himself had no inclination for a clerical life, and when he had completed his studies in the Faculty of Arts, he left for London, being then about 19 years of age. He obtained employment on the staff of the *Morning Chronicle*, where, in due time, he was intrusted with the care of the theatrical criticism and the reports in the House of Commons. He was called to the bar in 1806. His

sound sense, and unpretending activity and devotion to business, were awarded with an extensive common-law practice, and, after a time, with professional promotion. The silk-gown of a king's counsel was conferred upon him in 1827. Three years afterwards, he entered parliament actuated, he tells us in the preface to one of his works, by a desire to obtain for England the benefits of a national registry of titles to land. The effort, at the time, was unavailing, as the landlords, whom it was destined more immediately to benefit, completely misunderstood the purport of the project. C. was promoted by the Whig party, to which he had attached himself, to the Solicitor-generalship in 1832, and to the Attorney-generalship in 1834. In the same year, he was chosen the representative in parliament for Edinburgh. He continued to represent Edinburgh down to 1841, and remained in the office of Attorney-general during that period, with the exception of the short time in 1835, when the Conservatives were in power. In 1841, he was made Chancellor of Ireland and a peer of the United Kingdom; but held the office of Chancellor for only a few months, when the Melbourne cabinet left office, necessitating C. also to resign. For the first time since boyhood, he found himself without regular daily labour, and at the mature age of 60, set to work to win the literary fame which he professes always to have secretly coveted. His first publication was a collection of his speeches at the bar and in the House of Commons. For three or four years after the publication of his speeches, C. was engaged in the preparation of the *Lives of the Chancellors*, the first series of which appeared in 1845. In 1846, he joined the Russell cabinet in the capacity of Chancellor of the Duchy of Lancaster. His ministerial duties were not sufficiently arduous to interrupt his literary labours, and he proceeded to complete the *Lives of the Chancellors*, and to publish a supplemental series of *Lives of the Chief-justices of England*. Both works have enjoyed great popularity, but leave no doubt that the author was more fitted for a practical lawyer than for a man of letters. C. returned to more congenial labours in 1850; he was then appointed to succeed Denman as Chief-justice. He held the office for nine years, at the end of which he received the highest honour that can be obtained by a member of the legal profession—the Chancellorship of England. He died June 1861.

CAMPBELL, THOMAS, a distinguished English poet, was born in the city of Glasgow, 27th July 1777. His father was a merchant, and the poet was the youngest of ten children. He was sent to the university of his native city, and remained there six years. During his collegiate course, he received several prizes, and was particularly distinguished for his knowledge of Greek literature. On leaving the university, C. went to reside as a tutor for a year in the island of Mull. The scenery of the West Highlands made a deep impression on his mind, and to his abode in these grand and desolate regions we are indebted for many of the touches of sublimity which occur in his verses. Returning from Argyllshire, C. meditated the study of law, and repaired to Edinburgh; but he could not shake off his recollections. In his eyes, the mists were folded on the hills of Morven, the roar of Corrievrekin was in his ears, and instead of prosecuting the study of jurisprudence, he wrote *The Pleasures of Hope*. The poem was published in 1799, and went through four editions in a twelve-month. After its publication, C. went to the continent; and on December 3, 1800, witnessed from a Bavarian monastery the battle of Hohenlinden, fought between the French and Austrians. In 1801, he returned to England, with *The Exile of*

## CAMPBELL ISLAND—CAMPHOR.

*Erin and Ye Mariners of England* in his portmanteau; and shortly after, took up his abode in Edinburgh, where *Locheil's Warning* was composed. In 1803, C. proceeded to London, and adopted literature as a profession. He contributed articles to *The Edinburgh Encyclopaedia*, and compiled *The Annals of Great Britain from the Accession of George II. to the Peace of Amiens*, in 3 vols. In 1806, through the influence of Mr Fox, C. received a pension of £200 per annum from government. In 1809, he published *Gertrude of Wyoming*, which bears the same relation to *The Pleasures of Hope* that *The Castle of Indolence* bears to *The Seasons*—a less brilliant and striking, but more mature and finished performance. In 1818, C. was again in Germany, and on his return, he published his *Specimens of the British Poets*, in 7 vols. In 1820, he delivered a course of lectures on poetry at the Surrey Institution. From this date to 1830, C. edited *The New Monthly Magazine*, and contributed thereto several poems, one of which, *The Last Man*, is in some respects the loftiest of all his performances. In 1824, he published *Theodoric and other Poems*. In 1827, he was elected Lord Rector of the university of Glasgow, and received the unusual honour of re-election the two following years. He published *The Pilgrim of Glencoe and other Poems* in 1842. His later publications did not add to his fame. He died at Boulogne in 1844, and was buried in Westminster Abbey, Macaulay, Dean Milman, and other celebrated persons bearing the pall.

C. is an established English classic. With the young, *The Pleasures of Hope* will ever be a chief favourite; while readers of maturer years will linger with delight over the silvan scenery and tender domestic scenes of *Gertrude*. It is in his lyrics, however, that C. has ascended highest into the heavens of song—*Hohenlinden*, *Ye Mariners of England*, and *The Battle of the Baltic*, cannot be paralleled in the language. Than these lyrics, nothing can be more simple and spirited. Once read, they cannot be forgotten. They will fan the patriotism of many generations.

Campbell's Autograph.

**CAMPBELL ISLAND**, a lonely spot on the South Pacific, in lat. 52° 33' S., and long. 169° 9' E. Though it is mountainous, and measures only 36 miles round, it is yet valuable on account of its harbours. It is also scientifically interesting, being volcanic, and displaying a rich and rare flora.

**CAMPBELTON**, a royal burgh and seaport, on the east coast, near the south end of the peninsula of Cantire, Argyleshire, and the most important town in that county, is 65 miles west-south-west of Glasgow, on a fine harbour or sea-loch, 2 miles long, and 1 mile broad. It is noted for the number—between 20 and 30—of its whisky distilleries. It unites with Ayr, Inverary, Irvine, and Oban to return one member to parliament. A sculptured granite cross stands in the principal street, and is supposed to have been brought from Iona. Pop. (1871) 6680. The chief exports are whisky, herrings, and Highland cattle and sheep. In 1872, 621 vessels entered port—tonnage, 53,507; and 402 cleared it, of 40,146 tons. C. is a favourite summer resort.

**CAMPEA'CHY**, a seaport on the west side of

the peninsula of Yucatan, which divides the Caribbean Sea from the Gulf of Mexico. It is in lat. 19° 50' N., and long. 90° 33' W. Though it has a shallow haven, yet it is the centre of the trade in logwood; it exports likewise cotton and wax. It is a handsome city of 10,000 inhabitants, containing churches, convents, a cemetery, a theatre, a college, and ship-building docks.

**CAMPER**, PETER, one of the most learned and acute physicians and anatomists of the 18th c., was born at Leyden, 11th May 1722, and studied medicine there. In 1750, he became professor of medicine at Franeker; in 1755, at Amsterdam; and in 1765, at Groningen. In 1773, he resigned his post, resided some time at Franeker, and then travelled. On being elected a member of the state council in 1787, he removed to the Hague, where he died, 7th April 1789. C. was distinguished not only for the services he rendered to anatomy, surgery, obstetrics, and medical jurisprudence, but also as a promoter of the fine arts. He was remarkably skilful in pen-and-ink drawing, painted in oil, embossed, and even acquired considerable experience as a sculptor. For his observations on the facial angle, see article ANGLE. His work on the connection of anatomy with the art of drawing was an important contribution to the theory of art. Another work, *Description Anatomique d'un Éléphant Mâle*, edited by his son, G. A. Camper, and published at Paris in 1802, is also worthy of notice. C.'s collected writings, with plates, appeared under the title, *Oeuvres qui ont pour Objet l'Histoire Naturelle, la Physiologie et l'Anatomie comparée*, 3 vols. (Par. 1803).

**CAMPERDOWN**, a village of Holland, 27 miles north-west of Amsterdam, celebrated on account of the victory obtained off its coast by Admiral Duncan over the Dutch fleet, October 11, 1797. The Dutch fleet, consisting of 11 sail of the line and other smaller vessels, under the command of the gallant Admiral van Winter, had stolen out of the Texel during a storm, with the view to join the French fleet at Brest, when they were attacked by Admiral Duncan with 16 ships of the line. After an obstinate combat, attended with great loss on both sides, the Dutch admiral was compelled to strike, leaving 8 sail of the line and some smaller vessels in the hands of the English.

**CA'MPHENE**, or **CA'MPHILENE**, is an artificial variety of camphor obtained from turpentine, by acting thereon with the dry vapour of hydrochloric acid, and keeping the whole at a low temperature by immersing the vessel in a freezing mixture. A solid substance is produced, which separates in white crystalline prisms, and has the taste and agreeable aromatic smell of common natural camphor. As prepared, it is strictly a hydrochlorate of C.; but the latter can be obtained free from hydrochloric acid, by passing the vapour of the compound substance over dry heated quicklime, when the acid is held by the lime, and pure C. passes over. It is not so similar to ordinary camphor when thus freed from the hydrochloric acid.

**CA'MPHINE** is the name applied to a variety of spirit of turpentine obtained from the *Pistacia australis* of the Southern States of America, and rather extensively sold and used in Britain for burning in out-of-door lamps. It is very volatile, and burns very freely, giving off a pure white brilliant light; and when the vapour diffuses itself through air, and is set fire to, it forms a dangerous and violently explosive mixture.

**CAMPHOR** is a solid essential oil which is found in many plants, and may be separated from many essential oils. It particularly abounds in

## CAMPI—CAMPO-FORMIO.

certain species of the natural order *Lauraceæ* (q. v.). Almost all the C. of commerce is the produce of the C. Laurel or C. tree (*Camphora officinarum*, formerly known as *Laurus Camphora*), a native of China, Japan, Formosa, and Cochin-China, and which has been introduced into Java and the West Indies. The genus *Camphora* differs from *Cinnamomum* (see CINNAMON) chiefly in having a thin instead of a leathery calyx. The C. Laurel is a tree of considerable height, much branched, with lanceolate, evergreen leaves on short stalks, and small yellowish-white flowers in axillary and terminal panicles. The fruit is in size and appearance not unlike an imperfectly ripened black currant. Every part of the tree, but especially the flower, smells strongly of camphor. The wood is light and durable, not liable to be injured by insects, and much valued for carpenter's work. In the extraction of C. from the C. Laurel, the wood of the stem and branches is chopped up into fragments, and introduced into a still with water, and heat applied, when the steam generated carries off the C. in vapour. These vapours rise, and in passing through rice-straw, with which the head of the still is filled, the C. solidifies, and is deposited round the straw in minute grains or particles, somewhat about the size of raw sugar or coarse sand. These grains of impure C. are detached, and being introduced into a large globular glass vessel in quantities of about 10 lbs., are reheated, when first the water rises in steam, and is allowed to escape at a small aperture; and thereafter, this aperture being closed, the C. sublimes and resolidifies in the interior upper part of the flask, as a semi-transparent cake, leaving all the impurities behind. The flasks are then cooled and broken by throwing cold water on them, and the C. taken out, and sent into market. The glass globes employed are called by an Italian name, *bomboloz*, the sublimation of C. having been first practised in Venice.—C. was unknown to the Greeks and Romans, and was first brought to Europe by the Arabs. It is a white tough solid, slightly lighter than water, and floats thereon. It is very sparingly soluble in water, but freely soluble in alcohol, ether, acetic acid, and the essential oils. It fuses at 347°, and boils at 399°, and when set fire to, is very inflammable, and burns with a white smoky flame. Thrown upon water, it floats, and may be set fire to, when the currents generated alike from the solution in water and the irregular burning of the pieces, cause a curious rotatory motion. It has a peculiar hot aromatic taste, and an agreeable characteristic odour.

C. is used in medicine, both internally and externally, as a temporary stimulant. It is frequently employed in gout and rheumatism. In small doses, it acts as an anodyne and antispasmodic; in very large doses, it is an irritant poison. It is generally reckoned an aphrodisiac. Its alcoholic solution and liniments in which it is the principal ingredient, are much used for external application in sprains and bruises, chilblains, chronic rheumatism, and paralytic.—The effluvia of C. are very noxious to insects, and it is therefore much used for preserving specimens in natural history.

The BORNEO C. or SUMATRA C. of commerce, sometimes called HARD C., is the produce of *Dryobalanops aromatica*, a large tree of the natural order *Dipteracea* (q. v.). The C. is obtained by cutting down the tree, and splitting it into small pieces; being found in crystalline masses in natural cavities of the wood. To this substance, the Chinese ascribe extraordinary medicinal virtues, so that it is sold among them at more than fifty times the price of common camphor. It is seldom brought to Europe

as an article of commerce.—The *Dryobalanops aromatica* yields also a pale-yellowish limpid fluid, which gushes out when deep incisions are made in the tree with an axe, and which is generally called LIQUID C. or C. OIL. It is sometimes imported into Europe. It has a smell somewhat resembling that of C., but more aromatic, like oil of cajeput. It is supposed to be from this fluid that the crystalline Hard C. is deposited. See BORNEE.

CAMPI, a family of artists, who founded at Cremona, in the middle and near the close of the 16th c., an eclectic school of painting, parallel with that founded by the family Caracci (q. v.). GIULIO C. (1500—1572) was the head of the school. He studied painting, sculpture, and architecture under Giulio Romano. He also imitated the works of Titian (at least in colouring) and Pordenone with such success that his pictures have sometimes been ascribed to both of these artists. His female heads, like those of his brothers, are remarkably beautiful.—ANTONIO C. studied, under his brother, both painting and architecture. His knowledge of the latter was very serviceable in several of his paintings; for example, that of the sacristy of St Peter. He was also a plastic artist, an engraver, and the historian of his native place.—VINCENTO C. (b. before 1532, d. 1591) seems to have followed the guidance of Antonio rather than that of Giulio, and excelled more in small figures than in large pictures. His paintings of fruits are highly valued.—BERNARDINO C. (b. 1522, d. about 1590), a kinsman of the three brothers C., was the most famous of the whole. Lanzi terms him 'the Annibale Caracci' of the school. He studied first under Giulio C., but soon excelled his master. Afterwards, he chose Giulio Romano, Titian, and Correggio as models, but chiefly followed Raphael, yet without servile imitation. Many of his works are found in Milan and Cremona. In the latter place, the cupola of the choir in the church San-Giandomondo is Bernardino's master-piece. He was distinguished as a portrait-painter and engraver.

CA'MPION. See LYCHNIS, and SILENE.

CA'MPLI, a town in the province of Teramo, South Italy, about 5 miles north of the city of Teramo. It has a cathedral, an abbey, and several convents. Pop. about 7000.

CAMPOBA'SSO, a fortified town of South Italy, in the province of the same name, about 53 miles north-north-east of the city of Naples. It has a fine cathedral, a ruined castle, some convents, and palaces belonging to resident nobles. It has manufactures of cutlery, which enjoys a considerable reputation for excellence. Its situation, though far from inviting as regards scenery, is favourable for trade, which is facilitated by good roads. Pop. 14,500.

CAMPOBELLO, an island of New Brunswick, situated at the mouth of the Passamaquoddy Bay, in lat. 44° 57' N., and long. 66° 55' W. It is small, being 9 miles long, and from 1 to 3 miles broad; but it is decidedly valuable, possessing some good harbours, and, at its north end, a light-house of 60 feet in height.

CAMPO' DE CRIPAT'NA, a town of Spain, in the province of, and about 50 miles north-east of the city of Ciudad-Real. It has manufactures of coarse cloths, and some trade in corn and fruits. Pop. 5250.

CAMPO-FORMIO, a village in the province of Udine, Northern Italy, about 7 miles south-west of the city of Udine, is celebrated for the treaty of peace here concluded, October 17, 1797, between Austria and the French Republic. After subjugating Italy (1796), the French army had crossed the

Norio Alps, and threatened Vienna. Austria, therefore, hastened to arrange preliminaries of peace. In the treaty which was concluded by Bonaparte with the Count of Coblenz, 17th October 1797, Austria ceded the Netherlands, Milan, and Mantua, and received as compensation the districts Istria, Dalmatia, and the left bank of the Adige in the Venetian states, and the capital, Venice; while France took the remaining territory of Venice, its possessions in Albania, and the Ionian Islands. In the secret articles of the treaty, Austria, in ceding the left bank of the Rhine, was to receive as compensation Salzburg and the Bavarian district on the Inn; and promises were held out to the Duke of Modena, and other Italian houses, that their concessions should be compensated at the cost of Germany.

CAMPOMANÉS, PEDRO RODRIGUEZ, COUNT OF, Spanish minister and director of the Royal Academy of History at Madrid, founded by Philip V. in 1738, was born in Asturias in 1723. His talents and learning were devoted to the advancement of his native country. By his enlightened views of state policy, as well as by his writings, which ranked him among the most eminent Spanish authors, he obtained a great reputation throughout Europe. He gave effectual assistance to Count Aranda in his difficult enterprise of driving the Jesuits out of Spain. He died February 3, 1802. C.'s chief works are—*Antiguedad Marítima de la República de Cartago con el Péríodo de su general Hannon, traducido del Griego y ilustrado* (Madrid, 1756); *Discurso sobre el fomento de la Industria popular* (1771); *Discurso sobre la Educación popular de los Artisanos y su fomento* (1775); *Apendice a la Educación popular* (1775—1777). These writings contained his opinions on politics, taxation, agriculture, manufactures, and commerce. The best known of his financial productions is *Tratado de la Regalia de Amortización* (Madrid, 1765).

CAMPO SANTO (Holy Field) is now the Italian designation for a cemetery or burying-ground, but more especially for an enclosed place of interment, surrounded internally by an arcade, and destined to receive the remains of persons of distinction. The most famous C. S., and that from which the others derived the name, is that of Pisa—in the neighbourhood of the Dome, and consecrated to the memory of men who had deserved well of the republic. It was founded by Archbiishop Ubaldo, towards the end of the 12th century. The archbiishop, having been driven out of Palestine by Saladin, brought his fifty-three vessels, which had been destined for the conquest, laden with the earth of the Holy Land. This he deposited on the spot which was thence called the Holy Field, and which, as we have said, gave its name as a generic term to the burying-grounds of Italy. The architect of the existing building was Giovanni Pisano, under whose superintendence it was completed in 1283. It contains an area of 400 feet in length, and 118 in breadth; and is surrounded by a lofty wall, on the inner side of which a wide arcade runs round the whole enclosure, giving to it the character of one magnificent cloister. At the smaller eastern side, there is a large chapel, and two chapels of smaller size on the northern side. The lofty circular arches of the arcade are filled with the richest Gothic tracery, which belongs, however, to a later date—the latter half of the 15th c.—and consequently formed no part of the original design. The walls are adorned with frescoes, which are of great interest and value, both absolutely and with reference to the history of art. The oldest of those which have been preserved adorn one side of the eastern wall:

they represent the passion of Christ, his resurrection, and other sacred subjects. These remarkable paintings are supposed to date before the middle of the 14th c., and are ascribed to Buffalmaco. But the most marvellous productions are those of Giotto (q. v.), of Simone Memmi, the friend of Petrarch, and of Andrea and Bernardo Orcagna. As a museum of classical antiquities, the C. S. is perhaps even more remarkable than in any other point of view. Altars, sarcophagi, bas-reliefs, statues, inscriptions, everything that is interesting or curious which has come into the possession of the Pisans for centuries, they have accumulated within its walls.

CAMPVERE, now called VERE or VEERE, a small fortified town of the Netherlands, in the province of Zealand, in Walcheren Island, 4 miles north-north-east of Middleburg. It has a port on the Veerse Gat, a tract of water separating Walcheren from North Beveland. The town is now in a state of deplorable decay, but it still possesses remnants of its early prosperity in its town-house of white freestone, remarkable for its elegant tower, and in its beautiful cathedral. C. has now one calico-factory. Its population has dwindled down to about 1000.

From a historical point of view, C. is a city of great interest. In the year 1304 it was the scene of a battle between Guy, Count of Flanders, and William, governor of Holland and Zealand, in which the first was victorious. In 1572, it was delivered from the Spanish garrison; and, a century later, it was the first to proclaim the Prince of Orange, William III, stadholder. But C. is chiefly interesting for the trading relations subsisting between it and Scotland for nearly four centuries. Wolfaard van Borssela, Lord of Vere, Sandenburg, &c., having married Mary, the sister of James I of Scotland, the Scotch staple was transferred from Bruges to C. in 1444. C. owed its name to the circumstance, that there originally existed a *ferry* (Dutch, *veer*) from thence to the village of Campen, in North Beveland, a village situated on the spot where now lies the hamlet of Kamperland. The Scotch staple-right at Vere consisted in the privilege of having all goods, destined from Scotland to the Netherlands, brought to that city; and they could not be transferred to another place before they had been sold there. The numerous Scotchmen living at Vere were under the rule of a 'Conservator of the Scotch nation,' and had many privileges conceded to them, including the right to be governed by the law of Scotland. The last treaty respecting those rights was in 1741, after which time the increasing prosperity of Scotland rendered the renewal of such partial arrangements unimportant. The conservatorship, however, was held as a sinecure long after the necessity for the office had ceased, the name of Sir Alexander Ferrier appearing in the *Edinburgh Almanac* as 'Conservator at Campvere' so lately as 1847, after which time the office seems to have been abolished. The Scotch formed a separate religious community, which, from 1613 until the French Revolution, had a minister of its own, and afterwards, till 1809, was served by the minister of Vlissingen, when it ceased to exist.

CAMTOO'S, or GAMTOO'S, a river of the east division of the Cape Colony, of 200 miles in length. It rises in the Nieuwveld mountains, near lat. 32° S., and, flowing through the inland district of Beaufort, and the maritime one of Uitenhage, falls into that inlet of the sea which is immediately to the west of Algoa Bay. It is valuable as an aid to irrigation. For instance, Hankey, a station of the London Missionary Society on its banks, is

thoroughly watered by means of a splendid tunnel carried through solid rock at the expense of the association just mentioned.

CAMUCCI'NI, VINCENZO, one of the most distinguished modern historical painters in Italy, was born in Rome 1775. The school of which he became the head was founded on the theatrical antique style of the French painter David. The first important works by C. were the 'Assassination of Caesar' and the 'Death of Virginie,' both painted for Lord Bristol at the commencement of the present century. His picture of 'Unbelieving Thomas' was copied in mosaic for St Peter's Church. For the church of San Giovanni in Piacenza he executed a 'Presentation in the Temple,' which was greatly admired. These works were followed by many scenes from Roman history; among them, the pictures of 'Horatius Cocles,' and 'Romulus and Remus' as children. C. who, as a man and an artist, was highly honoured during his career, died at Rome, September 2, 1844.

CAMUS, ARMAND GASTON, a prominent character in the French Revolution, was born in Paris, April 2, 1740. On account of his superior knowledge of ecclesiastical law, he was elected Advocate-general of the French clergy. He was a zealous and ascetic Jansenist, and possessed of extraordinary firmness of character. He hailed the movements of 1789 with joy, and was elected member of the States-general by the people of Paris. In this position, he appeared as the resolute foe of the ancient régime. He gained possession of, and published, the so-called *Red Book*, giving accounts of court expenditure, which was highly disadvantageous to the court and its ministers. After the flight of Louis XVI., C., with Montmorin, Lafayette, and Bailly, accused the king of treason and conspiracy, and insisted on the suppression of all orders and corporations based on hereditary rights. As conservator of the national archives, he rendered an important service by preserving from destruction the old documents of the abolished corporations and institutions. He was absent in Belgium during the king's trial, but sent his vote for death. In March 1793, when he was commissioned to make prisoners of Dumouriez and other generals suspected of treason, C. himself and his four colleagues were taken prisoners and delivered over to the Austrians (April 3); but, after an imprisonment of two and a half years, he was exchanged for the daughter of Louis XVI. On his return to Paris, he was made member of the Council of Five Hundred, of which he became president, January 23, 1796, but resigned 20th May 1797, and devoted his time to literature. Remaining, however, true to his principles, he voted, July 10, 1802, against Napoleon's proposed consulship during life. C. died of apoplexy, November 2, 1804.

CA'MWOOD, or BARWOOD, a dyewood which yields a brilliant but not permanent red colour, and is used along with sulphate of iron to produce the red colour in English Bandana handkerchiefs. It is the wood of *Baphia nitida*, a tree of the natural order Leguminosæ, sub-order Cæsalpiniæ, a native of Angola. It is preferred to Brazil Wood (q. v.), as producing a finer and richer red.

CANA OF GA'LILEE, called by the natives 'Kefr Cana.' This place, celebrated in Scripture as the scene of our Lord's first miracle, when he turned water into wine, is now a small village of a few hundred inhabitants, who are principally Greek Christians or Nazarenes, situated about 13 miles west of the Sea of Galilee, and 6 miles north of Nazareth. At the entrance to the village there is a fountain of the clearest and most delicious water—the best, say the Christians of Palestine, in the

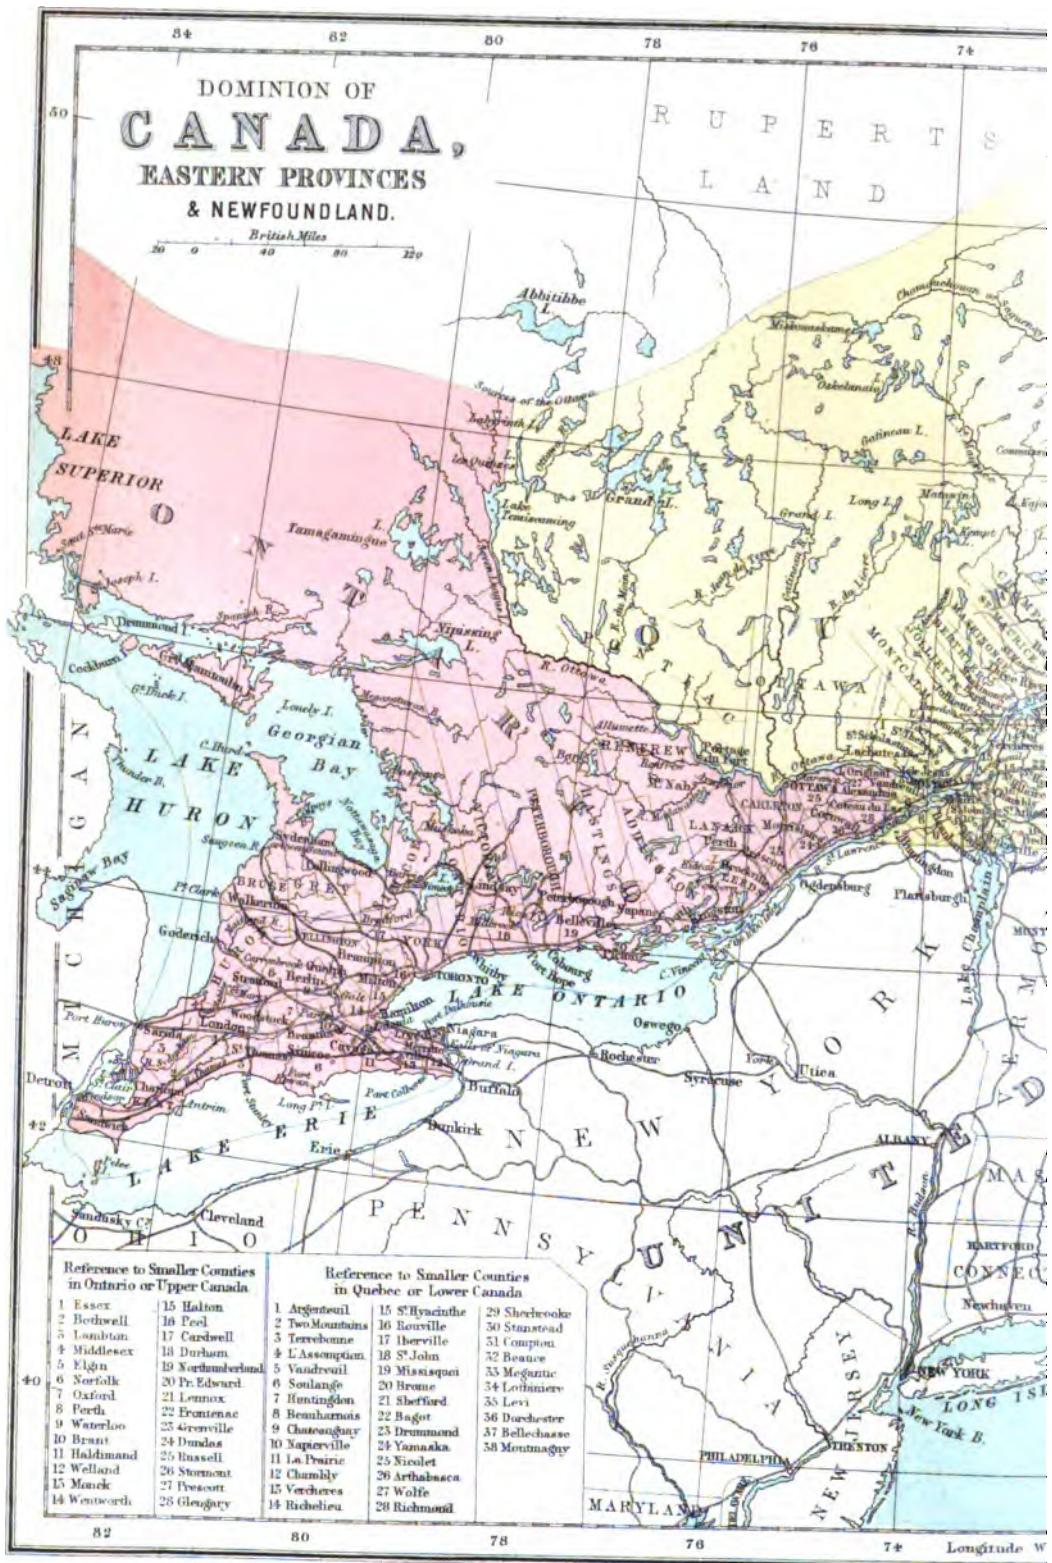

world: from it, it is supposed, the vessels for the marriage-feast were filled; and near the fountain are also lying the fragments of a Roman column. A house is still shewn as that in which the miracle was performed; and some earthen jars sunk into the floor are said to be the very jars in use on that day. A church was built over the spot, but it is now in ruins.

#### CANAAN. See PALESTINE.

CANADA, as a geographical designation, has had in history a variety of meanings. Originally, it comprised an extensive range of country reaching, under the French, as far as even the Mississippi, away beyond the boundary lakes. It was subsequently limited to a region chiefly in the basin of the St Lawrence—including in that term both the lakes and the river. C., in the sense in which that word is most generally known, was, in 1791, divided into two provinces, Ontario and Quebec, or Upper and Lower Canada. These two sections were re-united in 1840; but became separate members of the Confederation—the Dominion of Canada—in 1867. The country composed of these two provinces extends eastwards from near the Red River Settlement to the Gulf of St Lawrence, and from Michigan to New Brunswick. Northward, it reaches from the Canadian lakes and the St Lawrence to the high ridge of land which separates the rivers of C. from those of the region hitherto known as the Hudson Bay Territory, but since 1870 forming a part of the Dominion of Canada. C. was bounded north by the Hudson Bay Territory; east, by the Gulf of St Lawrence; south, by the States of Maine, New Hampshire, Vermont, New York, and the Lakes Erie and Ontario; west, by Lakes St Clair, Huron, and Superior; and north-west, by the Indian territories. The boundaries of the Dominion not having been surveyed, their area cannot yet be accurately stated. The nearest approximation to the boundaries of C. was 331,280 sq. miles, of which 121,260 were included in the province of Ontario, and 210,020 in the province of Quebec. The principal river of C. is the St Lawrence, and its most important tributaries are all from the left. The St Lawrence drains an area of 565,000 miles. The Ottawa, 450 miles long, forms the boundary between Ontario and Quebec. The St Maurice, nearly 400 miles in length, and the Saguenay, noted for its fine scenery, rank as rivers of the first magnitude, according to European analogies. The only affluents from the right worth naming are the Richelieu, the St Francis, and the Chaudiere; and even of these subordinate streams, the last two are totally Canadian, while the first, as the outlet of Lakes Champlain and George, belongs to the United States only in part.

In 1535, Jacques Cartier, a French navigator, born at St Malo in 1494, entering the St Lawrence on the festival of the saint of that title, took nominal possession of North America in the name of his king, Francis I. It was not, however, till nearly a century later (1608) that Quebec was taken formal possession of. From that stronghold, France ruled for 150 years a vast region, extending eastward to Acadia—Nova Scotia—westward to Lake Superior, and down the Mississippi to Florida and Louisiana. In 1759, a small British army—5000 in number—under the command of General Wolfe (q. v.), virtually wrenched *La Nouvelle France*, on the 'Plains of Abraham,' from her first European rulers by the taking of Quebec. Isle aux Noix, and Forts Oswegatchie and Lévis, successively passed into the hands of the British, and then Montreal was besieged and taken by General Amherst with an army of 17,000 men. The capitulation of that city,

which was signed September 1760, brought to a final close the era of French dominion in Canada. The people of the conquered country were secured, by the terms agreed to, in the free exercise of their religion; and peace was concluded between Britain and France in 1763.

In that year, a small portion of the recently acquired territory was organised by royal proclamation under English laws. In 1774, the new province was extended by parliamentary enactment, and that under French laws, down the Ohio to its confluence with the Mississippi, and up the latter stream to its source. Finally, C. receded to its present limits in 1783, giving up to the American republic the sites of six sovereign states—Minnesota, Wisconsin, Michigan, Ohio, Indiana, and Illinois. In 1791, it was divided, under separate legislatures, into two sections—the eastern retaining French institutions, and the western receiving those of England; and these sections, again, after political discontent had in each ripened into armed insurrection, were re-united for legislative purposes in 1840.

In 1763, the French population amounted to about 65,000, occupying the immediate banks of the lower St Lawrence and its tributaries. Excepting within the cities of Montreal and Quebec, the immigrants of a different origin, whether from the old colonies or from the mother-country, scarcely attempted to establish themselves among the ancient settlers; thus producing a kind of reciprocal isolation, which, even down to the present day, has not been materially disturbed. Generally speaking, therefore, the two grand elements of the provincial population are locally distinguished from each other—a relative position which has happily excluded, as between them, nearly every difficulty as to education and religion. The settlers of French origin, almost entirely confined to Lower C., occupy the banks of the St Lawrence and of the lower courses of its tributary streams; all the rest of Lower C. and the whole of Upper C., so far as they are reclaimed at all, belong to colonists of English race.

The origin of the name is most probably to be found in the assertion, that Jacques Cartier, the discoverer of Canada, having heard the natives apply the Indian word *Kannatha* (village) to their settlements, mistook it for the name of the whole country.

Upper and Lower C. have presented a striking contrast in their rates of progress. To take, for instance, the growth of towns: In Lower C., Sherbrooke, the capital of the Eastern Townships, situated on the river St Francis, with about 6000 inhabitants, forms almost the only addition to Quebec, Three Rivers, and Montreal—the three French foundations. The growth of Montreal and Quebec, remarkable enough in itself, has been owing rather to their commercial facilities with regard to the country at large than to the agricultural resources of their immediate vicinities; while Toronto, London, Kingston, and Hamilton—each nurtured chiefly by its own locality—have an aggregate population of above 120,000. Great part of Upper and Lower C., more especially the shores of Lake Superior, is valuable only for mineral resources, such as iron, zinc, lead, copper, silver, gold, cobalt, manganese, gypsum, marl, granite, sandstone, limestone, slate, and marbles of nearly every imaginable colour. Considerable portions also, though heavily timbered, chiefly with pine, are yet but little adapted to settlement and cultivation. Towards the Gulf of the St Lawrence, again, a considerable section derives importance mainly from the fisheries, being, with partial exceptions in Gaspé, comparatively

worthless for every other object. Thus the area for the profitable production of ordinary cereals cannot materially exceed 40,000 square miles, containing, however, within this space a singularly small proportion of irreclaimable surface. This cultivable block increases regularly in width and fertility from its commencement on the lower St Lawrence to the shores of Lake Huron. Below Quebec—to say nothing of the precarious nature of the crops—there may always be seen, on one or on both sides, the primeval forest. Between that city, again, and the basin of the Ottawa, a gradual improvement shews itself, even on the north side; and towards the south, there stretches away to the frontier of the United States a broad belt of generally undulating character, probably the best field in the country for the blending of pasture and agriculture. From the basin of the Ottawa inclusive, the parallel of the south end of Lake Nipissing may be said to cut off, towards the south-west, the entire residue of the practicable soil, in the shape of a roughly defined triangle, which, as a whole, is at least equal, in the growth of grain in general and of wheat in particular, to any region of the same extent in North America.

As C. slants southwards eight or nine degrees from the mouth of the St Lawrence to that of the Detroit, which communicates between Lakes St Clair and Erie, the climate of the west must be warmer than that of the east. In addition to this cause of difference, it holds as a general law over the continent that the climate improves in advancing westward, even on the same parallel. Besides, the lakes of Upper C. appear, in a good measure, to neutralise and mitigate the extremes of a Canadian climate. While Quebec in winter ordinarily enjoys five or six months of sleighing, the corresponding season in Toronto ranges from five or six days to five or six weeks. As to summer, the difference in favour of Toronto is rather in point of duration than of intensity. As indications of the climate of C., it may be stated that the isle of Orleans, immediately below Quebec, is famous for its plums, and the island of Montreal for its apples; and from the neighbourhood of Toronto to the head of Lake Erie, grapes and peaches ripen without any aid whatever. Melons, again, of large size, come to maturity, through the settled parts of the province, in the open air; and pumpkins and squashes attain enormous size, some of them near Toronto having weighed 300 lbs. The climate of C., though, as a whole, vastly steadier than that of the British Isles, is yet occasionally liable to such changes as among us are all but impossible. Montreal, for instance, may be said, on an average, to have an extreme cold of 24° below zero, and an extreme heat of 96° above it. Now, on short notice, a thaw may surprise the former temperature, and a frost the latter; so that there is room, in winter and summer respectively, for a comparatively sudden rise or fall of about 60°. In fact, it may be said that C. has the summer of Italy and the winter of Southern Russia or North Germany. The following table of temperatures will present a clearer idea of its climatic condition than any description which could be easily given. The cities selected may be accepted as tolerably crucial and convincing on such a question:

Toronto, average summer temperature,	.	.	67·8°
Paris,	"	"	64·5
Rome,	"	"	74·2
Toronto, average winter temperature,	.	.	24·5
Berlin,	"	"	31·4
St Petersburg,	"	"	18·1

But, what is of vast importance to mention, C., lying in the latitudes of the summer rains, and of the most valuable cereals and grasses, the latitude

## CANADA.

most favourable for animals which enhance domestic wealth—the ox, the sheep, and the horse—occupies one of the best positions in the world for rearing men and women. It lies in the latitude where man attains the greatest energy of body and mind, and from which have hitherto issued the conquering races. C. may thus be looked on as destined to influence the future of the world.

In the matter of communications, C. is unrivalled. The St Lawrence, with its lakes, puts it in connection at once with the most commercial sections of the United States, and with the open ocean. The navigation of this great water-system has been greatly assisted by art. Below Montreal, Lake St Peter has been deepened, so as to admit vessels of over 1800 tons burthen; and above that city, a series of cuts, skirting the rapids, admit sea-going vessels into Lake Ontario. Beyond this, the Welland Canal lifts the maritime navigation round the Falls of Niagara into Lake Erie. Without reckoning, therefore, the American works between Huron and Superior, the Canadian settlement at the foot of Sault Ste Marie, now a free port, is virtually, as it were, washed by the tides of the Atlantic. The Allan line of steamers plies weekly between Liverpool and Montreal in summer, and between Liverpool and Portland in winter. In addition to the navigation of the main artery, there are numerous canals and navigable streams and lakes throughout the province. The chief canal is the Rideau, connecting the river Ottawa with Lake Ontario.

Over and above all these facilities in the way of navigation, C. is not deficient in roads of every description. To say nothing of the snow and ice, with which, at least in the north and east of the country, the winter paves the length and breadth of land and water alike, or of the macadamised thoroughfares in the older localities, the government has laid out, in the newer and remoter townships, two great systems of highways, seven lines for the upper province, and five for the lower, subsidising, as it were, the same by free grants of 100 acres to each holder on both sides of every route, under condition of residence and cultivation. C. has a network of railways of a total length of 2854 miles. The Grand Trunk, which is at present the longest line in the world owned by any one company and under one management, has an unbroken line of communication from Portland to Lake Huron and Detroit. The Victoria Bridge (q. v.), by which this railway crosses the St Lawrence at Montreal, is one of the wonders of the world. An imperial parliamentary paper, issued in 1872, notifies the guarantee of a Canadian loan of £2,500,000, to be applied to the construction of a railway, through British territory, from Canada to the Pacific, and the improvement and enlargement of the Canadian canals. The western terminus of that great railway will be in Vancouver's Island. At Seymour's Narrows, at the widest span, the distance exceeds only by a little the width of the Menai Straits at the site of the Britannia Bridge; and a submerged rock, very similarly situated, is already placed by nature to do the same office as the Britannia rock. Vancouver's Island will thus acquire an additional claim to be entitled 'the gem of the Pacific.' A series of lines has been recently projected, of which two just finished—the Megantic International and the Inter-colonial—give Montreal direct railway communication with St John and Halifax, the chief cities respectively of New Brunswick and Nova Scotia.

Canada, Upper and Lower, has been the most valuable province of British America, and perhaps the most important colony of the United Kingdom. But the name has acquired a considerable extension

of territorial signification within the last few years. In 1867, an act for the union of Canada, Nova Scotia, and New Brunswick was passed, and by it these provinces were federally united into one Dominion under the crown of the United Kingdom, with a constitution similar to that of the mother country (see CANADA, in SUPP., Vol. X.). The whole of the vast territory which the Hudson Bay Company had held for nearly 200 years, under a royal charter issued by Charles II., was transferred to the imperial government in December 1869—the Company receiving an indemnity from the Canadian government of £300,000—and was by order of H.M. the Queen in council, received into the Dominion the following year. The portion of that territory known as Selkirk or Red River Settlement has been erected into the province of Manitoba. This province, hitherto known in the mother country as little more than a region fraught with local rebellion, contains an area of 14,340 square miles, or 9,177,600 acres. It is represented in the senate of the Dominion by two members, and in the House of Commons by four. British Columbia became a member of the Dominion in 1871. Prince Edward Island joined the Confederation in 1873, and the accession of Newfoundland cannot be long deferred; and then the 'Dominion of Canada' will be a phrase synonymous with the historical one, 'British North America.'

This vast extent of territory, a future rival to Russia, and extending from the latitude of Rome to the Arctic Ocean, stands in superficial area (3,500,000 square miles) above the United States (3,390,000), and below Europe (3,650,000). East and west it extends from the 53d to the 141st meridians. The total habitable area is, however, diminished considerably when the frozen regions north of the 60th parallel of latitude are deducted; just as the inhabitable parts of the United States suffer diminution by the arid region west of the 98th meridian, and east of the Rocky Mountains, over which the eye may wander to the horizon without sight of a living thing.

There is no state church in the Dominion. The Episcopal Church is governed by seven bishops; the Roman Catholic Church by one archbishop and eight bishops; the Presbyterian Church, which is in connection with the churches in Scotland, by annual Synods. In the province of Quebec, or Lower C., the Roman Catholic religion predominates—the great majority of the inhabitants being French. All the other religious denominations, Congregationalists, Baptists, Methodists, and many miscellaneous creeds, are well represented.

The population on the 2d day of April 1871, was ascertained to be as follows:

Nova Scotia,	387,800
New Brunswick,	285,777
Quebec, or Lower Canada,	1,191,576
Ontario, or Upper Canada,	1,620,850
Manitoba (in 1870),	11,882
North-west Territory (estimated),	28,700
British Columbia (estimated),	50,000
Total Population of Dominion then,	3,576,655
Newfoundland,	146,536
Prince Edward Island,	94,021
Total for British America, or the Dominion to be,	3,817,212

The 'population by religions' shews that there were returned :

Roman Catholics,	1,492,079
Presbyterians,	545,688
Methodists,	614,214
Church of England,	494,049
Lutherans,	37,935
Congregationalists,	21,859
Quakers,	7,345
Universalists,	4,896
Unitarians,	2,275

## CANADA BALSAM—CANAL.

The numbers of a great many other denominations were returned, but they are not of general interest.

The total revenue of the Dominion of C., for the financial year ending June 1872, amounted to £3,362,000, and the gross expenditure was £3,650,378, leaving a deficit of £288,378. In the financial estimates for the year ending June 1873, the total expenditure was fixed at £3,992,537. The debt of the Dominion, incurred chiefly on account of public works, the interest of which forms the largest part of the expenditure, amounted in 1870 to £23,198,741; and of this capital £15,169,435 represented debt payable in London.

In addition to the troops maintained by the imperial government—the strength of which was reduced, in 1871, to 2000 men—Canada has a large volunteer force, and a newly organised militia, brought into existence by a statute of the first Federal parliament, passed in March 1868, ‘to provide for the defence of the Dominion.’ The militia consists of all male British subjects between 18 and 60. Official returns of December 1871 give the strength of the active militia of the Dominion of Canada as 43,174.

The trade of the Dominion is chiefly with the United States and Great Britain, the greater part of the imports being from the latter country, and the greater part of the exports going to the former. The two staple articles of export to the United Kingdom are bread-stuffs and wool. In the year 1871 the exports of corn and flour to the mother country amounted in value to £2,967,550; of wood and timber to £3,900,670.

The emigrant meets in C. all the main elements of comfort and prosperity—the civilisation of Europe with the cheaper land and higher wages of America. Besides the free grants already mentioned along the newly opened highways, he may at reasonable rates, and under easy terms of payment, select, from many millions of acres, such allotments as may suit his resources, purchasing not only from the government, but also from either of the great companies—the British American for the lower province, and the Canada for the upper. If he has carried with him capital, or has acquired it on the spot by his skill or labour, he will always be able to secure a ready-made homestead for less than it would cost him to erect it. If he has substance to spare, he may invest it in duly registered mortgages at 8 per cent, or else buy blocks of about 50,000 acres each, at prices varying from 9d. sterling to 2s. an acre, and that on not very onerous conditions of survey and settlement. The Canadians, as a body, are warmly attached to Great Britain. See MONTRÉAL, TORONTO, QUÉBEC, SUPERIOR, VICTORIA BRIDGE; and CANADA, in SUPP., Vol. X.

**CANADA BALSAM** is a kind of turpentine (q. v.) obtained from the Balm of Gilead Fir (*Abies* or *Picea balsamea*), a native of Canada and the northern parts of the United States. See FIR. It exists in the tree in vesicles between the bark and the wood, and is obtained by making incisions, and attaching bottles for it to flow into. It is a transparent liquid, almost colourless, and with an agreeable odour and acrid taste. It pours readily out of a vessel or bottle, and shortly dries up, and becomes solid. When fresh, it is of the consistence of thin honey, but becomes viscid, and at last solid by age. It consists mainly of a resin dissolved in an essential oil, and its composition is as follows:

Essential Oil,	18·6
Resin, soluble in Alcohol,	40·0
Resin, sparingly soluble,	33·4
Elastic Resin,	4·0
Bitter Extractive and Salts,	4·0
	100·0

It is the finest kind of turpentine obtained from any of the *Coniferae*, and is much employed for medicinal purposes, particularly as a stimulant for the cure of mucous discharges, and as a detergent application to ulcers. It is also used for a variety of purposes in the arts—as an ingredient in varnishes, in mounting objects for the microscope, in photography (q. v.), and by opticians as a cement, particularly for connecting the parts of achromatic lenses to the exclusion of moisture and dust. Its value for optical purposes is very great, and depends not only on its perfect transparency, but on its possessing a refractive power nearly equal to that of glass.

### CANADA GOOSE. See GOOSE.

**CANAL**, an artificial channel for water, formed for purposes of drainage, irrigation, or navigation, but now usually employed to designate only such cuts as are intended for the passage of vessels.\*

Canals date from a period long anterior to the Christian era, and were employed as a means of irrigation and communication by Assyrians, Egyptians, and Hindus; also by the Chinese, whose works of this kind are said to be unrivalled in extent; one of them, the Imperial C., having a length of about 1000 miles. For the most part, however, these early canals were of one uniform level, and hence exhibit no great skill or ingenuity; and the moderns were content to follow the rudimentary efforts of the ancients in this way until the 16th c., when the invention of the Lock (q. v.)—shewing how canals might be generally and advantageously used for inland navigation, in countries whose surface was irregular—gave a great impulse to this branch of engineering. The Italians and Dutch, for both of which nations the invention of the lock has been claimed, were the first to develop this kind of engineering in Europe. In France, the first C. that of De Briare, to form a communication between the Loire and the Seine, was opened in 1642. In 1681 was completed the greatest undertaking of the kind on the continent, the C. of Languedoc, or the C. du Midi, to connect the Atlantic with the Mediterranean. The length of this C. is 148 miles, it has more than 100 locks, and about 50 aqueducts, and in its highest part it is no less than 600 feet above the sea. It is navigable for vessels of upwards of 100 tons. It was not until nearly a century later that C. navigation assumed importance in England, through the sagacity, energy, and liberality of the Duke of Bridgewater (q. v.), and his celebrated engineer, James Brindley (q. v.). The success of these works stimulated other public persons to engage in similar undertakings. Speculation in C. shares became a mania similar to that which overtook the people in connection with railways at a more recent period, and a crash ensued on the prospect of war in 1792. It would be an endless task to pursue the history of canal development in Britain, which speedily became intersected with these watery highways to an extent unequalled in any European country save Holland. In the space at our disposal,

\* In the fen-districts of the east coast of England, however, the large channels required for drainage are made subservient to purposes of inland navigation by sluices at the mouth—one to keep out the tide at high water, and another acting in the opposite direction, to retain water of depth sufficient in the channel to float such boats as make use of it. These combinations of drain and canal are commonly called *navigations*; hence the workmen employed in their construction were called *navigators*, which, contracted into *navy*, is now applied indiscriminately to persons engaged in any kind of earth-works.

## CANAL.

we shall briefly consider the several kinds of canal. See *SURZ*, and *SURZ CANAL* in SUPP., Vol. X.

Canals may be divided into three general heads—viz., 1. Canals proper, i.e., entirely artificial channels, having no water running through them beyond what is necessary for their own purpose; 2. Tidal, i.e., affected by the rise and fall of the tides; and 3. Rivers rendered navigable by weirs built across them to increase their depth, and having a lock at one end for the ascent or descent of vessels; and occasionally, when there is much fall, or any formidable obstruction in the river, by lateral cuts, with locks for part of their course.

Another division may be made (1) of ship-canals for the transit of sea-going vessels generally, from sea to sea; these are necessarily of large dimensions, and must be crossed by swing or draw bridges; and (2) of canals for the passage of mere boats or barges, generally without masts, so that they may be crossed by stone or other solid bridges. The largest ship C. in Europe is the Great North Holland C., completed in 1825, which has a breadth of 125 feet at the water-surface, and of 31 feet at the bottom, with a depth of 20 feet. It extends from Amsterdam to the Helder, a distance of 51 miles; it thus enables ships of as much as 1400 tons burden to avoid the shoals of the Zuider Zee. The surface of the water in this C. is below the high-water level of the German Ocean, from which it is protected by embankments faced with wicker-work. The locks on this C. are 297 feet long, 51 feet broad, and 20 feet deep. There is a similar C. from near Rotterdam to Hellevoetsluis, to avoid the shallows of the Brill at the mouth of the Maas. Another great ship C. is the Caledonian C. (q.v.). The Forth and Clyde C. is also one on a smaller scale for the passage of sea-going vessels. Its length is 35 miles; its medium width is 56 feet at the surface, and 27 feet at the bottom, and its depth 9 feet. It has 39 locks, each 75 feet long, and 20 feet wide, and a rise of 156 feet. In constructing ship-canals, it is important to secure a sheltered entrance, one not likely to become silted up, and of sufficient depth to admit vessels at all times of the tide; and towing-paths on both sides are desirable.

Among the principal canals in England for the passage of barges, some of which run to very great elevation, are the—

	Length. Miles.	Rise. Feet.
Grand Junction,	133	
Leeds and Liverpool,	128	433
Trent and Mersey,	93	336
Kennet and Avon,	57	403

The C. of the Loire is one of those aiding the navigation of a river; it has a width on the water-line of 33 feet, and a depth of 5½ feet, the locks being 17 feet broad, and 100 feet long. The river Lea and the Mersey and Irwell Navigations in England, and the Welland C. in Canada, formed to connect Lake Erie with Lake Ontario, and avoid the Falls of Niagara, are also among the most noteworthy works of this class; the river Thames, above the first lock at Twickenham, partakes also of the nature of a canal.

Many canals pass through long tunnels, some very low and without towing-paths, in which case the mode of propulsion is by the boatmen lying on their backs and pushing with their feet against the roof of the tunnel.

The great expenditure of water and time in 'locking' have led to the trial of various other plans for overcoming differences in level. On the Great Western C., boats are raised and lowered by means of machinery, called a perpendicular lift.

On the Morris C. (United States), boats are conveyed on a carriage up a railway inclined plane, from one reach to another; on the Chard C., Somersetshire, and on the Monkland C. near Glasgow, they are taken afloat in a caisson, or watertight vessel, up or down an inclined plane—in the latter case, empty boats of 60 tons burden are raised or lowered 96 feet.

Other matters engineers have to consider are an ample supply of water, by means of feeders and reservoirs, to the summit-level; stop-gates at convenient distances, to shut off the water in case of damage to any part of the C.; means of drainage when repairs are necessary; and provision against leakage through the banks, by puddling or otherwise. The floor-line or bottom of a C. is usually made twice the width of the largest boat likely to enter the C., with an addition of 6 or 8 inches for play at each side, and the depth 12 or 18 inches more than the draught of the boat.

The introduction of railways has materially interfered with C. traffic, and some canals have been altogether abandoned. Many, however, still continue to prosper, as, for instance, the Grand Junction, the Lea Navigation, and the Trent and Mersey. There are in Great Britain 2172 miles of C. proper, which have been established at a cost of £28,400,000; and 1315 miles of improved river navigation, formed at a cost of £6,270,000. In France, there are 1974 miles of C., the cost of which has been about £12,250,000; and in the United States, 2000 miles, costing £9,200,000. A new canal, which will shorten the distance from Amsterdam to the North Sea to 15 m., was in process of construction in 1873. The harbour is near Wyk-aan-Zee, and the minimum width is to be 80 yards. This canal is being constructed mainly by British capital and engineers.

*Law regarding Canals.*—The traffic, and generally the rights, duties, and liabilities of canal companies are regulated by two acts of parliament, the 8 and 9 Vict. c. 42, and the 17 and 18 Vict. c. 31, called 'The Railway and Canal Traffic Act, 1854.' The word *canal* is declared to include any navigation whereon tolls are levied by authority of parliament, and also the wharves and landing-places used by such canal or navigation; and *traffic* is defined as including not only passengers and their luggage, but also goods, animals, trucks, boats, and vehicles of every description. All tolls and charges in respect of the traffic are to be charged equally to all persons. It is declared to be the duty of canal companies to make arrangements for the receiving and forwarding of traffic without unreasonable delay, and without partiality; and facilities are given for a remedy to parties complaining of want of attention in these respects.

According to section 7 of the 17 and 18 Vict. c. 31, companies are liable for neglect or default in the carriage of animals or goods, although they may have given notice to the contrary. Where the effect of such neglect or default occasions the loss of or injury to animals, the act provides that no greater damages shall be recovered than as follows: for any horse, £50; for any neat cattle, per head, £15; for any sheep or pigs, per head, £2, unless at the time of delivery for transit, the animals were declared to have been of higher value. No special contract between the company and parties employing the canal shall be binding on the latter unless signed by them. The act saves the rights, privileges, and liabilities of companies under the Carriers' Act, the 11 Geo. IV. and 1 Will. IV. c. 68.

Injury to canals, with intent to obstruct the navigation, is punishable with penal servitude for not more than seven, or less than three years; or imprisonment for two years, with the addition of

hard labour, solitary confinement, and whipping, at the discretion of the court. See CARRIERS.

CANALETTO, or CANALE, the name of two Venetian painters, who have acquired a reputation for their landscapes and views of towns. The elder, ANTONIO C., born 1697, was the son and pupil of a theatrical decorator in Venice. He studied at Rome. He painted a numerous series of excellent views in Venice, among which that of the great canal are especially admirable for their fresh colouring, faithfulness, and the invention displayed in accessory objects. He came to England by the advice of Amiconai. He died in 1768, after having acquired both wealth and fame by his representations of English scenes, several of which are in Buckingham House, and are highly admired.

BERNARDO BELLOTTO, surnamed CANALETTO, nephew and pupil of Antonio, was born at Venice, 1724, and attained high excellence as a painter, and also as an engraver on copper. He practised his art in his native place, and afterwards in Rome, Verona, Brescia, Milan, and Dresden. Correct perspective, powerful effects of light and shade, and beautiful sky-tints, are the most prominent characteristics of his works. C. visited England, where, among several other excellent works, he painted a masterly interior view of King's College Chapel, Cambridge. He died in Warsaw, 1780.

CANAMINA, a town of Dahomey, Africa, about 12 miles south of the capital, Abomey. It is situated in the midst of a cultivated plain, and has a house for the accommodation of white men, set apart by the king. Pop. 10,000.

CANANORE, a seaport and military station of the district of Malabar, in the presidency of Madras. It is in lat. 11° 52' N., and long. 75° 26' E., being about 50 miles to the north of Calicut. The town stands at the head of a bay, which, opening from the south, forms its harbour, while the fort and cantonments occupy the bluff headland, which shelters the inlet on the side of the Arabian Sea. Besides pepper, grain, and timber, the neighbourhood produces immense quantities of cocoa-nuts, which are largely exported to the northward, where they are said to be scarce. C. has been a British possession since 1791, having in that year been taken from Tippoo Sultan by General Abercromby.

CATARA, the most northerly part of the presidency of Madras, on the west coast of the peninsula of Hindustan, separating the district of Malabar from Portuguese Goa. It stretches in N. lat. from 12° 11' to 15° 30', and in E. long. from 74° 9' to 75° 44', containing 7720 square miles, and numbering, in 1871, 915,139 inhabitants. The territory is divided into north and south the most noteworthy towns being Mangalore in the latter half, and Coonta, a place for the shipping of cotton, in the former. In consequence of the death of Tippoo Sultan, C. came into the possession of the East India Company in 1799.

CA'NARAC, a town on the Orissa coast, at the north-west angle of the Bay of Bengal, in lat. 19° 54' N., and long. 86° 10' E., being 235 miles to the south-west of Calcutta. It is remarkable chiefly for the remains in its vicinity of a colossal pagoda. The entire area, a square of about 13 acres, is said to have been surrounded by walls 150 cubits high and 19 broad; and the principal materials appear to have been red granite and black basalt, some of the blocks measuring 15 or 16 feet in length, by 6 or 8 in width, and 2 or 3 in thickness. Most of the sculptured embellishments have been removed to the temple of Juggernaut, which is in the same district of Pooree as C. itself.

CANARIES, or CANARY ISLANDS, a group

of islands belonging to Spain in the Atlantic Ocean, off the north-west coast of Africa, in lat. 27° 40'—29° 25' N., and long. 13° 25'—18° 16' W. The group consists of seven large and several small islets, having altogether an area of about 3800 square miles, and a population of about 270,000. The principal islands proceeding from east to west, are Lanzarote, Fuerteventura, Gran Canaria, Tenerife, Gomera, Palma, and Hierro or Ferro. The coasts are steep and rocky, and the surface is diversified with lofty mountains (the greatest elevation being attained in the Pico de Teyde, in the island of Tenerife, which has a height of 12,182 feet), narrow gorges, and fertile valleys. All the islands are of volcanic origin. On the summits of the highest elevations, depressions, like those left by fallen cones of volcanoes, are almost everywhere found; and the steep declivities are marked by deep fissures, of which, usually, only one penetrates the depressed summit, and exposes to view the several strata of the volcanic rock. There are numerous torrents, but no rivers, and fresh water is very scarce in the southern parts of the islands, and especially in Hierro.

The researches of Humboldt and Von Buch led to the division of the botanical geography of Tenerife into five distinct regions. The first, or region of African forms of vegetation, extends to about 1300 feet above the sea, and is marked by the growth of the date palm, sugar-cane, dragon's-blood tree, &c. The second region extends to the height of 2800 feet, and produces vines, corn, maize, olives, chestnuts, &c., in luxuriance. This zone represents the vegetation of Southern Europe. In the third region, rising 1200 feet or so higher, we have laurels and evergreens. In the fourth, extending to above 3000 feet, we find vegetation nipped by cold and excessive dryness, snow falling several months of the year, and only the *Pinus Canariensis* and other conifers flourishing. The fifth region attains an elevation of nearly 11,000 feet. Here are found a kind of *Spartium* (Broom) peculiar to this zone, with cedrine junipers, and one Alpine plant, *Arabis alpina*. The barren mountain-peaks are just below the limit of perpetual snow, although in a cavern at the height of 11,000 feet above the sea, snow is said to be preserved throughout the year. All the rest of the islands are similar in character, with the exception of Fuerteventura and Lanzarote, which are less elevated, more abundantly wooded, and more luxuriant in vegetation generally.

Minerals are few, and of little importance. Near the sea, the general temperature ranges from 60°—66° F., in the coldest month, January, to 78°—87° F., in the warmest month, October. The rainy season lasts from November to February; from April to October, the weather is uniformly fine. The islands, however, suffer much from the east and south-east winds, which, blowing over the hot deserts of Africa, burn up vegetation, and generate disease. The annual produce of the islands is estimated at 170,000 quarters of grain, 54,000 pipes of wine, 300,000 quintals of barilla, and 500,000 barrels of potatoes, besides oil and fruits of all kinds. The chief foreign trade is with the United States, England, and Hamburg; and an active trade between the islands themselves is carried on. Manufacturing industry is little developed. A captain-general rules over the whole, with a governor for each of the islands under him.

TENERIFE, the largest island of the group, has an area of 877 miles, with a population of 85,000. In the north-west of this island, which is the principal seat of the vine-culture, is situated the famous Pico de Teyde, or Peak of Tenerife (q. v.). The chief

## CANARIUM—CANARY GRASS.

town and port is Santa-Cruz de Santiago (q. v.), on the north-east coast.

GRAN CANARIA, which is next in importance, has an area of 758 square miles, with a population of 68,000. Its culminating peak is El Cumbre, with a height of 6648 feet. The capital, Las Palmas (q. v.), on the east coast, is the largest town of the archipelago.

PALMA has an area of 718 square miles, and a population of 33,000. Its highest peak, Pico de los Muchachos, has an elevation of more than 7600 feet. Capital, Santa-Cruz des las Palmas (q. v.), on the east coast.

The area and population of the other islands are as follows: LANZAROTE is 323 square miles, pop. 17,400; FUERTEVENTURA, 326 square miles, pop. 13,800; GOMERA, 169 square miles, pop. 11,700; HIERRO, 82 square miles, pop. 4400. The chief towns of these islands are small.

The C. are supposed to have been the Fortunate Islands of the ancients. The Carthaginians are said to have visited them, and Juba II., king of the two Mauritanias, wrote an account of them that has been transmitted to us by Pliny. In modern times, the first account of them was furnished in the first half of the 14th c., by the crew of a vessel that had been driven among them by stress of weather. A Spanish gentleman obtained a grant of them from the pope; but when an attempt at settlement was made, the Spaniards were driven off by the natives. In the beginning of the 15th c., the Spaniards succeeded in obtaining a footing in the islands; but a difference having arisen with Portugal concerning them, it was not until 1493 that the authority of Spain was finally established. Since that time, they have remained attached to the Spanish crown. The Guanches, who were the aborigines of the islands, have long ceased to exist as a separate people, the population being now quite Spanish. They were a brave and intelligent race.

CANARIUM, a genus of trees of the natural order *Anacardiaceæ*, natives of the south-eastern parts of Asia, the Malayan Archipelago, &c. The fruit is a drupe. The kernel of the fruit of *C. commune* is eaten both raw and roasted; and in Amboyna, bread is made of it, which is generally in the form of rolls about a yard long and an inch thick. An oil is expressed from it, which is used both for the table and for lamps. The tree is about 50 feet high. *C. sylvestris* also produces eatable kernels. *C. commune* is supposed to be one of the trees which yield ELEMI (q. v.), and *C. microcarpum* yields an oil very like copaiva, known in ship-building yards as DAMAR (q. v.).

CANARY, or CANARY BIRD, a beautiful little bird, very common as a cage-bird, and much esteemed for its musical powers. It is one of the numerous family of finches (*Fringillidae*), and is *Fringilla Canaria* of Linneus. Some modern ornithologists place it in the genus *Carduelis*, others in *Linota*; it is indeed intermediate between these genera, the goldfinches and the linnets. Some make it the type of a genus or sub-genus, *Canaria*. It is found in Madeira, the Canary Isles, and the Cape Verd Isles; frequents the neighbourhood of human habitations; builds its nest of moss, feathers, hair, &c., in thick, bushy, high shrubs or trees; and produces four, five, or even six broods in a season. In its wild state, its plumage is greenish, or greenish-yellow, sometimes tinged with brown, and exhibits less variety and beauty than in domestication. It was brought to Europe in the beginning of the 16th century. It breeds readily in confinement, and seems thoroughly

reconciled to its cage-life; but although canaries of long domesticated races sometimes excel in imitative powers and acquired strains, yet they are

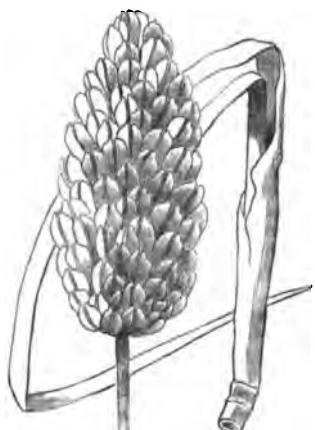

Canary.

surpassed in loudness and clearness of note by some of the wild birds, which, when caught and imported, are occasionally sold for extraordinary prices. Even in confinement, the C. often breeds four or five times a year, laying from four to six eggs each time. The eggs are pale blue. The male assists the female in building the nest and in feeding the young. Besides seeds of various kinds, which are their principal food, canaries are very fond of bland green leaves, such as those of chickweed, a supply of which is very necessary for their health; and one of their favourite luxuries is sugar. The C. not unfrequently lives 15 or 16 years. It can be taught various notes and airs, and some even learn to articulate words. The rearing and training of canaries afford occupation to no small number of persons, particularly in the Tyrol. The C. hybridises readily with some other species of finch, producing 'mules,' some kinds of which are valued as song-birds.—There are several species very closely allied to the C., one of which, a beautiful little bird, entirely yellow, with an orange crown, a native of Brazil, is sometimes sold in Britain as a song-bird, but its musical powers are very inferior to those of the common species.

CANARY GRASS (*Phalaris Canariensis*), a grass of which the seed is much used, under the name of *canary-seed*, as food for cage-birds, and which is, on that account, cultivated to some extent in the south of Europe, and in certain districts of Germany and England. It is a native of the Canary Islands, naturalised in the south of Europe, and in many places in Britain. The chief seats of its cultivation in England are the counties of Kent and Essex. The seed is sown early, generally in February, yet the crop is not reaped till after the ordinary grain harvest, for which reason the cultivation of C. G. is seldom attempted in the northern parts of Britain.—This grass attains a height of two or three feet, and has a crowded, egg-shaped, spike-like panicle, from an inch to almost two inches long; the spikelets are one-flowered, very much laterally compressed, a rudimentary scale-like floret on each side of the perfect floret; the glumes winged on the keel, and with two strips of darker green on each side; the *palea* awnless, shining, and at last firmly enclosing the seed. A fine flour is prepared from canary-seed, which is employed as dressing in fine cotton-weaving, and for the finishing of silken stuffs. The groats and flour of this small kind of grain are also used in the Canary Islands, in Barbary, and in Italy, as food, the

## CANARY PLANT—CANCER.

flour being made into bread, which is very nutritious and pleasant.—Other closely allied species of *Phalaris* produce a similar grain, but are inferior

Canary Grass.

in productiveness and quality.—A grass, now generally referred to this genus, and sometimes called RUM C. G. (*Phalaris arundinacea*), is very common on the banks of lakes and rivers, and in other wet places in Britain, and throughout Southern and Central Europe. It differs very much in appearance from C. G., having a large spreading panicle, generally of a reddish colour; and the glumes are not winged at the keel. It is a somewhat reed-like grass, 4–6 feet high, with creeping roots, which help to secure river-banks; and yields a great bulk of hay, but has been very generally despised as a coarse grass, fit only for littering cattle. The justice of this opinion has, however, been called in question, and the grass proclaimed to be very nutritious, and sufficiently acceptable both to horses and oxen when cut early. It may be mown twice a year. A variety with curiously striped leaves is well known in gardens, as *Ribbon Grass*, *Gardeners' Garters*, or *Ladies' Traces*.

### CANARY PLANT. See TROPAEOLUM.

CANARY WINE, also known as TENERIFE, is the produce of the Canary Islands, and resembles Madeira; but the name is properly applied only to the Bidone wine, which must be distinguished from the Malvoisie of the Canaries. The former is made from grapes gathered before they have ripened, and, when new, is crude and unpleasant; but in the course of two or three years, increasing in mildness as in age, becomes so much like Madeira, that it is often sold for it. Like Madeira, it is greatly improved by a voyage to the tropics. It is produced chiefly on the island of Tenerife, and the trade in the wine is mostly carried on at the chief port of this island. The Canary of the island of Palma is inferior to Tenerife, but may be consumed sooner, and has a pleasant flavour.

CANA'STER, the name given to a rush-basket in which tobacco is placed in Spanish America; hence is said to be derived the name canaster, now applied to tobacco of a certain kind.

CANCELLARIA, a genus of mollusks—class *Gastropoda* (q. v.), order *Pectinibranchiata*—with univalve shells, sometimes regarded as belonging to the family *Volutida*, or Volute Shells (q. v.), but now generally placed among *Buccinida*, or Whelks (q. v.). The spire is prominent, the last whorl

ventricose, the surface reticulated, the mouth large, the columella plaited. All the recent species are natives of tropical or subtropical seas, and are found chiefly on sandy bottoms, at the depth of a few fathoms. The fossil species, amounting to nineteen, occur in the newer strata from the chalk upwards.

CA'NOELLING OF DEEDS AND WILLS. The word cancel comes from the Lat. *cancelli* (lattice-work), and a deed was formerly said to be cancelled when lines were drawn over it in the form of lattice-work. The word cancel is now used to signify any sort of obliteration.

The Court of Chancery in England gives relief against the effect of improper cancellation; on the other hand, it may order a deed which has been improperly obtained to be delivered up in order to be cancelled. The effect of the cancellation is to make the deed void. If a deed is given up to be cancelled, and the cancellation does not take place, it remains in force at law. But if an obligee deliver up an obligation to be cancelled, and the obligor do not afterwards cancel it, and the obligee happen to get it again into his hands, and sue the obligor on it, the latter cannot plead its voidance, for the deed still remains in force at law—although here, too, equity would relieve, and decree according to the original cancellation. Where a deed is cancelled by consent of the parties to it, it is thereby destroyed as to their interest under it, but third parties may still produce it in evidence. As to a will, its cancellation may have the effect of revoking it, if done with such intention.

In Scotland, the system of registration of deeds and other writings prevents the occurrence of many of the questions that arise in England on this head, but the intention and effect of the cancellation or destruction of documents would in most cases be a question of evidence; and where it is necessary to know the contents of the destroyed paper, its effect may be judicially declared by a form of suit called an action for *proving the tenor*, as indeed may be done in an English court of equity by a bill to recover the contents of a lost document. In the Scotch law, again, a deed or other writing may be judicially cancelled or set aside by an action of reduction, and the courts in England substantially exercise a similar jurisdiction.

It would appear that where a testator has prescribed certain forms for the authentication of his will, and such forms have either not been observed by him, or if observed, have, in some essential particular, been negatived by obliteration, an intention to revoke will be presumed: thus, where a Scotchman, who had long resided in India, executed a will, concluding, 'In testimony of this being my last will and testament, I hereto set my hand and seal'; and the document was found in his repositories with the part to which the seal had evidently been affixed cut (not torn) off, the House of Lords held the deed to be cancelled, because the testator had himself, besides the usual solemnities, prescribed a seal as necessary to the authentication of his will. A will, however mutilated or cancelled by a testator during his insanity, would be good; and of course there is no effectual cancellation when done by a third party without sufficient authority. But all such considerations are questions of evidence. See DEED, WILL.

CANCELLING OF LETTERS-PATENT. The Lord Chancellor may cancel the Queen's Letters-patent, when granted contrary to the law, 'which,' says Blackstone, quoting Sir Edward Coke, 'is the highest point of his jurisdiction.' See LETTERS-PATENT, CHANCELLOR.

CANCER, a disease characterised by slow

alterations of structure, or tumours in various parts of the body, occurring either simultaneously or in a certain order of succession. In many cases, an isolated tumour in an external part is the earliest symptom; it is then viewed as the starting-point of the disease, and is termed a *malignant tumour* (*tumor mali moris*), from its presumed tendency to infect the system, and to cause the reproduction of growths similar to itself. It is right, however, to remark, that upon the pathology of C. authorities are by no means agreed, some holding that a constitutional taint or *diathesis* must always precede any local development of C., and that the first growth in point of time (or primary C.) is therefore only the first of a series determined by a pre-existing cause in the blood or general system; while others hold that C. is originally a truly local disease, or even that a growth at first simple (*non-malignant* or *benign*), may, in consequence of local causes, *degenerate*—i.e., become cancerous, and infect the whole system with the morbid tendency thus secondarily acquired. The discussion of this disputed question involves statements of a too complicated kind to be in place here; but it is a question of considerable importance, as bearing on the probability or improbability of curing the disease by extirpating the primary tumour at an early stage of its development. All authorities are agreed that, when any trace of secondary C. exists, the removal of the parts affected gives scarcely any hope of a favourable result, and, accordingly, operations under these circumstances, unless merely for the relief of local suffering, are discountenanced by all respectable surgeons. The disease, however, is one of which the ignorant as well as the learned have a well-founded dread, and hence it presents a large field for the practice of imposture, and for that less deliberate, but often not less hurtful kind of quackery which is the result of pure ignorance, grafted on a meddlesome desire to do good. We propose to give such a sketch of the characters and progress of cancerous disease as may serve, in some degree, as a protection against ignorance on the one hand, and deception on the other.

The leading character of C. being a tumour or morbid growth in a part, it is important, in the first place, to observe that not all, nor even the majority, of morbid growths are cancerous. A very large proportion of growths, involving swelling or change of structure in a part, are either determined by a previous process of inflammation—leading to chronic abscess and induration—or belong to what is called the non-malignant order of tumours—e.g., cysta, fatty and fibrous tumours, simple hypertrophy of glandular structures, cartilaginous, bony, calcareous, and vascular growths. See TUMOURS. Further, among the tumours admitted by general consent into the order of cancerous, there are widely different degrees of *malignancy* or *cancerousness*, so to speak; some having the tendency to spread rapidly, and infect the system at an early period, while others remain local for a considerable time, and may be removed while yet local, with good hope of a permanent recovery.

Now, the practical distinction, or *diagnosis*, to use the technical phrase, of these different tumours, is founded upon a very careful and delicate appreciation of the characters of the malignant and non-malignant tumours, considered as morbid products, and also upon a thorough knowledge of the anatomy and relations of the textures in which they arise. One of the leading characters of malignant tumours is the tendency to involve, by a kind of specific destruction or degeneration, the ultimate elements of the textures in which they arise, and in which they

spread. The attempt, therefore, to distinguish these from other growths, must always call for the highest qualities of the surgeon—large experience, guided at every step by consummate science, and, in particular, by minute and thorough knowledge of natural structure. And the difficulties of the inquiry are such, that even in the dead body, or in a tumour excised from the living body, all the resources of the anatomist, aided by the microscope, will occasionally fail in distinctly and surely discovering the true character of the morbid structure.

The most common seats of C. are, among external parts, the female breast, the eye, the tongue, the lip, the male genital organs, and the bones; among internal organs, the liver, stomach, uterus, rectum, gullet, peritoneum, and lymphatic glands. Some of these parts are more liable to primary, others to secondary cancer. Thus, the female breast, the neck of the uterus, the lower lip, the scrotum, the extremity of the penis, are very often the seats of a single cancerous tumour, which in its early stage at least seems to be unconnected with any constitutional taint; while the liver, the bones, and the lymphatic glands are more frequently the seats of secondary or multiple cancerous tumours. There are also differences in the character of the C. itself, apart from its anatomical seat, which are to be taken into account in estimating the probability of its being solitary. Some of these differences are regarded by pathologists as amounting almost to specific distinctions; thus, *acirrus*, or hard C., observed most frequently in the breast, uterus, and stomach, is more frequently solitary than *encephaloid* (brain-like), otherwise called *medullary*, or soft C.; again, *melanosis*, or *melanic* C., a variety charged with a brown or black pigment, is almost always multiple in its occurrence; while *epithelial* C., or *epithelioma*, as it has been recently termed, of which examples are frequently found in the lip, scrotum, penis, or tongue, is so generally solitary as to have led some pathologists to place it in a class altogether apart from the truly cancerous growths, with which, however, it presents too many points of affinity in its fatal tendency to recur after operation, and to infect the lymphatic glands and other structures adjoining the part primarily affected. Again, there are certain varieties of fibrous and of cartilaginous tumour, as well as certain tumours of bone, and bone-like tumours developed in soft parts (*osteoid*), which must be regarded, in the meantime, as occupying a doubtful position between the malignant and non-malignant growths. (Paget, *Lectures on Surgical Pathology*, vol. ii.)

Generally speaking, a tumour may be said to fall under the suspicion of being C. when it more or less completely infiltrates the texture in which it arises, and passes from it into the surrounding textures; when it invades the lymphatic glands adjoining the part first affected; when it is attended by stinging or darting pains, or by obstinate and slowly extending ulceration, not due to pressure; when it occurs in a person having impaired health, or past the middle period of life, and is not traceable to any known cause of inflammatory disease or local irritation, nor to any other known constitutional disease, such as syphilis or scrofula. The probabilities are of course increased if the tumour be in one of the habitual seats of C., or if it be attended by evidence of disease in some internal organ known to be frequently thus affected. But it is hardly necessary to point out that the very complex elements of diagnosis here referred to ought to be always submitted to the scrutiny and judgment of a well-educated medical adviser, whose skill and personal character place him above suspicion, before the disease has assumed such a form as to be beyond

## CANCER—CANCER ROOT.

the reach of remedial procedure. The patient who broods in secret over a suspicion of C., or who declines to apply for advice from a fear of encountering the truth, is in all probability only cherishing the seeds of future suffering; while if, as often happens, the suspicion is unfounded, a few minutes' careful examination would suffice to remove a source of misery which otherwise would poison the mind for years.

These remarks apply still more emphatically to the misguided persons who trust to the non-professional *cancer-curer*, or to the quasi-professional specialist. The charlatan, who pretends to hold in his hands a secret remedy for this most terrible disease, will invariably be found to pronounce almost every tumour C., and every C. curable. By this indiscriminating procedure, and by the fallacious promise of a cure without an operation, many persons who have never been affected with C. at all, have been persuaded to submit to the slow torture of successive cauterisations by powerful caustics, at the expense of needless mutilation and no small risk to life. In other cases, truly cancerous tumours have been removed slowly and imperfectly, at the cost of frightful and protracted sufferings, only to return at the end of a few weeks; and Mr Spencer Wells has lately shewn that in some notorious instances persons were reported as cured, when they had actually died of the disease at no long period after the supposed cure was stated to have taken place. (*Cancer and Cancer-curers*, London, 1860.)

What is really known as to the cure of C., may be stated in few words. Modern pathological researches render it probable that a complete suspension of the progress of C. sometimes, though rarely, takes place; and individual tumours are found not unfrequently to undergo partial healing, or even to become entirely metamorphosed into inert cicatrices, while others, associated with them, continue to advance. The degree of rapidity of the advance of C. is also, as we have already stated, exceedingly variable. But these observations modify only to a very slight degree the general doctrine, that C. is a disease tending to a fatal issue, and hardly, if at all, under the control of remedies, as to its ultimate result. The removal of a cancerous tumour, indeed, is still resorted to by surgeons; and there appears to be no reasonable doubt that when performed early, and in well-selected cases, it has been followed by long-continued exemption. But the occasional spontaneous arrest of such growths on the one hand, and the doubtful results of operation in a large proportion of cases on the other, have combined to render surgeons of late years more chary of the use of the knife. In aged persons, in particular, the question often resolves itself into a calculation of the chances of life, founded on a great number of conflicting data, and only to be solved by a careful attention to the state of the general health, as well as to the rate of progress of the local disease. Operations are now very rarely performed after the lymphatic glands are involved, or when there is evidence of a deteriorated constitution, or of internal disease; but sometimes great pain, or profuse and exhausting discharge from an external tumour, may justify its removal, as a palliative measure, even under these unfavourable circumstances. For the mode of removal of cancerous and other tumours, see TUMOURS.

Among the lower animals, this disease is more rare; nevertheless, cases are not unfrequent, presenting the same malignant characters as those observed in the human subject. Usually manifesting itself in the form of a specific tumour of some organ or tissue, there is a tendency to the invasion of other parts of the system, and the

development of a constitutional state called the cancerous cachexia. M. U. Leblanc of Paris, the best veterinary authority on this subject, has shewn that the dog and cat are most frequently affected with C.; and next in frequency come the pig, ox, horse, and mule. It has not been observed in birds, reptiles, or fishes. Females are more liable to C. than males. It is hereditary, but not transmissible from animals to man, or from one animal to another. It does not disappear under the influence of remedies, but, if possible, the tumours should be excised when first seen, and if the knife fail to extirpate the malady, cauterisation should be had recourse to. A relapse is almost certain; but Leblanc says there is greater chance for the patient, when a carnivorous animal, if it is kept on a strictly vegetable diet.

CANCER, the *Crab*, the fourth of the twelve constellations of the zodiac, usually represented on the globe as a crab, and denoted in works on astronomy by the sign ♋, which resembles the number 69 laid sideways. It contains, according to Flamsteed, 83 stars, of which the principal is *Acubens*, a star of the third magnitude. In the divisions of the ecliptic, the sign called C. occupies a place between 90° and 120° from the vernal equinox; but owing to precession, the sign and the constellation have not coincided for nearly 2000 years. See ECLIPTIC, PRECESSION, ZODIAC. Annexed is a representation of the constellation, which is one of the least striking

in the zodiac. Besides Acubens, it has two stars of the fourth magnitude, called by the Romans *Acelli* or the Little Asse; and a nebulous cluster of minute stars about 2° from the Asse, visible to the naked eye, and which goes by the name of *Præsepe* or the Manger.

CANCER. See CRAB.

CANCER, TROPIC OF. See TROPIC.

CANCER ROOT, or BEECH-DROPS (*Epiphegus Virginiana*), a parasitic plant of the natural order *Orobanchæa* (q. v.), a native of North America, growing almost exclusively on the exposed roots of beech-trees. Like all the other plants of its order, it has a curious appearance, having scales instead of leaves. Its stem is branching, and produces distant alternate white flowers, streaked with purple. The whole plant is powerfully astringent; and the root is brownish, spongy, and very bitter and nauseous in taste. It has acquired, in its native country, the reputation of being a cure for cancer. All parts of the plant are used, and externally more than internally. This plant, in conjunction with white oxide of arsenic, is believed to have formed a medicine once famous in North America under the name of *Martin's Cancer-powder*.—Another American plant of the same order, *Phelipaea biflora*, is sometimes also called C. R., and is used in the same way; and an infusion of the Common Broomrape (*Orobanche major*)—a native of Britain and of the south of Europe, parasitic on the roots of broom, furze, and

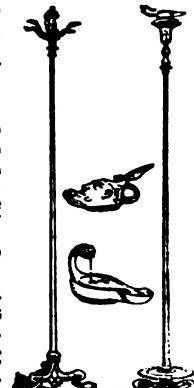

other leguminous plants—has been employed as a detergent application to foul sores.

**CANDAHAR**, or **KANDAHAR**, the capital of Central or Southern Afghanistan, situated about 200 miles to the south-west of Kabul. It is in lat.  $32^{\circ} 37' N.$ , and long.  $66^{\circ} 20' E.$ , and has an elevation of 3484 feet above the level of the sea. It is said to be an oblong square, while all its streets run straight, and cut one another at right angles—an alleged regularity which can hardly be reconciled with Elphinstone's avowed inability even to guess the extent of the city or the number of its inhabitants, which has been variously estimated at from 25,000 to 100,000. C. is well watered by two canals drawn from a neighbouring river, which send to almost every street its own adequate supply; and the same means of irrigation have covered the immediate vicinity with gardens and orchards. C. is a place of great trade, attracting dealers from Bokhara, and even from Samarcand. Among its permanent residents, C. has a larger proportion of Afghans, chiefly of the Doorzane tribe, than any other city of Afghanistan. About 2 miles to the northward rises a precipitous rock, crowned by a fortress impregnable to everything but heavy artillery. Here, amid all the disasters of the Afghan war, the British maintained their ground. C. has been a pivot for the history of Central Asia during more than 2000 years. It is supposed to have been founded by Alexander of Macedon, owing, most probably, its name to the oriental corruption of Iskender or Scander, as in Scanderoun or Iskenderun of Syria. A comparative blank of upwards of 13 centuries in the history reaches to the famous Mahmoud of Ghiznee, who wrested the stronghold from the Afghans. From that epoch down to 1747, when the native rule was permanently established, C., with brief and precarious intervals of independence, was held by Tatars, India, and Persia in turn.

**CANDEISH**, or **KHANDESH**, a collectorate in the presidency of Bombay (lat.  $20^{\circ} 10'$ — $21^{\circ} 58' N.$ , and long.  $73^{\circ} 37'$ — $76^{\circ} 20' E.$ ), and containing 10,166 sq. m., with a comparatively scanty pop. of (1871) 958,305. It lies chiefly in the valley or basin of the middle part of the Tapti, which enters the Gulf of Cambay below Surat; and it is bounded mostly by territories of nearly all the powerful native princes—the Nizam, Scindia, Holkar, and the Guicowar. Through its situation, it necessarily suffered much from the long contest between the Mohammedans and the Mahrattas, and also from the struggles among the rival chiefs of the latter. Accordingly, when, in 1818, it fell to the East India Company on the overthrow of the Peishwa, it presented little better than a scene of desolation, with ruined mansions, dismantled towns, and dilapidated temples. The difficulties of the new government were considerably aggravated by the Bheels, a more than half-savage race, that formed about an eighth of the population; and even beasts of prey, particularly tigers, had, under the constant influences of human strife, multiplied to an unusual extent. But the improvement was regular and steady. Peace and security reigned; so that roads, formerly hazardous for armed parties, were traversed in safety by unarmed individuals. The staple productions are cotton, wheat, and other grains, and also a little indigo. The cultivators are generally in a progressive condition, more especially in the cotton districts, and the well-watered taloos of Baglan.

**CANDELABRUM**, a Latin word signifying properly a candlestick (from *candela*, a candle), but more frequently employed to mean a support for a lamp. There were, perhaps, no articles of furniture in which the ancients combined the beautiful with

the useful to so large an extent as in their candlesticks and lamps. Candelabra usually stood on the ground, and were of considerable height—from 4 to 8, or even 10 feet. The most common were of wood; but metals of all kinds, including the precious metals, were used for their construction, and sometimes they were even adorned with gems. The candelabra found at Herculaneum and Pompeii are mostly of bronze. In the temples and palaces of the emperors, they were frequently of marble, and of great size and richness. They have usually a capacious cup at the top, either for the purpose of containing oil enough to feed a large flame, or that they might be used for burning incense. Though varying greatly in details, a general design runs through the forms of the candelabra of antiquity. They have all a foot or feet, a shaft, and a plinth on which a lamp is placed, or which is furnished with a socket for a candle. The base often consists of three feet of a lion, goat, griffin, or other animal real

Ancient Roman Candelabra.

Candelabrum, with suspended Lamps.

or imaginary. Sometimes a figure was introduced either into the body of the shaft, or placed on the top of it, in either case supporting the superincumbent portion of the C. on its head. Sometimes a figure was substituted for the shaft altogether, the receptacle for the oil being placed in one hand. In others, the shaft is a sliding one, like that of a music-stand, the object being, of course, to raise or depress the light at pleasure.

In addition to the various kinds of candelabra which, from their height, seem to have stood on the floor, the ancients had others intended to be placed on a table. These consisted either of a pillar or of a

tree, and from the capital of the former, or the branches of the latter, lamps were suspended, as in the accompanying illustration, which we copy from Smith's *Dictionary of Greek and Roman Antiquities*. The C., in this instance, including the stand, is only three feet high. From the size of the stand in proportion to the rest of the C., it would seem to have been used for some other purpose.

**CANDIA**, in Turkish, 'Kirid,' called in the most ancient times *Idea*, afterwards *Crete*, one of the largest islands of the Mediterranean, is situated at the entrance of the Archipelago, in long.  $23^{\circ} 40' - 26^{\circ} 40'$  E., lat.  $34^{\circ} 50' - 35^{\circ} 55'$  N. It is very irregular in form, its length being about 160 miles, and its breadth varying from 6 to 30 miles. The history of C. commences with Greek mythology, and historians and poets say that it was governed by its own kings, among whom were Saturn, Jupiter, and Minos, 1300 years before Christ. C. was conquered by the Romans under Metellus, who, on that account, had the title of 'Creticus'; on the division of the empire, it fell to the share of the eastern monarchs. In 823 A.D., it was conquered by the Saracens, who built the city of C. on the ruins of Heraclea. In 1204, it was sold by Pope Boniface—*to whom Baldwin I. gave it*—to the Venetians. The Venetians divided the island into four provinces—*Sitia, Candia, Retimo, and Canea*. In 1645, the Turks besieged Canea, and in 1669 conquered the island, after a war which lasted 24 years, and a blockade of 13 years—30,935 Christians, and 118,754 Turks being killed or wounded in the siege. At present, the island belongs to the Sultan of Turkey.

The island of C. is for the most part mountainous, the mountains being chiefly composed of freestone or of marble, which is either gray or white. Towards the south side of the western part of the island, there is a chain of high mountains, extending in length about  $37\frac{1}{2}$  miles, which, from their appearing white, especially at their west end, were anciently called Leuci. Mount Ida, now called by the natives Upailorites, is one in a chain of mountains extending to the north-west of the island almost to Retimo; the mountain is of gray marble, and the surface loose stones: there is no verdure on it except a few small shrubs. Jupiter is said to have passed great part of his youth amongst these mountains in the exercise of hunting and drawing the bow.

The island abounds in springs and fountains, which are found even by the sea-side; most of the rivers are dry in summer, but in winter many of them are very dangerous torrents. The island does not produce any minerals of importance. The soil of C. is fertile, and produces wheat in abundance. The exports, which consist chiefly of oil, wool, linseed, and fruit, amount in annual value to above £400,000, and the imports to about £440,000.

C. had once, according to Homer in his *Odyssey*, 90 cities; there are now only 3 principal towns: Megala Kastron or Candia, pop. 12,000, of which 9000 are Christians; Retimo or Rhithymnos, pop. 3200, of which 1500 are Christians; Canea or Khania, pop. 6000, of which 3800 are Christians. The total population of the island does not now number 290,000—less than half its amount at the outbreaking of the Greek revolution in 1821.

The language spoken by both Christians and Moahems in C. is modern Greek. The whole rural population may be said to have a common descent from the Cretans of the middle ages—the worldly advantages which used to result from embracing Islamism, induced whole districts to abandon the faith of their forefathers—but a mere change of religious faith was unaccompanied by any change of language.

**CANDIDATE** (*Lat. candidatus*). Among the Romans, a suitor for the office of consul, questor, praetor, &c., was named C. because, in appearing before the people, he wore a white (*candida*) toga without a tunic. His dress was chosen partly as an ostentation of humility, and partly as it served to display wounds received in battle. The candidature commonly lasted two years: in the first year, the C. was proved by the senate, whose decision, if favourable, was ratified by the popular assemblies; and, in the second, his name was entered in the list of candidates. During this period occurred the *ambitio*, or canvassing of voters, which often gave occasion to enormous bribery, in spite of the severe enactments passed to prevent the corruption of the electors. The elected C. was styled *Designatus*.

In the early Christian Church, newly baptized converts were styled **CANDIDATES**, on account of the white garments worn during eight days after baptism. In modern times, a German probationer or theological student who has been approved before the highest ecclesiastical authorities, is called a C.; but a still broader signification is also attached to the word, an applicant for any office, whatever, religious or secular, being termed a candidate.

**CANDLE**, a cylinder of wax or fatty matter, with a wick, intended for giving light. Candles are made principally of tallow; also of the solid portion of palm and cocoanut oils, of bleached wax, and of spermaceti. They are either dipped, moulded, or rolled. 'Dips' are made by stretching a number of wicks upon a suitable frame, so that they may hang down at a distance from each other equal to about double the intended thickness of the C.; these are then dipped in a trough of melted tallow, and hung upon a rack until cooled, then dipped again and again, until the required thickness is obtained. The dipper has a number of frames prepared before commencing, and by the time he has dipped the last, the first is cool enough to dip again. The tallow in the trough has to be kept only a little above its melting point, for if it were much hotter, it would melt away a portion of the tallow already on the wick, instead of adding to it. Tallow-candles are much improved by being kept a year or a winter before using.

Moulds, or mould-candles, are cast by pouring the tallow down a pewter tube, along the axis of which the wick has been previously fixed. These tubes are well polished in the inside, and several are fitted in a frame, the upper part of which forms a trough, into which the moulds all open; and thus by pouring into the trough, all the moulds are filled at once.

Wax-candles are not moulded, on account of the great amount of contraction which wax undergoes in cooling, and the difficulty of drawing it from the moulds. The wicks are warmed, and suspended over a basin of melted wax, which is poured over them until they acquire the proper thickness; they are then rolled, while hot, between two flat pieces of smooth hard wood, kept wetted to prevent adhesion.

Great improvements have recently been made in the manufacture of candles, and these are especially interesting from being the direct results of the progress of scientific chemistry—of theory applied in practice. All oils or fats are composed of one or more fatty acids combined with a base, called glycerine. The fatty acids constitute the combustible and more solid portion of the compound. Both acid and base are very weak, and it is a general law in chemistry, that a strong base, under favourable conditions, will separate a weaker one from its acid, by combining with the acid, and taking the place of the weak base; and a strong acid will

## CANDLEBERRY—CANDLEMAS.

in like manner displace a weaker one. Lime is a strong base, and being cheap, is used to separate the glycerine from the fatty acid of tallow, palm-oil, &c. This it does when the melted fat is stirred for some hours with a mixture of lime and water. The lime forms a hard insoluble soap, by combining with the fatty acid, and the glycerine remains in solution with the water. This lime-soap is then broken to powder; and the weak fatty acid separated by means of sulphuric acid, which combines with the lime, forming sulphate of lime. The whole being heated, the fatty acid floats on the top, is skimmed off, and the candles made from it. These are called composite candles; they give a purer light than ordinary tallow, from being freed from the glycerine, which not only softens the fat, but diminishes its combustibility. Pure stearic acid, or stearine, the chief fatty acid of tallow, is a hard crystalline substance, perfectly dry, and free from any greasiness, with a somewhat pearly lustre. Its crystalline structure presents a difficulty in the manufacture of candles, for when cast in moulds, it contracts on cooling, and leaves small spaces between the crystals. This has been obviated by mixing a little arsenic with it; but this method is now abandoned, on account of the poisonous gas evolved by the combustion of such candles, and the desired effect is obtained by mixing the stearine with a little wax, and pouring it into hot moulds.

To obviate the necessity of snuffing candles, several contrivances have been adopted; in all of them, the object is effected by causing the wick to bend over and its end to fall outside of the flame, and thus, by coming in contact with the oxygen of the air, to be completely burned—for such combustion cannot take place within the flame. See FLAME. This bending over is variously brought about. One method is by twisting the wick with one strand shorter than the rest, which is strained straight while the candles are being cast; and when released by the melting of a portion, it contracts, and bends the wick. Another method is by adding on one side of the wick a paste, consisting of a mixture of borax, bismuth, flour, and charcoal. Another, by coating one of the threads of the wick with a metallic envelope, by dipping it in fused bismuth; the metal fuses at the end of the burning wick, and forms a small globule, which bends the wick over, and is itself readily combustible at a red heat. These are called metallic wicks. Various other contrivances have been adopted for the same object.

Candles of this improved kind, in which the wick disappears in burning, and that bear a general resemblance to candles of wax, are now manufactured on an extensive scale, the progressive use of gas making apparently little impression on this branch of trade. Price's manufactory of 'patent' candles, as these improved candles usually are called, is perhaps the largest in England. It is situated at Vauxhall, in the neighbourhood of London, and its economic arrangements have attracted not a little public attention.

Candles were early introduced—with symbolical signification—into Christian worship, and are still so employed in the Roman Catholic Church. In the Church of England, candles are sometimes placed on the altar; but the practice is a subject of controversy. The numerous superstitious notions and observances connected with candles and other lights in all countries had a more remote origin, and may be considered as relics of the once universally prevalent worship of the sun and of fire. Numerous omens are taken from them, and they are also used as charms. In Britain, a portion of the tallow rising up against the wick of the candle, is

called a winding-sheet, and regarded as a sure omen of death in the family. A bright spark at the candle denotes that the party directly opposite is to receive a letter. Windy weather is prophesied from the waving of the flame without visible cause, and wet weather if the wick does not light readily. Lights appearing to spring up from the ground, or issue out of a house, and traverse the road or air by invisible agency, the superstitious in Wales and elsewhere call *corpe-candles*. They are ominous of death, and their route indicates the road the corpse is to be carried for burial. The size and colour of the light tell whether the fated person is young or old. It is or was customary in some places to light a candle, previously blessed, during the time of a woman's travail. C. were supposed to be efficacious after death as well as before birth, for they were placed on the corpse. The object was doubtless to ward off evil spirits, who were supposed to be always on the alert to injure souls on entering and on quitting the world. See also CANDLEMAS.

**CA'NDLEBERRY, CANDLEBERRY MYRTLE WAX TREE, WAX MYRTLE, TALLOW TREE, or BAYBERRY (*Myrica cerifera*),** a small tree or shrub of 4–18 feet high, but generally a low spreading shrub, a native of the United States of America, but most abundant and luxuriant in the south. It belongs to the natural order *Amentaceæ*, sub-order *Myrceæ*, according to some, a distinct natural order, distinguished by naked flowers, with 1-celled ovary, a drupaceous fruit (stone-fruit)—the scales becoming fleshy—and a single erect seed. The genus *Myrica* has male and female flowers on separate plants; and the scales of the catkin in both male and female flowers are concave. The C. has evergreen oblanceolate leaves, with two small serratures on each side at the point, sprinkled with resinous dots. The bark and leaves when bruised emit a delightful fragrance. The drupes—popularly called berries—are about the size of peppercorns, and when ripe, are covered with a greenish-white wax, which is collected by boiling them and skimming it off, and is afterwards melted and refined. A bushel of berries will yield four or five pounds. It is used chiefly for candles, which burn slowly with little smoke, and emit an agreeable balsamic odour, but do not give a strong light. An excellent scented soap is made from it.—*M. Gale* is the SWEET GALE of the moors and bogs of Scotland, well known for its delightful fragrance, a native of the whole northern parts of the world. Several species are found at the Cape of Good Hope, one of which, *M. cordifolia*, bears the name of WAX SHRUB, and candles are made from its berries.

**CA'NDLEMAS,** in its ecclesiastical meaning, is the feast of the Purification of the Virgin Mary, and is observed on the 2d of February. This festival is very strictly kept by the Roman Catholic Church, there being a procession with many lighted candles, and those required for the service of the ensuing year being also on that occasion consecrated; hence the name Candlemas Day. In Scotland, this day is one of the four term-days appointed for periodical annual payments of money, interest, taxes, &c., and of entry to premises—the three other term-days there being Whitsunday, Lammas, and Martinmas. See TERM.

An old document of the time of Henry VIII., preserved in the archives of the Society of Antiquaries, London, concerning the rites and ceremonies in the English Church, speaks thus of the custom of carrying candles: 'On Candlemas Day it shall be declared that the bearing of candles is done in the memorie of Christe, the spirituall lyghte whom Simeon dyd prophecy [*"a light to lighten the*

## CANDLE-NUT—CANEA.

Gentiles"], as it is reddish in the churche that day.' But an older and heathen origin is ascribed to the practice. The Romans were in the habit of burning candles on this day to the goddess Februa, the mother of Mars; and Pope Sergius, seeing it would be useless to prohibit a practice of so long standing, turned it to Christian account by enjoining a similar offering of candles to the Virgin. The candles were supposed to have the effect of frightening the devil and all evil spirits away from the persons who carried them, or from the houses in which they were placed. An order of council in 1584 prohibited the ceremony in England. There is a tradition in most parts of Europe to the effect that a fine C. portends a severe winter. In Scotland, the prognostication is expressed in the following distich :

'If Candlemas is fair and clear,  
There'll be two winters in the year.'

Christ's Presentation, the Holiday of St Simeon, and, in the north of England, the Wives' Feast-day, were names given to Candlemas Day. See Brand's *Popular Antiquities*, Bohn's edition.

CANDLE-NUT (*Aleurites triloba*), a tree of the natural order *Euphorbiaceæ* (q. v.), a native of the South Sea Islands, Madagascar, Molucca, Java, &c., which produces a heart-shaped nut with a very hard shell, and a kernel good to eat when roasted, although in a raw state it possesses in a slight degree some of the active properties so common in the *Euphorbiaceæ*, and is apt to cause purging and colic. It is about as large as a walnut. An excellent bland oil is procured from it, used both for food and as a lamp-oil. The inhabitants of the Society Islands after slightly baking these nuts in an oven, and removing the shell, bore holes through the kernels, and string them on rushes, hanging them up in their houses, to be used for torches, which are made by enclosing four or five strings in a leaf of the screw-pine (*Pandanus*). These torches are often used in fishing by night, and burn with much brilliancy. The lampblack used in tattooing was obtained from the shell of the candle-nut. A gummy substance exudes from the C. tree, which the Tahitians chew.

CANDLESTICK. The ordinary C. is so well known that no description is needed. The most important modern improvement in the C., is a contrivance for maintaining the candle at a uniform height, by means of a spring placed below the candle, and confined in the cylindrical body of the C.; this spring presses the candle upwards with sufficient force to drive it completely out, but for a collar at the top, against which the surface around the wick bears, and thus, as the candle melts, it yields to the pressure of the spring, and maintains a uniform height. The collar, when properly adjusted, also prevents the guttering to which composite candles are liable when exposed to currents of air or moved about.

CANDLISH, ROBERT SMITH, D.D., an eminent Scottish divine, was born in Edinburgh in 1806, entered the university of Glasgow in 1822, and was licensed as a preacher in connection with the Established Church in 1828. In 1834 he became minister of St George's, Edinburgh. From this period, his public career may be said to have commenced. With intense zeal, he advocated the justice and necessity of ecclesiastical reforms, and became one of the boldest and most vigorous leaders of the popular or 'non-intrusion' party. After the Disruption (see FREE CHURCH), he co-operated with Dr Chalmers and other chiefs of the newly formed denomination in organising, consolidating,

and extending its aggressive efforts. In 1845–1846, he took an active part in the establishment of the Evangelical Alliance. In 1847, he was, when Dr Chalmers died, appointed to the chair of Divinity, in the New College, Edinburgh, but did not assume the functions of this office. In 1862, he was appointed Principal of the same college. He died Oct. 19, 1873. His best known teachings through the press are *Contributions towards the Exposition of the Book of Genesis*; *The Atonement, its Reality and Extent*; *An Examination of Mr Maurice's Theological Essays*; *The Fatherhood of God*; and an *Exposition of the First Epistle of St John*.

CA'NDY. See CEYLON.

CA'NDYS (Gr.), a loose gown, worn by the Medes and Persians over their other garments. It was made of woollen cloth, which was either purple or of some other brilliant colour, and had wide sleeves. In the sculptures at Persepolis, nearly all the personages are represented as so attired. A gown of a very similar kind is still worn by Arabians, Turks, and other orientals.

CANDY-SU'GAR is the popular name applied to ordinary sugar when procured in large crystals by the gradual and slow cooling of a concentrated solution of sugar. See SUGAR.

CANDYTUFT (*Iberis*), a genus of plants of the natural order *Crucifera*, distinguished by unequal petals, the largest being towards the circumference of the dense corymbs in which the flowers grow, and by an emarginate pouch with the valves keeled and winged, the cells one-seeded, and the cotyledons accumbent. See COTYLEDON. The species are chiefly found in the countries surrounding the Mediterranean Sea, and the name C. is supposed to be derived from that of the island of Candia, the name *Iberis* from Iberia (Spain). One species, *I. amara*, remarkable for its bitterness, is a doubtful native of England. Some species are slightly shrubby, some are herbaceous perennials, some annuals. Some are among the most familiar ornaments of our flower-gardens, as the annual White and Purple C. (*I. umbellata*), the Sweet-scented C. (*I. odorata*), and two slightly shrubby species, *I. sempervirens* and *I. semperflorens*, the latter of which, in favourable situations, continues to blossom throughout the whole winter, and pleases the eye at all seasons, both by the abundance and the perfect whiteness of its flowers.

CANE, or KEN, a river rising in Bundelcund, near lat. 23° 54' N., and long. 80° 13' E., and, after a north-north-east course of 230 miles, entering the Jumna in lat. 25° 47' N., and long. 80° 35' E. It is too rapid and rugged for navigation; and is remarkable for the matchless beauty of its pebbles.

CANE, a term sometimes indiscriminately applied to any small and smooth rod, of the thickness of a walking-stick or less; but more correctly limited to the stems of the smaller palms and the larger grasses. We thus speak of Sugar C., Bamboo C., &c., among the latter; whilst among the former, this name is particularly appropriated to the species of the genus *Calamus*, also called Rattan. To this genus belong the canes largely imported from the tropical regions of the east for making bottoms of chairs, couches, &c. See RATTAN.

CANE SUGAR. See SUGAR.

CANE'A, or CANNA, called *Khania* (*Tu Chanid*) by the Greeks, is the capital of the island of Candia or Crete, and situated on the northern coast, in lat. 35° 28' N., and long. 24° 2' E. It occupies the site of the ancient Cydonia. The present city is of Venetian origin, and dates from 1252 A.D., when a colony was sent from Venice to occupy it. The object of its

foundation was to keep down the Greeks, who had been in arms, and at open war with their Italian lords, almost without intermission from the day when the Venetians first set foot on their shores. Venetian coats of arms are still observed over the doorways of some of the principal houses. C. is surrounded by a strong wall and deep ditch, both of which, however, are in a state of great dilapidation; it has a good but very shallow harbour. C. is the principal mart for Candian commerce, and exports to France and Italy, oil, soap, wax, &c. Consuls from all nations are stationed here, and it is the residence of the Turkish governor of Candia, and of the Greek bishop. Pop. about 12,000, of whom two-thirds are native Greeks; the rest mainly Turks. The language spoken is modern Greek. The environs of C. are very beautiful.

CANE-BRAKE (*Arundinaria macrosperma*), a large kind of reed or grass, indigenous to the warmer parts of the United States of North America. It grows in marshy situations. It is of a genus allied to the bamboo. The flowers are in panicles.

CANEILLA (*Canella alba*), a small tree common in the West Indies, where it is often called WILD CINNAMON. Its place in the botanical system has not yet been exactly ascertained, but it seems to be allied to *Pittosporaceæ*. The fruit is a small black berry. The whole tree is very aromatic, and its flowers are extremely fragrant. The bark of the young branches is the C. Bark of apothecaries, also known in commerce as White-wood Bark, and sometimes called White Cinnamon. It forms a considerable article of export from the Bahamas. It has an aromatic fragrance, regarded as intermediate between that of cinnamon and that of cloves, and a bitterish, acrid, pungent taste. It is employed as a stomachic and stimulant tonic, and as an aromatic addition to tonics or to purgatives, in debilitated conditions of the digestive organs.

CA'NÉS VENA'TICI (Lat. Hunting Dogs), a constellation of the northern hemisphere, added by Helvetius, and known generally as the greyhounds of Helvetius. The dogs are distinguished by the names of Asterion and Chara. On the celestial globe, they are represented as being held in leash by Bootes, and apparently pursuing Ursa Major (q. v.) round the pole of the heavens.

CANG, CANQUE, or KEA, an instrument of degrading punishment in use in China. It consists of a large wooden collar fitting close round the neck, and the weight of which is usually from 50 to 60 pounds. Over the parts where the C. fastens are pasted slips of paper, on which the mandarin places his seal, so that the culprit may not be relieved until the full term of his sentence has expired, which sometimes extends to 15 days. On the C. is also inscribed, in large letters, the offence and the duration of the punishment. The criminal having been paraded through the streets by the police, is then left exposed in some thoroughfare of the city. As he is incapable of using his hands, he has to be fed during the time he is suffering the penalty.

CA'NGAS DE O'NIS, a town of the Asturias, Spain, about 35 miles east-south-east of Oviedo. It is a poor place, but in its vicinity are one or two interesting monastic structures, and the cave whence the Goths fled and hid themselves, after the battle of Guadalete, in 711, and from which, in 718, they issued, and annihilated the Moorish invaders. Pop. 7000.

CANICATTI, a town of Sicily, in the province of Girgenti, and 15 miles east-north-east of the city of that name. It is situated on the banks of the

Naro, is well built, and has sulphur mines. The inhabitants, above 20,000 in number, are principally engaged in agricultural pursuits.

CANICULAR, CANICULAR DAYS, or DOG-DAYS, CANICULAR YEAR. Canicular was an old name of Canis Minor (q. v.); it was also used to denote Sirius, or the Dog-star, the largest and brightest of all the stars, and which is situated in the mouth of Canis Major (q. v.). From the Heliacal Rising (q. v.) of this star (Sirius), the ancients reckoned their dog-days, or *Dies Caniculares*, which were 40 in number—20 before, and 20 after the rising of the star. The rising of the dog-star was in ignorance supposed to be the occasion of the extreme heat and the diseases incidental to these days. It was by mere accident that the rising of the star coincided with the hottest season of the year, in the times and countries of the old astronomers. The time of its rising depends on the latitude of the place, and is later and later every year in all latitudes, owing to precession. In time, the star will rise in the dead of winter. The Canicular Year was that known among the Egyptians and Ethiopians. It was computed from one rising of Sirius to the next, and consisted ordinarily of 365 days, and every fourth year of 366. This year was sometimes called the Heliacal Year. The reason for computing the year from the rising of Sirius, seems to have been that, at the time, the heliacal rising coincided with the greatest swelling of the Nile.

CA'NIDÆ (Lat. *canis*, a dog), a family of the Digitsigrade (q. v.) section of carnivorous mammalia, which, as now generally defined, is less extensive than the Linnean genus *Canis*, the hyenas being excluded from it, and referred to the family Viverridae (civets, ichneumons, &c.). These families are, indeed, closely connected, and hyenas may be said to form a connecting-link between them, the dentition, however, making a nearer approach than in either of them to that of the cats or *Felidae*.—The C. have two flat tuberculous molar teeth or grinders on each side, behind the great carnivorous cheek-tooth—the last premolar of the upper jaw, a dentition resembling that of the bear family, or *Ursidae*, to which they exhibit a further resemblance in their power of adapting themselves to the use of vegetable food.

Their whole organisation fits them to be less exclusively carnivorous than the feline tribe. They have generally three incisors or cutting teeth, with one large canine tooth, and four premolars on each side in each jaw, two true molars on each side in the upper jaw, and three in the lower. The true molars are adapted for crushing either bones or vegetable food. The last premolars in the upper jaw are remarkably large, and particularly adapted for cutting flesh. See DOG, FENNEC, FOX, JACKAL, LYCAON, WOLF, &c.

Dentition of Canidae.

CA'NIS MA'JOR, the Greater Dog, a constellation of the southern hemisphere, below the feet of Orion. It contains Sirius, the brightest of all the stars, and its place may be found by means of this star, which is on the continuation of the line through the belt of Orion. According to Flamsteed, it contains 31 stars.

CA'NIS MI'NOR, the Lesser Dog, is a constellation of the southern hemisphere. It is near Canis Major, and just below Gemini. Procyon, of the first magnitude, is its principal star, and lies in a direct line between Sirius and Pollux; so that the position of the constellation may be found by means

## CANISTER SHOT—CANNIBAL.

of this star. According to Flamsteed, it contains in all 14 stars.

**CANISTER SHOT.** See CASE SHOT.

**CANKER**, a disease of plants, especially fatal to fruit-trees in many gardens. It is a kind of gangrene, usually beginning in the young shoots and branches, and gradually proceeding towards the trunk, killing the tree in the course of a few years. Wet subsoils seem in many cases to induce it, and it begins most readily in shoots that have been imperfectly ripened and injured by frost, or which have received some accidental wound. Those varieties of fruit-trees which have been long propagated by grafting and budding are most liable to it. It is sometimes cured by *heading down* the tree, and causing it to throw out new branches.

**CANKER**, a vague term applied to various diseases of the lower animals, characterised by their chronic nature, and consisting chiefly in ulceration, suppuration, and the development of fungoid excrescences in the parts affected.

**CANKER**, in the foot of the horse. This malady, believed by Gerlach of Berlin to be truly cancerous, is observed in two different forms: in the acute stage, when the malady is chiefly local; and in the chronic stage, when the constitution suffers, and all local remedies fail to restore a healthy function of the structures of the foot.

**Symptoms.**—It usually commences by discharge from the heels, or the cleft of the frog of the horse's foot. The horn becomes soft and disintegrated, the vascular structures beneath become inflamed, and the pain which the animal endures is intolerable. It is therefore very lame on one, two, or all feet, according to the number affected. Though there is no constitutional fever, the horse becomes emaciated, and unfit for work. During wet weather, and on damp soil, the symptoms increase in severity. The sore structures bleed on the least touch, and considerable fungoid granulations, commonly called proud flesh, form rapidly.

**Causes.**—This disease is occasionally hereditary, and it is most frequently seen in low-bred draught or coach horses. Dirt, cold, and wet, favour the production of the disease, and there is always a tendency to relapse when once an animal has been affected.

**Treatment.**—Pare away detached portions of horn, and, in mild cases, sprinkle powdered acetate of copper over the sore; apply over this pledges of tow, fixed over the foot by strips of iron or wood passed between shoe and foot. In severe cases, tar and nitric acid, creasote and turpentine, chloride of zinc paste, and other active caustics, have to be used for a time with the regular employment of pressure on the diseased surface. The animal requires to be treated constitutionally by periodical purgatives and alteratives. Good food, fresh air, and exercise often aid much in the treatment of the disease.

**CANNA**, one of the islands of the Hebrides, off the west coast of Scotland, 7 miles south-west of Skye, and 3 miles north-west of Rum. It belongs to Argyleshire, and is 4½ miles long from east to west, and 1 mile broad. The surface stands high above the sea, and consists of trap (claystone, porphyry, and trap conglomerate, with fragments of old red sandstone and bituminous wood), which has overflowed thin laminae of coal and shale. The island has a hill of basalt, called Compass Hill, which reverses the magnetic needle. Pop. (1871) 48.

**CANNABINACEAE**, a natural order of Dicotyledonous plants, or, according to many, a sub-order of **URTICACEAE** (q. v.), differing from the proper *Urticaceae* chiefly in the suspended exalbinous

seed, and hooked or spiral embryo. But only two plants of the order or sub-order are known, both of them valuable, **HEMP** (q. v.) and the **HOP** (q. v.).

**CANNES** (ancient *Canna*), a town of Southern Italy, in the province of Bari, 8 miles west-south-west of Barletta, not far from the mouth of the Ofanto, formerly the Aufidus. It is celebrated on account of the great victory here gained by Hannibal over the Romans in the summer of 216 b. c. Hannibal crossed the Aufidus at a ford, and attacked the Romans, who in a short time were almost annihilated by the terrible Numidian cavalry. Among those left on the field were Paulus *Æmilius*, the consul of the previous year; Minucius, the late Master of the Horse; and a vast number of Roman knights. The loss of the Romans is stated by Livy at 45,000 infantry and 3000 cavalry. As Hannibal lost in the battle 8000 men, he did not think it prudent to follow the advice of Maharbal, and advance rapidly on Rome. Twenty thousand Romans were made prisoners, partly on the field of battle and partly in the camp.

**CANNES**, a seaport town of France, in the department of Alpes-Maritimes, pleasantly situated on the Mediterranean, on the road to Nice. It is famed for its salubrity, which has induced a number of English families to make it a winter residence. Lord Brougham used to occupy a fine villa here. Latterly, the town has been much improved. It has fisheries of anchovies and sardines, and a trade in the produce of the district. After his escape from Elba, Bonaparte landed about a mile and a half to the east of C., March 1, 1815. Pop. (1872) 7844.

**CANNIBAL** (derived from a variety in the spelling of Caribe, the original inhabitants of the West India Islands, who were reputed to be man-eaters, and some tribes of whom, having no r in their language, pronounced their name *Canib*), means, like the Greek word *anthropophagos*, which is often used instead of it, one who feeds on human flesh. The practice is often attributed by classical and early Christian writers to races whose practices they denounce as abominable; but the denunciation is often better evidence of the abhorrence of cannibalism by those making the accusation than of its practice by the accused. Homer makes Polyphemus eat men, but only as one of his other unnatural attributes as a monster. The early Christian writers frequently attributed cannibalism to the unconverted. St Jerome gives his personal testimony to the practice, stating that when he was a little boy living in Gaul he beheld the Scots—a people of Britain—eating human flesh; and though there were plenty of cattle and sheep at their disposal, yet would they prefer a ham of the herdsman or a piece of female breast as a luxury. Statements in old authors still more absurd induced some thinkers to believe that cannibalism is unnatural, and to deny that it was ever practised by human beings except under the pressure of starvation. The accurate observation of late travellers has, however, put it beyond doubt that cannibalism has been and is systematically practised. Comte, as part of his system of positive philosophy, accepting of cannibalism as a condition of barbarism, maintains that the greatest step in human civilisation was the invention of slavery, since it put an end to the victor eating the vanquished. The facts, however, which we possess, shew that the people systematically addicted to human flesh are not the most degraded of the human race. For instance, in the Australian continent, where the larger animals are scarce, the people,

who are of an extremely degraded type, feed on worms and herbs, and have only been known in casual and exceptional conditions to feed on human flesh. The New Zealanders, on the other hand, who are the most highly developed aboriginal race with which late European civilisation has had to compete, were, down to a late period, systematic feeders on human flesh, despising the inefficient food which satisfied the natives of Australia. In Angas's *New Zealand Illustrated*, there is a picture of the country mansion of the accomplished chief Rangiheta, 'one of the finest specimens,' says the author, 'of elaborately ornamented dwellings yet extant.' Its name is Kai Tangata, which means, Eat man; and it had been so called in pleasing memorial of the feasts held within its walls. It has been supposed that the reason why, among the Jews and several eastern nations, the eating of swine's flesh was forbidden as an unclean food, was its resemblance to human flesh, and the danger that persons accustomed to the one might not retain their abhorrence of the other. In the Crusades, the Saracens charged their Christian enemies with eating unclean food, including flesh of men and of swine. In the old romance of Richard Cœur de Lion, he is represented, on recovering from sickness, as longing for a piece of pork; but that not being procurable, a piece of a Saracen's head was substituted for it, and pronounced by him to be infinitely more palatable. There have been many sad instances where people who naturally had a horror of such food, have been driven by starvation to eat human flesh—as in sieges and shipwrecks. Besides these instances, however, and the systematic cannibals, there is no doubt that people not otherwise habituated to the practice, have been excited by ferocity and revenge to eat, and with relish, the flesh of enemies. In many of the cannibal countries, only the flesh of enemies is consumed. As an instance that this is a natural development of ferocity in degraded natures, we may take the fate of the Princess Lamballe in the French Revolution, whose heart was plucked out by one of the savages of the mob, taken to a restaurant, and there cooked and eaten by him. The great Highland chief, Sir Ewen Cameron of Locheil, in a death-struggle with an English trooper, killed him by biting a piece out of his throat, and used to say it was the sweetest morsel he had ever tasted.

CANNING, GEORGE, a distinguished British statesman and orator, was born in London, April 11, 1770. His father, who was descended from an ancient family, incurred the displeasure of his relatives for marrying beneath his station, and died in poverty when his son was only a year old. His mother (who for a subsistence tried the stage, with but little success, married an actor, and subsequently a linen-draper) lived to rejoice in the success and participate in the good-fortune of her boy, whose education was liberally provided by an uncle. C. was first educated at Eton, from which he passed, at the age of 17, to Christ's Church College, Oxford, where he greatly distinguished himself, especially in classics. While here, he cultivated the friendship of the Hon. Charles Jenkinson (afterwards Lord Liverpool), who was of considerable service to him in after-life. From Oxford he went to Lincoln's Inn, but on the suggestion of Burke, as it is said, he soon relinquished the bar for a parliamentary career. He entered the House for Newport, Isle of Wight, in 1793, as the protégé and supporter of the minister, Pitt. In 1796, he was appointed an under-secretary of state. It was not, however, until 1798 that C. made a reputation as an orator and a statesman, by his speeches in favour of the abolition of the slave-trade, and

against Mr Tierney's motion regarding peace with the French Directory, the latter of which, especially, was regarded as a master-piece of eloquence, alike by the House and the country. In the debates on the Habeas Corpus Suspension Act, the union with Ireland, and other important questions, C. gave valuable assistance to the ministry, not only by his voice in parliament, but by his pen in a satirical paper, called the *Anti-Jacobin*, in which he especially lashed the 'New Philosophy,' as it was called, promulgated by the French republicans. *The Knife Grinder* is one of the best known and happiest of his efforts in this line. In 1801, Pitt resigned office, and C. joined the opposition against the Addington ministry. When Pitt again became premier in 1804, C. was made treasurer of the navy, an office which he held until Pitt's death in 1806. His opposition to the short-lived Grenville ministry which succeeded, savoured of the bitterness of party feeling, and his treatment of Fox in his last days, and of his memory after his death, was far from generous. When the Portland ministry was formed in 1807, C. was appointed Minister for Foreign Affairs, a position for which he was specially qualified, and his dispatches, written at this time, are models of manliness and lucidity. In 1812 all his eloquence was enlisted in favour of Catholic emancipation. During the same year he was elected for Liverpool, for which he was again returned three successive times. In 1814 he went as ambassador to Lisbon, returned in 1816, and was made President of the Board of Control, and supported the Liverpool ministry in all their arbitrary and repressive measures until 1820, when he resigned, in consequence of the action of the government against Queen Caroline. Nominated Governor-general of India in 1822, he was on the eve of departure when the suicide of the Marquis of Londonderry called him to the head of Foreign Affairs. In this capacity, C. conferred lasting benefits on his country. He infused a more liberal spirit into the cabinet, he asserted the independence of British politics against the diplomacy that would have entangled the nation with the Holy Alliance, and gave a new direction and impetus to commercial affairs by a gradual laying aside of the prohibitive system. He arranged the relations of Brazil and Portugal; drew the French cabinet into agreement with the British respecting Spanish American affairs; was the first to recognise the free states of Spanish America; promoted the treaty combining England, France, and Russia, for a settlement of the affairs of Greece, and which was signed July 6, 1827; protected Portugal from Spanish invasion; contended earnestly for Catholic emancipation; and prepared the way for a repeal of the corn-laws. In February 1827, a stroke of paralysis forced the Earl of Liverpool to resign, and Mr C. was called upon to form a new administration. His health, however, gave way under the cares of office, and he died 8th August of the same year. His remains were interred in Westminster Abbey, near those of Pitt. As a parliamentary orator, C. holds a prominent place in British annals. His acuteness of mind, power of expression, and well-pointed wit, were remarkable; but, on the whole, he was inferior to Pitt, Burke, and Fox. He lacked the imposing characteristics of the first, the overpowering enthusiasm of the second, and the winning address of the last. He was intensely British, and his foreign policy was of the character best calculated to promote British interests.

His speeches have been reprinted in 6 vols. 8vo, by Therry, and several memoirs, including one by his private secretary, Mr Stapleton, have been published.

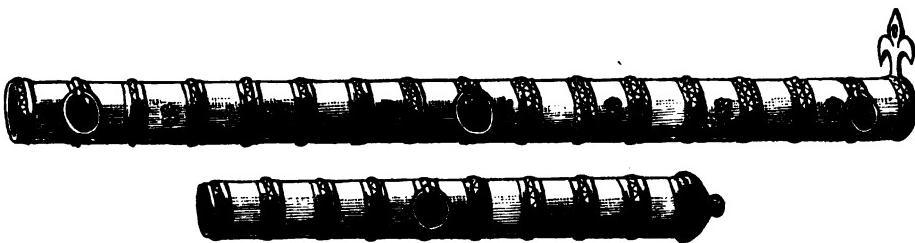

## CANNING—CANNON.

**CANNING, CHARLES JOHN, VISCOUNT**, second son of the above statesman, was born December 1812. Educated at Eton and Oxford, he succeeded to the peerage as Viscount C. on his mother's death in 1837, his elder brother, who was a captain in the navy, having been drowned at Madeira in 1828. In 1841 he became Under-secretary of State for Foreign Affairs in Sir Robert Peel's government, and afterwards Commissioner of Woods and Forests. When Lord Aberdeen came into office, he was made Postmaster-general; and in the beginning of 1856, he succeeded Lord Dalhousie as Governor-general of India. His conduct during the awful crisis of the Indian mutiny was decried at the

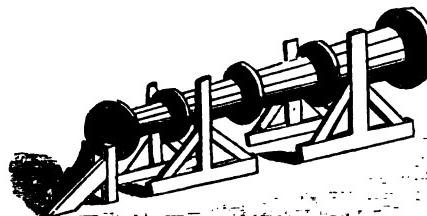

time by many as weak and pusillanimous; but the general opinion now, when all the circumstances of the case are better known, is that he acted with singular courage, moderation, and judiciousness. He died in London, 17th June 1862.

**CANNING, SIR STRATFORD.** See STRATFORD DE REDOLIFFE, VISCOUNT.

**CANNON**, is a general name for large pieces of ordnance or artillery, as distinguished from those pieces which can be held in the hand while being fired. No military weapon in use before the invention of gunpowder can fairly come under this designation; they were more generally of the kinds

Earliest forms of English Cannon, from examples in the Tower of London.

Mounting of a Cannon.—From Froissart.

described under **BALISTA**. At what exact date C. were first used is not known; but C., called 'crakys of war,' were employed by Edward III. against the Scots in 1327, by the French at the siege of Puy Guillaume in 1338, and by Edward III. at Crecy, and at Calais in 1346. Figs. 1 and 2 represent early forms of English C., and fig. 3 a mode of mounting the C. on carriages. The first C. or *bombards* were clumsy, wider at the mouth than at the chamber, and made of iron bars hooped together with iron rings. The balls fired from them were first made of stone, afterwards superseded by iron. In the 15th c., various kinds were known by the names of C., bombards, culverins, serpentines, &c. Bombards of great length and power were employed by Louis XI. during his Flemish campaign in 1477, some with stone balls, some with iron. About this time, C. began to be made by casting instead of with hooped bars; and bronze or brass as a material began to be used as well as iron. The C. of the 16th c. were generally smaller, but better finished, than those of the 15th. The largest C. made in the 17th c., so far as is known, was the Bejapoore cast-iron gun, 'Malick e Meidan,' or 'Lord of the Plain,' made either by Aurungzebe or by the Mahrattas; it was 14 feet long, 28 inches bore, and required a ball of 1600 lbs. weight. From the time of the great European wars in that century, C. have undergone vast improvements, as well as the science and art of artillery necessary for their management. Major Straith, a leading authority on this matter, gives the following tabular view of the chief kinds of

ordnance in use in the British service, prior to the introduction of rifled guns:

Kind.	Name.	Calibre. Inch.	Length. Feet. Inch.	Weight. Owt.
Iron Shell Guns,	12 inch,	12	8 4	90
	10 "	10	9 4	84
	8 "	8	8 9	60
Long Iron Guns,	32-pounders,	64	9 5	56
	24 "	58	9 0	47
	18 "	53	9 0	42
Long Brass Guns,	12 "	46	9 0	33
	9 "	42	8 6	28
	12 " (medium),	46	6 7	18
Iron Howitzers,	9 "	42	6 0	13
	6 " (heavy),	37	8 6	22
	6 " (light),	37	5 0	6
Brass Howitzers,	3 " (colonial),	29	4 0	3
	1 "	20	5 0	2
	10 inch,	100	5 0	40
Iron Carronades,	8 "	80	4 0	20
	32-pounders,	63	5 3	17
	24 "	50	4 9	12
Iron Mortars,	12 "	80	5 2	29
	42 "	68	4 4	22
	32 "	62	4 0	17
Brass Mortars,	24 "	57	3 9	13
	18 "	52	3 3	10
	12 "	45	2 8	6
Brass Mortars,	13 inch,	130	3 1	25
	10 "	100	3 4	16
	8 "	80	1 11	8
Brass Mortars,	5 "	55	1 3	150 lb.
	4 "	46	1 0	104 "

It must be borne in mind, however, that many of the novelties introduced within the last few years

## CANNON—CANNON-BALL TREE.

are not here included. Nevertheless the table will be useful for occasional reference. The apparent inconsistencies in length and weight are due to the great differences in thickness of metal; and if we were to go beyond the limits of the table, we should find that, during half a century, iron 32-pounders have varied from 63 down to so low as 25 cwt., and 24-pounders from 50 to 33 cwt.; in each case the length and weight varying, while the calibre remained constant. In the above table, the calibre is not always precisely the same for the same weight of ball; as instanced by the 32-pounders, which have 6 $\frac{1}{2}$ , 6 $\frac{3}{4}$ , and 6 $\frac{5}{8}$  inches calibre; this is due to the fact that some guns have more *windage*, or space round the ball, than others.

In England, during the last few years, great expense has been incurred in replacing old C. by others of larger power and calibre; while the French are gradually bringing about a limitation in the number of kinds and sizes, for the sake of simplicity.

This being merely a general or collective notice of all kinds of C. as a class, particulars concerning each kind will be found under such headings as **ARMSTRONG GUN**, **CARRONADE GUN**, **HOWITZER**, **LANCASTER GUN**, **MORTAR**, **SHELL GUN**, &c.

**CANNON, ALLOYS FOR.** The material formerly used for the manufacture of ordnance was Bronze (q. v.), consisting of about 90 parts of copper to about 10 parts of tin. In the casting of small C., such as 8-pounders, the alloy used contained 92 $\frac{1}{2}$  parts of copper to 7 $\frac{1}{2}$  parts of tin; while in the larger C. the tin was increased until the proportion reached 88 to 12. The presence of the tin increased the hardness of the alloy, but this was obtained at the expense of the tenacity. Great care must be taken to insure the purity of the copper and the tin. If lead is present, the alloy is always more or less soft, and, moreover, liable to fuse after repeated explosions; while the presence of a mere trace of sulphur, arsenic, phosphorus, &c., renders the alloy very brittle. It was customary, in the casting of C., to use up old C. or other bronze implements, so as to form a beginning of the fused metal in the furnace, and then to add little by little the extra amount of copper and tin. This mode of procedure was followed, owing to the difficulty found in getting copper and tin to amalgamate readily, so as to yield an alloy of uniform composition. This point is of great importance in the casting of ordnance, as the metals, when not properly alloyed, are liable to separate during cooling, and yield a C. of variable composition throughout. With the exception of small steel mountain guns, all British cannon are made (1874) of wrought-iron.

**CANNON FOUNDRY** is a very important manufacture, requiring a careful application of metallurgical processes. In 1856, the government invited iron smelters to send specimens of iron to the Royal Gun Factory at Woolwich, to test the capabilities of English metal for the manufacture of good guns. After three years of almost incessant experiments, it was announced, in 1859, that Netherton and Parkhead iron from Staffordshire, Bowling iron from Yorkshire, Blaenavon iron from Monmouthshire, and some other kinds, possess as many good qualities for the purpose as any foreign iron whatever—a decision which was as unexpected as it was welcome.

Many important questions have been practically settled during the last 15 years concerning the manufacture of large ordnance. Whether cast-iron, or wrought-iron bars bound together with iron-hoops; whether iron, or steel; whether steel outside of iron, or iron outside of steel; whether iron

or brass; if cast, whether cast hollow or solid; whether to be made for breech-loading or for muzzle-loading; whether for smooth bore or rifled bore—these are points on which elaborate and costly experiments are being made. Some of the results will be noticed under the particular kinds of ordnance to which they more especially relate.

When the earlier guns, made of hoop bars, were superseded by cast guns, the latter were always cast hollow; but a French founder, in 1749, discovered a mode of boring guns cast solid. Ever since that time, cannon have been more frequently cast solid than hollow, under a belief that the texture of the metal is rendered closer by this arrangement. This, as well as many other questions relating to the manufacture of large ordnance, is at the present day undergoing reconsideration.

British iron cannon were wholly made by contract until 1855, mostly at the great works in Yorkshire and Staffordshire, and at Carron in Scotland; but a large factory has been established within the arsenal at Woolwich, and the government has to some extent acquired the power of lowering the price and expediting the supply. The casting does not differ much in detail from that of other large masses of iron-work. There is a central pattern or model of well-seasoned wood, or of iron; there is an exterior casting-box, or jacket of iron; and there is a mass of well-compacted sand and clay, or sand and coke-dust, in the annular space between the pattern and the jacket. The jacket and the annulus of sand are built up piecemeal, so that the mould shall be vertical in the casting-pit, with the muzzle upwards. At Woolwich there are furnaces, each of which would contain molten metal enough for a large gun, such as a 68-pounder; but it is deemed better to melt in several furnaces for the larger castings, and to let the streams flow together into the mould. An additional mass of iron is left at the top, to compress the metal of the cannon by its weight when in the liquid state. After a due length of time for cooling, the jacket is opened and removed, the annulus of sand is knocked off, and the cannon is bored within and turned without, until the proper degree of smoothness is attained. In boring, according to some plans, the gun revolves, while the cutter is stationary; in others, the cutter revolves, while the gun is stationary. The cutter is a strong sharp steel tool at the end of a long bar; and a train of mechanism drives it onwards as fast as the bore is made. If the gun be cast hollow, the boring is only a kind of scraping of the interior; but if solid, the whole calibre is formed by a long-continued action of the cutter, which brings off the metal in fine fragments.

All the brass guns for British service were made by the government at Woolwich. The metal is in reality bronze, not brass (see preceding article). The general processes are similar to those for iron ordnance, with modifications depending partly on the smaller size of the guns, and partly on the characteristics of the metal. In France, brass guns were always used much more largely than in England; they are lighter, stronger, and more durable than those of iron; and it has been a question largely discussed among military men, whether brass guns are or are not worth the greatly increased cost which they involve. They are no longer manufactured for the British army. See **RIFLED ARMS**.

Certain peculiarities in the manufacture of special kinds of ordnance are noticed in the articles relating to them. See **WAR-SERVICES** in SUPP., Vol. X.

**CANNON-BALL TREE** (*Cecropia Guianensis*), a tree of the natural order *Lecythidaceæ*, a native of Guiana, of great size, the trunk being often more than two feet in diameter. It has large

## CANNSTADT—CANON.

ovate-oblong leaves; the flowers are produced in racemes, they are white and rose-coloured; and the fruit is large, ‘about the size of a 36-pound shot,’ nearly round. The hard woody shell of this fruit is used for drinking-vessels.

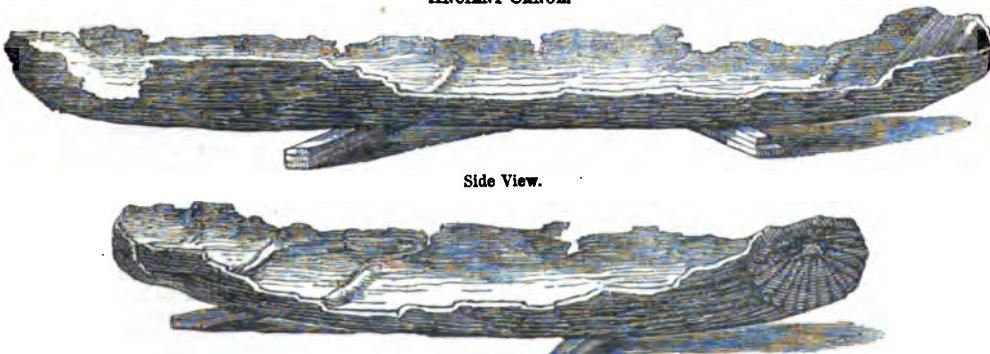

CANNSTADT, a town of Würtemberg, beautifully situated on the Neckar, about 3 miles north-east of Stuttgart. It owes its origin to the Romans, of whose presence there are still found many traces. It has numerous mineral springs, discharging 800,000 cubic feet of water in the 24 hours, which are much frequented during the season; manufactures of woollens, cottons, tobacco, &c.; and a large trade by means of the Neckar. Pop. (1871) 11,804.

CA'NO, ALONSO, an illustrious Spanish painter, the founder of the School of Granada, in which city he was born, March 1601. He received his first instructions in the principles of art from his father, Miguel Cano, who was an architect; studied sculpture under J. Montanes, and painting under Pacheco and Juan de Castillo; and attained celebrity so early, that, in 1638 or 1639, he was appointed court painter and architect to the king. C. was of a hasty temper, and was accused of having murdered his wife in a fit of violent jealousy, but the accusation appears to have been quite groundless. He was, however, subjected to the torture; but no confession having been elicited, he was acquitted and received again into the royal favour, named residentiary of Granada, and spent his last years in acts of devotion and charity. He died at Granada in 1664 or 1667.

In the opinion of Fuseli, he excelled all his contemporaries except Velasquez. His eminence in the three departments of the fine arts—sculpture, painting, and architecture—obtained for him the hyperbolical honour of being called the *Michael Angelo* of Spain. His pictures, marked by graceful design and pleasing colouring, are very numerous, and are preserved in Granada, Seville, Madrid, Malaga, and other Spanish cities.

CANOE\* is a boat made of a hollowed trunk of a tree, or of the bark shaped and strengthened. Canoes have been made large enough to carry twenty or thirty hogheads of sugar. Some have decks, and carry sail of rush or silk-grass; but they are generally open boats, rowed by paddles, and steered by an oar. They are seldom wide enough for two men to sit abreast, but vary greatly in length. Near sea-coasts, canoes are often made of light wooden-frames, covered with seal-skins, which are also drawn across as a deck, with only a hole left for one man to sit in. In the Hudson's Bay Territories, canoes are used which are light enough to be carried over the portages, or portions of river too shallow for navigation. Canoes, hollowed out of the trunks of oaks, seem to have been in use among the early inhabitants of the British Islands. They have been dug up in considerable numbers in England, Scotland, and Ireland. They appear to have been chiefly of two sorts—one about 10 feet long, with square ends, and projecting handles; the other, about 20 feet long, sometimes sharp at both ends, sometimes round at the prow and square at

ANCIENT CANOE.

Foreshortened View, shewing the End.

the stern. The accompanying wood-cut shews one of this last variety, dug out of a marsh in Sussex.

CATON, a word originally Greek, and signifying a measuring-rod (see CANOE—foot-note), applied in various arts and sciences to what serves for a rule or standard, but particularly employed to designate collectively those books which constitute the Holy Scripture, and are accepted by Christians as a rule of faith. See BIBLE. In ecclesiastical language, the word canon signifies, besides, not only a church-precept, but also the decree of a universal council, which is held valid as law. See CANON LAW. At one period the word was used to designate the prayers which the Roman Catholic priests said before, at, and after the consecration of the Host; the term is also employed to denote the catalogue or register of Catholic saints.

CANON, an ecclesiastical dignitary, so called as living under a rule, or as following the rule or canon of divine service. His office is of no great antiquity. According to Pasquier, the name was not known before Charlemagne. This, however, is

not precisely true, for the term C. was applied in the 4th c. to cenobites living under a common rule; but the office of C. is supposed to have been first instituted by Chrodegand, or Chrodegang, Bishop of Metz, in 763. It is at least certain that he was the author of the oldest canonical rule, which was simply an adaptation of the monastic rule (commonly but erroneously attributed to St Augustine) to the priests and ‘clerks’ specially

\* The word is sometimes said to have been borrowed by the Spaniards from the native Indian name of such boats. But a similar name exists in the Aryan languages: Ger. *kahn*, a boat; Old Fr. *cane*, a ship, and *canot*, a boat. The root of these words is the same as that of *cane* (Lat. *canna*), a reed or hollow stem, and signifies hollowness, capacity; Gr. *chaine*, to gape or yawn. From the same root come *cann*, a drinking-cup; *cannon* (Ital. *cannone*), properly a large tube, being an augmentative from *canna*, a hollow stem or tube; *canon* (Gr.), a ruler or straight rod, most readily obtained from a joint of a reed; *canal* (Lat. *canalis*), a pipe or conduit.

attached to the service of a cathedral or other church. It enjoined on the canons manual labour, the practice of silence at certain times, confession twice a year, and other duties needless to specify. The canons formed the council of the bishop, and assisted him in the government of his diocese. They lived in a house called a *monastery*, slept in a common room, ate at the same table, and were originally supported out of the episcopal revenues. In 816, Louis le Débonnaire induced the Council of Aix-la-Chapelle to draw up a general rule for the whole body of canons. Canons found their way not long afterwards into England, Scotland, and Ireland. Various reforms of C. were made in the 11th and beginning of the 12th century. Gradually, however, many began to emancipate themselves from the restrictions of monastic life, and to live independent of any rule, which is not at all surprising, for the canons were wont to keep apart from the 'lower clergy,' as they called parish priests and others who really laboured to impart religious instruction. They were often of noble families, loved titles—at Lyon, they were called *counts*—and in general were men of the world rather than true churchmen. Some of these reformed or remodelled Canons were called Black Canons, from wearing a black cassock; others, White Canons, from wearing a white habit like the *Premonstratens* of Picardy in France. The class of *secular* canons, whose manner of life was not conventional, and who therefore escaped destruction in England when the monasteries were abolished by Henry VIII, probably originated in a tendency to relax the severity of rule enjoined on the regulars, which indeed was hardly less stringent than in the case of ordinary monks. Secular canons still exist in the Anglican Church, and their duties—making allowance for the difference between the Roman Catholic and Protestant religions—are much the same in kind as they were before the Reformation. See CATHEDRAL.

CANON, in Music, a kind of fugue in which not merely a certain period or phrase is to be imitated or answered, but the whole of the first part with which the C. begins is imitated throughout by all the other parts. As in fugues, the melody of the part to be imitated is called the subject, and the others its reply. The C. is the highest degree of mechanical musical contrivance. The ancients spent more time in the construction and resolving of mere puzzling and unentertaining canons, than in the cultivation of good harmony and melody. Good canons, however, are always interesting, and different from any other composition. For a full treatment of writing a C., see Marpurg's *Abhandlung von der Fuge*, published by Peters, Leipzig.

CANON LAW is a collection of ecclesiastical constitutions for the government and regulation of the Roman Catholic Church, although many of its regulations have been admitted into the ecclesiastical system of the Church of England, and still influence other Protestant bodies. It was compiled from the opinions of the ancient Latin Fathers, the decrees of general councils, and the decretal epistles and bulls of the Holy See. These, from a state of disorder and confusion, were gradually reduced into method, and may be briefly described in the following chronological order: 1. *Gratian's Decree*, which was a collection of ordinances, in three books, commenced by Ivo, Bishop of Chartres, 1114 A.D., and subsequently corrected and arranged by Gratian, a Benedictine monk, in the year 1150, after the manner of Justinian's *Pandects of the Roman Law*. This work comprises ecclesiastical legislation, as it may be called, from the time of Constantine the Great, at the beginning of the 4th, to that of Pope Alexander III,

at the end of the 12th century. 2. The *Decretals*. They are a collection of canonical epistles, in five books, written by popes alone, or assisted by some cardinals, to determine any controversy, and first published about the year 1230, by Raimundus Barcinus. They lay down rules respecting the lives and conversation of the clergy, matrimony and divorce, inquisition of criminal matters, purgation, penance, excommunication, and other matters deemed to be within the cognizance of the ecclesiastical courts. To these five books of Gregory, Boniface VIII. added a sixth, published 1238 A.D., called *Sextus Decretalium*, or the *Sext*, which is itself divided into five books, and forms a supplement to the work of Barcinus, of which it follows the arrangement. The *Sext* consists of decisions promulgated after the pontificate of Gregory IX. Then there came the *Clementines*, which were constitutions of Pope Clement V., published 1308 A.D. These decretals form the principal portion of the canon law. John Andreas, a celebrated canonist in the 14th c., wrote a commentary on them, which he entitled *Novella*, from a very beautiful daughter he had of that name, whom he bred a scholar; the father being a professor of law at Bologna, had instructed his daughter so well in it, that she assisted him in reading lectures to his scholars, and therefore, to perpetuate her memory, he gave that book the title of *Novella*. 3. The *Extravagants* of John XXII, and other later popes, by which term is meant to be denoted documents which transcend the limits of a particular collection of regulations. These books, viz., *Gratian's Decree*, the *Decretals*, and the *Extravagants*, together form the *Corpus Juris Canonici*, or great body of the 'canon law,' as formerly received and administered by the Church of Rome. There are, however, other publications of a later period, of more or less authority, but which do not appear to have received the formal sanction of the Holy See.

This C. L., borrowing from the Roman civil law many of its principles and rules of proceeding, has at different times undergone careful revision and the most learned and scientific treatment at the hands of its professors, and was very generally received in those Christian states which acknowledge the supremacy of the pope; and it still gives ecclesiastical law more or less to Roman Catholic Christendom, although its provisions have in many countries been considerably modified by the *concordats* (q. v.) which the popes now and then find it expedient to enter into with Roman Catholic sovereigns and governments, whose municipal system does not admit of the application of the C. L. in its integrity. Indeed, the fact of its main object being to establish the supremacy of the ecclesiastical authority over the temporal power, is sufficient to explain why, in modern times, it is found to conflict with the views of public law and government, even in the case of the most absolute and despotic governments.

This ecclesiastical system, however, never obtained a firm footing in England, and the great lawyers and statesmen have always shewn not only an unwillingness to defer to its authority, but even an aversion to its rule. There was, however, a kind of national C. L. in England, composed of *legative* and *provincial* constitutions, adapted to the particular necessities of the English Church. The legative constitutions were ecclesiastical laws, enacted in national synods, held under the Cardinals Otho and Othobon, legates from Pope Gregory IX. and Pope Clement IV., in the reign of King Henry III., about the years 1220 and 1238. The provincial constitutions are principally the decrees of provincial synods, held under divers archbishops of Canterbury, from Stephen

## CANONICAL HOURS—CANONS OF THE CHURCH OF ENGLAND.

Langton, in the reign of Henry III., to Henry Chicheley, in the reign of Henry V., and adopted also by the province of York in the reign of Henry VI. At the dawn of the Reformation, in the reign of Henry VIII., it was enacted in parliament that a review should be had of the C. L.; and till such review should be made, all canons, constitutions, ordinances, and synodals provincial being then already made, and not repugnant to the law of the land or the king's prerogative, should still be used and executed. And as no such review has yet been perfected, upon this enactment now depends the authority of the C. L. in England, the limitations of which appear, upon the whole, to be as follows: that no canon contrary to the common or statute law, or the prerogative royal, is of any validity; that, subject to this condition, the canons made anterior to the parliamentary provision above mentioned, and adopted in our system (for there are some which have had no reception among us), are binding both on clergy and laity; but that canons made since that period, and having no sanction from the parliament, are, as regards the laity at least, of no force. See CANONS OF THE CHURCH OF ENGLAND.
